public justice, to put a malefactor to death, who has forfeited his life by the laws and verdict of his country. This is an act of necessity, and even of civil duty: and therefore not only justifiable, but commendable, where the law requires it. But the law must require it, otherwise it is not justifiable: therefore wantonly to kill the greatest of malefactors, felon, or a traitor, attainted, or outlawed, deliberately, uncompelled, and extrajudicially, is murder. And farther, if judgment of death be given by a judge not authorised by lawful commission, and execution is done accordingly, the judge is guilty of murder. Also such judgment, when legal, must be executed by the proper officer, or his appointed deputy; for no one else is required by law to do it, which requisition it is that justifies the homicide. If another person doth it of his own head, it is held to be murder; even though it be the judge himself. It must farther be executed, servato juris ordine; it must pursue the sentence of the court. If an officer beheads one who is adjudged to be hanged, or vice versâ, it is murder; for he is merely ministerial, and therefore only justified when he acts under the authority and compulsion of the law. But, if a sheriff changes one kind of punishment for another, he then acts by his own authority, which extends not to the commission of homicide: and besides this license might occasion a very gross abuse of his power. The king indeed may remit part of a sentence, as in the case of treason, all but the beheading; but this is no change, no introduction of a new punishment; and in the case of felony, where the judgment is to be hanged, the king, it has been said, cannot legally order even a peer to be beheaded. Again, in some cases homicide is justifiable rather by the permission, than by the absolute command, of the law: either for the advancement of public justice, which without such indemnification would never be carried on with proper vigor; or in such instances where it is committed for the prevention of some atrocious crime, which cannot otherwise be avoided. 2. Homicides committed for the advancement of public justice are (1). Where an officer, in the execution of his office, either in a civil or criminal case, kills a person that assaults and resists him. (2). If an officer, or any private person, attempts to take a man charged with felony, and is resisted ; and, in the endeavour to take him, kills him. (3). In case of a riot, or rebellious assembly, the officers endeavouring to disperse the mob are justifiable in killing them, both at common law, and by the riot oct, 1 Geo. I. c. 5. (4). Where the prisoners in a gaol, or going to a gaol, assault the gaoler or officer, and he in his defence kills any of them, it is justifiable, for the sake of preventing an escape. (5). If trespassers in forests, parks, chases, or warrens, will not surrender themselves to the keepers, they may be slain; by virtue of the statute 21 Edward I. stat. 2, de malefactoribus in parcis, and 3 & 4 W. & M. c. 10. But, in all these cases, there must be an apparent necessity on the officer's side; viz. that the party could not be arrested or apprehended, the riot could not be suppressed, the prisoners could not such an office as obliges one, in the execution of be kept in hold, the deer-stealers could not but

escape, unless such homicide were committed; otherwise, without such absolute necessity, it is not justifiable. (6.) If the champions, in a trial by battle, killed either of them the other, such homicide was justifiable, and was imputed to the just judgment of God, who was thereby presumed to have decided in favor of the truth. 3. In the next place, such homicide as is committed for the prevention of any forcible and atrocious crime, is justifiable by the law of nature; and also by the law of England, as it stood so early as the time of Bracton, and as it is since declared by stat. 24, H. VIII., c. 5. If any person attempts a robbery or murder of another, or attempts to break open a house in the night-time (which extends also to an attempt to burn it), and shall be killed in such attempt, the slayer shall be acquitted and discharged. This reaches not to any crime unaccompanied with force, as picking of pockets; or to the breaking open of any house in the day-time, unless it carries with it an attempt of robbery also. So the Jewish law, which punished no theft with death, makes homicide only justifiable in case of nocturnal housebreaking : 'if a thief be found breaking up, and he be smitten that he die, no blood shall be shed for him ; but, if the sun be risen upon him, there shall blood be shed for him; for he should have made full restitution.' At Athens, if any theft was committed by night, it was lawful to kill the criminal, if taken in the fact; and, by the Roman law of the XII tables, a thief might be slain by night with impunity, or even by day, if he armed himself with any dangerous weapon: which amounts very nearly to the same as is permitted by our constitution. The Roman law also justifies homicide, when committed in defence of the chastity either of one's self or relations; and so also, according to Selden, stood the law in the Jewish republic. The English law likewise justifies a woman killing one who attempts to ravish her: and so too the husband or father may be justified in killing a man who attempts a rape upon his wife or daughter; but not if he takes them in adultery by consent; for the one is forcible and felonious, but not the other. And there is no doubt but the forcibly attempting a crime, of a still more detestable nature, may be equally resisted by the death of the unnatural aggressor. For the one uniform principle that runs through our own, and all other laws, seems to be this: That where a crime, in itself capital, is endeavoured to be committed by force, it is lawful to repel that force by the death of the party attempting. But we must not carry this doctrine to the same length that Mr. Locke does; who holds, 'that all manner of force without right upon a man's person, puts him in a state of war with the aggressor; and, of consequence, that, being in such a state of war, he may lawfully kill him that puts him under this unnatural restraint.' However just this conclusion may be in a state of uncivilised nature, yet the law of England, like that of every other well regulated community, is too tender of the public peace, too careful of the lives of the subject, to adopt so contentious a system; nor will it suffer with impunity any crime to be prevented by death, unless the same, if committed, would also be

punished by death. In these instances of justifiable homicide, it may be observed, that the slayer is in no kind of fault whatsoever, not even in the minutest degree; and is therefore to be totally acquitted and discharged, with commendation rather than blame. But that is not quite the case in excusable homicide, the very name whereof imports some fault, some error, or omission; so trivial, however, that the law excuses it from the guilt of felony, though in strictness it judges it deserving of some little degree of punishment. See HOMICIDE, EXCUSABLE.

By stat. 39 Geo. III., c. 37, persons tried under the act 28 H. VIII., c. 15, for murder, and found guilty of manslaughter only, are declared entitled to the benefit of clergy, &c., as if it had been committed on land. And by stat. 46 Geo. Ill., c. 54, such offences may be tried in any of his majesty's islands or colonies by virtue of a commission under the great seal to commissioners, who shall have all such powers as are given by stat. 28 H. VIII., c. 15. And by stat. 57 Geo. III., c. 53, murders, &c., committed in the Bay of Honduras, New Zealand, Otaheite, or any islands or places, not within his majesty's dominions, by the master or crew of any British ship, or persons having been such, may be tried in any of his majesty's islands or colonies, under a commission issued by virtue of the act 46 Geo. III., c. 54. Now, at Honduras, such offences may be tried by commissioners specially appointed by virtue of a subsequent act. 59 Geo. III. c. 44. See also stat. 58 Geo. III., c. 98, as to offences relative to the slave-trade, title Slaves. Under stat. 10, 11, W. III., c. 25, sect. 13, mur-ders committed in Newfoundland, &c., may be tried in any county in England; and it does not appear that this act is repealed by stat. 32 Geo. III., c. 40, or the acts creating courts of jurisdiction in that country.

On the whole, homicide is malicious, and of course amounts to murder, unless where, first, justified by the command or permission of the law: secondly, excused on the account of accident or self-preservation; or, thirdly, alleviated into manslaughter, by being either the involuntary consequence of some act, not strictly lawful. or (if voluntary) occasioned by some sudden and sufficiently violent provocation. And all these circumstances of justification, excuse, or alleviation, it is incumbent upon the prisoner to make out, to the satisfaction of the court and jury : the latter of whom are to decide whether the circumstances alleged are proved to have actually existed; the former, how far they extend to take away or mitigate the guilt. For all homicide is presumed to be malicious, until the contrary appeareth upon evidence.— Fost. 255.

¹ HOMILÉTICAL, adj. Gr. δμιλητικος. Social; conversable.

His life was holy, and when he had leisure for retirements, severe: his virtues active chiefly, and homiletical; not those lazy sullen ones of the cloyster. Atterbury.

HOM'ILY, n.s. Fr. homilie; Gr. $\delta\mu\mu\lambda$ ia. A discourse read to a congregation.

Homilies were a third kind of readings usual in former times; a most commendable institution, as well then to supply the casual, as now the necessary defect of sermons. Howker.

HOM

What tedious *homily* of love have you wearied your parishioners withal, and never cried, Have patience, good people ! Shakspeare. As You Like It.

If we survey the homilies of the ancient church, we shall discern that, upon festival days, the subject of the homily was constantly the business of the day.

Hammond's Fundamentals.

HOMILY, from ὑμιλος, an assembly, is a sermon upon some point of religion, delivered in a plain manner, so as to be easily understood by the people. The Greek homily, says M. Fleury, signifies a familiar discourse, like the Latin sermo; and discourses delivered in the church were so named, to intimate that they were not harangues or matters of ostentation and flourish, like those of profane orators, but familiar and useful discourses, as of a master to his disciples, or a father to his children. All the homilies of the Greek and Latin fathers were composed by The privilege was not ordinarily bishops. allowed to priests till towards the fifth century. St. Chrysostom was the first presbyter that preached statedly. Origen and St. Augustine also preached; but it was by a peculiar license. Photius distinguishes hemily from sermon, in that the homily was performed in a more familiar manner; the prelate interrogating and talking to the people, and they in their turn answering and interrogating him, so that it was properly a conversation; whereas the sermon was delivered with more form, and in the pulpit, after the manner of the orators. The practice of compiling homilies, to be committed to memory, and recited by ignorant or indolent priests, commenced towards the close of the eighth century; when Charlemagne ordered Paul Deacon and Alcuin to form homilies or discourses upon the Gospels and Epistles, from the ancient doctors of the church. This gave rise to that famous collection entitled the Homiliarium of Charlemagne, which being followed as a model by many productions of the same kind, composed by private persons, from a principle of pious zeal, contributed much says Mosheim to nourish the indolence, and perpetuate the ignorance of a worthless clergy. There are still extant several fine homilies, composed by the ancient fathers, particularly St. Chrysostom and St. Gregory, The Clementine homilies are nineteen homilies in Greek, published by Cotelerius, with two letters prefixed; one of them written in the name of Peter, the other in the name of Clement, to James bishop of Jerusalem; in which last letter they are entitled Clement's Epitome of the Preaching and Travels of Peter. According to Le Clerc, these homilies were composed by an Ebionite in the second century; but Montfaucon supposes that they were forged long after the age of St. Athanasius. Dr. Lardner apprehends, that they were the original or first edition of the Recognitions; and that they are the same with the work censured by Eusebius under the title of Dialogues of Peter and Appion.

HOMILIES, TWO BOOKS OF, in the Church of England, are two books of plain sermons, set out by public authority, and ordered to be read in churches on Sundays and holidays, when there was no sermon. The first book was compiled

and published in the beginning of Edward the VI's reign; and the second in queen Elizabeth's time, by order of convocation, 1563.

HOMINE Replegiando, a writ for the bailing of a man out of prison, when he is confined without commandment of the king or his judges, or from any cause that is repleviable. But this writ is now seldom used; a writ of habeas corpus being sued out on the necessary occasions.

HOMO, man, is ranked by Linnæus under the class of mammalia and order of primates, or chiefs; and characterised by having four parallel fore teeth both in the upper and lower jaw, and two mammæ on the breast. The only species is the

H. sapiens, or sapient man, so named as being endowed with wisdom far superior to, or rather exclusive of, all other animals. See MAN.

The following is the arrangement of the species offered by Dr. Gmelin as more convenient than that of Linnæus.

H. albus, white, formed by the rules of symmetrical elegance and beauty. This division includes almost all the inhabitants of Europe; those of Asia on this side of the Oby, the Caspian, Mount Imaus, and the Ganges; likewise the natives of the north of Africa, of Greenland, and the Esquimaux.

H. badius, brown, of a yellowish brown color; having scanty hairs, flat features, and small eyes. This variety takes in the whole inhabitants of Asia not included in the preceding division.

H. cupreus, copper-colored, the complexion of the skin resembling the color of copper not burnished. The whole inhabitants of America, except the Greenlanders and Esquimaux.

H. fuscus, tawny, chiefly of a dark blackishbrown color; having a broad nose, and harsh coarse straight hair. The inhabitants of the southern islands, and of most of the Indian islands.

H. niger, black, of black complexion, having frizzly hair, a flat nose, and thick lips. The whole inhabitants of Africa, excepting those of its more northern parts. This variety is ranked by Dr. Gmelin third in order, though in the gradation of color it certainly should be last.

HOMODROMUS VECTIS, or lever, in mechanics, is a lever in which the weight and power are both on the same side of the fulcrum as in the lever of the second and third kinds; being so called because here the weight and power move both in the same direction, whereas in the heterodromus they move in opposite directions.

HOMOGE'NEAL, adj.) HOMOGE'NEOUS, adj. HOMOGE'NEALNESS, n. s. HOMOGENE'ITY, n.s. Homoge'neousness, n. s. Homog'eny, n.s.

Fr. homogene ; Gr. opoyevns. Showing the same nature or principles; similitude of kind : thus blood is said

to be an homogeneous fluid. Homogeny, a word obsolete, signifies joint nature.

l

The means of reduction, by the fire, is but by congregation of homogeneal parts. Bacon.

By the driving back of the principal spirits, which preserve the consistence of the body, their government is dissolved, and every part returneth to his nature or homogeny. Id.

Ice is a similary body, and *homogeneous* concretion, whose material property is water.

Browne's Vulgar Errours. The light, whose rays are all alike refrangible, I call simple, homogeneal, and similar. and that whose rays are some more refrangible than others, I call compound, heterogeneal, and dissimilar. Newton.

An homogeneous mass of one kind is easily distinguishable from any other; gold from iron, sulphur from allum, and so of the rest. Woodward.

The mixtures require a greater degree of fluidity and similarity, or homogeneity of parts. Arbuthnot.

Upon this supposition of only different diameters, it is impossible to account for the homogeneity or similarity of the secenned liquors. Cheyne.

HOMOLOGATION, from $\delta\mu\delta\lambda\sigma\gamma\iota a$, consent, in the civil law, the act of confirming or rendering a thing more valid and solemn, by publication, repetition, or recognition thereof.

HOMO'LOGOUS, *adj.* Fr. *homologue*; Gr. ομολογος. Having the same manner or proportions.

HOMO'NYMOUS, *adj.* Fr. *homonyme*; Gr. *ομωνυμος*. Denominating different things; equivocal; ambiguous.

As words signifying the same thing are called synonymous, so equivocal words, or those which signify several things, are called *homonymous*, or ambiguous ; and when persons use such ambiguous words, with a design to deceive, it is called equivocation. *Watts.*

HONAN, a province of China, bounded on the north by that of Petcheli and Chansi, on the west by Chansi, on the south by Houquang, and on the east by Chantong. Every thing that can contribute to render a country delightful is said to be united in this province; the Chinese therefore call it Tong-hoa, or the middle flower; it is situated indeed almost in the centre of China. The ancient emperors, invited by the mildness of the climate and the beauty of the country, fixed their residence here for a time. But the abundance of its fruits, pastures, and corn, the effeminacy of its inhabitants who are accounted extremely voluptuous, and the cheapness of provisions, have prevented trade from being so flourishing here as in the other pro-vinces. The whole country is flat, excepting towards the west, where there is a long chain of mountains, covered with thick forests; and the land is in such a high state of cultivation, that those who travel through it imagine they are walking in an immense garden. Besides the Hoangho, which runs through this province, it is watered by a great number of springs and fountains. It has also a valuable lake, which is frequented by a prodigious number of workmen, because its water is said to have the property of communicating a lustre to silk, which cannot be imitated. Exclusive of forts, castles, and places of strength, this province contains eight fou, or cities of the first class, and 102 of the second and third. In one of these cities, named Nanyang, is found a kind of serpent, the skin of which is marked with small white spots : the Chinese physicians steep it in wine, and use it as a remedy against the palsy. HONDEKOETER (Melchior), a famous

HONDEKOETER (Melchior), a famous Dutch painter, born at Utrecht in 1637, who excelled in painting animals, and especially birds. Vot. XI.

His father and grandfather were of the same profession. He was trained up to the art by his father; but surpassed not only him, but even the best of his contemporaries in a very high degree. Till he was seventeen years of age he continued under the direction of his father, and accustomed himself to paint birds in an elegant variety of actions and attitudes : and after his father's death, in 1653, he received instruction from his uncle, John Baptist Weeninx. His pencil was wonderfully neat and delicate; his touch light; his coloring exceedingly natural, lively, and remarkably transparent; and the feathers of his fowls were expressed with such a swelling softness as might readily and agreeably deceive the eye of any spectator. It is reported that he had trained up a cock to stand in any attitude he wanted to describe, and that he used to place the creature near his easel; so that at the motion of his hand the bird would fix itself in the proper posture, and would continue in that particular position, without the smallest perceptible alteration, for several hours together. His pictures sell at a high price, and are much sought after. Ile died at Utrecht in 1695, aged fifty-nine.

HONDIUS (Jesse), an eminent letter-founder, and engraver on copper and ivory, born in Flanders in 1563. He was author of a work entitled Descriptio Geographica Orbis Terrarum, published in folio, in 1607. He died in 1611.

HONDURAS, a province of the former kingdom of Guatimala, New Spain, now a portion of the central United States of North America, is bounded on the north by the bay of this name, which separates it from Yutacan; east by the Caribbean Sea; south by the province of Nicaragua; and west by Vera Paz. Its length is about 390 miles; and its breadth, from north to south, about 150 miles. Here Columbus landed, 14th August, 1502, on his fourth voyage, and took formal possession of the country for the king of Spain.

What is properly called the coast of Honduras extends from the Gulf of Anatic to Cape Honduras, where commences the Mosquito shore. The Mosquito Indians, who inhabit it, entertain that implacable ennity to the Spaniards, which has always prevented the latter from attempting any establishments on the coast. The only place of any consideration on this coast is San Fernando de Omoa, a large fort on a convenient bay; a fine river runs close to it, but it is the most unhealthy part of the coast from the stagnant waters. Truxillo is a town a mile from the sea, between two rivers abounding in fish: its port is safe, and the most frequented of the coast of Honduras.

The soil here is of great fertility, producing three crops of maize a-year; but the climate is hot, moist, and unhealthy to Europeans. The pasturage, as may be supposed, is luxuriant in the highest degree; and the precious metals have been found in the mountains. The chief products are mahogany log, and various dye woods, dyeing drugs, wool, cotton, wax, and honey. The rivers, which are numerous, abound in fish.

The indigenous inhabitants are idle and profligate : when first found by the Spaniards they were wholly careless of any other food than roots and insects, and soon became addicted to drunkenness.

Great Britain took possession of the Mosquito shore for eighty years, ending in 1788, and the Spaniards have always reekoned this a part of Honduras. Cape Gracios a Dios was the place where the British first established themselves, in the terrritory of Honduras Proper, in 1730. They then also fixed a colony about seventyeight miles from Cape Honduras, or 162 miles from Cape Gracios a Dios. Farther south, at Bluefield's River, 210 miles from the first colony, they afterwards found a fine harbour, an extensive river, and a natural situation for a fort, with spacious, beautiful, and fruitful plains. The Indians are largely employed by the British in striking the manati, or sea-cow, for the sake of the oil: they are much attached to the English; and being, after long and exterminating contests, driven into the mountains by their Spanish in-vaders, they never revisited the coast till the latter took possession of the shore. The same tribes inhabit nearly the whole coast of Honduras; but the most numerous tribe exists near Cape Gracios a Dios. The chief towns are Valladolid, or Comayaguas, Truxillo, Gracios a Dios, Omoa, or St. Francisco de Omoa.

HONDURAS BAY is that gulf of the Caribbean Sea between the peninsula of Yucatan and Cape Honduras. The English claim the right of eutting logwood on the coast of all this gulf, from Cape Catoche, on an island at the north-east point of Yucatan, to the river St. Juan in 12°, which has several times occasioned disputes with the Spanish government. The first adventurers in this business were persons of desperate fortunes and characters, who fled from the West India Islands; and who, during the season of inactivity on shore, pursued the business of piracy. In 1722 the Spaniards destroyed their establishments, and put to death all the persons they found in them; but, another settlement being formed, Spain at last was prevailed on to tolerate it within certain limits, and with the stipulation of building no forts. The former are, by treaty of 1783, the district between the Rio Hondo and the River Ballize, or Wallis of the English, the course of the rivers being the fixed boundaries : this district is a great plain full of lakes and swamps. The River Ballize has a course of 200 miles; and at its mouth is the grand establishment of the English for cutting mahogany, composed of wooden dwellings. See BALLIZE.

The trees are cut at the wet season of the year, and, after being dragged from the forests to the banks of the rivers, they are made into rafts and floated to the shore. These rafts frequently consist of 200 logs, and are floated as many miles; and, when the floods are unusually rapid, they sometimes break asunder, and the whole of the wood is hurried away to sea. But the mahogany obtained here is not equal in quality to that procured from the Spaniards. A few particulars of the mode of obtaining it will, however, he interesting.

The gangs of negroes employed in the work consist of from ten to fifty each; few exceed the latter number. The larger bodies are commonly

divided into several small ones : a plan which, it is supposed, facilitates labor. Each gang has one belonging to it who is styled the huntsman. He is generally selected from the most intelligent of his fellows: and his chief occupation is to search the woods, or, as in this country it is termed, the bush, to find labor for the whole. A negro of this description is often valued at more than £500. About the beginning of August the huntsman is despatched on his errand; and, if his owner be working on his own ground, this is seldom an employment of much delay. He cuts his way through the thickest of the woods to the highest spots, and climbs the tallest tree he finds, from which he minutely surveys the surrounding forests. At this season the leaves of the mahogany tree are invariably of a yellowreddish hue; and an eye accustomed to it can discover, at a great distance, the places where the wood is most abundant. He now descends, and to such places his steps are directed; when without compass, or other guide than what ob-servation has imprinted on his recollection, he never fails to reach the exact point to which he aims.

It is common to cut the mahogany tree about twelve feet from the ground, and a stage is erected for the axe-man employed. This, to an observer, would appear a labor of much danger, but it is seldom that any accident happens to the person engaged in it. The body of the tree, from the dimensions of the wood it furnishes, is deemed the most valuable; but, for purposes of an ornamental kind, the branches or limbs are preferred, the grain of these being much closer, and the vens richer. The last day of cutting down the trees, if the negroes have not been disturbed in their labor, is always one of festivity and merriment.

In the short intervals of leisure which now succeed they are employed in the improvement of their dwellings or huts composed of a few sticks and leaves, or in search of game, in which they are generally successful. The more ingenious turn their attention to the manufacture of small articles from the less valuable mahogany. The growth of the logwood here is extremely rapid, so much so that it is said to attain maturity in five or six years, when it is cut and sent to Europe in logs of a few feet long. Besides the mahogany and logwood tree,

Honduras Bay produces two or three kinds of the mangrove, as the red, white, and black. The first is preferred for the firmness of its texture, and its extreme durability. Its bark is little inferior to oak bark, when applied to the purpose of tanning. Cedars are large and abundant, and are commonly used in ship-building. palmetto, the sapadilla, and the sea-grape trees, are all also found very useful. Large pines of a superior quality abounded in many places. The bullet-tree, the iron-wood-tree, the calabashtree, and the button-wood tree, are also valuable. The althea grows at a considerable distance from the coast, and is generally made into rafts for floating the log-wood to the sea. The bark is also woven into ropes, which are nearly equal in strength and durability to those made of hemp. The tree that exudes the resinous sub339

stance called caoutchouc, or elastic gum, from which Indian-rubber is made, grows plentifully in several provinces of Guatimala, particularly in various parts of Honduras. In addition to these may be enumerated the locust-tree, the fustic, the cocoa-nut-tree, the cabbage, and the silkcotton-trees, besides which both trees and shrubs of a medicinal nature grow in great variety and profusion.

The banana-bird is much admired for the beauty of its plumage, and the rice-bird rivals the oriolan in flavor. The shores abound with aquatic birds of different kinds. But one of the most singular signts exhibited by the feathered race is in the myriads of swallows that are found in some parts during the periodical rains, particularly in Honduras. These birds rest for the night among the rushes of some watery savannah, and as soon as the dawn appears they quit their retreat in a body, and always rise to a certain height, in a spiral and compact form, which at a distance resembles an immense volume of smoke, after which they disperse for the day. Their descent to their resting places is at sunset, and is made much in the same way, but with almost inconceivable rapidity. The noise that accompanies it can only be compared to the falling of a vast torrent, or the rushing of a mighty wind. The humming-bird is seen in most of its splendid varieties, and the oxilis, one of the most minute and beautiful of this elegant tribe, is very common. The number of fish, insects, and reptiles, is also great.

The approach to this coast, and particularly to the Bay of Honduras, is attended with imminent danger; the difficulty of the navigation indeed is demonstrated by the numerous remains of vessels that have been wrecked on the different reefs and keys which are dispersed along it. During the continuance of north-winds, the danger becomes much increased. The weather at such seasons is usually hazy; and the currents, which in this part of the world are peculiarly governed by the influence of the winds, run with such extraordinary and unequal rapidity, as frequently disappoints all calculation. It is also worthy of remark, that so deceitful are the different keys found, from the general resemblance they bear to each other, that the most experienced seaman, when placed amongst them, often becomes fatally perplexed. Indeed, on making this coast, it is very unsafe to proceed without a pilot.

On taking a departure from Honduras, the hazard becomes, if possible, greater. The first object to attain in this instance is to make what are called the Northern Triangles, or three keys immediately close together, of a form analogous to that which their name imports, and distant in a N.N.E. direction about ten leagues from Ballize. A further stretch is then made for Cape Antonio, on the west side of Cuba. The making of this last place is considered as the most important object on the voyage homeward. Vessels who cannot do this are often driven into the galf of Mexico, and not unfrequently remain becalmed there for many weeks, or have to beat up for the gulf of Florida.

HONE, n.s. This word Casaubon derives

from Gr. akovn; Junius from Welsh hogsaen: Skinner, who is always rational, from Saxon pæn, a stone; hænan to stone .-- Johnson. There can be no question that Skinner is right as to the immediate origin of this word : the Goths had also hcin, a whetstone. A whetstone for a razor.

A hone and a parer to pare away grass. Tusser.

To HONE, v. n. Sax. bonzian. To pine; to long for any thing.

Hone (George Paul), a German lawyer, born at Nuremburg in 1662. He was bailiff of Cobourz, and counsellor to the duke of Meiningen. His chief works are, 1. Lexicon Topographicum Franconiæ. 2. History of the duchy of Saxe-Cobourg. He died at Cobourg in 1747.

HON'EST, adj. Hon'ESTLY, adv. Hon'ESTLY, n.s. Fr. honestc; Lat. hones-tus. Upright; just; sin-cere; candid; chaste; fair; open. Honest is the most familiar and universal term, applied alike to actions and principles.—*Crabb*.

Thus Walter lowly, nay but really,

Wedded with fortunat honestetee,-

In Goddes pees liveth ful esily

At home, and grace ynough outward had he : And for he saw that under low degree

Was honest virtue hid, the people him held

A prudent man, and that is seen ful seld.

Chaucer. The Clerkes Tale.

Follow not, therefore, the common reputation of honesty. If you will seem honest, be honest; or else seem as you are. Seek not the name without the thing; nor let the name be the only mark you shoot Wyatt's Letters to his Son. at.

Thou shalt not have thy husband's lands.

-Why, then mine honesty shall be my dower.

Shakspeare.

What art thou ?

A very honest-hearted fellow, and as poor as the king. Id.

Wives may be merry, and yet honest too. Id. It doth make me tremble,

There should those spirits yet breathe, that when they cannot

Live honestly, would rather perish basely. Ben Jonson. An honest physician leaves his patient, when he can contribute no further to his health. Temple.

Goodness, as that which makes men prefer their duty and their promise before their passiens or their interest, and is properly the object of trust, in our language goes rather by the name of honesty ; though what we call an honest man, the Romans called a good man; and honesty, in their language, as well as in French, rather signifies a composition of those qualities which generally acquire honor and esteem.

Id.

Tate will subscribe, but fix no certain day, He's honest, and as wit comes in, will pay. Heaven that made me honest, made me more

Than ever king did, when he made me love.

Rowe's Jane Shore.

For some time past all proposals from private persons to advance the public service, however honestly and innocently designed, have been called flying in the king's face. Swift.

The way to relieve ourselves from those sophisms, is an honest and diligent enquiry into the real nature and causes of things. Watts.

If you come for our thanks, take them and hence, The dungeon gloom is deep enough without you, And full of reptiles not less loathsome, though Byron. Their sting is honester.

HON 2Y, n. s. & v. n. Hon'ted, adj. Hon'ey-bag, n. s. Hon'ey-combed, adj. Hon'ey-combed, adj. Hon'ey-dew, n. s. Hon'ey-flower, n. s. Hon'ey-moon, n. s. Hon'ey-suckle, n. s. Hon'ey-less, adj.

Sax. pung; Belg. honig; Germ. honec, honag. This word is found in all the Gothic and Teutonic dialects. A thick, viscous, fluid substance, produced by bees. See APIS. Honied, covered with honey: sweet; luscious. To honey is to talk fondly. Ho-

HON'EY-WORT, n. s. neyless being without honey. The several compounds have specific meanings: Iloney-bag, the stomach. Honey-comb, the cells of wax in which the bee stores her honey. Honeycombed is a term used respecting a piece of ordnance flawed with little cavities by being ill cast. Honey-dew, a sweet dew which rests on leaves and flowers at particular seasons. 11o-Honey-gnat, an insect. ney-flower, a plant. Honey-moon, the first month after marriage, when there is nothing but tenderness and pleasure. Honey-suckle, Lat. *caprifolium*, woolbine. Houey-wort a plant. It hath a perennial root, and the appearance of a shrub. This plant produces large spikes of chocolate-coloured flowers in May, in each of which is contained a large quantity of black sweet liquor, from whence it is supposed to derive its name .- Miller.

The Swalowe, murderer of the beies smale, That maken *honie* of floures freshe of hewe.

Chaucer. The Assemblie of Foules. What do ye, honcycombe ! swete Alisoun ?

My faire bird ! my swete sinamoune !

That even would cut their throats like selish slaves whom

Now they fawn on ;

Like deadiy locusts eat the honey up

Which those industrious bees so hardly toiled for.

Otway's Orphan. Why, honey bird, I bought him on purpose for thee.

Dryden.

Then melfoil beat and honey-suckles pound ;

With these alluring savours strew the ground. *Id.* When the patient is rich, there is no fear of physi

cians about him as thick as wasps to a honey pot. L'Estrange.

There is a honcy-dew which hangs upon their leaves, and breeds insects. Mortimer.

The *honey-bag* is the stomach, which bees always fill to satisfy, and to spare, vomiting up the greater part of the *honey* to be kept against winter. Grew.

How honey-dews embalm the fragrant morn,

And the fair oak with luscious sweets adorn.

Garth.

A man should keep his finery for the latter season of marriage, and not begin to dress till the honey-moon is over. Addison.

A mariner having discharged his gun which was honey-combed, and loading it suddenly again, the powder took fire. Wiseman.

Honey is the most elaborate production of the vegetable kind, being a most exquisite vegetable sope, resolvent of the bile, balsamick, and pectoral : honey contains no inflammable spirit, before it has felt the force of fermentation; for by distillation it affords nothing that will burn in the fre. Arbuthnot.

New wine, with *honey*-tempered milk, we bring; Then living waters from the crystal spring. *Pope*. The milliners who furnish drapery Misses,

Throughout the season, upon speculation Of payment ere the honey-moon's last kisses

Have waned into a crescent's coruscation, Thought such an opportunity as this is

Of a rich foreigner's inclination

Not to be overlooked :---and gave such credit

That future bridegrooms swore and sighed and paid it. Byron.

HONEY, as a medicine, is a very useful detergent and aperient, powerfully dissolving viscid juices, and promoting the expectoration of tough phlegm. In some particular constitutions it has an inconvenience of griping, or of proving purgative; which is said to be in some measure pre-This, vented by previously boiling the honey. however, with all constitutions, is by no means effectual; and the circumstance has had so much weight with the Edinburgh College, that they do not now employ it in any preparation, and have entirely rejected the mella medicata, substituting syrups in their place: but honey is doubtless very useful in giving form to different articles, although there are some individuals with whom it may disagree. In order, however, to obtain the good effects of the honey itself, it must be used to a considerable extent, and as an article of diet. The following remarkable instances of the good effects of honey in some asthmatic cases are given by Dr. Monro, in his Medical and Pharmaceutical Chemistry :--- 'The late Dr. John Ilume, one of the commissioners of the sick and hurt of the royal navy, was for many years violently afflicted with an asthma. Having taken many medicines, without receiving relief, he at last resolved to try the effects of honey, having long had a great opinion of its virtues as

a pectoral. For two or three years he ate some ounces of it daily, and got entirely free of his asthma, and likewise of a gravelly complaint with which he had been long afflicted. About two years after he had recovered his health, when he was sitting one day in the office for the sick and hurt, a person laboring under a great difficulty of breathing, who looked as if he could not live many days, came to him and asked him by what means he had been cured of his asthma. Dr. Hume told him the particulars of his own case, and mentioned to him the means by which he had found relief. For two years after he heard nothing of this person, who was a stranger to him, and had seemed so bad that he did not imagine that he could have lived many days, and therefore had not even asked him who he was; but, at the end of that period, a man seemingly in good health, and decently dressed, came to the sick and hurt office, and returned him thanks for his cure, which he assured him had been entirely brought about by the free use of honey.'

HONEY-DEW, a term frequently applied to a clammy saccharine substance, which is often seen covering the leaves and other parts of different kinds of trees and plants, at some particular seasons of the year. It does not appear that the cause of this extraordinary appearance is yet fully understood, as it has not by any means been well ascertained whether it derives its origin from external circumstances, or some morbid affection of the vegetables themselves. It is generally, however, supposed to be the production of insects. See Apuis.

HONEY-SUCKLE. See LONICERA.

HONEY-SUCKLE, AFRICAN FLY. See HALLE-RIA.

HONEY-SUCKLE, AMERICAN UPRIGHT. See Λ_{ZALEA} .

HONEY-SUCKLE, FRENCH. See HEDYSARUM.

HONEY-SUCKLE GRASS. See TRIFOLIUM.

HONEY-WORT. See CERINTHE, and SISON.

HONFLEUR, a sea-port of France, in the department of Calvados (Normandy), the chief place of the canton and arrondissement of Pontl'Eveque. It has a tribunal of commerce and of inferior causes, an exchange, several foreign viceconsulates, a school of navigation of the fourth class, and is a post-town containing 10,000 inhabitants. High water at nine o'clock, at the full and change.

This town is beautifully situated on the left bank of the Seine, near the spot where it empties itself into the channel; and has an excellent port, capable of containing from thirty to thirty-five vessels. The tide rises from twenty to twentytwo feet from the open sea to the basin of the port, which is furnished with flood-gates to retain the waters at every height. The two beacons on the moles have been replaced by two lighthouses. There are regular passage-boats every day between this port and Havre. On the side of Grace there are beautiful walks on the seashore, commanding extensive views of the ocean and of both banks of the Seine from its mouth. Honfleur was anciently well fortified and endured several sieges: in 1440 the generals of Charles VII. took it from the English, and in

1594 it was the last place that submitted to Henry IV.

It has manufactures of lace, and is celebrated for sea biscuits; sulphate of iron and sulphuric acid are made here : it has also sugar refineries, vinegar breweries, tan yards, oil mills, rope grounds, and yards for ship-building. Its commerce consists in corn, cider, melous, sea fish, salt provisions, red and salted herrings, and building wood : it is the mart for colonial produce. It fits out vessels for the cod and whalefisheries, and for the colonies; and has an export and import trade with the different maritime powers of Europe and America. It is about thirty-six miles north-east of Caen, fifty-one west of Rouen, nine south-east of Havre, and 144 northwest of Paris.

HONIMOA, or Uliasser, one of the Molucca Islands; nine miles long, and three and a half broad. It is fertile in rice and cloves.

HONITON, a borough of Devonshire, with a market on Saturday, and a fair in July. A dreadful fire happened there in July 1747, which consumed three parts of the town : the damage was computed at £43,000. It has one church, half a mile from the town; and a large manufactory of bonelace. Just before the entrance into the town, from London, is a hill which commands one of the most beautiful prospects in the kingdom. Honiton has sent two members to parliament since the 28th of Edward I. It is seated on the Otter, 148 miles W. S. W. of London.

HON'OR, n. s. & v. a.) HON'ORARY, adj. HON'ORABLE, adj. Hon'ORABLENESS, n.s. (which actuates men HON'ORABLY, adv. HON'ORER, n. s.

Fr. honneur, Latin honor. These terms { respect the principle in the adjustment of) their rights, and are

derived from the Heb. hon, substance or wealth. Honor extends to every thing estimable or entitled to esteem .- Crabb. Honor is dignity; reputation; magnanimity; reverence; chastity; dignity of mien; glory; public marks of respect; privileges and titles of rank or birth; civilities; decorations: on my honor is a form of protestation used by the lords in judicial decisions instead of an oath; hence a common pledge for the veracity of the speaker : to honor is to reverence; dignify; glorify, or make illustrious : honorable, free from taint or reproach ; honest without intention of deceit; all the other acceptations of honor belong to it: honorary is often used as conferring honor without gain; as honorary secretary, &c.

He was called our father, and was continually honored of all men, as the next person unto the king

Esth. xvi. 11.

The poor man is honoured for his skill, and the rich man is honoured for his riches. Ecclus. x. 30.

He that is honoured in poverty, how much more in Id. 31. riches?

As he was honourable in all his acts, so in this that 1 Mac. xiv. 5. he took Joppe for an haven.

Honour honoureth him for his noblesse.

Chaucer. The Complaint of Venus.

Also thou shalt not swere for envie, neyther for favour ne for nede,-but only for rightwisnesse, and for declaring of trouthe to the honour and worship of Id. The Persones Tale. God.

Two of far nobler shape, erect and tall, Godlike erect ! with native honour clad

In naked majesty, seemed lords of all. Muton.

Therefore with manlier objects we must try His constancy, with such that have more show Of worth, of honour, glory, and popular praise, Rocks whereon greatest men have oftest wrecked.

Riches and honour they from laymen reap And with dull crambo feed the silly sheep.

Then warlike kings, who for their country fought, And honourable wounds from battle brought

Druden.

Many of those persons, who put this honourable task on me, were more able to perform it themselves. Id.

- He saw his friends, who whelmed beneath the waves.
- Their funeral honours claimed, and asked their quiet graves. Id.

The sire then shook the honours of his head,

And from his brows damps of oblivion shed. Id. 'Tis just ye gods ! and what I well deserve !

Why did I not more honourably starve? Id.

A late eminent person, the honour of his profession for integrity and learning. Burnet's Theory.

This monument is only honorary, for the ashes of the emperor lie clsewhere. Addison on Italy.

Honour's a sacred tie, the law of kings

The noble mind's distiguishing perfection,

That aids and strengthens virtue where it meets her, And imitates her actions where she is not :

It is not to be sported with. Id. Cato. Honours were conferred upon Antonine by Hadrian

in his infancy. Wotton's Roman History. If by honour is meant any thing distinct from conscience 'tis no more than a regard to the censure and esteem of the world. Rogers.

This is a duty in the fifth commandment, required towards our prince and our parent, under the name of honour; a respect, which, in the notion of it, implies a mixture of love and fear, and, in the object, equally supposes goodness and power. Id.

Such discourses, on such mournful occasions as these, were instituted not so much in honour of the dead, as for the use of the living. Atterbury.

Numbers engage their lives and labours, some to heap together a little dirt that shall bury them in the end; others to gain an honour, that at best can be celebrated but by an inconsiderable part of the world, and is envied and calumniated by more than 'tis truly Wake's Preparation for Death. given.

How loved, how honoured once, avails thee not. Pope.

I must not omit Mr. Gay, whose zeal in your concern is worthy a friend and honourer Id.

Then here a slave, or if you will a lord, To do the honours, and to give the word. Id.

- there is a woman

Worthy a brave man's liking. Were ye such You would have honoured her.

Byron. Deformed Transformed.

HONOR is used for a mark of esteem or submission, expressed by words, actions, and exterior behaviour, by which we make known the respect we entertain for a person on account of his dignity or merit. The word is used in general for the esteem due to virtue, glory, and reputation. It is also used for virtue and probity themselves, and for an exactness in performing whatever we have promised. Virtue and Honor were deified among the ancient Greeks and

Not fer fro thilke paleis honourable, Wher as this markis shope his marriage, Ther stood a thorpe, of sight delitable. !d. Sith this wretched woman overcome, Of anguish, rather than of crime hath been, Preserve her cause to her eternal doom ; And in the mean vouchsafe her honourable tomb. Spenser. They take thee for their mother, And every day do honour to thy grave. Shakspeare. His grace of Canterbury, Who holds his state at door, 'mongst parsuivants. -Ha! 'tis he, indeed ! Is this the honour they do one another ? Id. Be the honour flawed, I have three daughters, the eldest is cleven ; Id. If this prove true, they'll pay for it. She dwells so securely on the excellency of her honour, that the folly of my soul darcs not present itself : she is too bright to be looked against. Id. My hand to thee, my honour on my promise. Id. Thinkest : hou it honourable for a nobleman Still to remember wrongs ? Id. Thou happy father, Think that the clearest gods, who make them honours Of man's impossibilities, have preserved thee. Id. Return unto thy Lord, Bid him not fear the separated councils : His honour and myself are at the one ; And at the other is my good friend Catesby. Id. Henry the seventh, truly pitying My father's loss, like a most royal prince, Restored to me my honours; and, from ruins, Made my name once more noble. Id. We nourish 'gainst our senate The cockle of rebellion, insolence, sedition, Which we ourselves have plowed for, sowed and scattered, By mingling them with us, the honoured number. Id. If that thy bent of love be honourable, Thy purpose marriage, send me word to-morrow. Id. Now shall I see thy love ; what motive may Be stronger with thee than the name of wife? -That which upholdeth him, that thee upholds, His honour. Oh, thine honour, Lewis, thine honour.

as in the king's company, his cause being just and his Id.

Sir, I'il tell you,

Since I am charged in honour, and by him Id. That I think honourable.

The reverend abbot,

With all his convent, honourably received him. Id.

of thy fat woman :--let her descend, my chambers are honourable. Id.

into any action, the failing wherein may disgrace him more than the carrying of it through can honour him. Bacon.

After some six weeks, which the king did honourably interpose, to give space to his brother's intercession, he was arraigned of high treason, and condemned.

The carl sent again to know if they would entertain their pardon, in case he should come in person, and assure it : they answered, they did conceive him to he so honourable, that from himself they would most thankfully embrace it. Hayward.

Close to him pleasing went with painted face, And honour by some hidden cunning made ; Not honour's self, but honour's semblance base, For soon it vanished like an empty shade.

Fletcher's Purple Island.

Fd.

Methinks I could not die any where so contented quarrel honourable.

Here's a Bohemian Tartar tarries the coming down

A man is an ill husband of his honour, that entereth

Marvell.

Romans, and had a joint temple consecrated to them at Rome: but afterwards each of them had separate temples, which were so placed that no one could enter the temple of Honor without passing through that of Virtue; by which the Romans were continually put in mind that virtue is the only direct path to true glory. Plutarch tells us that the Romans, contrary to their usual custom, sacrificed to Honor uncovered; perhaps to denote, that, wherever honor is, it wants no covering, but shows itself openly to the world.

HONOR, in the beau monde, has a meaning materially different from the above, and which it is easier to illustrate than define. It is however subject to a system of rules, called the laws of honor, constructed by people of fashion, calculated to facilitate their intercourse with one another, and for no other purpose. Consequently nothing is considered as inconsistent with honor, but what tends to incommode its intercourse. Hence, as Paley very properly states the matter, profaneness, neglect of public worship or private devotion, cruelty to servants, rigorous treatment of tenants or other dependents, want of charity to the poor, injuries done to tradesmen by insolvency or delay of payment, with numberless examples of the same kind, are accounted no breaches of honor; because a man is not a less agreeable companion for these vices, nor the worse to deal with in those concerns which are usually transacted between one gentleman and another. Again, the law of honor being constituted by men occupied in the pursuit of pleasure, and for the mutual convenience of such men, will be found, as might be expected from the character and design of the law-makers, to be, in most instances, favorable to the licentious indulgence of the natural passions. Thus it allows of fornication, adultery, drunkenness, prodigality, duelling, and revenge in the extreme; and lays no stress upon the opposite virtues.

The king is styled the fountain of honor, as being the source of honors, dignities, &c. See PRE-ROGATIVE. Although the origin of all sovereignty is in the people, yet it is absolutely impossible that government can be maintained without a due subordination of rank. The British constitution has therefore entrusted the king with the sole power of conferring dignities and honors, in confidence that he will bestow them only upon such as deserve them. Hence all degrees of nobility, of knighthood, and other titles, are received by immediate grant from the crown: either expressed in writing, by writs or letters patent, as in the creation of peers and baronets; or by corporeal investiture, as in the creation of a simple knight. From the same principle also arises the prerogative of erecting and disposing of offices; for honors are in their nature convertible and synonymous. All offices under the crown carry, in the eye of the law, an honor along with them; because they imply a superiority of abilities, being supposed to be always filled with those who are most able to execute them. In fact all honors, in their original, had duties or offices annexed to them ; an earl, comes, was the conservator or governor of a county; and a knight, miles, was bound to attend the

king in his wars. For the same reason, therefore, that honors are in the disposal of the king, offices ought to be so likewise; and, as the king may create new titles, so may he create new offices; but with this restriction, that he cannot create new offices with new fees annexed to them, nor annex new fees to old offices; for this would be a tax upon the subject, which cannot be imposed but by act of parliament. Wherefore, in 13 Hen. IV., a new office being created by the king's letters patent for measuring cloths. with a new fee for the same, the letters patent were, on account of the new fee, revoked and declared void in parliament. Upon the same or like ground the king has also the prerogative of conferring privileges upon private persons : such as granting places or precedence to any of his subjects, or converting aliens, or persons born out of the king's dominions, into denizens; whereby some very considerable privileges of natural born subjects are conferred upon them. Such also is the prerogative of erecting corporations; whereby a number of private persons are united together, and enjoy many liberties, powers, and immunities in their political capacity, which they were incapable of in their natural.

Honor, MAIDS OF, are young ladies in the queen's household, whose office is to attend the queen when she goes abroad, &c. In Britain they are six in number, and their salary is £300 a year each.

HONOR POINT, in heraldry, is that next above the centre of the escutcheon, dividing the upper part into two equal portions.

HONORS OF WAR, in a siege, is when a governor, having made a long and vigorous defence, is at last obliged to surrender the place to the enemy for want of men and provisions, and makes it one of his principal articles to march out with the honors of war; that is, with shouldered arms, drums beating, colors flying, and all the baggage, &c.

All armies salute Honors, MILITARY. crowned heads in the most respectful manner, drums beating a march, colors and standards dropping, and officers saluting. Their guards pay no compliment, except to the princes of the blood; and even that by courtesy, in the absence of the crowned head. To the commander in chief the whole line turns out without arms, and the camp-guards beat a march, and salute. To generals of horse and foot, they beat a march, and salute; lieutenant-generals of ditto, three ruffs, and salute ; major-generals of ditto two ruffs, and salute; brigadiers of ditto one ruff and salute; colonels of ditto, rested arms, and no beating. Sentinels rest their arms to all fieldofficers, and shoulder to every officer. All governors that are not general officers, in all places where they are governors, have one ruff, with rested arms; but for those who have no commission as governors, no drum beats. Lieutenant-governors have the main-guard turned out to them with shouldered arms. The admiral or commander-in-chief of his majesty's fleet, is to rank with a field-martial of the army. The admirals, with their flags on the main-top-masthead, are to have rank with generals. Vice-admirals are to have rank as lieutenant-generals

344

Rear-admirals are to have rank as major-generals. Commodores, with broad pendants, are to have rank as brigadier-generals.

Captains commanding post ships, after three years from the date of their first commission for a post ship, are to have rank as colonels. All other captains, commanding post ships, are to have rank as lieutenant-colonels. Captains of his majesty's ships or vessels, not taking post, are to have rank as majors. Lieutenants of his majesty's ships are to have rank as captains.

The rank and precedence of sea officers, in the classes above-mentioned, are to take place according to the seniority of their respective commissions.

No land officer is to command any of his majesty's squadrons or ships, nor any sea-officer to command at land; nor shall either have a right to demand military honors due to their respective ranks, unless they are upon actual service.

All guards and sentinels are to pay the same compliments to the officers of the royal navy as are directed to be paid to the officers of the army, according to their relative ranks.

The compliments above directed are to be paid by the troops to officers in the service of any power in alliance with his majesty according to their respective ranks.

The honors paid by sentinels to the officers when encamped, or in garrison, are-Field-marshals; two sentinels, with ordered firelocks, at their tent or quarters. Generals of horse or foot; two sentinels, one with his firelock shouldered, the other ordered. Lieutenant-generals; one, with firelock ordered. Major-generals; one, with firelock shouldered. The first battalion of guards go under arms to the king only; not to stand by, nor draw up in the rear of their arms to any other; nor to give sentinels to foreigners. Second and third battalions draw up behind their arms to the princes, and to field-marshals; but when on grenadier guards, or out-posts, they turn out, as other guards do, to the officers of the day. They give one sentinel with shouldered arms to the princes of the blood, and to fieldmarshals when they lie alone in garrison.

HONORABLE, a title conferred on the youngest sons of earls, the sons of viscounts and barons; as also on such persons as have the king's commission, and upon those who enjoy places of trust and honor. Members of the king's privy council are styled right honorable.

HONCRARY is often applied to persons who bear some title or office merely for the name's sake, without performing any of its functions, or receiving any advantage from it; such as honorary counsellors, honorary fellows, &c.

HONORIACI, in antiquity, an order of soldiery in the eastern empire, who introduced the Goths, Vandals, Alani, Suevi, &c., into Spain. Didymus and Verinianus, two brothers, had, with great vigilance and valor, defended the passages of the Pyreneans against the Barbarians for some time, at their own expense; but, being at length killed, the emperor Constantius appointed the honoriaci to defend those passages, who, after laying them open to all the nations of the north them ravaging the Gauls, jouned those nations themselves.

HONORIUS, the second son of Theodosius the Great, was associated in the empire with his brother Arcadius, A. D. 395. See ROME. He died at Ravenna, A. D. 423, aged thirty-nine.

HONTHEIM (John Nicholas de), a learned author, born at Treves in 1700. He was made suffragan to the archbishop elector, and was a man of great taste and erudition. He wrote, 1. Historia Trevisensis Diplomatica et Pragmatica, 3 vols. folio. 2. A Supplement to it, in 2 vols. folio. 3. De Præsenti Statu Ecclesiæ Liber Singularis, 5 vols. 4to. He died in 1790.

HOOD, in composition, is derived from the Sax. pad; in Germ. *heit*; in Dut. *heid*. It denotes quality; character; condition; as, knighthood; childhood; fatherhood. Sometimes it is written after the Dutch, as maidenhead. Sometimes it is taken collectively: as, brotherhood, a confraternity; sisterhood, a company of sisters.

Hood, n. s. & v. a. Hood, n. s. & v. a. Hood'MAN-BLIND, n. s. Hood'WINK, v. a. The upper covering of a woman's head; a monk's cowl; a covering put over the hawk's eyes when he is not to fly; an ornamental fold that hangs down the back of a graduate, to mark his degree: to hood, to dress in a hood; to blind; to cover : hoodman-blind a play in which the person hooded is to catch another, and tell the name; blindman's buff: hoodwink, to blind with something bound over the eyes; to cover; hide; deceive; impose upon.

A white cote and a blew hode wered he.

Chaucer. Prologue to Cant. Tales.

While grace is saying, I'll hood mine eyes

Thus with my hat, and sigh, and say, Amen.

Shakspeare.

What devil was't, That thus hath cozened you at *hoodman blind*?

Be patient; for the prize I'll bring thee to,

Shall hood-wink this mischauce. Id. We will bind and hood-wink him so, that he shall suppose he is carried into the leaguer of the adversaries. Id.

So have I seen, at Christmas sports, one lost,

And hood-winked, for a man embrace a post. Ben Jonson.

Then might ye see,

Cowls, hoods, and habits, with their wearers tost,

And fluttered into rags. Milton's Paradise Lost.

She delighted in infamy, which often she had used to her husband's shame, filling all men's cars, but his, with reproach; while he, *hood-winked* with kindness, least of all men knew who struck him. Sidney.

They willingly *hood-winking* themselves from seeing his faults, he often abused the virtue of courage to defend his foul vice of injustice. Id.

An hollow crystal pyramid he takes,

In firmamental waters dipt above ;

Of it a broad extinguisher he makes,

And hoods the flames that to their quarry strove. Dryden.

In velvet, white as snow, the troop was gowned : Their *hoods* and sleeves the same. *Id.*

Prejudice so dexterously *hood-winks* men's minds as to keep them in the dark, with a belief that they are more in the light. Locke.

Must I wed Rodogune ? Fantastick cruelty of *hood-winked* chance !

. Rowe.

Satan is fain to hood-wink those that start. Decay of Piety. The cobler aproned, and the parson gowned, The friar hooded, and the monarch crowned.

Pope. On high, where no hoarse winds or clouds resort, The hood-winked goddess keeps her partial court.

Garth. He undertook so to muffle up himself in his hood, that none should discern him. Wotton.

Let due civilities he paid,

The wall surrender to the hooded maid. Gay.

The lacerna came, from being a military habit, to be a common dress : it had a *hood*, which could be separated from and joined to it. Arbuthnot.

Then she who hath been *hood-winked* from her birth, Doth first herself within death's mirrour see.

Davies.

Hoop (Robert, or Robin), a famous outlaw and deer-stealer, who chiefly harbored in Sherwood forest, in Nottinghamshire. He was a man of family, which, by his pedigree, appears to have had some title to the earldom of Huntingdon; and lived about the end of the twelfth century. He was famous for archery, and for his treatment of all travellers who came in his way, levying contributions on the rich, and relieving the poor. Falling sick at last, and requiring to be blooded, he is said to have been betrayed, and bled to death. He died in 1247, and was buried at Kirklees in Yorkshire, then a Benedictine monastery, where his gravestone is still shown.

Hoop (Samuel Lord Viscount), an English admiral, entered as a midshipman in the navy in 1740, and six years after was promoted to a lieutenancy; in 1754 he was made master and commander, and in 1759 post-captain. His father, we believe, was a clergyman in Devonshire. In 1778 he had the office of commissioner of Portsmouth dock-yard bestowed on him, but resigned it two years after, and was employed in the West Indies, where he preserved the isle of St. Christopher's from being taken by count de Grasse, and was a rear-admiral at the defeat of that officcr by Rodney, April 12th 1782. His services were now rewarded with an Irish peerage. In 1784 he was M.P. for Westminster; but vacated his seat in 1788 on obtaining the appointment of a lord of the admiralty. In 1793 he signalised himself by the taking of Toulon, and afterwards Corsica; in reward for which he was made a viscount, and governor of Greenwich hospital. He died at Bath in 1816.

HOOF, n.s. Hoof'ED adj. Hoof'-BOUND, adj. Sax. bor; Dut. hoef; Teutonic huff. The hard horny substance on the feet of graminivorous animals. Hoofed, furnished with hoofs. Hoof-bound, a disease to which horses are subject.

With the *hoofs* of his horses shall he tread down all thy streets. Ezek, xxvi. 11.

The bull and ran know the use of their horns, as well as the horse of his hoofs. More.

Among quadrupeds, the roc-deer is the swiftest; of all the *hoofed* the horse is the most heautiful; of all the clawed the lion is the strongest. *Grew*.

Now I behold the steed curvet and bound, And paw with restless *hoof* the smoking ground.

Gay.

A horse is said to be *hoof-bound* when he has a pain in the fore-feet, occasioned by the dryness and contraction or narrowness of the horn of the quarters, which straitens the quarters of the heels, and oftentimes makes the horse lame. A hoof-bound horse has a narrow heel, the sides of which come too near one another, insonuch that the flesh is kept too tight, and has not its natural extent. Farrier's Dictionary.

> And long upon my startled ear Rung his dark courser's hoofs of fear.

Byron. The Giaour.

HOOFT (Peter Cornelius Van), an eminent historian and poet, born in Amsterdam in 1581. He was lord of Muyden, and judge of Goyland. He died at the Hague in 1647. He wrote, 1. History of the Netherlands, from the Abdication of Charles V. to the year 1588. 2. Several Comedies, and Poems. 3. Historia Henrici IV. for which Louis XIII. made him a knight of St. Michael. 4. A Translation of Tacitus into Dutch.

HOOGEVEEN (Henry), a learned Dutch author, born at Leyden in 1712. His parents, though poor, gave him a good education, and in 1732 he became assistant master in the academy of Gorcum, and in 1738 removed to Culemburg. In 1745 he settled at Breda; in 1761 at Dort; and in 1764 at Delft, where he died in 1794. His works are 1. An Edition of Vigerus de Idiotismis Linguæ Græcæ. 2. Doctrina Particularum Linguæ Græcæ. 2. Doctrina Particularum Linguæ Græcæ. 4. Di tionarium Analogicum Græcum. Cambridge 1800.

HOOGHLY, or Saatgong, a district of Bengal, situated between 21° and 23° of N. lat., and extending on both sides of the river Bhagarutty. The coast is swampy and overgrown with jungle; but the northern part is fertile. It is intersected by rivers, and contains two extensive salt manufactories, as well as all the principal towns of the European nations settled in Bengal, on the Bhagarutty.

Hoogney, or Golin, a town of Bengal, once the capital of the foregoing district. It is supposed to have been founded and fortified by the Portuguese in the year 1538, and soon drew away the trade from Saatgong. In the middle of the seventeenth century the emperor Shah Jehan, who was irritated against the Portuguese attacked this place, and after a siege of three months and a half it was taken. In this siege not less than 1000 men of the Portuguese were killed, and 4400 men, women, and children, taken prisoners. On its capture 500 of the best looking young persons were sent to Agra; the girls being distributed among the harems of the emperor and nobility, and the boys forcibly made Mahommedans. Hooghly now became an imperial port : and a special governor was appointed, who, in the course of time, became independent of the provincial authorities. A few years after the English and Dutch obtained permission to erect factories here; when the former imprudently built theirs in the town; but the Dutch made choice of a spot two miles down the river. Hooghly, under the name of Bukhshy Bunder, became at this period the emporium of the greatest part of the trade carried on between Europe, Persia, Arabia, and India. The duties were levied ad valorem at two per cent. from Mahommedans, and three and a half from all others

346

except the English, who only paid 3000 rupees annually on the whole amount of their trade. At last (1686) a dispute occurred between the imperial troops and the English soldiers, when both parties had recourse to arms. During the conflict, our admiral Nicholson opened a cannonade on the town, which burnt 500 houses, and the British factory, valued at £300,000 sterling. The nabob, who resided at Daeca, was so highly incensed at this, that he ordered all the English factories and property to be confiscated. He also sent a force to expel them from Hooghly; but the English in the mean time embarked all their property and dropt down the river to Chuttanutty, the present Calcutta. At the peace of the following year, the nabob wished the English to return to Hooghly; but they declined the offer, and established themselves at Chuttanutty. In 1696 Hooghly was taken and pluudered by the rebels Soobha Sing and Rehim Khan, but was soon after recovered by the Dutch and restored to the Mogul government.

Hooghly was governed from this period to the middle of the last century by foujdars, under the nabob of Bengal; and, as it was a place of considerable importance and emolument, they always appointed one of their particular friends. On the 10th of January 1757 it was taken by the British ; and after retaken by the nabob Serajead-dowleh : in the month of June it was again taken possession of by the British. They nevertheless afterwards permitted the nabobs Meer Jaffier and Cossim Aly to appoint the foujdars; but in 1765, when the East India Company was appointed by the emperor dewan or collector of the revenues of Bengal, Bahar, and Orissa, they transferred the port duties from Hooghly to Calcutta : since this period the former has declined. The site of the old English factory is occupied by a handsome jail. Long. 80° 28' E., lat. 22° 24' N.

HOOGHLY RIVER, or the Bhagirutty is a river of Bengal, formed by the junction of the Ganges, the Dummooda, and Roopnarain rivers. The entrance is extremely dangerous and difficult, by reason of the sand-banks, frequently shifting; and which it would be the height of folly in the captain of any ship to attempt to pass without a pilot. The spring tides run up with great violence, advancing at the rate of fifteen miles an hour, and frequently overset boats. The effect is called by the natives Hooma. It gives notice of its approach by a rumbling noise : and the mode of escaping its fury is by getting into deep water, and facing it. The tide does not extend more than thirty miles above Calcutta. There are several kinds of good fish caught in this river ; but it also abounds with crocodiles and sharks. At Calcutta it is about three guarters of a mile broad; but at the mouth eight or ten miles wide. Few rivers have a more extensive commerce than it carries on; but it is only navigable for ships as high as the tide reaches. It is esteemed by the Hindoos the most sacred branch of the Ganges : and those who cannot afford to burn their dead, throw their bodies into

HOOGSTRATTEN (David Van), professor of belles lettres at Amsterdam, was born at Rot-

terdam in 1658. He published, 1. Poems in Latin. 2. Poems in Flemish. 3. A Latin Flemish Dictionary. 4. Notes upon Nepos and Terence. 5. A fine edition of Phædrus, for the prince of Nassau, in the style of the classics in usum Delphini. In the evening of Nov. 13th, 1724, he fell into a canal, and, though immediately taken out, died within eight days after, from the cold and fright.

HOOK, n. s. & v. a. HOOK'ED, adj. HOOK'EDNESS, n. s.

Sax.hoc; Bel. hoeck; Teutonic hoeke. Any Sthing bent so as to catch hold : as a shepherd's

HOOK'NOSED, adj. hook, and pot-hooks ; the curvated wire on which the bait is hung for fishes; a snare; an iron to seize the meat in the caldron, called a flesh-hook; a sickle; an instrument to lop branches of trees; the part of the hinge fixed to the post: hence the saying 'off' the hooks' for in disorder or out of temper. Hook, a field sown two years running : hook-or-crook, one way or other. To hook, to catch; entrap; fasten; draw out, whether by force or artifice. Hooked, bent; curvated. Hooknosed, having the aquiline nose-rise in the middle.

Among the ropes, ran the shering hokes;

** * * 赤 12 升; 4 :45 He sticketh him upon his speres ordes : He rent the saile with hokes like a sithe : He bringeth the cuppe and biddeth hem be blith. Chaucer. Legende of Good Women. Successours to Peter ben these In that, that Peter Christe forsoke, That leven had Gods love to lese Than shepherde had to lese his hoke ; He culleth the shepe as doth the coke Of hem seken the woll to rende,

And falsely glose the Gospell boke ; God for his mercy hem amende ! Chaucer. The Plowmannes Talc.

Then came to them a good old aged syre Whose silver lockes hedeckt his beard and hed, With shepheard's hooke in hand in fit attyre.

Spenser's Faerie Queene. About the caldron many cooks accoiled,

With hooks and ladles, as need did require ; The while the viands in the vessel boiled. Id. Like unto golden hooks,

That from the foolish fish their baits do hide. Spenser.

This falling not, for that they had not far enough undermined it, they assayed with great hooks and strong ropes to have pulled it down. Knolles.

My bended hook shall pierce

Shakspeare, Their slimy jaws. I may justly say with the hooknosed fellow of Rome there, Cæsar, I came, saw, and overcame.

Id. Henry IV.

A shop of all the qualities that man Loves woman for, besides that hook of wiving. Fairness, which strikes the eye. Shakspeare.

But she

Id. Winter's Tale. I can hook to me. Though divine Plato thus of pleasures thought,

They us with hooks and baits, like fishes caught. Denham.

Which he by hook or crook had gathered, Hudibras. And for his own inventions fathered.

Gryps signifies eagle or vulture ; from whence the epithet grypus, for an hooked or aquiline nose.

Browne

Now thou threatenest, with unjust decree, To scize the prize which I so dearly bought : Mean match to thine ; for still above the rest, Thy hooked rapacious hands usurp the best.

Dryden.

He would bring him by hook or crook into his quar-Id. rel.

She was horribly bold, meddling, and expensive, easily put off the hooks, and monstrous hard to be L'Estrange. pleased again.

Pease are commonly reaped with a hook at the end of a long stick. Mortimer.

Caterpillars have claws and feet : the claws are hooked, to take the better hold in climbing from twig to twig, and hanging on the backsides of leaves.

Grew.

347

The huge jack he had caught was served up for the first dish : upon our sitting down to it, he gave us a long account how he had hooked it, played with it, foiled it, and at length drew it out upon the bank. Addison.

Let me less cruel cast the feathered hook With pliant rod athwart the pebbled brook, Silent along the mazy margin stray And with the fine-wrought fly delude the prey.

Gay's Rural Sports. Not that I'd lop the beauties from his book,

Like flashing Bentley with his desperate hook.

Pope.

While Sheridan is off the hooks, And friend Delany at his books.

Swift. HOOKS OF A SHIP are all those forked timbers which are placed directly upon the keel, as well

in her run as in her rake. Can-hooks are those which being made fast to the end of a rope with a noose (like that which brewers use to sling or carry their barrels on), are made use of for slings. Loof-hooks are a tackle with two hooks; one to hitch into a cringle of the main or fore sail, in the bolt-rope at the leech of the sail by the clew; and the other is to hitch into a strap, which is spliced to the chess tree. Their use is to pull down the sail, and succour the tackles in a large sail and stiff gale, that all the stress may not bear upon the tack. It is also used when the tack is to be seized more secure, and to take off or put on a bonnet or drabbler.

HOOK (James), a musician of Norwich, was born 1746, and studied the science which he afterwards professed under Garland, organist to the cathedral of that city. His musical productions amount to more than 140 complete works. Of these the principal are The Ascension, an oratorio, 1776: Cupid's Revenge, a pastoral, 1772; Lady of the Manor, 1778; Jack of Newbury, 1795; Wilmore Castle, 1800; Soldier's Return, 1805; Operas. Tekeli, a melodrame; The Siege of St Quentin; Music Mad; and several other dramatic pieces, besides upwards of 2000 songs.

HOOKAH, in eastern customs, a pipe of peculiar construction, through which tobacco is smoked. Out of a small vessel, of a bell or globular form, and nearly full of water, issue two tubes, one perpendicularly, on which is placed the tobacco; the other obliquely to which the person who smokes applies his mouth; the smoke by this means, being drawn through water, is cooled in its passage and rendered more grateful. The hookah is known and used throughout the East; and it is frequently an implement of a

very costly nature, being of silver, and set with precious stones: in the better kind, that tube which is applied to the mouth is very long and pliant, and is termed the snake; people who use it in a luxurious manner, fill the vessel through which the smoke is drawn with rose-water, and it thereby receives some of the fragrant quality of that fluid. They are now becoming common in this country, and may be had at every tobacconist's.

HOOKE (Nathaniel), author of a well known Roman History, was a Roman Catholic by profession, and much attached to the doctrines of quietism and mysticism taught by Fenelon. The only particulars of his early life now known are furnished in the following letter to the earl of Oxford, dated October 7, 1722: 'My lord, the first time I had the honor to wait upon your lordship since your coming to London, your lordship had the goodness to ask me, what way of life I was then engaged in ; a certain mauvaise honte hindered me at that time from giving a direct answer. The truth is, my lord, I cannot be said at present to be in any form of life, but rather to live extempore. The late epidemical distemper seized me' (alluding to the unfortunate adventure of the South Sca Scheme); 'I endeavoured to be rich; imagined for a while that I was, and am in some measure happy to find myself at this instant but just worth nothing. If your lordship, or any of your numerous friends, have need of a servant, with the bare qualifications of being able to read and write, and to be honest, I shall gladly undertake any employments your lordship shall not think me unworthy of. I have been taught, my lord, that neither a man's natural pride, nor his self-love, is an equal judge of what is fit for him; and I shall endeavour to remember, that it is not the short part we act, but the manner of our performance, which gains or loses us the applause of Him who is finally to decide of all human actions. My lord, I am just now employed in translating from the French a History of the Life of the late archbishop of Cambray; and I was thinking to beg the honor of your lordship's name to protect a work which will have so much need of it. The original is not yet published. It is written by the author of the Discourse upon Epic Poetry, in the new edition of Telemaque. As there are some passages in the book of a particular nature, I dare not solicit your lordship to grant me the favor I have mentioned, till you first have perused it. The whole is short, and pretty fairly transcribed. If your lordship could find a spare hour to look it over, I would wait upon your lordship with it, as it may possibly be no unpleasing entertain-I should humbly ask your lordship's parment. don for so long an address in a season of so much business. But when should I be able to find a time in which your lordship's goodness is not employed? I am, with perfect respect and duty, my lord, your lordship's most obliged, most faithful, and most obedient humble servant, Nathaniel Hooke.' The translation here spoken of was afterwards printed in 13mo, 1723. From this period till his death Mr. Hooke enjoyed the confidence and patronage of men not less distinguished by virtue than by titles. He published

a Translation of Ramsay's Travels of Cyrus, in 4to.; in 1733 he revised a translation of The History of the Conquest of Mexico by the Spaniards, by Thomas Townsend, esq.; printed in 2 vols. 8vo.; and in the same year he published, in 4to., the first volume of The Roman History, from the building of Rome to the ruin of the Commonwealth ; illustrated with maps and other plates. In the dedication to this volume, Mr. Hooke took the opportunity of telling Pope, that the displaying his name at the head of those sheets was 'like the hanging ont a splendid sign, to catch the traveller's eye, and entice him to make trial of the entertainment the place affords.' The volume is introduced by Remarks on the History of the Seven Roman Kings, occasioned by Sir Isaac Newton's objections to the supposed 244 years duration of the royal state of Rome. Ilis nervous pen was next employed in digesting An Account of the conduct of the Dowager duchess of Marlborough, from her first coming to Court to the year 1710, in a letter from herself to lord -----, in 1742, 8vo.; her grace was so well pleased with this performance, that she complimented the author with a present of £5000, a sum which far exceeded his expectations. The second volume of his Roman History appeared in 1745; to which Mr. Hooke added The Capitoline Marbles, or Consular Calendars, an ancient Monument accidentally discovered at Rome in the year 1545, during the Pontificate of Paul HI. In 1758 he published Observations on, 1. The Answer of M. l'Abbé de Vertot to the late earl of Stanhope's Enquiry concerning the Senate of ancient Rome : dated December 1719. 2. A Dissertation upon the Constitution of the Roman Senate, by a Gentleman : pub-lished in 1743. 3. A Treatise on the Roman Senate, by Dr. Conyers Middleton : published in 1747. 4. An Essay on the Roman Senate, by Dr. Thomas Chapman: published in 1750; which he inscribed to Mr. Speaker Onslow. The third volume of Mr. Hooke's Roman History, to the end of the Gallic war, was printed under his inspection before his last illness; but did not appear till after his death, which happened in 1764. The fourth and last volume was published in 1771. Mr. Hooke left two sons; of whom one was a divine of the church of England ; the other a doctor of the Sorbonne, and professor of astronomy in that formerly illustrious seminary.

HOOKE (Robert), an eminent English mathematician and philosopher, was born in the Isle of Wight, in 1635. He very early discovered a genius for mechanics, by making curious toys with great art and dexterity. He was educated under Dr. Busby in Westminster school; where he acquired Greek and Latin, with Hebrew and some other oriental languages; and made himself master of a great part of Euclid's Elements. About 1653 he went to Christ Church in Oxford, and in 1655 was introduced to the Philosophical Society there; who first employed him to assist Dr. Wallis in his operations in chemistry, and afterwards recommended him to the honorable Robert Boyle, whom he served several years in the same capacity. He was also instructed in astronomy about this time by Dr. Seth Ward, and hencetorward distinguished himself by many mechanical inventions and improvements. He invented several astronomical instruments for making observations both at sea and land; and was particularly serviceable to Mr. Boyle in completing the invention of the air-pump. Sir John Cutler having founded a mechanical school, in 1664, he settled an annual stipend on Mr. Hooke for life, entrusting the president, council, and fellows of the Royal Society, to direct him with respect to the number and subject of his lectures; and on the 11th of January, 1664, 1665, he was elected by that society curator of experiments for life, with an additional salary. The rebuilding of the city of London after the dreadful fire in 1666 requiring an able person to set out the ground to the proprietors, Mr. Hooke was appointed one of the surveyors. Mr. Oldenburgh, secretary to the Royal Society, dying in 1677, Mr. Hooke was appointed to supply his place, and began to take minutes at the meeting in October, but did not publish the Transactions. In 1691 he was employed in forming the plan of the hospital near Hoxton, founded by Robert Aske, alderman of London, who appointed archbishop Tillotson one of his executors; and in December, the same year, Hooke was created M. D. by a warrant from that prelate. In 1696 an order was granted to him for repeating most of his experiments at the expense of the Royal Society, upon a promise of his finishing the observations, and deductions from them, and of perfecting the description of all the instruments contrived by him; but his increasing illness and general decay rendered him unable to perform it. He continued some years in this wasting condition, till he was quite emaciated. He died March 3rd, 1702, at his lodgings in Gresham College, and was buried in St. Helen's church, Bishopsgate Street, his funeral being attended by all the members of the Royal Society, then in London. He wrote, 1. Lectiones Cutlerianæ. 2. Micrographia, or Descriptions of minute bodies made by magnifying glasses. 3. A Description of Helioscopes. 4. A Description of some Mechanical Improvements of Lamps and Water 5. Philosophical Collections. Poises. 4to. After his death were published, 6. Posthumous works collected from his papers by Richard Waller, secretary to the Royal Society.

HOOKER (John), was born in Exeter, about 1524. He was instructed in grammar by Dr. Moreman, vicar of Menhiniot in Cornwall, and thence removed to Oxford. He next travelled to Germany, and resided some time at Cologne, where he kept exercises in law, and graduated. Thence he went to Strasburg, where he studied divinity under the famous Peter Martyr. He now returned to England, and soon after visited France, intending to proceed to Spain and Italy; but was prevented by a declaration of war. Returning therefore again to England, he fixed his residence in his native city, where, having married, he was in 1554 elected chamberlain, being the first person who held that office, and in 1571 represented his fellow-citizens in parliament. He died in 1601, and was buried in the cathe-dral at Exeter. He wrote, among other works, 1. Order and Usage of keeping of Parliaments in Ireland. 2. The events of Comets or Blazing

349

Stars, made upon the sight of the Comet Pagonia, which appeared in November and December, 1577. 3. An addition to the Chronicles of Ireland from 1546 to 1568; in the second volume of Holinshed's Chronicles. 4. A Description of the city of Exeter, and of the Sondrie Assaults given to the same; Holinshed's Chronicle, vol. HI. 5. A Book of Ensigns. 6. Translation of the History of the Conquest of Ireland, from the Latin of Giraldus Cambrensis; in Holinshed's Chronicle, vol. ii. 7. Synopsis Chorographica, or an Historical record of the province of Devon; never printed.

HOOKER (Richard), a learned divine, nephew to the preceding, born at Heavytree, near Exeter, in 1553. By his uncle he was first supported at the University of Oxford, with the addition of a small pension from Dr. Jewel, bishop of Salisbury, who in 1561 got him admitted one of the clerks of Corpus Christi College. In 1573 he was elected scholar. In 1577 he took the degree of M. A. and was admitted fellow. In July, 1579, he was appointed deputy professor of the flebrew language. In 1581 he took orders; and, being appointed to preach at St. Paul's cross, he came to London, where he was unfortunately drawn into a marriage with Joan Churchman, the termagant daughter of his hostess. Having thus lost his fellowship he continued in the utmost distress till 1584, when he was presented by John Cheny, esq. to the rectory of Drayton-Beauchamp, in Buckinghamshire. In this retirement he was visited by Mr. Edwin Sandys, and Mr. George Cranmer, his former pupils. They found him, with a Horace in his hand, tending some sheep in the common, his servant having been ordered home by his Xantippe. They attended him to his house; but were soon deprived of his company by an order from his wife for him to come and rock the cradle. Mr. Sandys's representation to his father of his tutor's situation, procured him the mastership of the Temple. Here he met with considerable molestation from one Travers, lecturer of the Temple, and a bigoted Puritan, who in the afternoon endeavoured to confute the doctrine he had delivered in the morning. From this disagreeable situation he solicited archbishop Whitgift to remove him to some country retirement, where he might prosecute his studies in tranquillity. Accordingly, in 1591 he obtained the rectory of Boscomb in Wiltshire, together with a prebend in the church of Salisbury, of which he was also made sub-dean. In 1594 he was presented to the rectory of Bishops-Bourne in Kent, where he died in 1600. He was buried in his parish church, and a monument (crected to his memory by William Cooper, Esq. He wrote, 1. Ecclesiastical Polity, in eight books. 2. A Discourse of Justification, &c., with two sermons, Oxford, 1612, 4to. 3. Several other sermons printed with the Ecclesiastical Polity.

HOOKER, in naval architecture, a vessel much ased by the Dutch, built like a pink, but rigged and masted like a hoy. Hookers will lie nearer a wind than vessels with cross sails can do. They are from fifty to 200 tons burden, and with a few hands will sail to the East Indies.

HOOLE (John), a poet and translator of some

celebrity, was born in London, December 1727, and was the son of a watchmaker. He acquired at a private boarding school an accurate knowledge of the Latin and French languages, and at the age of seventeen entered as a clerk at the East India House, where he closely studied the Italian language. He commenced the translation of the Jerusalem Delivered of Tasso in 1758, and published it in 1763. The dedication to the queen was composed by Dr. Johnson. In 1767 he published a translation of six dramas of Metastasio, in 2 vols.; and the next year brought out his tragedy of Cyrus; Timanthes in 1770, and Cleone in 1775, all equally unsuccessful dramatic efforts. In 1773 he published the first volume of his Orlando Furioso, the farther progress of which was impeded by his advancement to the auditorship of the Indian accounts; he however concluded it in 1783, in 5 vols. 8vo. In 1785 he wrote the life of his friend, Mr. Scott, of Amwell, and having retired from the India House, after a service of forty-two years, he took up his abode, with his wife and son, at the parsonage-house of Abinger, near Dorking. Here he connected the narrative of his Orlando in twenty-four books, and disposed the stories in a regular series. In 1792 he translated Tasso's Rinaldo, and ended his litarary labors with a Collection of dramas from Metastasio: but his translations are considered meagre and spiritless. He died respected in 1803.

1803. HOOP, n. s. & v. a. Sax. bop; Swed. hop; HOOP'ER, n. s. Belg. hocp. Any thing circular by which something else is bound, particularly casks or barrels; the whalebone with which women extend their peticoats; a farthingale; any thing circular. Hooper, a cooper, one that hoops tubs. Hoop, to encircle; clasp; surround; bind or enclose with hoops.

Thou shalt prove a shelter to thy friends,

A hoop of gold to bind thy brothers in,

That the united vessel of their blood

Shall never leak. Shakspeare. Henry IV. If I knew

What hoop would hold us staunch, from edge to edge

O' the' world, I would pursue it. Shakspeare.

A quarrel, ho, already ! what's the matter ? — About a hoop of gold, a paltry ring. Id.

If ever henceforth thou

Shalt hoop his body more with thy embraces, I will devise a death. Id. Winter's Tale.

The three-hooped pot shall have ten hoops, and I will make it felony to drink small beer. Shakspeare.

The casks for his majesty's shipping were hooped as a wine-cask, or hooped with iron. Raleigh.

I hoop the firmament, and make This my embrace the zodiack. Cleaveland.

To view so lewd a town, and to refrain,

What hoops of iron could my spleen contain ! D,yden.

That shelly guard, which hoops in the eye, and hides the greater part of it, might occasion his mistake. Grew.

I have seen at Rome an antique statue of Time, with a wheel or hoop of marble in his hand. Addison.

And learned Athens to our art must stoop, Could she behold us tumbling through a hoop.

Pope.

At coming in you saw her stoop :

The entry brushed against her hoop. Swift. All that hoops are good for is to clean dirty shoes, and to keep fellows at a distance. Clarissa.

Hoor, v. n. & v. a. Goth. wopgan or Hoor'ıNG-coUGH, n. s. (wopyan, or French heupper, derived from the Gothic. This word is often written whoop, which is more proper if we deduce it from the Gothic; and hoop if we derive it from the French.—Johnson. To shout; to make an outery by way of call or pursuit. Hooping-cough, or whooping-cough, from hoop to shout. A convulsive cough, so called from its noise; the chincough.

And, therwithal, they shriked and they houped; It semed as that the heven shulde falle.

Chaucer. The Nonnes Preestes Tale. Dastard nobles

Suffered me, by the voice of slaves, to be Hooped out of Rome. Shakspeare. Coriolanus.

HOOPER (George), a learned author, born at Grimeley in Worcestershire, about 1640. He was educated at Westminster, studied at Oxford, and was well skilled in mathematics, and the eastern languages. In 1672 he became chaplain to the bishop of Winchester; and soon after to archbishop Sheldon; and in 1677 almoner to the princess of Orange, whom he accompanied to Holland. In 1691 he was made dean of Canterbury; and in 1702 bishop of Bath and Wells. He wrote, 1. The Church of England free from the imputation of Popery; 2. A Discourse concerning Lent; 3. New danger of Presbytery; 4. An Enquiry into the state of the Ancient Measures; 5. De Valentinianorum hæresi conjecturæ; 6. Several sermons; and 7. An Enquiry into the state of the Ancient Measures; the Attic, Roman, and Jewish; with an appendix, concerning our old English money and measures; 1721, 8vo. He died in 1727. All his works were printed in 1 vol. folio, at Oxford, 1757.

HOOPER (John), bishop of Worcester, was born in Somersetshire, and educated at Oxford. In 1518 he took the degree of A. B., and afterwards became a Cistercian monk; but, disliking his fraternity, returned to Oxford, and became somewhat of a Lutheran. In 1539 he was made chaplain and steward to Sir John Arundel, who afterwards suffered with the protector in the reign of Edward VI. But that very Catholic knight, as Wood calls him, discovering him to be a heretic, he was obliged to leave the kingdom. After continuing some time in France he returned to England, and lived with a gentleman named Seintlow; but, being again discovered, he escaped in the habit of a sailor to Ireland; thence embarked for the continent, and fixed his abode in Switzerland. Upon Edward's accession, Mr. Hooper returned once more to his native country. In 1550, by his old patron Sir John Arundel's interest with the earl of Warwick, he was consecrated bishop of Gloucester; and in 1552 was nominated to the see of Worcester, which he held in commendam with the former. But Mary had scarce ascended the throne, before he was imprisoned, tried, and condemned to the flames. He suffered at Gloucester on the 9th of February, 155⁺, being then near sixty years of age. He was an avowed enemy to the church of Rome, and in the former reign had been one of Bonner's accusers.

HOORN, a sea-port town of the Netherlands, in North Holland; in the department of the Texel, and late province of West Friesland. Its name is derived from the curving shape of the port; and it is the capital of an extensive district of North Holland. In 1426 it was surrounded with the walls, and, in 1508, greatly enlarged; but in 1557 it was almost destroyed by a storm and inundation which broke down the dams. In 1577 the harbour was built, which is reckoned the best on the Zuider Zee. The adjacent lands are fertile, and famed for fattening cattle. The town is still fortified, and has five gates, several churches and hospitals. Hence also commences a canal, which leads through Alcmaer to Petten, and connects the Zuider Zee with the North Sea.

The manufactures are of carpets and woollen cloths; ship-building is also extensively carried on. Its trade is in cattle, butter, cheese, and herrings, and is very extensive. This town was entered by a strong body of British (12,000), on the 19th of September, 1799, while the Russians and the remainder of our troops were engaged at Alemaer in an action which terminated unfavorably; these troops bore a part next day in the second battle of Alcmaer. Hoorn was the birth-place of Schouten the navigator. Population about 9000: fourteen miles east of Alcmaer, and twenty N. N. E. of Amsterdam.

HOORN, or HORN, a town of France in the department of the Lower Meuse, and late bishopric of Liege; three miles west of Ruremond, and twelve south of Venlo. Long. 5° 55' E, lat. 51° 12' N.

HOORN, or HORN ISLANDS, two islands in the South Pacific Ocean, on the north of the Friendly Isles, discovered in the year 1616 by Le Maire and Schouten, who landed and staid here some days; their ship lying at anchor at the mouth of a river called, after the name of the vessel, the Gulf of Concord. They are supposed to be the same islands which are called Hamoa by the natives. Long. 171° 30' E., lat. 15° S.

HOORNBECK (John), professor of divinity in the universities of Leyden and Utrecht, was born at Haerlem in 1617. He was well acquainted with the classical, oriental, and European languages, and published many works; among which are, 1. A refutation of Socinianism, in 3 vols. 4to.; 2. A Treatise for the conviction of the Jews; 3. Of the Conversion of the Heathen; 4. Institutiones Theologicze, &c. Bayle represents him as a complete model of a divinity professor.

HOOT, v. n., v. a., & n. s. Fr. huer, huec; Welsh hut; Swed. hut. To shout in contempt; to cry as an owl; to drive with noise and shout. Clamor; noise; shouting.

We loved him ; but, like beasts,

Our coward nobles gave way to your clusters, Who did *hoot* him out o' the' city. Shakspeare.

Some keep back

The clamorous owl, that nightly hoots, and wonders At our queint sports. Id.

The owl of Rome, whom boys and girls will hoot ! That were I set up for that wooden god

That keeps our gardens, could not fright the crows, Or the least bird, from muting on my head.

Ben Jonson.

Its assertion would be entertained with the hoot of Glanville's Scepsis. the rabble.

A number of country folks happened to pass thereby, who hollowed and hooted after me as at the arrantest Sidney. coward.

Matrons and girls shall hoot at thee no more.

Dryden.

Partridge and his clan may hoot me for a cheat and impostor, if I fail in any particular of moment.

Swift.

When the falling stars are shooting, And the answered owls are hooting.

Byron. Manfred.

HOP, v. n. & n. s. HOP'PERS, n. s.

Sax. poppan; Teut. hoppen; Swedish, hoppa.

To jump or skip lightly; HOP'PER, n. s. to leap on one leg; to walk lamely or halt. hop is a jump ; also a place where meaner people dance. Hopper, he who hops or jumps on one leg; the box or open frame of wood into which the corn is put to be ground, so called because it is always hopping, or in agitation, and which is called in French, for the same reason, tremie or tremue ; a basket for carrying seed. ' In Saxon to hoppe signifies exactly the same as to dance, though with us it hath acquired a Indicrous sense; and hopster, is a female dancer.'--- Notes to Chaucer. Hoppers, commonly called Scotch hoppers, a kind of play in which the actor hops on one leg.

Right by the hopper wol I stand

Quod John and seen how that the corn gas in ; Yet, saw I never (by my fader kin) ! How that the hopper wagges til and fra.

Chaucer. The Reves Tale.

Yet, saw I brent the shippes hoppesteres. Id. The Knightes Tale.

Softly feel

Her feeble pulse, to prove if any drop Of living blood yet in her veins did hop.

Faerie Queene.

I would have thee gone,

And yet no further than a wanton's bird,

That lets it hop a little from her hand, And with a silk thread plucks it back again.

Shakspeare.

Go, hop me over every kennel home; For you shall hop without my custom, sir. Id.

Be kind and courteous to this gentleman,

Hop in his walks, and gambol in his eyes. Id.

Men with heads like dogs, and others with one huge foot alone, whereupon they did hop from place to Abbot. place.

I'd sooner trust my fortune with a daw,

That hops at every butterfly it sees,

Than have to do in honour with a man

That sells his virtues for a woman's smiles.

Otway.

The painted birds, companions of the spring, Hopping from spray to spray were heard. Dryden,

Your Ben and Fletcher, in their first young flight, Did no Volpone, nor no Arbaces write ; But hopped about, and short excursions made

From bough to bough, as if they were afaid. Id.

The limping smith observed the saddened feast, And hopping here and there, hunself a jest, Put in his word. Id. Homer. Just at the hopper will I stand,

In my whole life I never saw grist ground, And mark the clack how justly it will sound.

Betterton.

The salt of the lake Asphaltites shooteth into perfect cubes. Sometimes they are pyramidal and plain, like the hopper of a mill. Grew.

When my wings are on, I can go above a hundred yards at a hop, step, and jump. Addison.

I am highly delighted to see the jay or the thrush hopping about my walks. Id. Spectator.

Why don't we vindicate ourselves by trial or deal. aud hop over heated ploughshares blindfold ? Collier

Graminivorous birds have the mechanism of a mill : their maw is the hopper which holds and softens the grain, letting it drop by degrees into the stomach.

Arbuthnot on Aliments.

Hop, n.s. & v.a. Belg. hop ; Lat. lupulus, or perhaps from hoop, to bind round. A plant used in the composition of beer: hop to impregnate with hops.

If hop yard or orchard ye mind for to have,

For hop poles and crotches in lopping to save.

Tusser.

The planting of hop yards is profitable for the planters, and consequently for the kingdom. Bacon. Beer hath malt first infused in the liquor, and is

afterwards boiled with the hop. Id. Next to thistles are hop strings, cut after the

flowers are gathered. Derham. Brew in October, and hop it for long keeping. Mortimer.

Have the poles without forks, otherwise it will be troublesome to part the hop vines and the poles. Id.

When you water hops, on the top of every hill put dissolved dung, which will enrich your hop hills. Id.

In Kent they plant their hop gardens with appletrees and cherry-trees between. Id.

The price of hoeing of hop ground is forty shillings an acre. Id.

Hop holes, the largest sort, should be about twenty foot long, and about nine inches in compass. Id.

To increase the milk, diminished by flesh meat, take malt-drink not much hopped. Arbuthnot.

Hop, in botany, see HUMULUS. Hops were first brought into England from the Netherlands in the year 1524. They are first mentioned in the English statute-book in 1552, viz. in the 5 and 6 of Edw. VI. cap. 5. And by an act of parliament of the first year of king James I. anno 1603, cap. 18, it appears that hops were then produced in abundance in England. The hop being a plant of great importance, we shall consider what relates to the culture and management of it, under distinct heads.

The hop-planters esteem the richest and strongest ground the most proper; and, if it be rocky within two or three feet of the surface, the hops will prosper well; but they will not thrive on a stiff clay or spongy wet land. The Kentish planters estcem new land best for hops; they plant their hop-gardens with apple trees at a large distance, and with cherry trees between; and when the land has done it's best for hops, which they reckon it will in about ten years, the trees may begin to bear. The cherry trees last about thirty years, and, by the time the apple trees are large, they cut down the cherries. The Essex planters reckon a moory land the most proper for hops. As to the situation of a hop-ground, one that inclines to the south or west is the most eligible; but, if it be exposed to the north-east or south-west winds, there should be a shelter of some trees at a distance, because the north-east winds are apt to nip the tender shoots in the spring; and the south-west winds frequently break and blow down the poles at the end of summer, and very much endanger the hops. In winter provide soil and manure for the hop-ground against the following spring. If the dung be rotten mix it with two or three parts of earth, and let it incorporate together till you have occasion to use it in making your hop hills; but, if it be new dung, then let it be mixed as before till the spring in the next year, for new dung is very injurious to hops. Dung of all sorts was formerly more commonly used than it is now, especially when rotted and turned to mould, and they who have no other manure must use it : which if they do, cows' or hogs' dung, or human ordure mixed with mud, may be a proper compost, because hops delight most in manure that is cool and moist.

Hops require to be *planted* in a situation so open as that the air may freely pass round and between them, to dry up and dissipate the moisture, whereby they will not be so subject to fireblasts, which often destroy the middle of large plantations, while the outsides remain unhurt. As for the preparation of the ground for planting, it should in the preceding winter be ploughed and harrowed even; and then lay upon it in heaps a good quantity of fresh rich earth, or well rotted dung and earth mixed together, sufficient to put half a bushel in every hole to plant the hops in, unless the natural ground be very fresh and good. The hills where the hops are to be planted should be eight or nine feet asunder, that the air may freely pass between them; for in close plantations they are very subject to what the hop-planters call the fire-blast. If the ground is intended to be ploughed with horses between the hills, it will be best to plant them in squares chequerwise; but if it be so small that it may be done with the breast-plough or spade, the holes should be ranged in a quincunx form. Which way soever is adopted, a stake should be stuck down at all the places where the hills are to be made. Great caution should be observed in the choice of the plants, as to the kind of hop; for if the hop-garden be planted with a mixture of several sorts of hops that ripen at different times, it will cause a great deal of trouble, and be a great detriment to the owner. The two best sorts are the white and the gray bind; the latter is a large square hop, more hardy, and is a more plentiful bearer, and ripens later than the former. There is another sort of the white bind, which ripens a week or ten days before the common; but this is tenderer, a: d a less plentiful bearer; but it has this advantage, that it comes first to market. But if three grounds, or three distant parts of one ground, be planted with these three sorts, there will be this convenience, that they may be picked successively as they become ripe. The sets should be five or six inches long, with three or more joints or buds on them. If there be a sort of

hop you value, and would increase plants and sets from, the superfluous binds may be laid down when the hops are tied, cutting off the tops, and burying them in the hill; or, when the hops are dressed, all the cuttings may be saved ; for almost every part will grow, and become a good set the next spring. As to the seasons of planting hops, the Kentish planters prefer October and March, both which sometimes succeed very well; but the sets are not to be had in October, unless from some ground that is to be destroyed; and likewise there is some danger that the sets may be rotted, if the winter prove very wet; therefore the most usual time or procuring them is in March, when the bops are cut and dressed. As to the manner of planting the sets, there should be five good sets planted in every hill, one in the middle and the rest round about sloping, the tops meeting at the centre; they must stand even with the surface of the ground; let them be pressed close with the hand, and covered with fine earth, and a stick should be placed on each side the hill to secure it. The ground being thus planted, all that is to be done more during that summer, is to keep the hills clear from weeds, and to dig up the ground in May. and to raise a small hill round about the plants. In June you must twist the young binds or branches together into a bunch or knot; for if they are tied up to small poles the first year, in order to have a few hops from them, it will not countervail the weakening of the plants. A mixture of compost or dung being prepared for hop-ground, the best time for laying it on, if the weather prove dry, is about Michelmas, that the wheels of the dung-cart may not injure the hops, nor furrow the ground : if this be not done then, you must wait till the frost has hardened the ground, so as to bear the dung-cart; and this is also the time to carry on your new poles, to recrnit those that are decayed and to be cast out every year. If you have good store of dung, the best way will be to spread it in the alleys all over the ground, and to dig it in the winter following. The quantity they will require will be forty loads to an acre, reckoning about thirty bushels to the load. If you have not dung enough to cover all the ground in one year, you may lay it on one part one year, and on the rest in another, or a third; for there is no occasion to dung the ground after this manner oftener than once in three years. Those who have but a small quantity of dung, usually content themselves with laying on about twenty loads upon an acre every year; this they lay only on the hills, either about November, or in the spring; which last some account the best time, when the hops are dressed, to cover them after they are cut; but, if it be done at this time, the compost or dung ought to be very well rotted and fine. As to the dressing of the hops, when the hopground is dug in January or February, the earth about the hills and very near them, ought to be taken away with a spade, that you may come the more conveniently at the stock to cut it. About the end of February, if the hops were planted the spring before, or if the ground be weak, they ought to be dressed in dry weather; but else, if the ground be strong and in perfection, the

middle of March will be a good time; and the latter end of March, if it be apt to produce over rank binds, or the beginning of April may be soon enough. Then having with an iron picker cleared away all the earth out of the hills, so as to clear the stock to the roots, with a sharp knife you must cut off all the shoots which grew up with the binds the last year; and also all the young suckers, that none be left to run in the alley, and weaken the hill. It will be proper to cut one part of the stock lower than the other, and also to cut that part low that was left highest the preceding year. By pursuing this, method you may expect to have stronger buds and also keep the hill in good order. In dressing those hops that have been planted the year before, you ought to cut off both the dead tops and the young suckers which have sprung up from the sets, and also to cover the stocks with fine earth a finger's length in thickness.

About the middle of April the hops are to be poled, when the shoots begin to sprout up; the poles must be set to the hills deep into the ground, with a square iron picker or crow, that they may the better endure the winds; three poles are sufficient for one hill. These should be placed as near the hill as may be, with their bending tops turned outwards from the hill, to prevent the binds from entangling; and a space between two poles ought to be left open to the south to admit the sun-beams. The poles ought to be in length sixteen or twenty feet, more or less, according as the ground is in strength; and great care must be taken not to overpole a young or weak ground, for that will draw the stock too much, and weaken it. If a ground be overpoled, you are not to expect a good crop from it; for the branches which bear the hops will grow very little till the binds have over-reached the poles, which they cannot do when the poles are too long. Two small poles are sufficient for a ground that is young. If you wait till the sprouts or young binds are grown to the length of a foot, you will be able to make a better judgment where to place the largest poles; but, if you stay till they are so long as to fall into the alleys, it will be injurious to them, because they will ertangle one with another, and will not elasp about the pole readily. Maple or aspen poles are accounted the best for hops, on which they are thought to prosper best, because of their warmth; or else, because the climbing of the hop is promoted by means of the roughness of the bark. But, for durability, ashen or willow poles are preferable; but chestnut poles are the most durable of all. If, after the hops are grown up, you find any of them have been underpoled, taller poles may be placed near those that are too short to receive the binds from them.

As to the *tying* of hops, the buds that do not clasp of themselves to the nearest pole, when they are grown to three or four feet high, must be guided to it by the hand, turning them to the sun, whose course they always follow. They must be bound with withered rushes, but not so close as to hinder them from elimbing up the pole. Continue to do this till all the poles are furnished with binds, of which two or three are

VOL. XI.

enough for a pole; and all the sprouts and binds that you have no occasion for are plueked up; but, if the ground be young, then none of these useless binds should be plucked up, but should be wrapped up together in the middle of the hill. When the binds are grown beyond the reach of your hands, if they forsake the poles, you should make use of a stand ladder in tying them up. Towards the end of May, when you have made an end of tying them, the ground must have the summer dressing : this is done by casting up with the spade some fine earth into every hill. A month after this hoe the alleys with a Dutch hoe, and make the hills up to a convenient bigness. About the middle of July hops begin to blow, and will be ready to gather about Bartholomew-tide. A judgment may be made of their ripeness by their strong scent, their hardness, and the brownish color of their seed. When by these tokens they appear to be ripe, they must be picked with all the ex-pedition possible; for if at this time a storm of wind should come, it would do them great damage by breaking the branches, and bruising and discoloring the hops; and it is very well known, that hops picked green and bright will sell for a third more than those which were discolored and brown. The most convenient way of picking them is into a long square frame of wood, called a bin, with a cloth hanging on tenter hooks within it, to receive the hops as they are picked. The frame is composed of four pieces of wood joined together, supported by four legs, with a prop at each end to bear up another long piece of wood, placed at a convenient height over the middle of the bin; this serves to lay the poles upon, which are to be picked. This bin is commonly eight feet long, and three feet broad ; two poles may be laid on it at a time, and six or eight persons may work at it, three or four on each side. It will be best to begin to pick the hops on the east or north side of the ground, if you can do it con-veniently; this will prevent the south-west wind from breaking into the garden. Having made choice of a plot of ground, containing eleven hills square, place the bin upon the hill which is in the centre, having five hills on each side; and, when these hills are picked, remove the bin into another piece of ground of the same extent, and so proceed till the whole hop-ground is finished. When the poles are drawn up to be picked, take care not to cut the binds too near the hills, especially when the hops are green, because it will make the sap to flow excessively. The hops must be picked very clean, i. e. free from leaves and stalks; and, as there shall be occasion, two or three times in a day the bin must be emptied into a hop-bag made of coarse linen cloth, and carried immediately to the oast or kiln to be dried; for, if they should be long in the bir or bag, they will be apt to heat and be discolored If the weather be hot there should no more poles be drawn than can be picked in an hour, and they should be gathered in fair weather if it can be, and when the hops are dry; this will save some expense in firing, and preserve their color better when they are dried. The crops of hops being thus bestowed, take care of

2 A

the poles against another year, which are best to be laid up in a shed, having first stripped off the haulm from them; but if you have not that conveniency, set up three poles in the form of a triangle, or six poles as you please, wide at bottom; and having set them into the ground with an iron picker, and bound them together at the top, set the rest of your poles about them; and, being thus disposed, none but those on the outside will be subject to the injuries of the weather, for all the inner poles will be kept dry, unless at the top; whereas, if they were on the ground, they would receive more damage in a fortnight then by standing all the rest of the year. The best method of drying hops is with charcoal on an oast or kiln, covered with hair-cloth, of the same form and fashion as that used for drying malt. There is no need of particular directions for making these, as every carpenter and bricklayer in those countries where hops grow, or malt is made, knows how to build them. The kiln ought to be square, and may be of ten, twelve, fourteen, or sixteen feet over at the top, where the hops are laid, as the plantation requires, and room will allow. There ought to he a due proportion between the height and hreadth of the kiln and the beguels of the steddle where the fire is kept, viz. if the kiln be twelve feet square on the top, it ought to be nine feet high from the fire, and the steddle ought to be six feet and a half square, and so proportion-ably in other dimensions. The hops must be spread even upon the oast a foot thick or more, if the depth of the curb will allow it; but care must be taken not to overload the oast if the hops be green or wet. The oast ought to be first warmed with a fire before the hops are laid on, and then an even steady fire must be kept under them; it must not be too fierce at first, lest it seorch the hops, nor must it be suffered to sink or slacken, but rather be increased, till the hops be nearly dried, lest the moisture or sweat which the fire has raised fall back and discolor them. When they have lain about nine hours they must be turned, and in two or three hours more they may be taken off the oast. It may be known when they are well dried by the brittleness of the stalks and the easy falling off of the hop leaves. It is found by experience that the turning of hops, though it be after the most easy and best manner, is not only an injury to the hops, but also a waste of fuel and time, because they require as much fuel and as long a time to dry a small quantity, by turning them, as a large one. Now this may be prevented by having a cover to be let down and raised at pleasure to the upper bed whereon the hops lie. This cover may also be tinned, by nailing single tin plates over the face of it; so that when the hops begin to dry, and are ready to burn, i. e. when the greatest part of their moisture is evaporated, then the cover may be let down within a foot or less of the hops like a reverberatory, which will reflect the heat upon them, so that the top will soon be as dry as the lowermost, and every hop be equally dried. As soon as the hops are taken off the kiln lay them in a room for three or four weeks to cool, give, and toughen; for if they are bagged immediately they

will powder, but if they lie a while (and the longer they lie the better, provided they be covered close with blankets to secure them from the air) they may be bagged with more safety, not being liable to be broken to powder in treading; and this will make them bear treading the better, and the harder they are trodden the better they will keep. The common method of bagging is as follows : they have a hole made in an upper floor, either round or square, large enough to receive a hop-bag, which consists of four ells and a half of ell-wide cloth, and also contains ordinarily 21 cwt. of hops; they tie a handful of hops in each lower corner of the bag to serve as handles to it; and they fasten the mouth of the bag, so placed that the hoop may rest upon the edges of the hole. Then he that is to tread the hops down into the bag, treads the hops on every side, another person continually putting them in as he treads them till the bag is full; which being well filled and trodden, they unrip the fastening of the bag to the hoops, let it down, and close up the mouth of the bag, tying up a handful of hops in each corner, as was done in the lower part. Hops being thus packed, if they have been well dried. and laid up in a dry place, will keep good several years; but care must be taken that they be not spoiled by the mice making their nests in them.

In spring, while the bud is yet tender, the tops of the plant being cut off and boiled are eaten like asparagus, and found very wholesome, and of service to loosen the body. The heads and tendrils are good to purify the blood in the scurvy, and most cutaneous diseases; decoctions of the flowers, and syrups thereof, are of use against pestilential fevers; juleps and apozems were formerly made with hops for hypochrondriacal and hysterical affections, and to promote the menses. A pillow stuffed with hops, and laid under the head, is said to procure sleep in fevers attended with a delirium. His late majesty George III. had a pillow of this kind presented for his use in 1787. But the principal use of hops is in the brewery, for the preservation of malt liquors; which, by the superaddition of this balsamic, aperient, and diuretic bitter, become less viscid, less apt to turn sour, more palatable, more disposed to pass off by urine, and in general more salubrious. They are said to contain an agreeable odoriferous principle, which promotes the vinous fermentation. When slightly boiled, or infused in warm water, they increase its spirituosity.

To judge of the quality of hops, observe how far a yellow clamminess, peculiar to this plant, abounds in the sample: the brightest colored hops are not always the best flavored; but purchasers dwell much on the color, which should therefore be preserved as bright as possible. A hop plantation, on a good soil, may be continued from fifteen to thirty years. They in general, however, begin to decline about the tenth year. Some advise that the plantation should then be destroyed, and a fresh one made; others consider it the best plan to break up and plant a portion of new ground every two years, letting an equal quantity of the old be destroyed, as in

this way a regular succession of good plantation will be kept up, and the expense be gradually incurred. For this is a serious consideration; being estimated, in some districts, at from not less than £70 to £100 the acre. The produce is uncertain; often very considerable; but some seasons nothing, after all the labor of culture, except picking, has been incurred. Where the lands are of the proper sort, and there are hoppoles on the farm, and the farmer has a sufficient capital, it is probably a sort of husbandry that may be had recourse to with advantage; but, under the contrary circumstances, hops will seldom answer. ' In growing them in connexion with a farm,' says Mr. Loudon, ' regard should be had to the extent that can be manured without detriment to the other tillage lands. On the whole, hops are an expensive and precarious crop, the culture of which should be well considered before it is entered upon.'

From this useful writer we abstract the following account of the diseases of hops. ' It is apt,' he observes, ' in the very early stage of its growth, to be devoured, as it rises above the surface of the ground, by the ravages of an insect of the flea kind. At a more advanced age it is subject to the still more injurious effects of the green or long-winged fly, red spider, and otter moth; the former, by the depositing of their ova, afford the means of producing lice in great abundance; by which the plants are often very greatly, if not wholly destroyed, and the larvæ of the latter prey upon the roots, and thus render the plants weak and subject to disease. The honey-dew is another disease to which the hop is exposed about the same time, and by which it is often much injured. The mould occurs in general at a somewhat later period, being equally injurious. Hop-crops are also exposed to other injuries, as the blight and fireblast, but which take place at different times, though mostly towards the latter periods of the growth of the plants. The flea, which is said to be an insect of the same kind as that which is so prejudicial to the young turnip, is observed to make the greatest havoek in seasons where the nights are cold and frosty, and the days hot and inclined to be dry; eating off the sweet tender tops of the young plants; and which, though not wholly destroyed, shoot forth afterwards in a far less vigorous manner, and of course become more exposed to diseases. It has been found to commit its depredations most frequently on the plants in grounds that have been dunged the same year; on which account it has been suggested that the manure employed for the purpose of covering the hills should be previously well mixed and incorporated as we have directed; and that it should be applied either over the whole of the land, or only the hills, as soon as possible after the plants have been cut over; but the former practice is probably the best. lt makes its greatest depredations in the more early cold spring months, at the latter end of April and beginning of the succeeding month, disappearing as the season becomes more mild and warm. In these cases, the principal remedy is that of having the land in a sufficient state of fertility, to enable the young plants to shoot up with such

vigor and rapidity as to become quickly incapable of being fed upon and devoured by the insect. And the frequent stirring of the mould about the roots of the plants by the hoe may be of utility in the same view.

' With respect to the green or long-winged fly, it mostly makes its appearance about the latter end of May, and in the two succeeding months; being supposed to be produced by the prevalence of north-easterly winds about that period. It is highly destructive to the young leaves of the plants. They are said, under such a state of the wind, to scarcely ever fail covering the leaves: and, by dropping their ova, producing an abundance of lice, by which the crops are often much injured; as, when they have once obtained complete possession of the plants, they seldom or ever leave them before they are wholly destroyed. The forwardest and most luxuriant hop-vines, are in general the most disposed to be attacked by insects of this sort. Their removal chiefly depends upon a change taking place in the wind more to the south, and the setting in of more mild, warm, and temperate weather.' It has been found that the otler moth, by depositing its eggs upon the roots of the plants, renders them liable to be attacked by the larva, and the healthy growth of the hops to be thereby greatly impaired, the crops being of course much injured in their produce. Stirring the earth well about the roots of the plants may probably sometimes be serviceable in cases of this kind.

' The honey-dew mostly occurs after the crops have been attacked by some of these kinds of insects, and when the weather is close, moist, and foggy. In these cases, a sweet clammy substance is produced upon the leaves of the plants, which has the taste of honey, and they have at first a shining appearance, but afterwards soon become black. It is a disease that mostly happens in the more forward crops; and the chief dependence of the planter for its removal, according to Bannister, is that of heavy thunder showers taking place; as by this means, when the destruction of the hops has not proceeded too far, they are often much restored, the insects that devour the leaves and vines being greatly destroyed, the growth of fresh shoots promoted, and a favorable bloom brought on the plants. The fen, mould, or mildew, is a disease to which the hop-erop is exposed at a later period of its growth, and which chiefly attacks the part where the hop is attached to the stem. It is said that its production is greatly promoted by moist damp weather, and a low situation; those hop-crops, that grow in low, close, rich, grounds, being the most liable to be attacked by it: and it is found to soon spread itself over the whole crop, after it has once seized upon any part of it. The nature of this vegetable disease has not been yet sufficiently investigated; it has been suggested by Darwin and Willdenow to be a plant of the fungus kind, that is capable of growing without light or change of air, attaching itself to plants already in a morbid condition, and by its roots penetrating their vessels. And, on this supposi-tion, the best remedy is believed to be that of thinning the plants, in order to afford a more free circulation of air, and admit the light more 2 A 2

extensively; by which the vigor of the hop-plants may be restored, and the disease be of course removed. In this view, it is probable, by planting the hills more thinly, and making them at greater distances from each other, the disease might in some measure be prevented from taking place.

' Diseases termed blights are frequently met with in hop-crops, at different periods of the growth of the plants, but mostly in the more early stages of their rising from the hills, while the nights are cold and frosty in the spring months, and the days have much sun and heat; by which the living powers of the plants are greatly exhausted in the day-time by the stimulus of heat, and of course much injured, or wholly destroyed in the nights, from being exposed to a freezing air, which is incapable of exciting the actions which are necessary for the preservation of vegetable life. As the presence of this disease is supposed to be greatly connected with the prevalence of winds from the northern or easterly quarters, there is often a flea produced of a similar kind to that which attacks the shoots in their early growth. It is highly injurious, by preying upon the nutriment of the blossoms, and thereby diminishing their weight and changing them to a brown color, which is very prejudicial in their sale at the market. The fire-blast is also a disease that hop-crops are exposed to, in the later periods of their growth, and generally supposed to proceed from the particular state of the air or weather. It has been conjectured to be the effect of lightning, as it takes place, for the most part, at those seasons when it is the most prevalent, and in a very sudden manner: and besides, the most forward and most luxuriant vines are the most subject to be affected. It has been suggested, that in exposures that are particularly liable to have the crops thus injured, it may be advisable to plant thinner, to keep back the growth of the plants as much as possible, by extirpating all the most forward shoots, and to employ a less proportion of the earthy compost in their culture.

The hop-grower has the annoyance of being placed under the excise laws. Every grower of hops in Britain being legally obliged to give notice to the excise, on or before the first day of September, of the number of acres he has in cultivation; the situation and number of his oasts; the place or places of bagging, which, with the store-rooms, or warehouses, in which the packages are intended to be lodged, are entered by the revenue officer. No hops can be removed from the rooms thus entered before they have been weighed and marked by a revenue officer; who marks, or ought to mark, not only the weight, but the name and residence of the grower, upon cach package. There is a penalty on importing or using corrupt hops, imposed by stat. 1 Jac. 1. c. 18. No bitter is to be used in brewing but hops, by 9 Ann. e. 12, see. 24; and no hops are to be imported into Ireland from other parts but Great Britain, 5 Geo. 11. c. 9. Landing foreign hops, before the duty is paid, incurs the penalty of having the hops burnt, and ship forfeited, 7 Geo. H. c. 19. There is also a penalty on sophisticating hops, 7 Geo. II. c. 19 sec. 2; on cutting hop-binds, 10 Geo. II. c. 32, sec. 4; and by 6 Geo. 11. c. 37, sec. 6, this is made a felony,

without benefit of clergy. For the duty upon hops see stats. 39 & 40 Geo. III. c. 81; and 48 Geo. III. c. 134 for preventing frauds in the trade of hops; these acts regulate the mode of packing, bagging, and weighing them.

HOPE, n. s. & v. n.]
HOPE'TUL, adj.
HOPE'FULLY, adv.
HOPE'FULNESS, n. s.
Hope'LESS, adj.
HO'PER, n. s.
HO'PINGLY adv

356

Sax bopa; Dut. hope; Germ. hoffen; Gr. $\sigma \pi \epsilon v \omega$. Expectation of future good attended with pleasure; confidence in a future event, or the future conduct of any

person: that which gives hope; the object of hope: to live in expectation or confidence as to the future: hopeful, likely to gratify desire, obtain success, or answer expectation; full of hope: this sense is almost confined to Scotland, though found in good writers: hopeless, without hope; desperate: hoper, one that has pleasing expectatations: hopingly, with encouragement: hope, a sloping plain between the ridges of mountains.

There is hope of a tree, if cut down, that it will sprout out again. Job xiv. 7.

He shall strengthen your heart, all ye that hope in the Lord. Psalm xxxi. 24.

It is good being put to death by men, to look for hope from God, to be raised up again by them.

2 Mac. vii. 14.

Blessed is he who is not fallen from his hope in the Lord. Ecclus. xiv. 2.

If hope me faile, than alle am I

Ungracious and unworthy;

In hope I well comforted be;

For love, whan he betaught hire me,

Sayed that hope where so I go

Should aie be relese to my wo.

Chaucer. Romaunt of the Rose.

With him went Hope in rancke, a handsome mayd, Of chearefull looke and lovely to behold ;

In silken samite she was light arayd,

And her fayre locks were woven up in gold.

Spenser. Faerie Queene.

Are they indifferent, being used as signs of immoderate and hopeless lamentation for the dead? Hooker.

Men of their own natural inclination *hopeful* and strongly conceited, whatsoever they took in hand. *Id*.

Alas! I am a woman, friendless, hopeless.

Shakspeare. Thy mother felt more than a mother's pain,

And yet brought forth less than a mother's hope; To wit, an indigested deformed lump. Id.

The sun shines hot; and, if we use delay,

Cold-biting winter mars our hoped for hay. Id. He will advance thee :

I know his noble nature, not to let

Thy hopeful service perish. Id.

When in heaven she shall his essence see,

This is her sovcreign good, and perfect bliss; Her longing, wishings, hopes, all finished be;

Her joys are full, her motions rest in this. Davies. Sweet hope ! kind cheat ! fair fallacy ! by thee

We are not where or what we be; But what and where we would be; thus art thou

Our absent presence, and our future now. Crashaw.

One sign of despair is the peremptory contempt of the condition which is the ground of *hope*; the going on not only in terrours and amazement of conscience, but also holdly, *hopingly*, and confidently in wilful habits of sin. Hammond.

Hope ! of all ills that men ondure

The only cheap and universal cure !

Thou captive's freedom, and thou sick man's health ! Thou loser's victory, and thou beggar's wealth !

Cowley.

Faith is opposed to infidelity, and hope to despair. Taylor.

Hope for good success, according to the efficacy of the causes and the instrument, and let the husbandman hope for a good harvest. Id.

What to the old can greater pleasure be, Than hopeful and ingenious youth to see ?

Denham.

They were ready to renew the war, and to prosecute it hopefully, to the reduction or suppression of the Irish. Clarendon.

He watches with greedy hope to find

His wish, and best advantage, us asunder; Hopeless to circumvent us joined, where each

To other, speedy aid might lend at need.

Milton.

He sought them both, but wished his hap might find

Eve separate : he wished, but not with hope Of what so seldom chanced : when to his wish, Beyond his hope, Eve separate he spies. Id.

But physick yet could never reach

The maladies thou me dost teach;

Whom first the cramp of hope does tear,

And then the palsy shakes of fear. Marvell. From your promising and generous endeavours we may hopefully expect a considerable enlargement of

the history of nature. Glanville. I was hopeful the success of your first attempts

would encourage you to make trial also of more nice and difficult experiments. Boyle.

To encourage our hopes, it gives us the highest assurance of most lasting happiness, in case of obedience. Tillotson.

The Trojan dames

To Pallas' fane in long procession go, In hopes to reconcile their heavenly foe.

Dru

Dryden.

Hopeless of ransom, and condemned to lie In durance, doomed a lingcring death to die. Id. She was his care, his *hope*, and his delight,

Most in his thought, and ever in his sight. Id.

Who knows what adverse fortune may befall ! Arm well your mind, hope little, and fear all. Id.

So stands the Thracian herdsman with his spear Full in the gap, and hopes the hunted hear. Id.

Why not comfort myself with the *hope* of what may be, as torment myself with the fear on't?

L'Estrange. Hope is that pleasure in the mind which every one finds in himself, upon the thought of a profitable future enjoyment of a thing, which is apt to delight

him. Locke. May sorrow shame and sickness overtake her, And all her beauties like my hopes he blasted.

Rowe's Royal Convert.

They take up a book in their declining years, and grow very hopeful scholars by that time they are threescore. Addison.

Set down beforehand certain signatures of hepefulness, or characters, whereby may be timely described what the child will prove in probability. Wotton.

He left all his female kindred either matched with peers of the realm actually, or *hopefully* with earls' sons and heirs. Id.

Whatever ills the friendless orphan bears,

Bercaved of parents in his infant years,

Still must the wronged Telemachus sustain,

If hopeful of your aid, he hopes in vain. Pope. With looks unmoved, he hopes the sealy breed,

And eyes the dancing cork and bending reed. Id. I except all hopers, who turn the scale, because the strong expectation of a good certain salary will outweigh the loss by had rents. Swift.

Hope, of all passions, most befriends us here; Passions of prouder name befriend us less. Joy has her tears; and transport has her death; Hope like a cordial, innocent though strong, Man's heart at once inspirits and screnes.

Young's Night Thoughts.

But to the generous still improving mind That gives the hopeless heart to sing for joy, Diffusing kind beneficence around Boastless as now descends the silent dew. Thomson's Seasons.

The wretch condemned with life to part, Still still on *hope* relies

And every pang that rends the heart Bids expectation rise.

On the verge,

From side to side, beneath the glittering mern, An Iris sits, amidst the infernal surge, Like Hope upon a death-bed ; and unworn Its steady uyes, while all around is torn By the distracted waters, hears serene Its brilliant hues with all their beams unshorn; Resembling, 'mid the torture of the scene, Love watching Madness with unalterable micn.

Byron. Childe Harold.

Goldsmith.

HOPE, in ethics, is the desire of some good, attended with a belief of the possibility, at least, of obtaining it; and enlivened with joy, greater or less, according to the greater or less probability of our possessing the object of our hope. Alexander, preparing for his Asian expedition, distributed his hereditary dominions among his friends; allotting to some villages, to others boroughs, to others cities; and, being asked what he had reserved for himself, replied, Hope.

HOPE (Dr. John), professor of botany in the university of Edinburgh, was born in Edinburgh on the 10th of May 1725. After finishing the usual course of education, he studied medicine at the university of Edinburgh. Having finished his academical education, he visited other medical schools, and upon his return obtained the degree of M. D. from the university of Glasgow in 1750. A few months after he was admitted a member of the royal college of physicians in Edinburgh, and entered upon the practice of medicine in that city. In 1761 Dr. Hope, by a commission from his majesty, was appointed king's botanist for Scotland, and su-perintendant of the royal garden at Edinburgh; and a few weeks after was elected, by the town council of Edinburgh, successor to Dr. Alston in the professorships of botany and materia me-In 1777 he was nominated regius prodica. fessor of medicine and botany in the university, and had the offices of king's botanist and superintendant of the royal garden conferred upon him for life, which till that time had been granted during pleasure only. Dr. Hope married the daughter of Dr. Stevenson, an eminent physician in Edinburgh; by whom he had four sons and one daughter. He died in November 1786. He was a member not only of the Royal Society of London, but also of several foreign societies; and at the time of his death he held the distinguished office of president of the royal college of physicians.

HOPE LAND, an island of the South Pacific Ocean, discovered in 1772 by Mr. Marson. It is intersected by mountains, rising above each other in a triple range, which are covered with snow, and so high as to be visible at the distance of twelve leagues. It is not far from Ceram Island, in long. 32° 11' E., and lat. 46° 45' N.

HOPEA, in botany, a genus of the polyandria order, and polyadelphia class of plants: CAL. quinquefid, superior: cor. pentapetalous; the stamina are many, and coalited into five pencils; there is one style; the fruit is a plum, with a trilocular kernel. There is only one species, viz. a native of Carolina.

HOPE, GOOD, CAPE OF. See GOOD HOPE. HOPKINS (Ezekiel), hishop of Derry in Ireland, was the son of a clergyman in Devonshire; and was for some time chorister of Magdalen College, Oxford, and usher of the adjoining school. He was afterwards a presbyterian minister, and was extolled as an excellent preacher. Lord Roberts, happening to hear him preach, was so pleased with his discourse and his manner, that he retained him as his chaplain, when he was sent as lord lieutenant into Ireland, and preferred him to the deanery of Raphoe; and, on his being recalled, so strongly recommended him to his successor that he was soon preferred to the bishopric of Raphoe, whence he was translated to Derry. During the war under the ear! of Tyrconnel, at the revolution, he withdrew into England; and was chosen minister of St. Mary, Aldermanbury, in London, where he died in 1690. His Sermons, his Exposition of the ten Commandments, and that of the Lord's prayer, are much esteemed. His works were printed together, folio, in 1710.

HOPLITÆ, or HOPLITES, from $\delta \pi \lambda_0 \nu$, armour, in antiquity, were such of the candidates at the Olympic and other sacred games as ran races in armour. One of the finest pieces of the famous Parrhasius was a painting which represented two hoplites; the one running, in a violent perspiration, the other laying his arms down, as quite spent and out of breath.

HOPLITODROMOS, from δπλον, armour, and $\delta_{\rho\epsilon\mu\omega}$, I run, in the ancient gymnastic sports, a term applied to such persons as went through those toilsome and robust exercises in complete almour; by which the exercise became much more violent, and the wearing of armour in the time of battle much more easy.

HOPLOMACIII, Όπλομαχοι, of όπλον, and $\mu \alpha \chi \circ \mu \alpha i$, I fight, in antiquity, a species of gladiators who fought in armour, either completely armed from head to foot, or only with a casque and cuirass.

HOR, a mountain, or mountainous tract of Arabia Petræa, situated in that circuit which the Israelites took to the south and south-east of Edom in their way to the borders of Moab. Aaron died on it. It was also called Seir.

HORAE, 'Qoat, the Hours, in ancient mythology, were esteemed goddesses, the daughters of Jupiter and Themis; at first only three in number, Eunomia, Dice, and Irene; to whom were afterwards added two more, Carpo and Thallote. Homer makes them the door-keepers of heaven. Ovid allots them the employment of harnessing the sun's horses;

Jungere equos Titan velocibus imperat Horis ;

358

and speaks of them as standing at equal distances about the throne of Sol;

----- et positæ spatiis æqualibus, Horæ.

The poets represent them as dressed in fine colored or embroidered robes, and gliding on with a quick and easy motion. They presided over the seasons, and were worshipped at Athens.

HORÆA, in antiquity, solemn sacrifices, consisting of fruits, &c., offered in spring, sum-mer, autumn, and winter; that heaven might grant mild and temperate weather. These, according to Meursius, were offered to the goddesses called Horæ.

HORAL, adj. ; Fr. horaire; Lat. hora. Re-HORARY, adj. Slating to the hour; continuing for an hour. See Hour.

I'll draw a figure that shall tell you What you perhaps forgot befell you, By way of horary inspection,

Which some account our worst erection.

Hudibras.

When, from a basket of summer-fruit, God by Amos foretold the destruction of his people, thereby was declared the propinquity of their desolation, and that their tranquillity was of no longer duration than those horary or soon decaying fruits of summer.

Browne's Vulgar Errovrs.

In his answer to an horary question, as what hour of the night to set a fox-trap, he has discussed, under the character of Reynard, the manner of surprising all sharpers. Tatler.

Howe'er reduced and plain, The watch would still a watch remain ; But, if the horal orbit ceases, The whole stands still, or breaks to pieces.

Prior.

HORAPOLLO, or HORUS APOLLO, a grammarian of Panaplus in Egypt, according to Suidas, who first taught at Alexandria, and then at Constantinople under Theodosius. There are extant, under his name, two books on the hieroglyphics of the Egyptians; which Aldus first published in Greek in 1505, in folio; and they have often been published since, with a Latin version and notes. It is not certain, however, that the grammarian of Alexandria was the author of these books; they being rather thought to belong to another Horapollo of more ancient date : on which head, see Fabricius's Bibliotheca Græca.

HORATH, three Roman brothers, who, in the reign of Tullus Hostilius, fought against the three Curiatii, who belonged to the army of the Albans. The two armies being equal, three brothers on each side were chosen to decide the contest of superiority. Two of the Horatii were first killed; but the third, by his address, successively slew the three Curiatii, and by this victory rendered the city of Alba subject to the Romans. See Rome.

HORATIUS, surnamed Cocles from his losing an eye in combat, was nephew to the consul Horatius Pulvillus, and descended from the surviving brother who killed the Curiatii. Porsenna, laying siege to Rome, drove the Romans from Janiculum; and pursued them to the wooden bridge over the Tiber which joined the city to Janiculum. Largius, Herminius, and Horatius Cocles, sustained the shock of the

enemy on the bridge, and prevented their entering the city with the Romans; but, Largius and Herminius having passed the bridge, Horatius Cocles was left alone, and repulsed the enemy till the bridge was broken under him : he then threw himself armed into the Tyber, swam across the river, and entered Rome in triumph.

HORATIUS FLACCUS (Quintus), a celebrated lyric Roman poet, was the grandson of a freed man, and was born at Venusium, 64 B. C. He had the best masters in Rome, after which he completed his education at Athens. Having taken up arms, he embraced the party of Brutus and Cassius, but threw away his shield at the battle of Philippi. Some time after he gave himself up entirely to the study of poetry. His talents soon made him known to Augustus and Mecænas, who had a particular esteem for him, and loaded him with favors. Horace also contracted a strict friendship with Agrippa, Pollio, Virgil, and all the other great men of his time. He lived without ambition, and led a tranquil and agreeable life with his friends, but was subject to a defluxion in his eyes. He died at the age of fifty-seven. There are still extant his Odes, Epistles, Satires, and Art of Poetry; of which there have been a great number of edi-The best are those of the Louvre, in tions. 1642, folio; of Paris, 1691, 4to.; of Cambridge, 1699; that with Bentley's emendations, printed at Cambridge in 1711; Fowlis' edition, Glasgow, 1744; and, we may add, the edition printed at St. Andrews, in 1796, under the care of the learned Dr. Hunter, who, in correcting it, compared the text with those of above forty other copies.

HORDE, n. s. A clan; a migratory crew of people. It is applied only to the Tartars.

Of lost mankind, in polished slavery sunk, Drove martial horde on horde with dreadful sweep, And gave the vanquished world another form.

Thomson.

- Nor would the hostile horde Of many-nationed spoilers from the Po Quaff blood and water. Byron. Childe Harold.

HORDEUM, barley, in botany, a genus of the digynia order, and triandria class of plants; natural order fourth, gramina : CAL lateral, bi-valved, uniflorous, and triple. The involucrum consists of six leaves, and contains three flowers. Common receptacle toothed and excavated. There are ten species; only one of which, viz :-

1. H. murinum, or wall barley grass, is a native of Britain.

2. II. vulgare, or common barley, cultivated in our fields. Its native place is said to be Sicily. For the culture &c. of common barley, SEE RURAL ECONOMY.

HORDICALIA, or HORDICIDIA, in antiquity, a religious feast held among the Romans on the 15th of April, wherein they sacrificed cattle big with young. A great part of the offerrings were made in the temple of Jupiter. They consisted of thirty cows big with calf, and were offered to Tellus, the earth. The calves taken out of their bellies were burnt at first by the pontifices, afterwards by the eldest vestal virgin.

HOREB, or OREB, a mountain of Arabia Petræa, contiguous to and on the south side of mount Sinai; the scene of many miraculous appearances.

HOREHOUND. See MARRUBIUM.

3.59

HOREHOUND, BASE. See STACHYS.

HOREHOUND, BASTARD. See SIDERITIS.

HOREHOUND, WATER. See Lycopus.

HORESTI, an ancient nation of North Britain, beyond Solway Frith, mentioned by Tacitus. Their country, according to Camden, is now called Eskdale.

HORITES, an ancient people, who at first dwelt in the mountains of Seir beyond Jordan (Gen. xiv. 6.) They had princes, and were powerful, even before Esau made a conquest of their country. (Gen. xxxvi. 20-30.) The Horites, the descendants of Seir, and the Edomites, seem afterwards to have been confounded, and to have composed but one people. (Deut. ii. 2, xxxiii. 2, and Judg. v. 4.) They dwelt in Arabia Petræa and Arabia Deserta, to the south-east of the promised land. We find the Hebrew word mini Chorim, which in the book of Genesis is translated Horites, used in an appellative sense in several other passages of Scripture, and to signify nobles, or great and powerful men (1 Kings xxi. 8, 11, and Neh. ii. 16, iv. 14, v. 7, vi. 17, vii. 5, xii. 17, Eccl. x. 17, Isa. xxxiv. 12, Jer. xxvii. 20, xxxix. 6); and it has been supposed, that the Greeks might derive hence their heroes, in like manner as they derived Anax, a king, from the sons of Anak, the famous giant.

HORI'ZON, n. s.

HORIZON'TAL, adj. HORIZON'TALLY, adv.) view, distinguished into sensible and real: the sensible horizon is the circular line which limits the view; the real is that which would bound it, if it could take in the hemisphere. Near the horizon; parallel to the horizon; on a level.

Gr. oor Zwv. The line

Id.

When the morning sun shall raise his car Above the border of this horizon,

We'll forward towards Warwick and his mates. Shakspeare.

She began to cast with herself from what coast this blazing star should first appear, and at what time it Bacon. must be upon the horizon of Ireland.

As when the sun, new risen,

Looks through the horizontal misty air,

Shorn of his beams; or from behind the moon,

In dim eclipse, disastrous twilight sheds On half the nations.

Milton. In his East the glorious lamp was seen,

Regent of day ; and all the horizon round

Invested with bright rays.

As it will not sink into the bottom, so will it neither float above, like lighter hodies; but, being near in weight, lie superficially, or almost horizontally unto it. Browne.

An obelisk crected, and golden figures placed horizontal about it, was brought out of Egypt by Augus-Id.

The morning lark, the messenger of day,

Saluted in her song the morning gray ;

And soon the sun arose with beams so bright,

That all the horizon laughed to see the joyous sight. Dryden.

When the sea is worked up in a tempest, so that the horizon on every side is nothing but foaming billows and floating mountains, it is impossible to describe the agreeable horrour that rises from such a Addison prospect.

The problem is reduced to this: what perpendicular height is necessary to place several ranks of rowers in a plane inclined to a horizontal line in a given angle? Arbuthnot on Coins. Fields, woods, and streams,

Each towering hill, each humble vale below, Shall hear my cheering voice; my hounds shall wake The lazy morn, and glad the *horizon* round.

Somerville's Chase.

Hail to the joyous day! with purple clouds The whole horizon glows. Thomson.

She who was named Eternal, and arrayed Her warriors but to conquer—she who veiled Earth with her haughty shadow, and displayed, Until the o'er-canopied horizon failed, Her rushing wings—Oh she was Almighty hailed! Byron. Childe Harold.

The HORIZON, in geography and astronomy, is a great circle of the sphere, dividing the world into two parts or hemispheres; the one upper and visible, the other lower and hid. The word literally signifies bounding the sight; being formed of ' $o\rho i \zeta \omega$, I bound. See ASTRONOMY and GEOGRAPHY.

HORIZON, RATIONAL, TRUE, or ASTRONOMI-CAL, also called simply and absolutely the horizon, is a great circle, whose plane passes through the centre of the earth, and whose poles are the zenith and nadir.

HORIZON, SENSIBLE, VISIBLE, OF APPARENT, is a less circle of the sphere, which divides the visible part of the sphere from the invisible. Its poles, too, are the zenith and nadir: and consequently the sensible horizon is parallel to the rational; and it is cut at right angles, and into two equal parts, by the verticals. The sensible horizon is divided into eastern and western.

A HORIZONTAL DIAL is that drawn on a parallel to the horizon: having its gnomon or style elevated according to the altitude of the pole of the place it is designed for. Horizontal dials are, of all others, the most simple and easy.

HORIZONTAL LINE, in perspective, is a right line drawn through the principal point, parallel to the horizon: or it is the intersection of the horizontal and perspective planes. See PERSPEC-TIVE.

HORIZONTAL PLANE is that which is parallel to the horizon of the place, or nothing inclined thereto. The business of levelling is to find whether two points be in the horizontal plane; or how much is the deviation. See LE-VELLING.

HORMINUM, clary, in botany, a genus of the gymnospermia order, and didynamia class of plants: natural order forty-second, verticillatæ; CAL. campanulated, with four segments nearly equal; the fourth larger, and emarginated : con. upper lip concave. There are several species; the most remarkable of which is the

II. verbenaceum, or common wild clary. It grows naturally on sandy and gravelly ground in many parts of Britain. It has sometimes been called oculus Christi, from the supposed virtues of its seeds in clearing the sight, which it does by its viscous covering; for when any thing happens to fall into the eye, if one of the seeds is put in at one corner, and the eyelid kept close over it, moving the seed gently along the eye, whatever happens to be there will stick to it, and so be brought out.

HORN, n. s. HORN'-BEAK, n. s. HORN'-BEAM, n. s. HORN'EBEAM, n. s. HORN'ED, adj. HORN'ER, n. s. HORN'ER, n. s. HORN'-FOOT, n. s. HORN'-PIPE, n. s. HORN'-FONE, n. s. HORN'-STONE, n. s. HORN'-STONE, n. s. HORN'-STONE, n. s. HORN'-STONE, n. s. Saxon, bonn; Gothic, haurn; Belg. horn, hoorn. The hard bodies which grow on the heads of some granninivorous quadrupeds, and serve them for weapons. An instrument of wind music: the extremity of the moon, when waxing or waning; the feelers of a snail: this gives rise to the proverb, to 'pull in your horns;' to repress one's

ardor: a drinking-cup: antler of a cuckold: figuratively horn-mad, mad as a cuckold. Hornbeak, horn-fish, a kind of fish. Horn-beam, a species of tree. Horn-book, the first book used by children, and covered with horn. Horner, one that works in, or sells horn. Hornet, Sax. *hypnetice*, from its horns: a very large strong stinging fly, which makes its nest in hollow trees. Horn-foot, hoofed. Horn-owl, a species of owl with horns. Hornpipe, a country dance. Hornstone, a kind of blue stone. Horn-work, a kind of angular fortification: horned, horny, made of, or resembling horn.

He shewed him, or they went to soupere, Forestes, parkes, ful of wilde dere ;---

Ther saw he hartes with hir hornes hie

The gretest that were ever seen with eie.

Chaucer. The Frankeleines Tale. Janus sit by the fire with double berd

And drinketh, of his bugle horn, the wine. Id. A lusty tabrere,

That to thee many a hornpipe played,

Whereto they dauncen each one with his maid.

Spenser.

The squire 'gan nigher to approach,

And wind his horn under the castle wall,

That with the noise it shook as it would fall.

Id. Faerie Queene.

Id.

As when two rams, stirred with ambitious pride, Fight for the rule of the rich fleeced flock,

Their horned fronts so herce on either side Do meet, that, with the terrour of the shock,

Astonished both stand senseless as a block. Id. There's a post come from my master, with his horn

full of good news. Shakspeare.

I am glad he went not in himself : if he had, he would have been horn-mad. Id.

He teaches boys the hornbook.

Love's feeling is more soft and sensible,

Than are the tender horns of cockled snails. Id. Aufidius,

Hearing of our Marcius's banishment,

Thrust forth his horns again into the world,

Which were inshelled when Marcius stood for Rome, And durst not once peep out. Id.

If I have horns to make one mad,

Let the proverb go with me, I'll be horn-mad. Id.

There many a hornpipe he tuned to his Phyllis. Raleigh.

No beast that hath horns hath upper teeth. Bacon.

Let all the quicksilver i' the mine Run to the feet veins, and refine Your firkhum jerkhum to a dance, Shall fetch the fiddlers out of France, To wonder at the hornpipes here Of Nottingham and Derbyshire. Ben Jonson.

Yes I have brought (to help our vows) Horned poppy, cypress boughs. Id. Mad frantick men, that did not inly quake ! With hornfoot horses, and brass wheels, Jove's storms to emulate. Hakewill on Providence.

Thither all the horned host resorts, To graze the ranker mead. Denham.

He thought he by the brook of Cherith stood, And saw the ravens with their horny beaks Food to Elijah bringing even and morn. Milton.

Retiring from the popular noise I seek This unfrequented place to find some ease, Ease to the body some, none to the mind, From restless thoughts, that like a deadly swarm Of hornets armed, no sooner found alone, But rush upon me thronging, and present Time past, what once I was, and what am now. Id. Samson Agonistes.

Merchants, venturing through the main, Slight pyrates, rocks, and horns for gain.

Hudibras.

The goddess to her crooked horn Adds all her breath : the rocks and woods around, And mountains, tremble at the infernal sound. Dryden.

Fair Ascanius, and his youthful train, With *horns* and hounds a hunting match ordain. Id.

Tyrrheus, the foster-father of the beast, Then elenched a hatchet in his horny fist. Id. She hlessed the bed, such fruitfulness conveyed, That ere ten moons had sharpened either horn,

fo crown their bliss, a lovely bey was born. Id. Thou king of horned floods, whose plenteous urn

Suffices fatness to the fruitful corn. Id. Silence, in times of suffering, is the best;

'Tis dangerous to disturb a hornet's nest. Id.

Nothing has been considered of this kind out of the ordinary road of the *hornbook* and primer. Locke. The *horny* or pellucid coat of the eye doth not lie

in the same superficies with the white of the eye, but risch up above its convexity, and is of an hyperbolical figure. Ray on the Creation.

Hornets do mischief to trees by breeding in them. Mortimer.

The skin of a bull's forehead is the part of the hide made use of by horners, whereupon they shave their horns. Grew.

Florinda danced the Derbyshire hornpipe in the presence of several friends. Tatler.

Bending the bull's tough neck with pain,

That tosses back his horns in vain. Addison. The pineal gland was encompassed with a kind of horny substance. Id.

To master John the English maid

A hornbook gives of gingerbread ;

And, that the child may learn the better,

As he can name, he cats the letter. Prior. As the serum of the blood is resolvable by a small heat, a greater heat coagulates it so as to turn it horny, like parchment; but when it is thoroughly putified in will be here more than a start of the second

trified, it will no longer concrete. Arbuthnot. All that process is no more surprising than the eruption of horms in some brutes, or of teeth and beard in men at certain periods of age. Bentley.

The moon

Wears a wan circle round her blunted horns. Thomson.

Unhappy confiding in the length

Of horny beak, or talons crooked strength, Who durst abide his rage; the blade descends, And from the panting trunk the pioion rends. Beattic. This moon, which rose last night round as my shield, Had not yet filled her *horn*, when by her light A band of fierce barbarians from the hills

Rushed like a torrent down upon the vale,

Sweeping our flocks and herds. Home's Douglas. 1'll call him

Who bears the golden *horn*, and bears such bright And blooming aspect, Huon; for he looks Like to the lovely boy lost in the forest And never found till now.

Byron. Deformed Transformed.

HORN, in physiology, is of the same nature as the gelatinous matter of animals, and is only that matter charged with a less quantity of water, and a larger quantity of earth, and sufficiently condensed to have a firm and solid consistence. By digesting horn with water, in Papin's digester, it may be entirely converted into jelly. Horn is a perfectly animalised matter, and furnishes in distillation the same principles as all animal matters; that is, at first a pure phleghm, with a degree of heat not exceeding that of boiling water; then a volatile alkaline spirit, which becomes more and more penetrating and strong; a fetid, light, and thin oil; a concrete volatile salt, which forms ramincations upon the sides of the receiver; much air; fetid oil, which becomes more and more black and thick; and, lastly, it leaves in the retort a considerable quantity of almost incombustible coal, from which, after its incineration, scarcely any fixed alkali can be obtained. Animal oil, and particularly that which is drawn first in the distillation of horn, is susceptible of acquiring great thinness and volatility by repeated distillations. The horns of stags, contain a larger quantity of the same kind of earth which is in bones; hence they seem to possess an intermediate nature betwixt horns and bones. Horns make a considerable article in the arts and manufactures. Bullocks' horns, softened by the fire, serve to make lanterns, combs, knives, ink-horns, tobacco-boxes, &c.

In the staining or dyeing of horn the black dye is given by steeping brass in aqua-fortis till it be returned green: with this the horn is washed once or twice, and then put into a warmed decoction of logwood and water. Green is begun by boiling it, &c., in alum water; then with verdigris, am moniac, and white wine vinegar; keeping it hot therein till sufficiently green. Red is begun by boiling it in alum water, and finished by decoction in a liquor compounded of quicklime steeped in rain water, strained, and to every pint an ounce of Brasil-wood added. In this decoction the bone, &c., is to be boiled till sufficiently red.

In order to imitate tortoise-shell, the horn to be dyed must be first pressed into proper plates, scales, or other flat form; then take of quicklime two parts, and of litharge one part: temper them together to the consistence of a soft paste with soap lie. Put this paste over all the parts of the horn, except such as are proper to be left transparent, in order to give it a nearer resemblance of the tortoise shell. The horn must remain in this manner covered with the paste till it be thoroughly dry; when, the paste being brushed off, the horn will be found partly opaque and partly transparent, in the manner of tortoiseshell : and when put over a foil, of the kind of 362

Laten called assidue, will be scarcely distinguishable from it. It requires some degree of fancy and judgment to dispose of the paste in such a manner as to form a variety of transparent parts of different magnitudes and figures; and it will be an improvement to add semitransparent parts; which may be done by mixing whiting with some of the paste to weaken its operation in particular places; by which spots of a reddishbrown will be produced, which, if properly interspersed, especially on the edges of the dark parts, will greatly increase both the beauty of the work, and its similitude with the real tortoiseshell.

HORN, in geography. See HOORN.

HORN, a musical instrument of the wind kind, is chiefly used in hunting, to animate and bring together the dogs and the hunters. The term was anciently, wind a horn, all horns being in those times of a winding shape; but, since straight horns were made, we say blow a horn, and sometimes sound a horn. See Music. The Hebrews made use of horns formed of ram's horns to proclaim the Jubilee.

HORN, FRENCH, is a wreathed or contorted trumpet. It labors under the same defects as the trumpet itself; but these have of late been so palliated as to require no particular selection of keys for this instrument.

HORN, an island on the coast of Florida, between Ship and Massacre Islands. It is nearly seventeen miles long, and about half a mile wide, having many trees on the middle of it.

HORN, CAPE, is the most southern extremity of South America, and the south point of a group of islands, of unequal extent, lying before Nassau Bay, known by the name of the Hermit Islands. North-west of the cape are two peaked rocks, like sugar-loaves. Some other straggling rocks lie west, and one south of it; but they are all near the shore. It is cold, lofty, and covered with wood. It was discovered by Jacob le Maire, a Dutchman, in 1616; and Anson and others have encountered, in passing this cape, the most dreadful tempests; but of late years it has been the common course of all vessels, being found much preferable to the tedious passage through the straits of Magellan. The shore is inhabited by savages, of whom little is known. Long. 67° 46' W., lat. 55° 58' S.

HORN, FALSE, CAPE, a cape of South America, nine miles north-east of Cape Horn.

HORNBACH, a town of Germany in the late duchy of Deux Ponts, now annexed to the French republic, and included in the department of Savre and Moselle. It is seated on the river Horn, with a Benedictine abbey, five miles south-east of Deux Ponts. Long. 7° 36' E., lat. 49° 10' N.

HORN-BEAM, in hotany. See CARPINUS.

HORNBERG, an ancient town of Germany, in the Black Forest, and duchy of Wirtemberg, with a fortress upon a mountain. It is seated on the river Gutlash, twenty-one miles northeast of Friburg. Long. 8° 27' E., lat. 48° 12' N.

HORN-BILL. See BUCEROS.

HORNBLEND is a black or green inducated bole of clay, consisting of scaly particles, which are distinguishable from those of mica, by being less shining, thicker, and rectangular. It is generally found amongst iron ores, and sometimes intermixed with nrica, forming a compact stone.

HORNCASTLE, a market town of Lincolnshire. It had a castle, from the architecture of which, and the coins sometimes dug up, it is thought to have been a station of the Romans. The town is well built and tolerably healthy. It is a signiory of thirteen lordships. It has a market on Saturday, and fairs in June and August. It is twenty miles east of Lincoln, and 136 north of London.

HORN-DISTEMPER, a disease incident to horned cattle, affecting the internal substance of the horn, commonly called the pith, which it insensibly wastes, and leaves the horn hollow. The pith is a spongy bone, the cells of which are filled with an unctuous matter. It is furnished with a great number of small blood-vessels, is overspread with a thin membrane, and appears to be united by sutures with the bones of the head. According to an account of this distemper published by Dr. Tufts in the Memoirs of the American Academy, vol. i., the spongy bone is sometimes partly, and sometimes entirely wasted. The horn loses its natural heat, and a degree of coldness is felt upon handling it. The distemper, however, is seldom suspected without a particular acquaintance with the other symptoms, which are a dulness in the countenance of the beast, a sluggishness in moving, a failure of appetite, an inclination to lie down, and, when accompanied with an inflammation of the brain, a giddmess and frequent tossing of the head. The limbs are sometimes affected with stiffness, as in a rheumatism; in cows the milk often fails, the udder is hard, and in almost all cases there is a sudden wasting of the flesh. As soon as the distemper is discovered, an opening into the diseased horn should be immediately made; which may be done with a gimlet of a moderate size, in such a part of the horn as is most favorable for the discharge. It is recommended as most prudent to bore at first two or three inches above the head. If it is found hollow, and the gimlet passes through to the opposite side, and no blood discharges from the aperture, it may be best to bore still lower, and as near the head as it shall be judged that the hollowness extends. This opening is affirmed to be a necessary measure, and often gives immediate relief. Care must be taken to keep it clear, as it is apt to be clogged by a thin fluid that gradually oozes out and fills up the passage. Some saw off the horn; but, according to the best information, it does not succeed better than boring. From the cases Dr. Tufts has seen, he is led to conclude that injections are in general unnecessary; that, when the distemper is early discovered, no more is required than a proper opening into the horn, keeping it sufficiently clear for the admission of fresh air, the removal of the compression, and the discharge of floating matter. But when the distemper has communicated its effects to the brain, so as to produce a high degree of inflammation, it is doubted whether any method of cure will succeed.

HORNE (George), D. D., bishop of Norwich, was born at Otham in Kent, in 1730. He was educated at Maidstone, and took his degrees of M. A. and D. D. at Oxford. In 1753 he entered into orders, and was soon distinguished as a preacher. In 1776 he was elected vice-chancellor; and, in 1781, bishop of Norwich. Having early adopted the principles of Hutchinson, he displayed his abilities in defending them. He wrote, 1. An impartial state of the case between Sir Isaac Newton and Mr. Hutchinson; 2. The Theology and Philosophy in Cicero's Somnium Scipionis explained, 8vo.; 3. Spicilegium Shuckfordianum, or A Nosegay for the Critics, 8vo.; 4. A View of Mr. Kennicott's Method of Correcting the Hebrew Text, 8vo.; 5. Considerations on the Life and Death of John the Baptist, 8vo., 1769; 6. A Commentary on the Psalms, 2 vols. 4to.; 7. A Letter to Adam Smith, LL.D., on the Life, Death, and Philosophy of David Hume, 12mo.; 8. Letters on Infidelity, 12mo. 9. A Letter to Dr. Priestley, 8vo.; 10. Sermons, 5 vols.; and several other works. He died at Bath in 1792; and was much esteemed for his learning and piety.

HORNECK (Dr. Anthony), a learned divine, born at Baccharach, in the Lower Palatinate, in 1641. He studied divinity under Dr. Spanheim at Heidelberg; afterwards completed his studies at Oxford, and became vicar of Allhallows in that city. In 1665 he became tutor to lord Torrington, son of the duke of Albemarle, who presented him to the rectory of Doulton in Devonshire, and a prebend in Exeter. He was afterwards chosen preacher of the Savoy. In 1693 he was collated to a prebend in Westminster, and to another m the cathedral of Wells. He published, 1. The Great Law of Consideration; 2. The Happy Ascetic; 3. Delight and Judgment; 4. The Fire of the Altar; 5. The Exercise of Prayer; 6. The Crucified Jesus; Several Sermons, and other works. He died in 1696, and was interred in Westminster Abbey, where a monument is erected to his memory.

HORNER (Francis), esq., M.P. and barristerat-law, was born at Edinburgh in the year 1778. He was educated at the high school, and finished his studies at the university of that place, where he formed an intimacy with lord Henry Petty, subsequently marquis of Lansdowne, Mr. Brougham, and the early conductors of the Edinburgh Review. He himself was one of its ablest writers. He first came into parliament in the year 1806. In 1810 he was chairman to the Bullion Committee, and the author of the then excellent report on that intricate subject. His application to business, however, so much impaired his constitution, that he was obliged to seek the climate of Italy, and died, greatly lamented, at Pisa, 8th February, 1817.

HORNET, in zoology. See VESPA.

HORN-FISH, OF GAR-FISH. See Esox.

HORNING, in Scots law, a writing issuing from the signet, in his majesty's name, at the instance of a creditor against his debtor, commanding him to pay or perform within a certain time, on pain of being declared rebel, and by a caption put in prison.

HORNIUS (George), professor of history at Leyden, was born in the Palatinate, and died at Leyden in 1670. He went mad at the latter

part of his life; which was supposed to be occasioned by the loss of 6000 florins he had entrusted with an alchymist at the Hague. His works are, 1. Historia Ecclesiastica, ad ann. 1666, which is esteemed; 2. De Originibus Americanis, 1652, 8vo.; 3. Geographia Vetus et Nova; 4. Orbis Politicus.

HORNPIPE, a common instrument of music in Wales, consisting of a wooden pipe, with holes at stated distances, and a horn at each end; the one to collect the wind blown into it by the mouth, and the other to carry off the sounds as modulated by the performer.

HORNPIPE is also the name of an English air, probably derived from the above instrument. The measure is triple time, with six crotchets in a bar; four beats with the hand down and two up.

HORNSEA, a town of Yorkshire, 188 miles from London. It is almost surrounded by a small arm of the sea; and the church, having a high steeple, is a noted sea-mark.

HORNSBY (Thomas), D. D., an English mathematician and astronomer, was born 1734, and became Savilian professor of astronomy, profesor of natural philosophy, lecturer on experimental philosophy, and keeper of the Rat-cliffe library, Oxford. He had taken the degrees of M.A. and D.D., and was a fellow of the Royal Society. He published the following papers in their Transactions :-- On the Parallax of the Sun, 1763; Observations on the Solar Eclipse, April 1st, 1764, at Oxford; Account of the Improvements to be made by Observations of the Transit of Venus, in 1769; Observations on the Transit of Venus, and Eclipse of the Sun, June 3d, 1769; The Quantity of the Sun's Parallax, as deduced from Observations of the Transit of Venus, on June 3d, 1769; Enquiry into the Quantity and Direction of the proper Motion of Arcturus ; with some Remarks on the Diminution of the Obliquity of the Ecliptic. Dr. Hornsby also distinguished himself as the editor of the Astronomical Observations of Dr. Bradley, at Greenwich, which were published in 2 vols. folio, 1798.

HOROG'RAPHY, n.s. Fr. horographie; Gr. $\omega \rho a$ and $\gamma \rho a \phi \omega$. An account of the hours.

HOR'OLOGE, n.s. Latin horologium;

Horol'ogy. **)** Greek $\omega \rho \alpha$ and $\lambda \epsilon \gamma \omega$. Any instrument that tells the hour: as a clock; a watch; an hour-glass.

He'll watch the horologe a double set,

If drink rock not his cradle Shukspeare. Before the days of Jerome there were horologies, that measured the hours not only by drops of water in glasses, called clepsydra, but also by sand in glasses, called clepsammia. Browne.

HOROLOGF, HOROLOGIUM, $\Omega \rho o \lambda o \gamma i o \nu$, of $\omega \rho a$, an hour, and $\lambda \epsilon \gamma \pi$, I read or speak, a common name among the ancient writers for any instrument or machine for measuring the hours; such are our clocks, watches, sun-dials, &c. Modern inventions, and gradual improvements, have given birth to some new terms that come properly under this head, and annexed new meanings to others totally different from what they had originally. All chronometers that announced the hour by striking on a bell were called clocks: thus, we read of pocket-clocks. In like manner, all clocks that did not strike the hour, were called watches or time-pieces. In Sir Isaac Newton's report to the house of commons, in 1713, relative to the longitude act, he states the difficulties of ascertaining the longitude by means of a watch : yet it is obvious, from several circumstances, that his remarks were to be understood of a timepiece regulated by a pendulum; for his objections are founded on the known properties of the pendulum, some of which differ essentially from the properties of the balance and spring. At this time, such machines for measuring time as are fixed in their place are called clocks, if they strike the hour: if they do not strike the hour, they are called time-pieces; and when constructed with more care, for a more accurate measure of time, they are called regulators. Mr. John Harrison first gave the name of timekeeper to his watch, for which he received £20,000.

HOROWETRY, n. s. Fr. horometric; Gr. $\omega_{\rho\alpha}$ and $\mu_{\epsilon\tau\rho\epsilon\omega}$. The art of measuring hours.

It is no easy wonder how the *horometry* of antiquity discovered not this artifice. Browne.

HOROSCOPE, n. s. Fr. horoscope; Greek $\omega_{\rho\rho\sigma\kappa\sigma\sigma\sigma\varsigma}$. The configuration of the planets at the hour of birth.

The Greek names this the horoscope ;

This governs life, and this marks out our parts, Our humours, manners, qualities and arts.

Creech.

A proportion of the horoscope unto the seventh house, or opposite signs every seventh year, oppresseth living creatures. Browne.

Him born beneath a boding horoscope,

His sire, the blear-eyed Vulcan of a shop,

From Mars his forge sent to Minerva's school.

Dryden.

How unlikely is it, that the many, almost numberless conjunctions of stars, which occur in the progress of a man's life, should not match and countervail that one horoscope or conjunction which is found at his birth. Drummond.

They understood the planets and the zodiack by instinct, and fell to drawing schemes of their own horoscopes in the same dust they sprung out of.

Bentley.

HOROSCOPE, from $\dot{\omega}\rho a$, an hour, and $\sigma \kappa \epsilon \pi \tau \sigma \rho a t$, I consider, in astrology, is the degree or point of the heavens rising above the eastern point of the horizon at any given time, when a prediction is to be made.

HOROSCOPE is also used for a scheme or figure of the twelve houses or twelve signs of the zodiac, wherein is marked the disposition of the heavens for any given time.

HORREA, in Roman antiquity, were public magazines of corn and salt meat, out of which the soldiers were furnished on their march in the military roads of the empire. Horrea was also the name which they gave to their granaries.

HOR'RENT, adi.
HORRIBLE, adj.
HOR'RIBLENESS, n. s.
Hor'RIBLY, adj.
Hor'RID, autj.
HOR'RIDNESS, n. s.
HORRIF'IC, adj.
HORRIS'ONOUS, adj,
HOR'ROR, n. s.

Fr. horreur; Lat. horreo, horror, horridus, horrificus, horrisonus. Words severally expressive of feelings which affect the senses more than the mind. Horrid and horrible, derivatives of horror, signify the extreme of those sensations, which, through the eye for the most part produce corresponding feelings. The order is thus : fearful ; dreadful; frightful; tremendous; terrible; terrific; horrible; horrid. Crabb says, 'shrieks may be frightful, thunder and lightning tremendous, the roaring of a lion terrible, the glare of his eye terrific, the actual spectacle of killing horrible or horrid.' Horrisonous, sounding dreadfully. Horrent, pointed outwards; bristled with points. Horror is extreme terror, mixed with detestation; dreadful thoughts; gloom; dreariness: a term used in medicine to describe the first stage of an ague fit.

Horrour is always drede of harme that is to come. Chaucer. The Persones Tale.

Certes, ther is non so *horrible* sinne of man that ne may in his lif, be destroyed by penitence, thurgh vertue of the passion and of the death of Crist. *Id.*

Over them sad horrour, with grim hue,

Did always soar, beating his iron wings ; And after him owls and night-ravens flew,

The hateful messengers of heavy things.

Faerie Queene.

1 41 . 1.1

Give colour to my pale cheek with thy blood, That we the *horrider* may seem to those

Which chance to find us. Shakspeare. Cymbeline.

Not in the legions

Of horrid hell can come a devil more damned, In evils to top Macheth. Shakspcare. Macbeth.

I have supt full with horrours;

Direness, familiar to my slaughterous thoughts, Cannot once start me. Id.

No colour affecteth the eye much with displeasure : there be sights that are *horrible*, because they excite thn memory of things that are odious or fearful.

Bacon.

All objects of the senses, which are very offensive, do cause the spirits to retre; and, upon their flight, the parts are in some degree destitute, and so there is induced in them a trepidation and *horrow*.

Id. Natural History.

A dungeon horrible on all sides round, As one great furnace flamed. Milton.

Horror on them fell, And horrid sympathy. *Id.* Him a globe

Of fiery scraphim incircled round With bright emblazonry and horrent arms. Id.

Me damp horrour chilled

At such bold words, vouched with a deed so bold Id

Death

Grinned horrible a ghastly smile to hear, His famine should be filled; and blest his maw, Destined to that good hour. Id. Paradise Lost. O conscience into what abyss of tears

And horrors hast thou driven me. Milton. Deep horrow seizes every human breast ;

Their pride is humbled, and their fear confest. Dryden.

I can forgive

A foe, but not a mistress, and a friend ! Treason is there in its most horrid shape

Where trust is greatest ! and the soul resigned Is stabb'd by her own guards. Id The contagion of these ill precedents, both in ci-

vility and virtue, horribly infects children. Locke.

Eternal happiness and eternal misery, meeting with a persuasion that the soal is immortal, are of all others, the first the most desirable, and the latter the most horrible to human apprehension. South.

A bloody designer suborns his instrument to take away such a man's life, and the confessor represents the horridness of the fact, and brings him to repent-Hammond. ance.

Her gloomy presence saddens all the scene, Shades every flower, and darkens every green ; Deepens the murmur of the falling floods, And breathes a browner horrour on the woods. Pope.

Already I your tears survey,

Already hear the horrid things they say. Id. His jaws horrifick, armed with three-fold fate,

Here dwells the direful shark. Thomson.

But hence ye thoughts ! that rise in Horror's shape, This hour bestows or ever bars escape.

Byron. The Bride of Abydos.

HORROR strictly signifies such an excess of fear as makes a person tremble. See FEAR, FRIGHT, and TERROR. In medicine it denotes a shivering and shaking of the whole body, coming by fits. It is common at the beginning of all fevers, but is particularly remarkable in those of the intermittent kind.

HORROR OF A VACUUM was an imaginary principle among the ancient philosophers, to which they ascribed the ascent of water in pumps, and other similar phenomena, which are now known to be occasioned by the weight of the air.

HORROX (Jeremiah), a celebrated English mathematician and astronomer of the seventeenth century, was born at Toxteth, near Liverpool, about 1619, and educated at Emanuel College, Cambridge. He began, about 1633, to study astronomy; but made little proficiency in the science for about three years, after which we find him in correspondence with the Gresham College professor. He accurately observed the transit of Venus over the sun's disk, November 24th, 1639; but was unfortunately cut off by death January 3d, 1640-1; only a few days after he had finished his treatise, entitled Venus in Sole visa. Other productions of his pen, left in an imperfect state, were collected and published by Dr. Wallis, in 1673, under the title of Opera Posthuma. Horrox seems to have been the first who ever predicted or observed the passage of Venus over the sun's disk; and his theory of lunar motions afforded assistance to Newton, who spoke of him as a genius of the highest order.

HORSE, n. s. & v.a.) Sax. popr. A neigh-HORSE'BACK, n.s. § ing quadruped, used in war, and draught, and carriage; a constellation: to take a horse to set out to ride: used in a plural sense for horses, horsemen; cavalry; something on which linen is hung to dry; a wooden machine which soldiers ride by way of punishment : joined to another substantive, it signifies something large or coarse, as horse-face. Horse, to mount ; to carry on the back ; to ride ; to cover a mare. Horseback, riding posture.

And, after that, within a while, I sic * * such a rout As all men on erth had ben assembled,

On that place, well horsed for the nones, Stering so fast that all the erth trembled.

But for to speke of riches and stones,

And men and horse, I trow the large wones

Of Preter John ne all his tresory,

Might not unneth have bought the tenth party. Chaueer. The Floure and the Leafe.

I've seen the French,

And they can well on horseback. Shakspeare. Stalls, bulks, windows

Are smothered, leads are filled, and ridges horsed With variable complexions; all agreeing In earnestness to see him. Id.

A horse ! a horse ! my kingdom for a horse ! Id.

I did hear The galloping of horse : who was't came by ?

Id.

The armies were appointed, consisting of twentyfive thousand horse and foot, for the repulsing of the enemy at their landing. Baeon's War with Spain.

If they had known that all the king's horse were quartered behind them, their foot might very well have marched away with their horse. Clarendon.

Then came the thrifty troop of privateers

Whose horses each with other interferes,

Before them Higgins rides with brow compact,

Mourning his countess anxious for his act.

Marvell.

Alexander fought but one remarkable battle, wherein there were any elephants, and that was with Porus, king of India; in which notwithstanding he was on horseback. Browne.

He came out with all his clowns, horsed upon such cart-jades, and so furnished, as I thought with myself, if that were thrift, I wisht none of my friends ever to thrive. Sidney.

When mannish Mevia, that two-handed whore, Astride on horseback hunts the Tuscan boar.

Dryden's Juvenal.

The' Arcadian horse

With ill success engage the Latin force. Id. /Eneid.

We call a little horse, such a one as comes not up to the size of that idea which we have in our minds to belong ordinarily to horses. Locke.

If you let him out to horse more mares than your own, you must feed him well. Mortimer.

I took horse to the lake of Constance, which is formed by the entry of the Rhine. Addison on Italy .-

If your ramble was on horseback, I am glad of it on account of your health. Swift to Gay.

Stern Hassan only from his horse

Disdains to light, and keeps his course.

Byron. The Giaour.

HORSE, in zoology. See Equus. Horses were very rare in Judea till Solomon's time. Before him we find no horsemen mentioned in the armies of Israel. David, having defeated Hadadezer king of Shobah (2 Sam. viii. 4, 5), took 1700 horses, and lamed all belonging to the chariots of war, reserving only 100 chariots. The judges and princes of Israel rode on mules or asses. After David's time horses were more common in Judea. Solomon had a great number of horses; but he kept them rather for pomp than for war, for he had no military expeditions. Moses had forbidden the king of the Hebrews to keep a great number of horses (Deut. xvii, 16), lest at any time he should be inclined to carry the people into Egypt. Josiah took away the horses which his predecessors had consecrated to the sun (2 Kings xxiii, 17). We know the sun was worshipped over all the east, and that the horse, the swiftest of tame beasts, was consecrated to this deity, who was represented as riding in a chariot drawn by the most beautiful and swiftest horses in the world, and performing every day his journey from east to west, in order to communicate his light to mankind.

Xenophon describes a solemn sacrifice of horses to the sun: they were all the finest steeds, and were led with a white chariot, crowned, and consecrated to the god. The horses which Josiah removed out of the court of the temple were probably appointed for similar sacrifices. The rabbins say that these horses were every morning put to the chariots dedicated to the sun, whereof there is mention made in the same book; and that the king, or some of his officers, got up and rode to meet the sun in its rising, as far as from the eastern gate of the temple to the suburbs of Jerusalem. Others are of opinion that the horses mentioned in the book of Kings were of wood, stone, or metal, erected in the temple in honor of the sun. Horses were used both among the Greeks and Romans in war, but were not originally very numerous; for, as each horseman provided his own horse, few would be able to bear the expense. Horses, for a considerable time, were managed by the voice alone, or by a switch, without bridle, saddle, or stirrups. Their harness was skins of beasts, and sometimes cloth. Both horses and men, amongst the Greeks, underwent a severe probation before their admission into the cavalry.

In the management of a horse, upon a journey, see that his shoes be not too strait, or press his feet, but be exactly shaped; and let him be shod some days before you begin a journey, that they may be settled to his feet. Observe that he is furnished with a bit proper for him, and by no means too heavy, which may incline him to carry low, or to rest upon the hand when he grows weary, which horsemen call making use of his fifth leg. The mouth of the bit should rest upon his bars about half a finger's breadth from his tushes, so as not to make him frumble from his lips; the curb should rest in the hollow of his beard a little above the chin; and, if it gall him, you must defend the place with a piece of buff or other soft leather. Observe that the saddle do not rest upon his withers, reins, or back bone, and that one part of it do not press his back more than another. Some riders gall a horse's sides below the saddle with their stirrup-leathers, especially if he be lean; to prevent this, you should fix a leather strap between the 'points of the fore and hind bows of the saddle, and make the stirrup leather pass over them. Begin your journey with short marches, especially if your horse has not been exercised for a long time; suffer him to stale as often as you find him inclined; and even invite him to it; but do not excite mares to stale, as their vigor is thereby diminished. Ride softly for a quarter or half an hour before you arrive at an inn, that the horse, not being too warm, nor out of breath, when put into the stable, you may unbridle him; but, if husiness obliges you to ride fast, you must then (the weather being warm) let him be walked, that he may cool by degrees; if it be very cold, let him be covered with cloths ; but, in case you have not the conveniency of a sheltered walk, stable him forthwith, and let his whole body be rubbed and dried with straw. As soon as the

horse is partly dried, and ceases to heat in the flanks, let him be unbridled, his bit washed, cleansed, and wiped, and let him eat his hay at pleasure. If he be very dry, and has not got water on the road, give him oats washed in good mild ale. The dust and sand will sometimes so dry the tongues and mouths of horses, that they lose their appetites. In such case, give him bran well moistened with water to cool and refresh his mouth; or wash his mouth and tongue with a wet sponge, to oblige him to eat. These directions are to be observed after moderate riding; but, if you have rode excessively hard, unsaddle your horse, and scrape off the sweat with a knife, or scraper, holding it with both hands, and scraping always with the hair; then rub his head and ears with a large hair-cloth, wipe him also between the fore and hind legs; in the mean time, his body should be rubbed all over with straw, especially under his belly and beneath the saddle, till he is thoroughly dry. That done, set on the saddle again, cover him; and if you have a warm place, let him be gently led up and down in it, for a quarter of an hour; but if you have not, let him dry where he stands. Or you may unsaddle him immediately; scrape off the sweat; let the hostler take a little vinegar and squirt it into the horse's mouth; then rub his head between the fore and hind legs, and his whole body, till he is pretty dry : let him not drink till he be thoroughly cool, and has eaten a few oats; for many, by drinking too soon, have been spoiled. Set the saddle in the sun or by a fire, in order to dry the pannels.

When horses are arrived in an inn, a man should, before they are unbridled, lift up their feet, to see whether they want any of their shoes, or if those they have do not rest upon their sides; afterwards he should pick and clear them of the earth and gravel, which may be between their shoes and soles. If you water them abroad, upon their return from the river cause their feet to be stopped with cow-dung, which will ease their pain; and, if it be in the evening, let the dung continue in their feet all night, to keep them soft and in good condition : but, if your horse have brittle feet, it will be requisite to anoint the fore feet, at the onsetting of the hoofs, with butter, oil, or hog's grease, before you water him in the morning, and in dry weather they should also be greased at noon. Many horses, as soon as unbridled, instead of eating, lay themselves down to rest, because of the pain they feel in their feet, so that one is apt to think them unwell: but, if their eyes are lively and good and if they will eat lying, they are in good health; yet if you handle the feet perhaps they will feel extremely hot, which discovers their suffering in that part. Examine, therefore, if their shoes do not rest upon their soles, which is somewhat difficult to be certainly known without unshoeing them; but if you take off their shoes, and look to the inside of them, you may perceive that those parts which rest upon the soles are more smooth and shining than the others: in this case, pare the feet in those parts, and fix on their shoes again, anointing the hoofs, and stopping the soles with hog's-lard.

After a long day's journey, at night feel your

3

horse's back : if he be pinched, galled, or swelled (if you do not immediately discover it, perhaps you may after supper), there is nothing better than to rub it with good brandy, or with lead water. If the galls are between the legs, use the same remedy; but if the hostler rubs him well between the legs, he will seldom be galled in that part. To preserve horses after travel, as soon as you arrive from a journey, immediately draw the two heel-nails of the fore feet; and, if it be a large shoe, then four : two or three days after, you may blood him in the neck, and feed him for ten or twelve days only with wet bran, without giving him any oats; but keep him well littered. The reason of drawing the heel-nails is because the heels are apt to swell, and, if they are not thus eased, the shoes would press and straiten them too much; it is also advisable to stop them with cow-dung for a while; but do

not take the shoes off nor pare the feet. The following bath will be very serviceable for preserving a horse's leg. Take the dung of a cow or ox, and make it thin with vinegar, so as to be of the consistence of thick broth; and, having added a handful of small salt, rub his fore legs from the knees, and the hind legs from the gambrels, chafing them well with and against the hair, that the remedy may sink in and stick to those parts. Thus leave the horse till morning, not wetting his legs, but giving him his water that evening in a pail; next morning lead him to the river, or wash his legs in soft water, which will keep them from swelling. Those persons who, to recover their horse's feet, make a hole in them, which they fill with moistened cow-dung, and keep it in their fore feet during the space of a month, act very injudiciously; because, though the continual moisture that issues from the dung occasions the growing of the hoof, yet it dries and shrinks it so excessively when out of that place, that it splits and breaks like glass, and the foot immediately straightens. It is certain that cow-dung, contrary to the opinion of many people, spoils a horse's hoof; it does indeed moisten the sole; but it dries up the hoof, which is of a different nature from it. In order, therefore, to recover a horse's feet, instead of cowdung, fill a hole with blue wet clay, and make him keep his fore feet in it for a month. Most horses that are fatigued, or over-ridden, and made lean by long journeys, have their flanks altered without being pursy, especially vigorous horses that have worked too violently. To recover them, give each of them in the morning half a pound of honey very well mingled with scalded bran; and, when they readily eat the half pound, give them the next time a whole one, and afterwards two pounds, every day continuing this course till your horses are empty, and purge kindly with it; but, as soon as you perceive that their purging ceases, give them no more honey. Administer powder of liquorice in the scalded bran for a considerable time; and, to cool their blood, it will not be improper to let them have three or four glisters. If the horse be very lean, give him some wet bran, over and above his proportion of oats; and grass is also beneficial, if he be not pursy. Sometimes excesrive feeding may do horses more harm than good,

by rendering them subject to the farcy. Be cautious, therefore, in giving them too great a quantity at a time. When a horse begins to drink water heartily, it is a certain sign that he will recover in a short time. All the time you are upon a journey, let your horse drink of the first good water you come to, after seven o'clock in the morning if it be in summer, and after nine or ten in winter. That is accounted good water which is neither too quick and piercing, nor too muddy. This is to be done, unless you would have him gallop a long time after drinking; for if so, you must forbear. Though it is the cusstom in England to run and gallop horses after drinking; yet, says M. de Sollysel, it is the most pernicious practice that can be imagined for horses. Although a horse he warm, and sweat very much, yet if he is not quite out of breath, and you have still four or five miles to ride, he will be better after drinking a little, than if he had drunk none at all. But if the horse be very warm, you should at coming out of the water, redouble your pace, to warm the water in his belly. If when you bait he be hot or sweaty, you must not let him drink, as it would endanger his life; and, when his bridle is taken off, his excessive thirst will hinder him from eating, so that he will not offer to touch his meat for an hour or two; therefore he should have his oats given him washed in ale or beer, or only a part of them, if you intend to feed him again after he has drunk. Some think that horses are often spoiled by giving them oats before their water; because they say the water makes the oats pass too soon, and out of the stomach undigested. But M. de Sollysel affirms, that though it be the common custom not to do it till after, yet it is proper to feed with oats both before and after, especially if the horse be warm, and has been hard rode.

HORSE, STONE. See STALLION.

The count de Buffon gives the following directions for breeding horses :---When the stallion is chosen, and all the mares intended for him are collected together, there must be another stonehorse, to discover which of the mares are in heat; and, at the same time, contribute to inflame them. All the mares are to be brought successively to this stone-horse; which should also be inflamed, and suffered frequently to neigh. As he is for leaping every one, such as are not in heat keep him off, while those which are so suffer him to approach them. But, instead of being allowed to satisfy his impulse, he must be led away, and the real stalliou substituted in his stead. This trial is necessary for ascertaining the true time of the mare's heat, especially of those which have not yet had a colt; for, with regard to such as have recently foaled, the heat usually begins nine days after their delivery; and on that very day they may be led to the stallion to be covered; and nine days after, by the experiment above-mentioned, it may be known whether they are still in heat. If they are, they must be covered a second time; and thus successively every ninth day while their heat continues : for when they are impregnated their heat abates, and in a few days ceases entirely. The stud must be fixed in a good soil, and in a suitable place, proportioned to the numbers of mares and stallions intended to be used. This spot must be divided into several parts, enclosed with rails or ditches well fenced ; in the part where the pasture is the richest, the mares in fold, and those with colts by their sides, are to be kept. Those which are not impregnated, or have not yet been covered, are to be separated, and kept with the fillies in another close, where the pasture is less rich, that they may not grow too fat. Lastly, the young stone colts, or geldings, are to be kept in the driest part of the fields, and where the ground is most unequal; that, by running over the uneven surface, they may acquire a freedom in the motion of their legs and shoulders. This close, where the stone colts are kept, must be very carefully separated from the others, lest the young horses break their bounds, and enervate themselves with the mares. If the tract be so large as to allow of dividing each of these closes into two parts, for putting oxen and horses into them alternately, the pasture will last much longer than if continually eaten by horses; the ox improving the fertility, whereas the horse lessens it. In each of these closes should be a pond; standing water being better than running, which often gripes them; and, if there are any trees in the ground, they should be left standing, their shade being very agreeable to the horses in great heats; but all stems or stumps should be grubbed up, and all holes levelled, to prevent accidents. Ín these pastures the horses should feed during the summer; but in the winter the mares should be kept in the stable and fed with hay. The colts also must be housed, and never suffered to feed abroad in winter, except in very fine weather. Stallions that stand in the stable should be fed more with straw than hay; and moderately exercised till covering time, which generally lasts from the beginning of April to the end of June. But during this season they should have no other exercise, and be plentifully fed, but with the same food as usual. Before the stallion is brought to the mare he should be dressed, as that will greatly increase his ardor. The mare must also be curried, and have no shoes on her hind feet, some of them being ticklish, and apt to kick the stallion. During the first seven days, let four different mares be successively brought to him; and the ninth day let the first be again brought, and so successively while they continue in heat : but, as soon as the heat of any one is over, a fresh mare is to be put in her place, and covered in her turn every nine days; and as several retain even at first, second, or third time, it is computed that a stallion, by such management, during the three months, may cover fifteen or eighteen mares, and beget ten or thirteen colts. After being covered, nothing more is requisite than to lead her away to the field.

The first foal of a mare is never so strongly formed as the succeeding; so that care should be taken to procure for her, the first time, a larger stallion, that the defect of the growth may be compensated by the largeness of the size. Particular regard should also be had to the difference or congruity of the fashion of the stallion and the mare, in order to correct the faults

of the one by the perfections of the other; especially never to make any disproportionate copulations, as of a small horse with a large mare, or a large horse with a small mare; as the produce of such copulation would be small, or badly proportioned. It is by gradation that we must endeavour to arrive at natural beauty. It has been observed, that horses fed in dry and light grounds produce temperate, swift, and vigorous foals, with muscular legs and a hard hoof; while the same bred in marshes and moist pastures have produced foals with a large heavy head, a thick carcass, clumsy legs, bad hoofs, and broad feet. These differences proceed from the air and food; but what is more difficult to be accounted for, and still more essential than what we have hitherto observed, is, to be continually crossing the breed to prevent a degeneracy. In coupling of horses, the color and size should be suited to each other, the shape contrasted, and the breed crossed by an opposition of climates : but horses and mares foaled in the same stud should never be joined. These are essential articles; but there are others which should by no means be neglected; as, that no short-docked mares be suffered in a stud, because, from their being unable to keep off the flies, they are much more tormented by them than others which have a long sweeping tail; and their continual agitation from the stings of these insects, occasions a diminution in the quantity of their milk, and has a great influence on the constitution and size of the colt, which will be vigorous in proportion as its dam is a good nurse. Care must also be taken that the stud mares be such as have been brought up in pastures, and never over-worked. Mares which have always been brought up in the stable on dry food, and afterwards turned to grass, do not breed at first; some time is required for accustoming them to this new aliment. Though the usual season for the heat of mares be from the beginning of April to the end of June, yet it is not uncommon to find some among a large number that are in heat before that time; but it is advisable to let this heat pass over without giving them to the stallion, because they would foal in winter; and the colts, besides the inclemency of the season, would have bad milk for their nourishment. Again, if the mares are not in heat till after the end of June, they should not be covered that season; because the colts, being foaled in summer, have not time for acquiring strength sufficient to repel the injuries of the following winter. Many, instead of bringing the stallion to the mare, turn him loose into the close, where all the mares are brought together ; and there leave him to choose such as will stand to him. This is a very advantageous method for the mares; they will always take horse more certainly than in the other; but the stallion, in six weeks, will do himself more damage than in a number of years by moderate exercise, conducted in the manner already mentioned. When the mares are pregnant, and their belly begins to swell, they must be separated from those that are not, lest they hurt them. They usually go eleven months and some days; and foal standing, whereas most other quadrupeds lie down. Those

that cannot foal without great difficulty, must be assisted; the foal must be placed in a proper situation; and sometimes, if dead, drawn out with cords. The head of the colt usually presents itself first, as in all other animals: at its coming out of the matrix, it breaks the secundines or integuments that enclose it, which is accompanied with a great flux of the lymph contained in them; and at the same time one or more solid lumps are discharged, formed by the sediment of the inspissated liquor of the allantoides. This lump, which the ancients called the hippomanes of the colt, is so far from being, as they imagined, a mass of flesh adhering to the head of the colt, that it is separated from it by a membrane called amnois. As soon as the colt is fallen, the mare licks it, but without touching the hippomanes; which points out another error of the ancients, who affirmed that she instantly devours it. The general custom is to have a mare covered nine days after her foaling, that no time may be lost; but it is certain, that the mare having, by this means, both her present and future foal to nourish, her ability is divided, and she cannot supply both so largely as she might one only. It would therefore be better, in order to have excellent horses, to let the mares be covered only every other year; they would last the longer, and bring foals more certainly: for, in common studs, it is so far from being true that all mares which have been covered bring colts every year, that it is considered as a fortunate circumstance if half, or at most two-thirds of them foal. Mares, when pregnant, will admit of copulation; but it is never attended with any superfœtation. They usually breed till they are fourteen or fifteen years of age; and the most vigorous till they are about eighteen. Stallions, when well managed, will engender till the age of twenty, and even beyond; but it must be observed, that such horses as are soonest made stallions are also the soonest incapable of generation : thus the large horses, which acquire strength sooner than the slender, and are therefore often used as stallions as soon as they are four years old, are incapable of generation before they are sixteen.

The breed of horses in Great Britain is as mixed as that of its inhabitants: the frequent introduction of foreign horses has given us a variety that no other single country can boast : most other countries producing only one kind; while ours, by a judicious mixture of the several species, by the happy difference of our soils, and by our superior skill in management, has brought each quality of this noble animal to the highest perfection. In the annals of Newmarket may be found instances of horses that have literally outstripped the wind, as the celebrated M. Condamine has shown in his remarks on those of Great Britain. Childers is an amazing in-stance of rapidity; his speed having been more than once exerted equal to eighty-two feet and a half in a second, or nearly a mile in a minute. The species used in hunting is a happy combination of the former with others superior in strength, but inferior in point of speed and lineage : a union of both is necessary; for the fatigues of the chase must be supported by the

there are instances of single horses that are able to draw on a plain, for a small space, the weight of three tons; but could with ease, and for a continuance, draw half that weight. But the most remarkable proof of the strength of our British horses is to be drawn from that of our mill horses : some of these will carry at one load thirteen measures ; which, at a moderate computation of seventy pounds each, will amount to 916 pounds; a weight superior to that which the less sort of camels will bear: this will appear less surprising as these horses are by degrees accustomed to the weight; and the distance they travel no greater than to and from the adjacent hamlets. Our cavalry, in the late campaigns (when they had opportunity), showed, over those of our allies, as well as the French, a great superiority both of strength and activity: the enemy was broken through by the impetuous charge of our squadrons; when the German horses, from their great weight and inactive make, were unable to second our efforts. The present cavalry of this island only supports

spirit of the one, as well as by the vigor of the other. No country can bring a parallel to the strength and size of our horses destined for the

draught; or to the activity and strength united of those that form our cavalry. In London

its ancient glory. It was eminent in the earliest times; our scythed chariots, and the activity and good discipline of our horses, struck terror even into Cæsar's legions: and the Britons, as soon as they became civilised enough to coin, took care to represent on their money the animal for which they were so celebrated. It is now impossible to trace out this species; for those which exist among the indigenæ of Great Britain, such as the little horses of Wales and Cornwall, the hobbies of Ireland, and the shelties of Scotland, though admirably well adapted to the uses of those countries, could never have been equal to the work of war: but probably we had even then a larger and stronger breed in the more fertile and luxuriant parts of the island. Those we employ for that purpose, or for the draught, are an offspring of the German or Flemish breed, meliorated by our soil and a judicious culture. The English were ever attentive to an exact culture of these animals. The esteem that our horses were held in by foreigners, so long ago as the reign of Athelstan, may be collected from a law of that monarch, prohibiting their exportation, except they were designed as presents. These must have been the native kind, or the prohibition would have been needless; for our commerce was at that time too limited to receive improvement from any but the German kind, to which country their own breed could be of no value. But, when our intercourse with the other parts of Europe was enlarged, we soon laid hold of the advantages this gave of improving our breed. Roger de Belesme, earl of Shrewsbury, first introduced the Spanish stallions into his estate in Pow Island, from which that part of Wales was for many ages celebrated for a swift and generous race of horses. Giraldus Cambrensis, who lived in the reign of Henry II., takes notice of it; and Michael Drayton, contemporary with Shakspeare, alludes to their excellence in

2 B

VOL. XI.

the sixth part of his Polyolbion. This kind was probably destined to mount our gallant nobility or courteous knights for feats of chivalry. From these sprung, to speak the language of the times, the flower of coursers, whose elegant form added charms to the rider, and whose activity and managed dexterity gained him the palm in that field of gallantry and honor. The increase of our inhabitants, and the extent of our manufactures, together with the former neglect of internal navigation to convey those manufactures, multiplied the number of horses : an excess of wealth, before unknown in these islands, increased the luxury of carriages, and added to the necessity of a culture of these animals: their high reputation abroad has also made them a branch of commerce, and proved another cause of their vast increase.

In France, horses of the Bretagne breed are strongly made, and have generally black hair, or brown-hay; and good legs and feet, with a hardy mouth, and a head short and fleshy; but in general they are clumsy. The horses of Franche Comté are said to have the legs of tigers, and the belly of a hind; but they are short and thick, and of a middle size; being much more proper for drawing than riding. The horses of Gascony are not unlike those of Spain ; but they are not so handsome nor so active, and therefore they are more proper to draw carriages. The Limosin horses are very vicious, and are good for little till they are six years old. Their color is generally bay, or a bay-brown. The horses of Normandy are much like those of Bretagne; and those of Poitou have good bodies, legs, feet, and eyes; but they are far from being handsome. The horses of Germany are more handsome than those of Belgium and are of great use for carriages, and the army, especially for drawing artillery. They have a great deal of hair about the legs; are not large, but are well set; and yet have tender feet. The Hungarian horses are excellent for the coach, as well as for riding; but they are large, though well proportioned ; are of all colors, and in general very swift. The Danish horses are low, short, and square ; but they have a fine head and short hair. The horses of the Low Countries are very fit for the coach, and they are often known by the name of Flanders mares. The Polish horses are like the Danish; only they have not so fine a forehand; their color is generally a bright bay, and that of the outward peel of an onion; and they are fiery and vicious. The horses of Switzerland are pretty much like those of Germany. Those of Piedmont are fiery, of a middle size, and of all sorts of colors; their legs are good and handsome, their eyes fine, their ears small, and their mouths good; but they do not carry their heads well. The horses of Naples and Italy are generally ill made and lean; they never do well in a colder climate. The Spanish horses are well made and handsome, as well as very active and nimble; they have good eyes, handsome legs and heads, and are easily managed ; The Turkish horses are of different shapes ; but are generally swift, though their mouths are bad. Most of them are white, though there are other colors; and they are in general large, hardy, of draught horses, are owing to bad water. If strong, and fit for the road. The horses of Bar- there be any running stream in the neighbour-

bary, commonly called barbs, have strong hoofs and are fine racers : they preserve their vigor to the last; some of them are used as stallions in Britain. The horses of China are very vigorous, though low in height. Those of the Eluth Tartars are good and full of fire, and their size is much the same as the Polish horses; they are afraid of nothing, not even of the lions and tigers. In various parts of Hindostan they are numerous, and of all colors ; but generally of the middle size, though there are some as large and as handsome as those in Europe. The wild horses of Tartary differ little from the tame; but are so swift, that they will avoid the arrows of the most skilful hunters.

HORSES, DRAUGHT, in farming, are a sort of coarse-made horses destined for the service of the cart or plough. These, for what is called the show draught, are to be chosen of an equal height; for otherwise, when put into the cart, one draws unequally with the other. The draught horse should be large bodied and strong loined, and of such a disposition as rather to be too dull than too brisk, and rather to crave the whip than to draw more than is needful. Mares are the fittest for this use for the farmer, as they will be kept cheap, and not only do the work, but give a yearly increase of a foal. They should have a good head, neck, breast, and shoulders; for the rest of the shape, it is not of much consequence. Draught horses should be always kept to that employ. Some put them to the saddle on occasion, but it does them harm, alters their pace, and spoils them for labor. The draught horse ought to have a large broad head, because horses of this shaped head are less subjeet than others to diseases of the eyes. The ears should be small, straight, and upright; the nostrils large and open, that he may breathe with the more freedom. A horse with a full and bold eye always promises well. On the other hand a sunk eye and an elevated brow are bad signs The horse is esteemed fittest for this purpose, also, that has a large and round buttock, which neither sinks down nor cuts. He must have a firm and strong tail, and the dock must be thick and well furnished with hair, and placed neither very high nor very low. The legs should be rather flat and broad than round; the roundness of the leg being a fault in a horse destined to labor that will soon ruin him. As to the hinder legs, the thighs should be fleshy and long, and the whole muscle which shows itself on the outside of the thigh should be large and very thick.

Nothing is so essential to the health of these serviceable creatures as cleanliness; if they are fed ever so well, and not kept clean, they will be subject to numerous diseases. The servant who has the care of them ought to be up very early, and to clean the racks and mangers from all filth. The currying of them must be carefully performed every morning, but not in the stable, for the dust to fall upon the other horses. After the horses are dusted, you should twist a wisp of straw hard up, and, wetting it in water, rub the legs, shoulders, and body. Many of the diseases

hocd, they should always be led to that to water every day in summer, but in winter well-water is warmer and better for them. If there be a necessity of giving them well-water, in summer, it must be drawn up some hours before the time, and exposed to the sun-beams in tubs or troughs; marsh-water, or that of lowland ditches, is worst of all. When the laboring horse has drunk his water, he should have his oats given him, carefully sifted. It is a common practice, as soon as a horse is come in from his work, to rub down his legs with a hard wisp of hay; but the best judges of horses absolutely condemn this, and observe, that after hard labor it brings down humors into them, and makes them stiff. The rubbing itself is wholesome, but the doing it when the creature is hot is the mischief. The racks are to be well supplied with hay, and the horses should be left to rest and eat about two hours, and then led to water; after this they should be fed. In the evening, the first thing to be done is to examine the feet, and see if any thing is amiss about the shoes. A very material thing for the preservation of all sorts of cattle, but of none so much as draught horses, is fresh and clean litter.

In old horses, the eye-pits are generally deep ; but this is only an equivocal mark, being also found in young horses begot by old stallions. The most certain knowledge of the age is to be obtained from the teeth. Of these a horse has forty; twenty-four grinders or double teeth, four tushes, and twelve fore-teeth; mares have no tushes, or at least very short ones. It is not from the grinders that we know the age; it is discovered first by the fore teeth, and afterwards by the tushes. The twelve fore-teeth begin to shoot within twelve days after the colt is foaled. These first or foal teeth, are round, short, not very solid, and are east at different times, to be replaced by others. At the age of two years and a half the four middle fore-teeth are cast, two in the upper jaw and two in the lower. In one year more four others drop out, one on each side of the former, which are already replaced. When he is about four years and a half old he sheds four others, and always next to those which have fallen out and been replaced. These four foalteeth are replaced by four others, but are far from growing so fast as those which replaced the eight former, and are called the corner-teeth; they replace the last four foal-teeth, and by these the age of a horse is discovered. They are easily known, being the third both above and below, counting from the middle of the jaw. They are hollow, and have a black mark in their cavity. When the horse is four years and a half old they are scarcely visible above the gum, and the cavity is very sensible; at six years and a half they begin to fill; and the mark continually diminishes and contracts till seven or eight years, when the cavity is quite filled up, and the black spot effaced. After eight years, these teeth ceasing to afford any knowledge of the age, it is judged of by the tushes: which are four teeth adjoining to those last mentioned ; and, like the grinders, are not preceded by any other teetli. The two in the lower jaw usually begin to shoot at three years and a half, and those of the upper

jaw at four; continuing very sharp-pointed till six. At ten the upper seem blunted, worn out, and long, the gum contracting itself as its years increase; the barer therefore they are, the older is the horse. From ten to thirteen or fourteen years little can be seen to indicate the age; but at that time some hairs of the eye-brows begin to turn gray. This mark, however, is equivocal, horses from old stallions or mares having gray hairs in the eye-brows when they are not above nine or ten years old. In some horses the teeth are of such a hardness as not to wear; and in such the black mark always subsists, being never effaced by time; but the age of these horses, which are called beguts by the French, is easily known; the hollow of the tooth being filled up, and at the same time the tushes very long. This is more common in mares than in horses. The age of a horse may be also known, though less accurately, by the bars in his mouth, which wear away as he advances in years.

When the horse is without blemish the legs and thighs are clean, the knees straight, the skin and shank thin, and the back-sinew strong and well braced. The sinews and the bones should be so distinct as to make the legs appear thin and lathy, not full and round. The pastern joints should never be large and round, nor must there be any swelling near the coronet. The hock should be lean and dry, not puffed up with wind. With regard to the hoof, the coronet should be equally thick, and the horn shining and gravish. A white horn is the sign of a bad foot, for it will wear out in a short time; and likewise when the horn is thin, it is liable to be spoiled in shoeing, and by travelling hard on stony grounds. This is best known when the shoe is taken off: for then the verge all round the sole will appear thin, and the horse will wince at the least touch of the pincers. A strong foot has the fibres of the hoof very distinct, running in a direct line from the coronet to the toe, like the grain of wood. In this case care must be taken to keep the foot moist and pliable. The greatest inconvenience attending a hard strong foot is its being subject to rifts and fissures, which cleave the hoof quite through sometimes from the coronet down to the bottom. A narrow heel is likewise a defect; and, when it is not above two fingers in breadth, the foot is bad. A high heel causes a horse to trip and stumble often; and the low one, with long yielding pasterns, is very apt to be worn quite away on a journey. Too large a foot in proportion to the rest of the body renders a horse weak and heavy. The head of a horse should be small, and rather lean than fleshy. The ears should be small, erect, thin, sprightly, and point-The forehead, or brow, should be neither ed too broad nor too flat, and should have a star or snip thereon. The nose should rise a little, and the nostrils should be wide, that he may breathe more freely. The muzzle should be small, and the mouth neither too deep nor too shallow. The jaws should be thin, and not approach too near together at the throat, nor too high upwards towards the onset, that the horse may have sufficient room to carry his head in an easy graceful posture. The eyes should be of a middle size, bright, lively, and full of fire. The tongue should

3 B 2

be small, that it may not be too much pressed by the bit; and it is a good sign when his mouth is full of white froth, for it shows that he will not soon be overheated. The neck should be arched towards the middle, growing smaller by degrees from the breast and shoulder to the head. The hair of the mane should be long, small, and fine; and, if it be a little frizzled, so much the better. The shoulder should be pretty long; the withers thin, and enlarge gradually from thence downwards; but so as to render his breast neither too narrow nor too gross. A thick shouldered horse soon tires, and trips and stumbles every minute; especially if he has a thick large neck at the same time. When the breast is so narrow that the fore-thighs almost touch, they are never good for much. A horse of a middle size should have the distance of five or six inches between his fore-thighs, and there should be less distance between his feet than his thighs near the shoulders when he stands upright. The body of a horse should be of a middling size in proportion to his bulk, and the back should sink a little below the withers; but the other parts should be straight and no higher behind than before. He should also be home-ribbed; but the short ribs should not approach too near the haunches, and then he will have room to fetch his breath. When a horse's back is short in proportion to his bulk, and yet otherwise well limbed, he will hold out a journey, though he will travel slow. When he is tall, at the same time with very long legs, he is but of little value.

The wind should never be overlooked in the choice of a horse : and it may easily be known by his flanks, if he is broken-winded, when he stands quiet in the stable; because he always pinches them in with a very slow motion, and drops them suddenly. A thick-winded horse fetches his breath often, and sometimes rattles and wheezes. This may be always discovered when he is put to brisk exercises. The temper of a horse should always be observed; a vicious horse generally lays his ears close to his pole, shows the whites of his eye, and looks sullen and dogged. An angry horse may be known by his frowning looks; and he generally seems to stand in a posture of defence. When he is very vicious he pays no regard to the groom that feeds him: however, some horses that are ticklish will lay back their ears, and yet be of a good disposition. A fearful horse is apt to start, and never leaves it off till he is old and useless. A fretful horse is very unfit for a journey; and you may discover his temper as soon as he gets out of the stable. A dull, heavy, sluggish horse may be easily known, whatever tricks are used to rouse his spirits.

With regard to the color of a horse, the bright bay, and indeed all kinds of bays in general, are accounted good colors. The chestnut horse is generally preferable to the sorrel, unless the former happens to be bald, or party colored, with white legs. Brown horses have generally black manes and tails, and their joints are of a rusty black. Those of this color that are dappled are much handsomer than the rest. Horses of a shining black, and well marked without too much white, are high in esteem for their beauty. A star, or

blaze, or white muzzle, or one or more feet tipped with white, are thought to be rather better than those that are quite black. Of grays, the dappled are accounted best; though the silver gray make a more beautiful appearance, and often prove good. The iron gray with white manes and tails are thought not to be so hardy. Grays of every kind will turn white sooner or later; but the nutmeg gray, when the dappled parts incline to bay or chestnut, are said to be good hardy horses. Roan horses have a diversity of colors mixed together; but the white is most predominant. They are all generally hardy, and fit for the road ; and some are exceedingly good. Those of a strawberry color most resemble the sorrel, and they are often marked with white on the face and legs. When the bay is blended with it, he seems to be tinctured with claret; and some of these prove to be very good. Dun, sallow, and cream-colored horses have a list down their backs; and their manes and tails are black. Dun horses are seldom chosen by gentlemen; and yet they may be very useful to the country farmer. The sallow and cream-colored are more esteemed, both for beauty and use. Those horses that are finely spotted with gay colors like leopards are a great rarity, and for that reason are only in the hands of great men.

HOUSES, RACE. See RACING.

HORSÉBEAN, n. s. Horse and bean. A small bean usually given to horses.

Only the small horsebean is propagated by the plough. Mortimer.

HORSE'BLOCK. n.s. Horse and block. A block on which they climb to a horse.

HORSEBOAT', n. s. Horse and boat. A boat used in ferrying horses.

HORSEBOY', n.s. Horse and boy. A boy employed in dressing horses; a stable-boy.

Some horseboys, being awake, discovered them by the fire in their matches. Knolles's History.

HORSE'BREAKER, n. s. Horse and break. One whose employment is to tame horses to the saddle.

Under Sagittarius are born chariot-racers, horsebreukers, and tamers of wild beasts. Creech.

HORSECHEST'NUT, n.s. Lat. asculus. Horse and chestnut. A tree. It hath digitated or fingered leaves: the flowers, which consist of five leaves, are of an anomalous figure, opening with two lips: there are male and female upon the same spike: the female flowers are succeeded by nuts, which grow in green prickly husks. Their whole year's shoot is commonly performed in three weeks' time, after which it does no more than increase in bulk, and become more firm; and all the latter part of the Summer is occupied in forming and strengthening the buds for the next year's shoots.

The horsechestnut grows into a goodly standard.

HORSE'COURSER, n. s. Horse and courser. Junius derives it from *horse* and *cose*, an old Scotch word, which signifies to change; and it should therefore, he thinks, be written *horsecoser*. The word now used in Scotland is *horsecouper*, to denote a jockey, seller, or rather changer of horses. It may well be derived from course, as

Mortimer.

he that sells horses may be supposed to course or exercise them. One that runs horses, or keeps horses for the races. A dealer in horses.

A Florentine bought a horse for so many crowns, upon condition to pay half down: the horsecourser comes to him next morning for the remainder.

L'Estrange.

A servant to a horsecourser was thrown off his horse. Wiseman.

HORSE'CRAB, n.s. A kind of fish.

HORSE'CUCUMBER, n.s. Horse and cucumber. A plant.

The horsecucumber is the large green cucumber, and the best for the table, green out of the garden.

Mortimer.

HORSE'DUNG, n.s. Horse and dung. The excrements of horses.

Put it into an ox's horn, and, covered close, let it rot in hot horsedung. Peacham on Drawing.

HORSE'EMMET, n. s. Horse and emmet. Ant of a large kind.

HORSE'FLESH, n.s. Horse and flesh. The flesh of horses.

The Chinese eat horseflesh at this day, and some gluttons have colt's flesh baked. Bacon.

An old hungry lion would fain have been dealing with a good piece of horseflesh; but the nag he thought would be too fleet for him. L'Estrange.

HORSE'FLY, n.s. Horse and fly. A fly that stings horses, and sucks their blood.

HORŠE'FOOT, n.s. An herb. The same with coltsfoot.

HORSE'HAIR, n.s. Horse and hair. The hair of horses.

His glittering helm, which terribly was graced With waving horsehair. Dryden.

HORSE'IIEEL, n. s. An herb.

HORSE'LAUGH, n. s. Horse and laugh. A loud violent rude laugh.

A horselaugh, if you please, at honesty; A joke on Jekyl. Pope. HORSE'LEECH, n. s. Horse and leech. A great leech that bites horses.

The horseleech hath two daughters, crying Give, give. Proverbs.

Let us to France; like horseleeches, my boys, The very blood to suck. Shakspeare.

From leech; signifying a physician. A farrier.

HORSE'LITTER, n.s. Horse and litter. A carriage hung upon poles between two horses, in which the person carried lies along.

He that before thought he might command the waves of the sea, was now cast on the ground and carried in an horselitter. 2 Mac. ix. 8.

HORSE'MAN, n. s. Horse and man. One skilled in riding.

A skilful horseman, and a huntsman bred.

Dryden.

One that serves in wars on horseback.

Encounters between *horsemen* on the one side, and foot on the other, are seldom with extremity of danger; because, as *horsemen* can hardly break a battle on foot, so men on foot cannot possibly chase *horsemen*. Hayward.

In the early times of the Roman commonwealth a horseman received yearly tria millia æris, and a foot soldier one mille; that is more than sixpence a-day to a horseman, and twopence a-day to a foot soldier. Arbuthnot on Coins.

> I saw him urge as fleet a steed As ever served a horseman's need. Byron. The Giaour.

A rider ; a man on horseback.

With descending showers of brimstone fired, The wild Barbarian in the storm expired; Wrapt in devouring flames the *horseman* raged, And spurred the steed in equal flames engaged.

Addison.

A horseman's coat shall hide Thy taper shape, and comeliness of side.

Prior.

HORSEMANSHIP.

HORSE'MANSHIP, n.s. From horseman. The art of riding; the art of managing a horse.

He vaulted with such ease into his seat,

As if an angel dropt down from the clouds

To turn and wind a fiery Pegasus,

And witch the world with noble horsemanship.

Shakspeare.

His majesty, to shew his horsemanship, slaughtered two or three of his subjects. Addison.

They please themselves in terms of hunting or horsemanship. Wotton.

Peers grew proud, in horsemanship t' excel ;

Newmarket's glory rose, as Britain's fell. Pope.

Ilonsemanship, in its utmost latitude, comprehends whatever relates to the knowledge of the make, color, age, temper, and qualities of horses; their respective contrivies and climates, with the method of breeching, breaking, propagating, &c.; the discovery of the uses or services they are futted for; whether for war, the race, the saddle, or labor; and forwarding and accommodating them for these purposes. In this general sense it also includes the knowledge of the defects and diseases of horses, and the remedies proper for them, with the several operations requisite thereto; and thus comprehends the whole art of farriery. But the word is most commonly used for the art of riding and directing a horse to advantage; not only in the ordinary motions, but more especially in the managing, or making him work upon volts, airs, &cc., and in this view chiefly we propose to consider it.

Sect. I.—Of Preparing Horses to be Mounted.

Though most horses are bought at an age when they have already been backed, they should be prepared for the rider with the same care, gentleness, and caution, as if they had never been handled, in order to prevent accidents, which might otherwise arise from a skittishness or other causes: and, as it is proper that they should be taught the figure of the ground they are to go upon when they are at first mounted, they should be previously trotted in a longe on circles, without any rider.

The earl of Pembroke's directions on this subject are :--Put an easy cavesson upon the horse's nose, and make him go forward round you, standing quiet and holding the longe; and let another man, if you find it necessary, follow him with a whip. All this must be done very gently, and but a little at a time; for horses are spoiled by overmuch work more than by any other treatment whatever; and that by very contrary effects; for sometimes it drives them into vice, madness, and despair, and often stupifies and totally dispirits them.

The first obedience required in a horse is going forwards; till he performs this duty freely, never think of making him rein back, which would inevitably make him restive; as soon as he goes forwards readily, stop and caress him. Remember in this, and every other exercise, to use him to go equally well to the right and left; and, when he obeys, caress him and dismiss him immediately. If a horse that is very young takes fright, and stands still, lead on another horse before him, which probably will induce him to follow. , 'ut a snaffle in his mouth; and, when he goes freely, saddle him, girting him at first very loose. Let the cord which you hold be long and loose; but not so much so as to endanger the horse's entangling his legs in it. Small circles, in the beginning, would constrain the horse too much, and put him upon defending himself. No bend must be required at first; never suffer him to gallop false; but, whenever he attempts it, stop him without delay, and then set him off afresh. If he gallops of his own accord, and true, permit him to continue: but, if not, do not demand it of him at first. Should he jnmp, shake the cord gently upon his nose, and he will fall into his trot again. If he stands still, plunges, or rears, let the man who holds the whip make a noise with it; but never touch him till necessary to make him go on. When you change hands, stop and caress him, and entice him to come up to you: for by presenting yourself, as some do suddenly before horses, and frightening them to the other side, you run a great risk of making them shy. If he keeps his head too low, shake the cavesson to make him raise it; and in whatever the horse does, whether he walks, trots, or gallops, let it be a constant rule, that the motion be determined, and really such as is intended, without the least shuffling, pacing, or any other irregular gait.

Sect. II.—OF PLACING THE RIDER, AND REN-DERING HIM FIRM ON HORSEBACK.

The greatest attention, and the same gentleness that is used in teaching a horse, should also be observed in training his rider. Every method must be practised to create and preserve, both in man and horse, all possible feeling and sensibility; contrary to the usage of many ridingmasters, who seem industriously to labor at abolishing these in both.

As many essential points depend upon the manner in which a man is at first placed on horseback, it ought to be attended to with exact-

ness. The absurdity of putting a man, who perhaps has never been on horseback before, upon a rough trotting horse, to which he is obliged to cling with all the force of his arms and legs, is sufficiently obvious. No man can be well seated on horseback, unless he be unconstrainedly master of the balance of his body, and at his ease; which cannot be, if his attention be otherwise engaged; as it must wholly be in a raw unprepared horseman on a rough horse.

The first time a man is put on horseback he should be placed upon a very gentle horse; and not attempt to trot him till he is quite easy in the walk; nor gallop, till he trots properly. Nor should horses be made to trot till they are obedient, and their mouths well formed on a walk; nor to gallop, till the same be effected on a trot. When he attains firmness in his seat, the more he trots rough horses the better. This is the best, easiest, and shortest method: by it a man is soon made a sufficient horseman; but in the other methods a man contracts all sorts of bad habits, and rides worse every day. Before a man mount he should be taught to know if the curb be well placed; that is, when the horse has a bit in his mouth, which at first he should not; but only a snaffle, till the rider is firm in his seat, and the horse also somewhat taught : likewise if the nose-band be properly tight; the throat-band somewhat loose; and the mouthpiece neither too high nor too low in the horse's mouth, so as not to wrinkle the skin nor to hang lax; the girths drawn moderately, but not too tight; and the crupper and the breast-plate properly adjusted. A very careful hand may venture on a bit at first, and succeed with it; only with colts it is better to avoid any pressure on the bars at first, which a curb, though ever so gently used, must in some degree occasion. When the bridle, &c., have been well looked to, let the man approach the horse gently near the shoulder; then, taking the reins and an handful of the mane in his left hand, let him put his foot softly in the left stirrup, by pulling it towards him, lest he touch the horse with his toe; then, raising himself up, let him rest a moment on it with his body upright, but not stiff; and after that, passing his right leg clear over the saddle, without rubbing against any thing, let him seat himself gently down. He must be cautious not to take the reins too short, for fear of making the horse rear, run, fall back, or throw up his head; but let him hold them of an equal length, neither tight nor slack, and with the little finger between them. Horses should be accustomed to stand still to be mounted, and not to stir till the rider pleases. All soldiers are instructed to mount and dismount equally well on both sides, which may be of great use in times of hurry and confusion.

The rider should be placed in his saddle, with his body rather back, and his head held up without stiffness; seated neither forwards, nor very backwards: with the breast elevated a little, and the lower part of the body a little forwards; the thighs and legs turned in without constraint, and the feet in a straight line neither turned in nor out. By this position the natural weight of the thighs has a proper pressure, and the legs are

ready to act: they must hang down easy and naturally, and so as not to be wriggling about, touching, and tickling the horse's sides, but always near them, in case they should be wanted, as well as the heels. The body must be kept easy and firm, and without any rocking ; which is a bad habit easily contracted, especially in galloping. The left elbow must be gently leant against the body a little forwards : unless it he so rested, the hand cannot be steady, but will always be checking, and consequently hurt the horse's mouth. The hand and elbow ought to be equally high; if the hand were lower, it would constrain and confine the motion of the horse's shoulders : but, as the mouths of horses are different, the place of the hand also must occasionally differ: a leaning, low, heavy forehand requires a high hand; and a horse that pokes out his nose a low one. The right arm must be placed in a symmetry with the left; only let the right hand be a little more forward or backward, higher or lower, as occasion may require, in order that both hands may be free; both arms must be a little bent at the elbow, to prevent stiffness. A soldier's right hand should be kept unemployed in riding; it carries the sword, which is a sufficient business for it.

One rule ought never to be neglected about the hand, that it must be kept clear of the body; i. e. about two inches and a half forwards from it, with the nails turned opposite to the belly, and the wrist a little rounded downwards; a position not less graceful than ready for slackening, ightening, and moving the reins from one side to the other as may be found necessary.

When the rider is well placed, the more rough trotting he has without stirrups the better; but with a strict care always that his position be preserved very exactly. In all cases great care must be taken to hinder his clinging with his legs: in short, no clinging by hands or legs is ever to be allowed. If the motion of the horse be too rough, slacken it, till the rider grows by degrees more confident; and, when he is quite firm and easy on his horse in every kind of motion, stirrups may be given him; but he must never leave off trotting often without any. The stirrups should be neither short nor long; but of such a length, that when the rider, being well placed, puts his feet into them (about one-third of the length of each foot from the point of it), the points may be between two and three inches higher than the heels. The rider must not bear upon his stirrups, but let the natural weight of his legs rest on them; for, if he bears upon them, he will be raised above and out of his saddle; which should never be, except when a soldier charges sword in hand, with the body inclined forwards at the very instant of attacking. Spurs may be given as soon as the rider is grown familiar with stirrups; or even before, if his legs are well placed.

The hand should always be firm, but delicate; that is, a horse's mouth should never be surprised by any sudden transition of it, either from slack to tight, or from tight to slack. Every thing in horsemanship must be effected by degrees, but at the same time with spirit and resolution. That hand which, by giving and taking properly, gains its point with the least force, is the best; and the horse's mouth, under such a direction, will consequently be the best, supposing equal advantages in both from nature. This principle of gentleness should be observed upon all occasions, and in every part of horsemanship. Sometimes the right hand will be necessary, upon troublesome horses, to assist the left; but the less this is done the better. The snaffle must on all occasions be uppermost; that is, the reins of it must be above those of the bridle, whether the snaffle or the bit be used separately, or together.

When the rider knows enough, and the horse is sufficiently prepared and settled to begin any work towards suppling, one rein must be shortened according to the side worked to; but it must never be so much shortened as to make the whole strength rest on that rein alone: for, not to mention that the work would be false and bad, one side of the horse's mouth would thus be always deadened; whereas it should always be kept fresh by its own play, and by the help of the opposite rein's acting delicately in a somewhat smaller degree of tension; the joint effect of which produces in a horse's mouth the proper, gentle, and easy degree of appui or bearing.

A coward and a mad man make equally bad riders, and are both soon discovered and confounded by the superior sense of the creature they are mounted upon, who is at the same time equally spoiled by both. The coward, by suffering the animal to have his own way, not only confirms him in his bad habits, but creates new ones in him; and the mad or violent rider, by false and violent motions and corrections, drives the horse, through despair, into every vicious trick that rage can suggest.

The hands and legs should always act in correspondence with each other; the latter being subservient and assistant to the former. Upon circles, in walking, trotting, or galloping, the outward leg is the only one to be used, and that only for a moment at a time, in order to set off the horse true, or put him right if he be false; and, as soon as that is done, it must be taken away again immediately: but if the horse be lazy, or otherwise retain himself, both legs must be used and pressed to his sides at the same time together. The less the legs are used, in general, the better. Very delicate good riders, with horses they have dressed themselves, will scarcely ever use them. By the term outward is understood the side which is more remote from the centre; and by inward is meant the side next to the centre. In reining back, the rider should be careful not to use his legs, unless the horse back on his shoulders; in which case they must be both applied gently at the same time, and correspond with the hand. If the horse refuse to back at all, the rider's legs must be gently approached, till the horse lifts up a leg, as if to go forwards; at which time, the rein of the same side with that leg which is lifted up, will easily bring it backwards, and oblige the horse to back ; but if the horse offers to rear, the legs must be instantly removed. The inward rein must be tighter on circles, so that

the horse may bend and look inwards, and the outward one crossed over a little towards it, and both held in the left hand.

The man and horse should begin on very slow motions, that they may have time to understand what is taught them; and in proportion as the effects of the reins are better comprehended, and the manner of working becomes more famihar, the quickness of motion may be increased. Every rider must learn to feel, without the help of the eye, when a horse goes false, and remedy the fault accordingly: this is an intelligence which nothing but practice, application, and attention, can give. A horse may not only gallop false, but also trot and walk false. If a horse gallops false, that is to say, if going to the right he leads with the left leg, or if going to the left he leads with the right; or in case he is dis-united, i. e. if he leads with the opposite leg behind to that which he leads with before; stop him immediately, and put him off again pro-perly. The method of effecting this is by approaching your outward leg, and putting your hand outwards; still keeping the inward rein the shorter, and the horse's head inwards, if possible: and, if he should still resist, then bend and pull his head outwards also; but replace it again, bent properly inwards, the moment he goes off true. A horse is said to to be disunited to the right, when going to the right, and consequently leading with the right leg before, he leads with the left behind; and is said to be disunited to the left, when going to the left, and consequently leading with the left leg before, he leads with the right behind. A horse may at the same time be both false and disunited; in correcting both which faults, the same method must be used. He is both false and disunited to the right, when in going to the right he leads with the left leg before, and the right behind; notwithstanding that hinder leg be with propriety more forward under his belly than the left, because the horse is working to the right: and he is false and disunited to the left, when in going to the left he leads with the right leg before and the left behind; notwithstanding, as above, the hinder leg be with propriety more forward under his belly than the right, because the horse is working to the left.

In teaching to sit rightly on horseback, the greatest attention must be given to prevent stiffness, and sticking by force in any manner: stiffness disgraces every undertaking, and sticking serves only to throw a man when displaced a greater distance from his horse: whereas, by a proper equilibrating position of the body, and by the natural weight only of the thighs, he must be firm and secure in his seat. As the rider becomes more firm, and the horse more supple, it is proper to make the circles less; but not too much so, for fear of throwing the horse forward upon his shoulders.

Some horses, when first the bit is put into their mouths, if great care be not taken, will put their heads very low. With such horses, raise your right hand with the bridoon in it, and play at the same time with the bit in the left hand, giving and taking. On eircles, the rider must lean his body inwards; unless great attention be given to make him do it, he will be perpetually losing his seat. It is scarcely possible for him to be displaced, if he leans his body properly inwards.

Sect. III.—OF SUPPLING HORSES WITH MEN UPON THEM BY THE EPAULE EN DEDANS, &c., WITH AND WITHOUT A LONGE, ON CIRCLES AND ON STRAIGHT LINES.

When a horse is well prepared and settled in all his motions, and the rider firm, it will be proper to proceed towards a farther suppling and teaching of both. Begin this new work by bringing the horse's head a little more inwards than before, pulling the inward rein gently to you by degrees. When this is done try to gain a little on the shoulders, by keeping the inward rein the shorter as before, and the outer one crossed over towards the inward one. The intention of these operations is this: the inward rein serves to bring in the head, and procures the bend; whilst the outward one, that is a little crossed, tends to make that bend perpendicular, and as it should be; that is to say, to reduce the nose and the forehead to a perpendicular line with each other: it also serves, if put forward. as well as crossed, to put the horse forward, if necessary; many horses being apt, in this and other operations, rather to lose their ground backward, when they should rather advance: if the nose were drawn in towards the breast, beyond the perpendicular, it would confine the motion of the shoulders, and have other bad effects.

All other bends besides those above specified are false. The outward rein, being crossed, not in a forward sense, but rather a little backward, serves also to prevent the outward shoulder from getting too forward, and makes it approach the inward one; which facilitates the inward leg's crossing over the outward one, which is the motion that so admirably supples the shoulders. Care must be taken that the inward leg pass over the outward one without touching it : this inward leg's crossing over must be helped also by the inward rein, which you must cross towards and over the outward rein every time the outward leg comes to the ground, in order to lift and help the inward leg over it: at any other time, but just when the outer leg comes to the ground, it would be wrong to cross the inward rein, or to attempt to lift up the inward leg by it; nay, it would be demanding an absolute impossibility, and pulling about the reins and horse to no purpose : because, in this case, a very great part of the horse's weight, resting upon that leg, would render such an attempt not only fruitless, but also prejudicial to the sensibility of his mouth: moreover, it would put the horse under a necessity of straddling before, and of leading with the wrong leg.

When the horse is thus far familiarised to what you require of him, proceed to effect by degrees the same crossing in his hinder legs. By bringing in the fore legs more you will or course engage the hinder ones in the same work : if they resist, the rider must bring both reins more inwards; and, if necessary, put back also, and approach his inward leg to the horse; and if the horse throws out his eroup too far, he must bring both reins outwards, and, if absolutely necessary, he must also make use of his outward leg, in order to replace the horse : observing that the croup should always be considerably behind the shoulders, which in all actions must go first; and, the moment that the horse obeys, the rider must put his hand and leg again in their usual positions.

Nothing is more ungraceful in itself, more detrimental to a man's seat, or more destructive of the sensibility of a horse's sides, than a continual unsettledness in a horseman's legs, which prevents the horse from ever going a moment together, steady, or determined. A horse should never be turned, without first moving a step forwards: and, when it is doing, the rider must not lift his elbow, and displace himself; a motion only of the hand from the one side to the other being sufficient for that purpose. It should also be a constant rule, never to suffer a horse to be stopped, mounted, or dismounted, but when he is well placed. The slower the motions are when a man or horse is taught any thing, the better.

The figures worked upon must be great at first, and afterwards made less by degrees, according to the improvement which the man and horse make; the cadenced pace also, which they work in, must be gradually augmented. The changes from one side to the other should be in a bold determined trot, and at first quite straight forwards, without demanding any side motion on two pistes, which it is very necessary to require afterwards when the horse is sufficiently suppled. By two pistes is meant, when the fore and hinder parts do not follow, but describe two different lines.

In the beginning, a longe is used on circles, and also on straight lines, to help both the rider and the horse; but afterwards, when they are grown more intelligent, they should go alone. At the end of the lesson, rein back; then put the horse forwards by degrees, approaching both legs gently to his sides, and playing with the bridle : if he rears, push him out immediately into a full trot. Shaking the cavesson on the horse's nose, and also putting yourself before him and rather near to him, will generally make him back, though he otherwise refuse to do it : moreover, a slight use and approaching of the rider's legs will sometimes be necessary in backing, in order to prevent the horse from going too much upon his shoulders : but the pressure of the legs ought to be very small, and taken quite away the moment that he puts himself upon his haunches. If the horse will not back upon a straight line properly, the rider must not be permitted to have recourse immediately to his leg, and so distort himself by it; but first try, if crossing over his hand and reins to which ever side may be necessary, will not be alone sufficient : and if not, then employ the leg.

After a horse is properly prepared, and goes freely on his several paces, he ought to be kept to a proper degree upon his haunches, with his hinder legs well placed under him; whereby he will be always pleasant to himself and his rider, will be light in hand, and ready to execute whatever may be demanded of him. The method that is commonly used, of forcing a horse sideways, is a glaring absurdity, and very hurtful to the animal; instead of suppling him, it obliges him to stiffen and defend himself, and often makes a creature that is naturally benevolent, restive, frightened, and vicious.

A running snaffle is best for horses who have very long and high fore-hands, and who poke out their noses; but, for such as bore and keep their heads low, a common one is preferable; though any horse's head may be kept up also with a running one, by the rider keeping his hands very high and forwards: but whenever either is used alone without a bridle, upon horses that carry their heads low and that bore, it must be sawed about from one side to the other.

This lesson of the epaule en dedans should be taught to all who intend to teach horsemanship or to break horses; and the more of such that can be found the better: none others should ever be suffered upon any occasion to let their horses look any way besides the way they are going. But all horses whatever, and all men who are designed for teaching others, must go thoroughly and perfectly through this excellent lesson.

SECT. IV.—OF THE HEAD TO THE WALL, AND THE CROUP TO THE WALL.

This lesson should be practised immediately after that of the epaule en dedans, in order to place the horse properly the way he goes, &c. The difference between the head to the wall, and the croup to the wall, consists in this: in the former the fore-parts are more remote from the centre, and go over more ground; in the latter, the hinder parts are more remote from the centre, and consequently go over more ground; in both, as well as in all other lessons, the shoulders must go first. In riding horses, the head to the wall is the easier lesson of the two at first, the line to be worked upon being marked by the wall, not far from his head.

The motion of the legs to the right is the same as that of the epaule en dedans to the left, and so vice versâ; but the head is always bent and turned differently: in the epaule en dedans the horse looks the contrary way to that which he goes; in this he looks the way he is going. In the beginning very little bend is required; too much at once would astonish the horse, and make him defend himself; it must be augmented by degrees. If the horse absolutely refuses to obey, it is a sign that either he or his rider has not been sufficiently prepared by previous lessons. It may happen that weakness or a hurt in some part of the body, or sometimes temper, though seldom, may be the cause of the horse's defending himself: it is the rider's business to find out whence the obstacle arises ; and, if he finds it to be from the first mentioned cause, the previous lessons must be resumed; if from the second, proper remedies must be applied; and if from the last cause, when all fair means that can be tried have failed, proper correction must be used.

In practising this lesson to the right, bend the horse to the right with the right rein ; helping the

left leg over the right (at the time when the right leg is just come to the ground), with the left rein crossed towards the right, and keeping the right shoulder back with the right rein towards your body, in order to facilitate the left leg's crossing over the right; and so likewise vice versa to the left, each rein helping the other by their properly mixed effects. In working to the right the rider's left leg helps the hinder parts on to the right, and his right leg stops them if they get too forwards; and so vice versa to the left: hut neither ought to be used, till the hand being employed in a proper manner has failed, or finds that a greater force is necessary to bring about what is required than it can effect alone; for the legs should not only be corresponding with, but also subservient to, the hand; and all unnecessary aids, as well as all force, ought always to be avoided as much as possible.

In the execution of all lessons the equilibrium of the rider's body is of great use to the horse; it ought always to go with, and accompany every motion of the animal; when to the right, to the right; and when to the left, to the left. Upon all horses, in every lesson and action, it must be observed, that there is no horse but has his own peculiar appui or degree of bearing, and also a sensibility of mouth, as likewise a rate of his own, which it is absolutely necessary for the rider to discover. A bad rider always takes off at least the delicacy of both. The horse will inform his rider when he has got his proper bearing in the mouth, by playing pleasantly and steadily with his bit, and by the spray about his chaps. A delicate and good hand will not only always preserve a light appui or bearing in his sensibility; but also of a heavy one, whether natural or acquired, make a light one. The lighter this appui can be made, the better, provided that the rider's hand corresponds with it; if it does not, the more the horse is properly prepared, so much the worse.

Instances of this inconvenience of the best of appuis, when the rider is not equally taught with the horse, may be seen every day. Gentlemen try to get their horses bitted, as they call it, without being suitable prepared themselves for riding them; the consequence of which is, that they ride in danger of breaking their necks; till at length, after much pulling about, and by the joint insensibility and ignorance of themselves and grooms, the poor horse gradually becomes a mere senseless unfeeling automaton; and thereby grows what is called settled. When the proper appui is found, and made of course as light as possible, it must not be kept duly fixed without any variation, but be played with ; otherwise one equally continued tension of reins would render both the rider's hand and the horse's mouth very dull. Slight and frequent giving and taking is therefore necessary to keep both perfect.

Whatever pace or degree of quickness you work in, be it ever so fast, or ever so slow, it must be cadenced; time is as necessary for a horseman as for a musician. This lesson of the head and of the tail to the wall is especially to be taught every soldier; scarcely any manœuvre can be performed without it. In closing and opening files, it is almost every moment wanted.

SECT. V.—OF MAKING HORSES STAND FIRE, AND ENDURE NOUSES, ALARMS, SIGHTS, &C.

To make horses stand fire, the sound of drums, and different noises, use them to :t by degrees in the stable at feeding-time; and, instead of being frightened at it, they will soon come to like it as a signal for eating. With regard to such horses as are afraid of burning objects, begin by keeping them still at a certain distance from some lighted straw: caress the horse; and in proportion as his fright diminishes, bring gradually the burning straw nearer, and increase the size of it. By this means he may very quickly be brought to be so familiar with it, as to walk undaunted even through it.

As to horses that are apt to lie down in the water, if animating them, and attacking them vigorously, should not have the desired effect, then break a straw-bottle full of water upon their heads, and let the water run into their ears, which is a thing they dislike very much.

All troop horses must be taught to stand quiet and still when they are fired from, to stop the moment you present, and not to move after firing till they are required to do it: in short, the horse must be taught to suffer the rider to act upon him with the same freedom as if he was on foot. Patience, coolness, and temper, are the only means requisite for accomplishing this end. Begin by walking the horse gently; then stop and keep him from stirring for some time, so as to accustom him by degrees not to have the least^{*} idea of moving without orders: if he does, then back him : and when you stop him, and he is quite still, leave the rems loose.

To use a horse to fire-arms, first put a pistol or carabine in the manger with his seed; then use him to the sound of the lock and the pan; after which, when you are upon him, show the piece to him, presenting it forwards, sometimes on one side, sometimes on the other : when he is thus far reconciled, proceed to flash in the pan; after which, put a small charge into the piece, and so continue augmenting it by degrees to the quantity which is commonly used: if he seems uneasy, walk him forward a few steps slowly; and then stop, back, and caress him. Horses are also often disquieted and unsteady at the clash, and drawing, and returning of swords ; all which they must be familiarised to gradually and gently.

It is necessary for cavalry in general, but particularly for light cavalry horses, to be very ready and expert in leaping ditches, hedges, gates, &c. The leaps, of whatever sort, to which horses are at first brought, ought to be very small, and the rider must keep his body back, raise his hands a little in order to help the fore parts of the horse up, and be very attentive to his equilibrium. It is best to begin at a low bar covered with furze, which pricking the horse's legs, if he does not raise himself sufficiently, prevents his contracting a sluggish and dangerous habit of touching, as he goes over. Let the ditches also you first bring horses to be narrow. Accustom them to come up to every thing which they are to leap over, and to stand coolly at it for some time; then to raise themselves gently up in order to form an idea of the distance. When they leap well standing, use them to walk gently up to the leap, and to go over it without first halting at it. After this practice is familiar to them, repeat it in a gentle trot, and so by degrees faster and faster, till at length it is as familiar to them to leap flying on a full gallop as another way.

As horses are apt to be frightened at the sight and smell of the dead of their own species, it is advisable to habituate them to walk and leap over carcasses; but the greatest gentleness ought here to be used. Horses should also be accustomed to swim; and a very small portion of strength is sufficient to guide a horse in the water, where they must be permitted to heave their heads, and be no way constrained

The practice of cutting off extremities from horses is in all cases very pernicious. It is particularly so in regard to a troop-horse's tail. It is almost incredible how much they suffer at the piquet for the want of it; kicking about and laming one another; whilst other horses, with their tails on, brush off all flies, are cool and at their ease, and mend daily.

Sect. VI.—OF REINING BACK, AND MOVING FORWARD IMMEDIATELY AFTER; PIAFING PILLARS, &C.

Never finish your work by reining back with horses that have any disposition towards retaining themselves; but always move them forwards, and a little upon the haunches also, after it, before you dismount, unless they retain themselves very much indeed; in which case, nothing at all must be demanded from the haunches. This lesson of reining back, and piafing, is proper to conclude with, and puts a horse well on the haunches : it may be done, according as horses are more or less suppled, either going forward, backing, or in the same place : if it is done well advancing, or at most on the same spot, it is sufficient for a soldier's horse. For to piafe in backing is too much to be expected in the hurry of training numbers of men and horses together

This lesson should indeed never be attempted at all, till horses are very well suppled, and accustomed to be put together; otherwise it will create restiveness. If they refuse to back, and stand motionless, the rider's legs must be approached with the greatest gentleness to the horse's sides: at the same time that the hand is acting on the reins to solicit his backing. This seldom fails of procuring the desired effect, by raising one of the horse's fore legs, which is consequently very easily brought backwards by a small degree of tension in the reins.

Well performed, this lesson is particularly serviceable, when pillars are used. Very few regimental riding-houses have pillars, and it is fortunate they have not; for though, when used with skill, they are one of the greatest and best discoveries in horsemanship; they must be allowed to be very dangerous and pernicious when not under proper direction.

SECT. VII.—Of CURING RESTIVENESS, VICI-OUSNESS, STARTING, &C.

Whenever a horse makes resistance, one ought to examine very minutely all the tackle about him; if any thing hurt or tickle him; whether he have any natural or accidental weakness, &c. For want of this precaution many disasters happen, and the animal is frequently accused falsely of being restive and vicious. Correction, according to the way it is used, throws a horse into more or less violent action, which, if he be weak, he cannot support; but a vicious strong horse is to be considered in a very different light, being able both to undergo, and consequently to profit by all lessons; and is far preferable to the best natured weak one upon earth. Patience and attention are never failing means to reclaim such a horse; in whatsoever manner he defends himself, bring him back frequently with gentleness (not, however, without having given him proper chastisement if necessary) to the lesson which he seems most averse to.

Horses are by degrees made obedient, through the hope of reward and the fear of punishment. To blend the operation of the two judiciously together is very difficult; requiring much thought and practice, a good head, and a good disposition. The coolest and best-natured rider will always succeed best. If a horse be impatient, or choleric, never strike him, unless he absolutely refuse to go forward; which you must then resolutely oblige him to do, and which will be of itself a correction. Resistance in horses is sometimes a mark of strength and vigor, and proceeds from spirit, as well as sometimes from viciousness or weakness. Great care should, therefore, be taken to distinguish from which of these causes a horse's resistance arises, before any remedy or punishment is adopted. It is sometimes a bad sign when horses do not at all resist, and may proceed from a sluggish disposition. Horses again are oftener spoilt by having too much done to them, and by attempts to dress them in too great a hurry.

After a horse has been well suppled, if there are no impediments, natural or accidental, and he still resist, chastisement becomes necessary; but this must not be frequent, but always firm, and as little violent as possible. Some horses have quicker parts and more cunning than others. Many will imperceptibly gain a little every day on the rider. Various, in short, are their dispositions and capacities. It is the rider's business to find these out, and to make a horse sensible of attachment, but at the same time that he will be master.

Plunging is a common defence among restive and vicious horses; if they do it while backing, they must, by the rider's legs and spurs firmly applied, be obliged to go forward, and their heads kept up high. But, if they do it flying forwards, keep them back, and ride them gently and very slow for a good while together. Of all bad tempers and qualities in horses, those which are occasioned by harsh treatment and ignorant riders are the worst.

Rearing is a vicious habit, and, in weak horses especially, a very dangerous one. While

the horse is up, the rider must yield his hand; and, when the horse is descending, he must vigorously determine him forwards; if this be done at any other time but while the horse is coming down, it may add a spring to his rearing, and make him fall backwards. With a skilful hand on them, horses seldom persist in this habit. If the foregoing method fail, make the horse kick up behind by getting somebody on foot to strike him behind with a whip; or by pricking him with a goad.

Starting often proceeds from a defect in the sight, which, therefore, must be carefully examined. Whatever the horse is afraid of, bring him up to gently, and caress him at every step. Nothing but great gentleness can correct this fault. If you let him pass the object without bringing him up to it, you increase the fault, and confirm him in his fear. Before such horses as are to a great degree functul of any object, make a quict horse, proceed towards it, and gradually entice them to approach nearer and nearer. If the horse thus alarmed be undisciplined and headstrong, he will probably run away with his rider; when his head must be kept up high, and the snaffle moved backwards and forwards from right to left, taking up and yielding the reins of it, as well as the reins of the bit; but this last must not be moved backwards and forwards like the snaffle, but only taken up and yielded properly. No man ever yet did, or ever will, stop a horse, or gain any point over him by main force, or by pulling against him.

Sect. VIII.—Rules for Inexperienced Horsemen.

On this subject Mr. Thompson has given the following rules :- In the first place, every horse should be accustomed to stand still when he is mounted. One would imagine this might be readily granted; yet we see how much the contrary is practised. When a gentleman mounts at a livery stable, the groom takes the horse by the bit, which he bends tight round his under jaw : the horse, striving to go on, is forced back; advancing again, he frets, as he is again stopped short, and hurt by the manner of holding him. The rider, in the mean time, mounting without the bridle, or at least holding it but slightly, is helped to it by the groom, who, being thoroughly employed by the horse's fluttering, has at the same time both bridle and stirrup to give. This confusion would be prevented, if every horse were taught to stand still when he is mounted. Forbid your groom, therefore, when he rides your horse to water, to throw himself over from a horse-block, and kick him with his leg even before he is fairly upon him. This wrong manner of mounting is what chiefly teaches horses this vicious habit.

A constant practice of mounting in the proper manner is all that is necessary to prevent a horse from going on till the rider is fairly in the saddle. A common method is to stand near the eroup or hinder part of the borse, with the bridle held long. By this manner of holding the bridle, before you mount, you are liable to be kicked; and, when you are mounted, your horse may go on some time, or play what gambols he

pleases, hefore the rein is short enough in your hand to prevent him. It is common likewise for an awkward rider, as soon as his foot is in the stirrup, to throw himself with all his force to gain his seat ; which he cannot do, perhaps, till he has first overbalanced himself on one side or the other. The way to mount with ease and safety is, to stand rather before than behind the stirrup. In this posture take the bridle short, and the mane together in your left hand, helping yourself to your stirrup with your right, so that your toe may not touch the horse in mounting. When your left foot is in the stirrup, move on your right, till you face the side of the horse, looking across over the saddle. Then with your right hand grasp the hinder part of the saddle; and with that and your left, which holds the mane and bridle, lift yourself upright on your left foot. Remain thus a mere instant on your stirrup, only so as to divide the action into two motions. While you are in this posture you have a sure hold with both hands, and are at liberty either to get safely down, or to throw your leg over and gain your seat. By this deliberate motion likewise you avoid, what every good horseman will endeavour to avoid, putting the horse into a flutter.

To dismount, hold the bridle and mane together in your left hand, as when you mounted; put your right hand on the pommel of the saddle, to raise yourself; throw your leg back over the horse; grasp the hinder part of the saddle with your right hand; remain a moment on your stirrup; and in every respect reverse the actions of mounting your horse. Take care not to bend your right knee in dismounting, lest your spur should rub against the horse.

When you ride, hold your bridle at a convenient length. Sit square, and let not the purchase of the bridle pull forward your shoulder: but keep your body even, as it would be if each hand held a rein. Hold your reins with the whole grasp of your hand, dividing them with your little finger. Let your hand be perpendicular; your thumb will then be uppermost and placed on the bridle. Bend your wrist a little outward; and, when you pull the bridle, raise your hand towards your breast, and the lower part of the palm rather more than the upper. Let the bridle be at such a length in your hand, as, if the horse should stumble, you may be able to raise his head, and support it by the strength of your arms, and the weight of your body thrown backward. If you hold the rein too long, you are subject to fall backward as your horse rises. If, knowing your horse perfectly well, you think a tight rein unnecessary, advance your arm a little(but not your shoulder) towards the horse's head, and keep your usual length of rein. By this means you have a check upon your horse, while you indulge him.

If you ride with a curb, make it a rule to hook on the chain yourself; the most quiet horse may bring his rider into danger, should the curb hurt him. If, in fixing the curb, you turn the chain to the right, the links will unfold themselves, and then oppose a farther turning. Put on the chain loose enough to hang down on the horse's under lip, so that it may not rise and press his jaw till the reins of the bridle are moderately pulled. If your horse has been used to stand still when he is mounted, there will be no occasion for a groom to hold him; but if be does, suffer him not to touch the reins, but that part of the bridle which comes down the cheek of the horse. He cannot then interfere with the management of the reins, which belongs to the rider only; and holding a horse by the curb (which is ever painful to him) is evidently improper when he is to stand still.

Take care not to ride with your arms and elbows as high as your shoulders; nor let them shake up and down with the motion of the horse. The posture is unbecoming, and the weight of the arms (and of the body too if the rider does not sit still) acts in continual jerks on the jaw of the horse, which must give him pain, and make him unquiet, if he has either a tender mouth or any spirit.

Riders wonder why horses are gentle as soon as they are mounted by skilful horsemen. The reason is, the horse goes on at his ease, yet finds all his motions watched; which he has sagacity enough to discover. Such a rider hides his whip, if he finds his horse is afraid of it; and keeps his legs from his sides. Avoid the ungraceful custom of letting your legs shake against the sides of the horse: and as you are not to keep your arms and elbows high, and in motion, so you are not to rivet them to your sides, but let them fall easy: an awkward horseman seems flying off at all points.

It is often said with emphasis, that such a one has no seat on horseback; meaning not only that he does not ride well, but that he does not sit on the right part of the horse. To have a good seat is to sit on that part of the horse which, as he springs, is the centre of motion ; and from which, of course, any weight would be with most difficulty shaken. As in the rising and falling of a board, placed in equilibrio, the centre will be always most at rest, the true seat will be found in that part of your saddle into which your body would naturally slide if you rode without stir-rups; and is only to be preserved by a proper poise of the body, though the generality of riders imagine it is to be done by the grasp of the thighs and knees. The rider should consider himself as united to his horse in this point; and, when shaken from it, endeavour to restore the balance.

The mention of the two extremities of a bad seat may help to point out the true one. The one is, when the rider sits very far back on the saddle, so that his weight presses the loins of the horse; the other, when his body hangs forward over the pommel of the saddle. The first may be seen practised by grooms when they ride with their stirrups affectedly short; the latter by fearful horsemen on the least flutter of the horse. Every good rider has, even on the hunting saddle, as determined a place for his thighs as can be made for him by the bars of a demi-peak. Indeed there is no difference between the seat of either : only, as in the first you ride with shorter stirrups, your body will be consequently more behind your knees.

To have a good seat for the rider, the saddle

must fit well. In general the saddle presses as nearly as possible on that part which we have described as the point of union between the man and the horse; but so as not to obstruct the motion of the horse's shoulders. Place yourself in the middle or lowest part of it: sit erect; but with as little constraint as in a chair. The ease of action marks the good rider: you may repose yourself, but not lounge. The studied exactness acquired in the riding-house, by those whose deportment is not easy, appears ungenteel and unnatural.

If your horse stops short, or endeavours, by raising and kicking, to unseat you, do not bend your body forward, as many do in those circumstances : that motion throws the breech forward, and the rider out of his seat; whereas the advancing the lower part of the body, and bending back the upper part and shoulders, is the method both to keep your seat, and to recover it when lost. The bending your body back, and that in a great degree, is the greatest security in flying leaps; it is a security, too, when your horse leaps standing. The horse's rising does not try the rider's seat; the lash of his hind legs ought chiefly to be guarded against, and is best done by the body being greatly inclined back. Stiffen not your legs or thighs; and let your body be pliable in the loins, like the coachman's on his box.

This manner of sitting will counter-balance every rough motion of the horse; whereas the fixture of the knees, so commonly laid a stress on, will in great shocks conduce to the violence of the fall. Were the cricket-player, when the ball is struck with the greatest force, to hold his hand firm and fixed to receive it, the hand would be bruised, or perhaps the bones fractured by the resistance. To obviate this, he yields his hand to the motion of the ball for a certain distance; and thus, by a due mixture of opposition and obedience, catches it without sustaining the least injury. The case is exactly the same in riding : the skillful horseman will recover his poise by giving some way to the motion; and the ignorant horseman will be flung out of his seat by endeavouring to be fixed.

Stretch not out your legs before you; this will push you against the back of the saddle; neither gather up your knees, like a man riding on a pack; this throws your thighs upwards; each practice unseats you. Keep your legs straight down; and sit not on the most fleshy part of the thighs, but turn them inwards, so as to bring in your knees and toes. It is more safe to ride with the ball of the foot pressing on the stirrup, than with the stirrup as far back as the heel; for the pressure of the heel, being in that case behind the stirrup, keeps the thighs down.

When you find your thighs thrown upwards, widen your knees to get them and the upper part of your fork lower down on the horse. Grasp the saddle with the hollow or inner part of your thighs, but not more than just to assist the balance of your body: this will also enable you to keep the spurs from the horse's sides, and to bring your toes in. Sink your heels straight down; for, while your heels and thighs keep down, you cannot fall; this, aided by the hend of the back, gives the security of a seat to those who bear themselves up in their stirrups in a swift gallop, or in the alternate rising and falling in full trot.

Let your seat determine the length of your stirrups, rather than the stirrups your seat. If more precision is requisite, let your stirrups, in the hunting saddle, be of such a length, as that, when you stand in them, there may be the breadth of four fingers between your seat and the saddle. It would greatly assist a learner, if he would practice in a large circle, as directed in Sect. II., without stirrups; keeping his face looking on the outward part of the circle, so as not to have a full view of the horse's head, but just of that which is on the outward part of the circle; and his shoulder, which is to-wards the centre of the circle, very forward. You thus learn to balance your body, and keep a true seat, independent of your stirrups; you may probably likewise escape a fall, should you at any time lose them by being accidentally shaken from your seat.

As the seat in some measure depends on the saddle, because a saddle with a high pommel is thought dangerous, the other extreme prevails, and the pommel is scarcely allowed to be higher than the middle of the saddle. The saddle should lie as near the back-bone as can be. without hurting the horse; for the nearer you sit to his back, the better seat you have. If it does so, it is plain the pommel must rise enough to secure the withers from pressure ; therefore a horse, whose withers are higher than common, requires a high pommel. If, to avoid this, you make the saddle straight, the inconvenience spoken of follows; you sit too much above the horse's back, nor can the saddle form a proper seat. There should be no ridge from the button at the side of the pommel, to the back part of the saddle. That line also should be a little concave for your thighs to lie at ease. In short, a saddle ought to be, as nearly as possible, as if cut cut of the horse.

When you want your horse to move forward, raise his head a little, and touch him gently with your whip; or else press the calves of your legs against his sides. If he does not move fast enough, press them with more force, and so till the spur just touches him. By this practice he will, if he has any spirit, move upon the least pressure of the leg. Never spur him by a kick ; but, if it be necessary to spur him briskly, keep your heels close to his sides, and slacken their force as he becomes obedient. When your horse attempts to be vicious, take each rein separate, one in each hand, and, advancing your arms forward, hold him very short. In this case it is common for the rider to pull him hard, with his arms low. But the horse, thus having his head low too, has it more in his power to throw out his hee's: whereas, if his head be raised very high, and his nose thrown out a little, he can neither rise before nor behind; because he can give himself neither of those motions, without having his head at liberty. A plank, placed in equilibrio, eannot rise at one end unless it sinks at the other.

If your horse is headstrong, pull not with one

continued pull, but stop, and back him ofter just shaking the reins, and making repeated pulls till he obeys. Horses are so accustomed to bear on the bit when they go forward, that they are discouraged if the rider will not let them do so. If a horse is loose-necked, he will throw up his head at a continued pull; in which situation the rider, seeing the front of his face, can have no power over him. When your horse does thus, drop your hand, and give the bridle play, and he will of course drop his head again into its proper place: while it is coming down make a second gentle pull, and you will find his mouth. With a little practice, this is done almost instantaneously; and this method will stop, at the distance of a few yards, a horse which will run away with those who pull at him with all their might.

Almost every one has observed, that when a horse feels himself pulled with the bridle, even when he is going gently, he often mistakes what was designed to stop him, as a direction to bear on the bit, and go faster. Keep your horse's head high, that he may raise his neck and crest; play a little with the rein, and move the bit in his mouth, that he may not press on it in one constant and continued manner; be not afraid of raising his head too high; he will naturally be too ready to bring it down, and tire your arms with its weight, on the least abatement of his mettle. When you feel him heavy, stop him, and make him go back a few paces: thus you break by degrees his propensity to press on his bridle.

Many are pleased with a round neck, and a head drawn in towards his breast; but this is a mistake. Let your horse carry his head bridling in, provided he carries it high, and his neck arching upwards: but if his neck bends downwards his figure is bad, his sight is too near his toes, he leans on the bridle, and you have no command over him. If he goes pressing but lightly on the bridle, he is the more sure-footed. and goes pleasanter, as your wrist only may guide him. If he hangs down his head, and makes you support the weight of that and his neck with your arms bearing on his fore legs (which is called being on his shoulders), he will strike his toes against the ground, and stumble. If your horse is heavy upon the bit, tie him every day for an hour or two, with his tail to the manger, and his head as high as you can make him lift it, by a rein on each post of the stall, tied to the rings of the snaffle-bit.

Horse-breakers and grooms have a great propensity to bring a horse's head down, and seem to have no seat without a strong hold by the bridle. They know indeed that the head should yield to the reins, and the neck form an arch; but do not take the proper pains to make an arch upward. A temporary effect of attempting to raise the horse's head may perhaps be making him push out his nose. They will here tell you, that his head is too high already; whereas it is not the distance from the nose, but from the top of his head to the ground, which determines the head to be high or low. Besides, although the fault is said to he in the manner of carrying the head, it should rather be said to be in that of the neck; for, if the neck was raised, the head would be more in the position of one set on a well formed neck.

The design, therefore, of lifting up the head is to raise the neck, and thereby bring in the head; for, even while the bridle makes the same line from the rider's hand to the bit, the horse's nose may be either drawn in or thrust out, according as his neck is raised or depressed. Instead of what has been here recommended, we usually see colts broken with their heads cavessoned very low, their necks stiff, and not in the least suppled. When the breaking tackle is left off, and they are mounted for the road, having more food and rest, they frequently plunge, and a second breaking becomes necessary. Then, as few gentlemen can manege their own horses, they are put into the hands of grooms, from whom they learn a variety of bad habits.

No curb, martingale, or other forcible method, will teach a horse to carry his head or neck in a posture which nature has made uneasy to him. By trying to pull in his nose farther than he can bear you will give him a bad habit. You could not indeed contrive a more effectual method to make him continually toss his nose up and throw his foam over you. It is a common custom to be always pulling at the bridle, as if to set off to advantage either the spirit of the horse, or the skill of the rider. Our horses therefore are taught to hold their heads low, and pull so as to bear up the rider from the saddle, standing in his stirrups, even in the gentlest gallop : how very improper this is we may be experimentally convinced; when we happen to meet with a horse which gallops otherwise we immediately say, he canters excellently, and find the ease and pleasure of his motion. When horses are designed for the race, and swiftness is the only thing considered, the method may be a good one.

It is not to be wondered that dealers are always pulling at their horses: that they have the sour constantly in their sides, and are at the same time continually checking the rein: by these means they make them bound, and champ the bit, while their rage has the appearance of spirit. These people ride with their arms spread, and very low on the shoulders of their horses : a method which makes them stretch their necks, and gives a better appearance to their forehands : it conceals also a thick jaw, which, if the head were up, would prevent its yielding to the bit : it hides likewise the ewe-neck, which would otherwise show itself. Indeed, if you have a horse unsteady to the bit, formed with a naturally heavy head, or one which carries his nose obstinately in the air, you must find his mouth where you can, and make the best of him.

Many horses are taught to start by whipping them for starting. How is it possible they can know it is designed as a punishment? In the riding house the horse is taught to rise up before, and to spring and lash out his hinder legs, by whipping him when tied between two pillars, with his head a little at liberty. If he understood this to be a punishment for doing so, he would not by that method learn to do it. He seems to be in the same manner taught to spring and fly when he is frightened. Most horses would go quietly past an object from which they were beginning to fly if their riders, instead of gathering up their bridles and showing themselves so ready, would throw the reins loose upon their necks.

When a horse starts at any thing on one side the generality of riders turn him out of the road, to make him go up to the cause of his starting : if he does not get the better of his fear, or readily comply, he commonly goes past the object, making with his hinder parts, or croup, a great circle out of the road; whereas he should learn to keep straight on, without minding objects on either side. If he starts at any thing on the left, hold his head high, and keep it straight in the road, pulling it from looking at the thing he starts at, and keeping your right leg hard pressed against his side, towards his flank : he will then go straight along the road. By this method, and by turning his head a little more, he may be forced with his croup close up to what frightened him : for, as his head is pulled one way, his croup necessarily turns the other.

Always avoid a quarrel with your horse, if you can : if he is apt to start you will find occasions enough to exercise his obedience, when what he starts at lies directly in his way, and you must make him pass; if he is not subject to start you should not quarrel with him about a trifle. It must be observed, however, that this rule, in going past an object, may perhaps be a little irregular in a maneged horse, which will always obey the leg: but even such a horse, if he is really afraid, and not restive, it may not be amiss to make look another way; unless the object be something to the sight of which you would par-ticularly accustom him. The case will also be different with a horse whose fear is owing to his not being used to objects; but such a one is not to be rode by any horseman to whom these rules are directed : the starting here meant arises merely from the horse's being pampered, and springing through liveliness.

The practice of making a horse go immediately "p to every thing he is afraid of, and not suffering nim to become master of his rider, seems to be sometimes carried too far.

We are apt to suppose that a horse fears nothing so much as his rider: but may he not, in many circumstances, be afraid of instant destruction? of being crushed? of being drowned? of falling down a precipice? Is it a wonder that a horse should be afraid of a loaded waggon? may not the hanging load seem 'to threaten the falling on him? There cannot be a rule more general than, in such a case, to show him there is room for him to pass. This is done by turning his head a very little from the carriage, and pressing your leg which is farthest from it against his side.

A horse is not to stop without a sign from his rider. Is it not then probable that, when driven up to a carriage he starts at it, he conceives himself obliged either to attack or run against it? Can he understand the rider's spurring him, with his face directed to it, as a sign for him to pass it? That a horse is easily alarmed for his face and eyes is evident from this, that he will even catch back his head from a hand going to caress him. That he will not go with any force, face to face, even to another horse, if in his power to stop; and that he sees perfectly sideways, are useful hints for the treatment of horses with regard to starting. Though you ought not to whip a horse for starting, there can be no good effect from clapping his neck with your hand to encourage him. If you take any notice of his starting, it should be rather with some tone of voice which he usually understands as an expression of dislike to what he is doing; for there is opposition mixed with his starting, and a horse will ever repeat what he finds has foiled his rider.

Notwithstanding the directions above given, of not pressing a horse up to a carriage he starts at, yet, if one which you apprehend will frighten him meets you at a narrow part of the road, when you have once let him know he is to pass it he sure you remain determined, and press him on. Do this more especially when part of the carriage has already passed you : for if, when he is frightened, he is accustomed to go back, and turn round, he will certainly do it if he finds, by your hand slackening and legs not pressing, that you are irresolute; and this at the most dangerous point of time, when the wheels of the carriage take him as he turns. Remember not to touch the curb rein at this time; it will certainly check him.

The person who would lead a horse by the bridle should not turn his face to him when he refuses to follow him: if he raises his arms, shows his whip, or pulls the bridle with jerks, he frightens the horse, instead of persuading him to follow; which a little patience may bring about. Ride with a snaffle; and use your curb, if you have one, only occasionally. Choose your snaffle full and thick in the mouth, especially at the ends to which the reins are fastened. Most of them are made too small and long; they cut the horse's mouth, and bend back over the bars of his jaw, working like pincers.

The management of the curb is a very nice matter : a turn of the wrist, rather than the weight of your arm, should be applied to it. The elasticity of a rod, when a fish is hooked, may give some idea of the proper play of a horse's head on his bridle; his spirit and his pliableness are both marked by it. A horse should never be put to do any thing which he is not ready at, in a curb; you may force him, or pull his head any way, with a snaffle, but a curb acts only in a straight line. A horse may indeed be turned out of one track into another by a curb; but it is because he knows it is a signal. When he is put to draw a chain, and does not understand the necessity he is then under of taking a larger sweep when he turns, you frequently see him restive, as it is then called ; but put him on a snaffle, or buckle the rein to that part of the bit which does not curb him, and the horse submits to be pulled about, till he understands what is desired of him. These directions suppose your horse to have spirit, and a good mouth; if he has not, you must take him as he

is, an l ride him with such a bit as you find most easy.

When you ride upon a journey be not so attentive to your horse's nice carriage of himself as to your encouragement of him, and keeping him in good humor. Raise his head; but, if he flags, indulge him with bearing a little more upon the bit than you would suffer in an airing. If a horse is lame, tender-footed, or tired, he naturally hangs upon his bridle. On a journey, therefore, his mouth will depend greatly on his strength and the goodness of his feet. Be then very careful about his feet, and let not a blacksmith spoil them.

Few people, even though practised in riding, know they have any power over a horse but by the bridle; nor any use for the spur, except to make him go forward. A little experience will teach them a further use. If the left spur touches him, and he is at the same time prevented from going forward, he has a sign, which he will soon understand, to move sideways to the right; in the same manner to the left, if the right spur goads him. He afterwards, through fear of the spur, obeys a touch of the leg, in the same manas a horse moves his croup from one side of the stall to the other, when any one strikes him with his hand. In short, his croup is guided by the leg as his head is by the bridle. He will never disobey the leg, unless he becomes restive. By these means you will have a far greater power over him; he will move sideways if you close one leg to him; and straight forward if both : even when he stands still, your legs held near him will keep him on the watch; and, with the slightest unseen motion of the bridle upwards, he will raise his head, and show his fore-hand to advantage. On this use of the legs of the rider, and guidance of the croup of the horse, are founded all the airs (as the riding-masters express themselves) which are taught in the manege; the passage, or side-motion of troopers to close or open their files; and indeed all their evolutions.

But some degree of this discipline is convenient even for common use. It is useful if a horse is apt to stumble or start. By pressing your legs to his flank, and keeping up his head, he is made to go light on his fore-legs, which is aiding and supporting him ; and, if he does actually stumble, by helping him at the very instant to exert himself, while as yet any part of him remains not irrecoverably impressed with the precipitate motion. Hence this use of the hand and legs of the rider is called giving aids to a horse; for, as to holding up the weight of a heavy inactive horse by mere pulling, it is as impossible as to recover him when falling down a precipice. A horse is supported and helped by the hands and legs of his rider in every action they require of him; hence he is said to perform his airs by the aids from his rider.

The same discipline is useful if a horse starts. For if, when he is beginning to fly to one side, you press your leg on the side he is flying to, he stops his spring immediately; he goes past what he started at, keeping straight on, or as you choose to direct him : and he will not fly back 385

from any thing if you press him with both legs; you keep his haunches under him going down a hill; help him on the side of a bank; more easily avoid the wheel of a carriage; and approach more gracefully and nearer to the side of a coach or horseman. When a pampered horse curvets irregularly, and twists his body to and fro, turn his head either to the right or left, or both alternately (but without letting him move out of the track), and press your leg to the opposite side; your horse cannot then spring on his hind-legs to one side, because your leg prevents him; nor to the other, because his head looks that way, and a horse does not start and spring to the side on which he looks. Hence the impropriety of the habit which many riders have, of letting their legs shake against the sides of the horse : if a horse is taught, they are then continually pressing him to violent action; and if he is not they render him insensible and incapable of being taught. The fretting of a hot horse will hence be excessive, as it can no otherwise be moderated than by the utmost stillness of the seat, hands, and legs of the rider.

Colts at first are taught to bear a bit, and by degrees to pull at it. If they did not press it, they could not be guided by it. By degrees they find their necks stronger than the arms of a man; and that they are capable of making great opposition, and often of foiling their riders. Then is the time to make them supple and pliant. The part which of all others requires most this pliancy is the neck. Hence the metaphor of stiffnecked for disobedient. A horse cannot move his head but with the muscles of his neck : this may be called his helm ; it guides his course, changes and directs his motion.

In a word, the inexperienced horseman should endeavour to remember on all occasions, that there is an ability and readiness in a horse to move every limb, on a sign given him by the hands or legs of his rider; as well as to bend his body, and move in a short compass, quick and collected, so as instantly to be able to perform any motion.

HORSE'MARTEN, n. s. A kind of large bee. HORSE'MEAT, n. s. Horse and meat. Provender.

Though green peas and beans be caten sooner, yet the dry ones that are used for *horsemeat* are ripe last. Bocon.

HORSE'MINT, n. s. A large coarse mint. HORSE'MUSCLE, n. s. A large muscle.

The great *horsemuscie*, with the fine shell, that breedeth in ponds, do not only gape and shut as the oysters do, but remove from one place to another.

Bacon.

HORSENS, a well-built sea-port of Jutland, on the Cattegat. It contains about 2400 inhabitants, and has manufactures of flannel and woollen stuffs, and good fisherics. Nincteen miles S. S. W. of Aarhuus. Long. 9° 52' E., lat. 55° 52' N

HORSE'PLAY, *n.s.* Horse and play. Coarse, rough, rugged play.

He is too much given to horseplay in his raillery, and comes to battle like a dictator from the plough. Dryden.

HORSE'POND, n. s. Horse and pond. A pond for horses.

HORSE'RACE, n.s. Horse and race. A match of horses in running.

In horseraces men are curious that there be not the least weight upon the one horse more than upon the other. Bacon.

Trajan, in the fifth year of his tribuneship, entertained the people with a horserace. Addison.

HORSE'RADISH, n. s. Horse and radish. A root aerid and biting: a species of seurvygrass.

Horseradish is increased by sprouts spreading from the old roots left in the ground, that are cut or broken off. Mortimer.

Stomachicks are the cresse acrids, as horseradish and scurvy-grass, infused in wine.

Floyer on the Humours.

HORSE'SHOE, n.s. Horse and shoc. A plate of iron nailed to the feet of horses. An herb.

I was thrown into the Thames, and cooled glowing hot in that surge, like a horseshoe. Shakspeare.

HORSE-SHOE, in fortification, a work sometimes of a round, sometimes of an oval figure, enclosed with a parapet, raised in the ditch of a marshy place, or in low grounds; sometimes also to cover a gate, or to lodge soldiers, to prevent surprises, or relieve a tedious defence.

HORSE-SIDE HEAD, a disease in infants in which the sutures of the skull are too open, or too great a vacuity is left between them; so that the aperture shall not be totally closed up, or the cranium in that part not be so hard as the rest for some years after. When the disease continues long, it is reputed a sign of weakness and short life. Sometimes the disorder arises from a collection of water in the head, called an hydrocephalus.

HORSE-SHOE ISLAND, a low island, near the north coast of New Holland at the bottom of the gulf of Carpentaria, between one and two miles long. Lat. 17° 2' S.

HORSE-SHOE POINT, the most southerly point, near the east end of the island of St. Christopher. Long. 63° 32' W., lat. 17° 19' N.

HORSE'STEALER, n. s. Horse and steal. A thief who takes away horses.

He is not a pickpurse, nor a *horsestealer*; but, for his verity in love, I do think him as concave as a covered goblet, or a worm-eaten nut.

Shakspeare. As You Like It.

HORSE'TAIL, n.s. A plant. See Epiledra and Equisetum.

HORSE'TONGUE, n. s. An herb. See Ruscus.

HORSE-VETCH. Hippocrepis.

HORSE'WAY, n. s. Horse and way. A broad way by which horses may travel.

Knowest thou the way to Dover?

-Both stile and gate, horseway and footpath.

Shakspeare. King Lear.

HORSE-WORM, in natural history, a species of fly worm called also bott, produced of eggs deposited by a two-winged fly, of the shape and size of the humble bee, in the intestines of horses. See Borrs.

HORSEY ISLAND, a small island off the coast 2 C

of Essex, opposite Walton lights. It is six Thorley. In 1781 he became archdeacon of St. miles in circumference, and abounds with game. Alban's, and carly in 1782 vicar of South Weald four miles from Harwich. In 1783 and 1784 he was engaged

HORSHAM, a borough and market town of Sussex, near St. Leonard's forest, thirty-six miles from London, so named from Horsa, brother to Hongist the Saxon. It is one of the largest towns in the county, and has sent members to parliament since the 30th of Edward I. The county gaol is in this town, and the assizes are often held here. It is a borough by prescription, governed by two bailiffs, and burgage holders, &c., who elect the members of parliament. It has a very fine church, and a well-endowed free school; with a weekly market on Saturday, famous for poultry, and a monthly fair. Here are several meeting-houses for dissenters, and several charitable gifts to the poor parishioners.

HORSLEY (John), M. A. and F. R. S., a learned English antiquary born at Northumberland, and educated in Scotland, where he took his degree. He was afterwards minister of a dissenting congregation in Northumberland, where he died in 1731. He wrote an extensive and learned work, entitled Britannia Romana, wherein he gives a copious and accurate account of the relics of Roman antiquity in Britain.

HORSLEY (Samuel), a learned modern di-vine of the English church, was born October 1733 in St. Martin's in the Fields, London, of which parish his father held the curacy. His grandfather was a dissenter. He was educated, according to some accounts, at Westminster school, and at Trinity Hall, Cambridge, where he took the degree of LL. B. in 1758: but Mr. Chalmers disputes his ever being at Westmin-Having been ordained, he became curate ster. to his father, then rector of Newington Butts, which benefice he resigned to his son in 1759. In 1767 he was chosen a fellow of the Royal Society ; and published the same year an elabo-rate treatise, entitled The Power of God deduced from the computable instantaneous production of it in the Solar System, 8vo. This he afterwards called 'a singular and whimsical production, which would in all probability roll down the gutter of time and be forgotten.' In 1768 he went to Christ Church, Oxford, as private tutor to lord Guernsey, son of the earl of Aylesford; and took at that university the degree of LL.D. In 1770 he printed, at the Clarendon press, Apollonii Pergæi Inclinationum, Libri ii. Restituebat S. Horsley. In November 1773 he was elected secretary to the Royal Society; and presented by the earl of Aylesford to the rectory of Aldbury, in Surrey, which he held by dispensation, with that of Newington. The next year he published Remarks on the Observations made in the last Voyage towards the North Pole, for discovering the Acceleration of the Pendulum in lat. 79° 50', in a letter to the hon. C. J. Phipps, 4to.; and married, in December, the daughter of the Rev. John Botham, his predecessor at Aldbury. He now (1776) circulated proposals for a new edition of the works of Sir Isaac Newton, in five volumes quarto, and procured the patronage of bishop Lowth, who collated him to a prebend in St. Paul's. He resigned Aldbury in 1779, and the next year obtained the living of

Alban's, and early in 1782 vicar of South Weald in Essex. In 1783 and 1784 he was engaged in a controversy with Sir Joseph Banks, respecting his conduct as president of the Royal Society; and delivered several very eloquent speeches on the occasion. Dr. Horsley finally withdrew from the society, and about the same period commenced his celebrated controversy with Dr. Priestley. See our article ANTITRINITARIANISM. Lord chancellor Thurlow now presented him to a prebendal stall in the cathedral of Gloucester; and in 1788 he was, through the same interest, made bishop of St. David's, fully supporting in his episcopal character the reputation for learning and ability which he had previously acquired. His first charge, delivered in 1790, attracted great attention, as did his speech in the house of lords, on the Catholic bill, May 31st, 1791. He was promoted to the see of Rochester, and made dean of Westminster in 1793, on which he resigned the living of Newington: and in 1802 he was translated to St. Asaph. He died at Brighton, October 4th, 1806. Bishop Horsley, besides the works noticed, was the author of Critical Disquisitions on the 18th chapter of Isaiah, 4to .: Hosea, a new translation, with notes, 4to.; a Translation of the Psalms, 2 vols.; Biblical Criticisms; 4 vols. 8vo.; Sermons; Charges; Elementary Treatises on the Mathematics; on the Prosodies of the Greek and Latin Languages: and Various Papers in the Philosophical Transactions.

HORSTIUS (Dr. James), professor of medicine in the university of Helmstadt, was born at Torgau, in 1537, and took the degree of M. D. at Francfort in 1562. He wrote five treatises; 1. On the Qualities of a Good Physician; 2. On those of a Good Apothecary; 3. On the Plague, in German; 4. A Commentary in libros Hippocratis de corde; and, 5, De Noctambulis, on Sleep-walkers. He died in 1600.

HORSTIUS (Gregory), M. D., nephew of the above, called the *E*sculapius of Germany, was also born at Torgau in 1578. He graduated at Basil in 1606, and was professor of physic in several universities. He published several books, which are esteemed, and died at Ulm in 1636.

1636. HORTATION, n. s. Lat. hortatio, hortor. HOR'TATIVE, n.s. The act of exhorting or HOR'TATORY, adj. The act of exhorting or encouraging; a precept which animates or exhilarates. Hortatory, applicable to precepts, not to persons; lively, animating, &c.; as, a hortatory speech, not a hortatory speaker.

HORTENSIUS (Lambert), a philosopher, historian, and poet, born at Utrecht in 1501. He assumed this name because his father was a gardener. He studied at Louvain, and was many years rector at Naarden, where he died in 1577. He wrote De Bello Germanico, and several other works.

HORTENSIUS (Martin), a celebrated astronomer, born at Delft in 1605. He wrote a treatise De Mercurio sub sole viso, et Venere invisa; also two tracts De Utilitate et Dignitate Matheseos; et de Oculo ejusque præstantiå. He died n 1539.

HORTICULTURE, n.s.) Lat. hortus and HORTICULAN, adj. Scultura. The art of cultivating gardens. Hortulan, belonging to a garden.

This seventh edition of my hvrtulan kalendar is yours. Evelyn.

HORTICULTURE (of Latin hortus, a garden, and colo I till or dress) is the art of practical gardening, and we adopt this term in preference, because of its direct bearing upon practical operations, as well as because it has been very properly used of late to designate some important societies of gentlemen associated to promote the art. See Society, HORTICULTURAL, OF LON-DON, &C.

We shall not detain the reader with the praises of this pursuit, to be found in almost all our polite writers, but adopt a brief sketch of its *history* from Horace Walpole, and proceed to give practical directions :—

SECT. I.-HISTORY OF GARDENING.

' Gardening,' says Mr. Walpole, ' was probably one of the first arts that succeeded to that of building houses, and naturally attended property and individual possession. Culinary, and afterwards medicinal herbs, were the objects of every head of a family : it became convenient to have them within reach, without seeking them at random in woods, in meadows, and on mountains, as often as they were wanted. When the earth ceased to furnish spontaneously all those primitive luxuries, and culture became requisite, separate enclosures for rearing herbs grew expcdient. Fruits were in the same predicament; and those most in use, or that demanded attention, must have entered into and extended the domestic enclosure. Noah planted a vineyard, and drank of the wine; and thus were vineyards, as well as kitchen-gardens and orchards, introduced. No doubt the prototype of all these was the garden of Eden.'

We have reason to think, that for many centuries the term garden implied no more than a kitchen-garden or orchard. The garden of Alcinous, in the Odyssey, is the most renowned in the heroic times. No admirer of Homer can read this description without rapture.' 'Yet,' continues our author, 'what was that boasted paradise with which

the gods ordained Fo grace Alcinous and his happy land?

Why, divested of harmonious Greek and bewitching poetry, it was a small orchard and vineyard, with some beds of herbs and two fountains that watered then, enclosed within a quickset hedge. The whole compass of this pompous garden contained four acres. The trees were apples, figs, pomegranates, pears, olives, and vines. Alcinous's garden was planted by the poet, enriched by him with the fairy gift of eternal summer, and was no doubt an effort of imagination surpassing any thing he had ever seen. As he has bestowed on the same happy prince a pa-

lace with brazen walls, and columns of silver, he certainly intended that the gardens should be proportionably magnificent.'

The hanging gardens of Babylon were a still greater prodigy. But, as they are supposed to have been formed on terraces, Mr. Walpole concludes, 'they were, what sumptuous gardens have been in all ages till the present, unnatural, enriched by art, possibly with fountains, statues, balustrades, and summer-houses, and were any thing but verdant and rural.' The suiting of the situation to the nature of the trees seems, from the account given by Josephus, (Contra Apion, lib. i. s. 19), to have been one view in these erections. And the success seems to have been answerable, as the trees, says Quintus Curtius, lib. 5, flourished extremely well, and grew as tall as in their native situations.

The eastern gardens appear to have been planted adjoining to the house or palace to which they belonged. Thus king Ahasuerus went immediately from the banquet of wine to walk in the garden of the palace. Esther, vii. 7. The garden of Cyrus, at Sardis, mentioned by Xenophon, seems also to have been contiguous to the palace: as was that of Attalus, mentioned by Justin, lib. xxxvi. c. 4.

The character of the gardening, among the Greeks, it is not very easy to ascertain. The Academus was a wooded shady place; and the trees appear to have been of the olive species It was situated beyond the limits of the walls, and adjacent to the tombs of the heroes; and, though we are not informed of the particular manner in which this grove was laid out, it may be gathered from Pausanias's Attica, that it was elegantly ornamented. At the entrance was an altar dedicated to Love. Within were the altars of Prometheus, the Muses, Mercury, Minerva, and Hercules; and at a small distance the tomb of Plato. So that, in all probability, it was highly adapted by art, as well as nature, to philosophic reflection and contemplation. Plutarch says, ' that before the time of Cimon, the Academus was a rude and uncultivated spot: but that it was planted by that general, and had water conveyed to it. It was divided into gymnasia, or places of exercise, and philosophic walks, shaded with trees. These flourished very well, until they were destroyed by Sylla, along with those in the Lyceum. Near the academy were the gardens of the philosophers, of Plato and Epicurus; which, however, were probably bu small. The scene of Plato's Dialogue concerning Beauty is elegantly described as being on the banks of the Ilissus, and under the shade of the plantane; but, as no artificial arrangement of objects is mentioned, the prospect seems to have been merely natural.

A taste for gardening does not appear to have prevailed among the Romans, otherwise than as a matter of utility, till a very late period; at least the writers on husbandry, Cato, Varro, Cohumella, and Palladius, make no mentiou of a garden as an object of pleasure, but solely with

2 C 2

respect to its productions of herbs and fruits. The gardens of Lucullus are the first we find mentioned of remarkable magnificence; though indeed, from the extravagance to which these were arrived, it is evident they could not be the first. Plutarch speaks of them as incredibly expensive, and equal to the magnificence of kings. They contained artificial elevations of ground to a surprising height, of buildings projected into the sea, and vast pieces of water upon land. In short, his extravagance was so great, that he acquired the appellation of the Roman Xerxes. It is not improbable, from the consideration of Lucullus having spent much time in Asia, in a situation wherein he had an opportunity of observing the most splendid constructions of this kind, that these gardens might be laid out in the Asiatic style.

The Tusculan villa of Cicero, though often mentioned, is no where described in his works, so as to give an adequate idea of the style in which his gardens were disposed; and little is to be traced in Virgil relative to this subject. Pines, it seems probable, were a favorite ornament in gardens (Eccl. vii. 65); and flowers, roses especially, were much esteemed (Georg. iv. 118), perfumes indeed having been always highly valued in warm climates. Virgil places Anchises in Elysium, in a grove of bays, of the sweet-scented kind. There appears also to have prevailed among the Romans a piece of luxury relative to gardens, which is equally prevalent at present among us, namely, the forcing of flowers at seasons of the year not snited to their natural blowing : and roses were then, as at present, the principal flowers upon which these experiments were tried; as appears from Martial, Lampridius, and others. See Epig. 1. vi. ep. 80, &.c.

When Roman authors, Mr. Walpole remarks, whose climate instilled a wish for cool retreats, speak of their enjoyments in that kind, they sigh for grottoes, caves, and the refreshing hollows of mountains, near irriguous and shady founts; or boast of their porticoes, walks of plants, canals, baths, and breezes from the sea. Their gardens are never mentioned as affording shade and shelter from the rage of the dog-star. Pliny has left us descriptions of two of his villas. As he used his Laurentine villa for his winter retreat, it is not surprising that the garden makes no considerable part of the account. All he says of it is, that the gestatio, or place of exercise, which surrounded the garden (the latter consequently not being very large), was bounded by a hedge of box, and, where that was perished, with rosemary; that there was a walk of vines; and that most of the trees were fig and mulberry, the soil not being proper for any other sorts. On his Tuscan villa he is more diffuse; the garden makes a considerable part of the description :--- and what was the principal beauty of that pleasure ground ? Exactly what was the admiration of this country about a century ago; box trees cut into monsters, animals, letters, and the names of the master and the artificer. In an age when architecture displayed all its grandeur, all i.s purity, and all its taste; when arose Vespasian's amphitbeatre, the temple of Peace,

Trajan's forum, Domitian's baths, and Adrian s villa, the ruins and vestiges of which still exci.e our astonishment; a Roman consul, a polished emperor's friend, and a man of elegant literature and taste, delighted in what the mob now scarcely admire in a college garden. All the ingredients of Pliny's corresponded exactly with those laid out by London and Wise on Dutch principles. He talks of slopes, terraces, a wilderness, shrubs methodically trimmed, a marble basin, pipes spouting water, a cascade falling into the basin, by trees alternately planted with planes, and a straight walk, whence issued others parted off by hedges of box and appletrees, with obelisks placed between every two. There wants nothing but the embroidery of a parterre, to make a garden in the reign of Trajan serve for the description of one in that of king William III. In one passage, however, Pliny seems to have conceived that natural irregularity might be a beauty; in opere urbanissimo, says he, subita velut illati ruris imitatio. Something like a rural view was contrived amidst so much polished composition. But the idea soon vanished : lineal walks immediately enveloped the slight scenc, and names and inscriptions in box again succeeded to compensate for the daring intrusion of nature.

In the paintings found at Herculaneum are a few traces of gardens. They are small square enclosures, formed by trellis-work and espaliers, and regularly ornamented with vases, fountains, and careatides, elegantly symmetrical, and proper for the narrow spaces allotted to the garden of a house in a capital city.

From these remarks it appears how naturally and insensibly the idea of a kitchen garden slid into that which has for so many ages been peculiarly termed a garden, and by our ancestors in this country distinguished by the name of a pleasure garden. A square piece of ground was originally parted off in early ages for the use of the family : to exclude cattle, and ascertain the property, it was separated from the fields by a hedge. As pride and design of privacy increased, the enclosure was dignified by walls; and, in climes where fruits were not lavished by the ripening glow of nature and soil, fruit trees were assisted and sheltered from surrounding winds by the like expedient; for the inundation of luxuries, which have swelled into general necessities, have almost all taken their source from the simple fountain of reason.

When nature and prospect were thus excluded, by the custom of making square gardens enclosed with walls, pomp and solitude combined to call for something that might enrich and enliven the insipid and unanimated partition. Fountains, first invented for use, which grandeur loves to disguise and throw out of sight, received embellishments from costly marbles, and, at last, to contradict utility as it were, tossed their waste of waters into air in spouting columns. Art, in the hands of rude man, had at first been made a succedaneum to nature; in the hands of ostentatious wealth it became the means of opposing nature ; and, the more it traversed the march of the latter, the more nobility thought its power was demonstrated. Canals measured by the

line were introduced in lieu of meandering streams, and terraces were hoisted aloft in opposition to the facile slopes that imperceptibly unite the valley to the hill. Balustrades defended these precipitate and dangerous elevations, and flights of steps rejoined them to the subjacent flat from which the terrace had been dug. Vases and sculpture were added to the unnecessary balconies, and statues furnished the lifeless spot with mimic representations of the excluded sons of men. Thus difficulty and expense were the constituent parts of those sumptuous and selfish solitudes; and every improvement that was made was but a step farther from nature. The tricks of water-works to wet the unwary, not to refresh the panting spectator; and parterres embroidered in patterns like a petticoat, were but the childish endeavours of fashion and novelty to reconcile greatness to what it surfeited on.

To crown these impotent displays of false taste, the shears were applied to the lovely wildness of form with which nature has distinguished each various species of tree and shrub. The venerable oak, the romantic beech, the useful elm, even the aspiring circuit of the lime, the regular round of the chestnut, and the almost moulded orangetree, were corrected by such fantastic admirers of symmetry. The compass and square were of more use in plantations than the nursery-man. The measured walk, the quincunx, and the etoile, imposed their unsatisfying sameness on every royal and noble garden. Trees were headed, and their sides pared away: many French groves seem green chests set upon poles. Seats of marble, arbors, and summer-houses, terminated every vista; and symmetry, even where the space was too large to permit its being remarked at one view, was so essential, that, as Pope observed,-

Each alley has a brother, And half the garden just reflects the other.

It does not precisely appear what our ancestors meant by a *bower*: it was probably an arbor; sometimes it meant the whole frittered enclosure, and in one instance it certainly included a labyrinth. Rosamond's bower was indisputably of that kind; though whether composed of walls or hedges we cannot determine. A square and a round labyrinth were so capital ingredients of a garden formerly, that in Dn Cerceau's architecture, who lived in the time of Charles IX, and Henry III., there is scarcely a ground-plot without one of each.

In Kip's Views of the Seats of our Nobility and Gentry, every house is approached by two or three gardens, consisting, perhaps, of a gravel walk, and two grass-plats or borders of flowers. Each rises above the other by two or three steps, and as many walls and terraces, and so many iron gates, that we recollect those ancient romances in which every entrance was guarded by giants or dragons. Yet, though these and such preposterous inconveniences prevailed from age to age, good sense in this country had perceived the want of something at once more grand and more natural.

These reflections, and the bounds set to the waste made by royal spoilers, gave origin to *parks*. They were contracted forests, and extended gardens. Hentzer says, after Rous of Warwick, the first park was that at Woodstock. If so, it might be the foundation of a legend that Henry II. secured his mistress in a labyrinth; it was no doubt more difficult to find her in a park than in a palace, where the intricacy of the woods, and various lodgings buried in covert, might conceal her actual habitation. It is more extraordinary that, having so long ago stumbled on the principle of modern gardening, we should have persisted in retaining its reverse, symmetrical and unnatural gardens.

Milton's description of Eden is a warmer and more just picture of the present style than Claude of Lorraine could have painted from Hagley or Stourhead. The first lines we quote exhibit Stourhead, says our author, on a more magnificent scale :---

Through Eden went a river large, Nor changed his course, but through the shaggy hill Passed underneath ingulphed : for God had thrown That mountain as his garden mound, high raised Upon the rapid current——

Hagley seems pictured in what follows :----

Which through veins Of porous earth, with kindly thirst updrawn, Rose a fresh fountain, and with many a rill Watered the garden-----

What coloring, what freedom of pencil, what landscape in these lines !

From that sapphire fount the crisped brooks, Rolling on orient pearl and sands of gold, With mazy error under pendent shades, Ran nectar, visiting each plant, and fed Flowers worthy of Paradise, which not nice art In beds and curious knots, but nature boon Poured forth profuse on hill and dale and plain, Both where the morning sun first waraly smote The open fields; and where the unpierced shade, Imbrowned the noon-tide bowers :--Thus was this place

A happy rural seat of various view.

Now let us turn to an admired writer, posterior to Milton, and see how cold, how insipid, how tasteless is his account of what he pronounced a perfect garden. We speak not of his style, which it was not necessary for him to animate with the coloring and glow of poetry. It is his want of ideas, of imagination, of taste, that deserve censure, when he dictated on a subject which is capable of all the graces that a knowledge of beautiful nature can bestow. Sir Wil-'iam Temple was an excellent man; Milton, a genius of the first order.

⁴ The best figure of a garden,' says Sir William, ⁴ is either a square or an oblong, and either upon a flat or a descent : they have all their beauties, but the best 1 esteem an oblong upon a descent. The beauty, the air, the view, make amends for the expense, which is very great in finishing and supporting the terrace walks, in levelling the parterres, and the stone stairs that are necessary from one to the other. The perfectest figure of a garden I ever saw, either at home or abroad, was that of Moor park in Hertfordshire, when I knew it about thirty years ago. It was made by the countess of Bedford, esteemed among the greatest wits of her time, and celebrated by Dr. Donne; and with very great care, excellent con-

trivance, and much cost; but greater sums may be thrown away without effect or honor, if there want sense in proportion to money, or ' if nature be not followed; which I take to be the great rule in this, and perhaps in every thing else, as far as the conduct not only of our lives but of our governments.' [We shall see how natural that admired garden was.] ' Because I take the garden I have named to have been in all kinds the most beautiful and perfect, at least in the figure and disposition, that I ever have seen, I will describe it for a model to those that meet with such a situation, and are above the regard of common expense. It lies on the side of a hill, upon which the house stands, but not very steep. The length of the house, where the best rooms and those of most use or pleasure are, lies upon the breadth of the garden; the great parlour opens into the middle of a terrace gravel walk that lies even with it, and which may lie, as I remember, about 300 paces long, and broad in proportion ; the border set with standard laurels and at large distances, which have the beauty of orange trees out of flower and fruit. From this walk are three descents by many stone steps, in the middle, and at each end, into a very large parterre. This is divided into quarters by gravel-walks, and adorned with two fountains and eight statues in the several quarters. At the end of the terrace walk are two summer houses, and the sides of the parterre are ranged with two large cloisters open to the garden, upon arches of stone, and terminating with two other summer-houses even with the cloisters, which are paved with stone, and designed for walks of shade, there being none other in the whole parterre. Over these two cloisters are two terraces covered with lead and fenced with balusters; and the passage into these airy walks is out of the two summer-houses at the end of the first terrace walk. The cloister facing the south is covered with vines, and would have been proper for an orange house, and the other for myrtles or other more common greens, and had, I doubt not, been cast for that purpose, if this piece of gardening had been then in as much vogue as it is now. From the middle of this parterre is a descent by many steps flying on each side of a grotto that lies between them, covered with lead, and flat, into the lower garden, which is all fruit-trees ranged about the several quarters of a wilderness, which is very shady; the walks here are all green, the grotto embellished with figures of shell rock-work, fountains, and water-works. If the hill had not ended with the lower garden, and the wall were not bounded by a common way that goes through the park, they might have added a third quarter of all greens; but this want is supplied by a garden on the other side the house, which is all of that sort, very wild, shady, and adorned with rough rock-work and fountains. This was Moor Park when I was acquainted with it, and the sweetest place, 1 think, that I have seen in my life, either before or since, at home or abroad.

⁶ It is unnecessary to add any remarks on this description. Any man might design and build as sweet a garden, who had been born in and never stirred out of Holborn. It is not, however, peculiar to Sir William Templo to think in that manner. How many Frenchmen are there who have seen our gardens, and still prefer unnatural flights of steps and shady cloisters covered with lead! Le Nautre, the architect of the groves and grottoes of Versailles, came hither, on a mission to improve our taste. He planted St. James's and Greenwich parks—no great monuments of his invention.'

⁴ Fortunately Kent and a few others were not quite so timid, or we might still be going up and down stairs in the open air. It is true, we have heard much lately, as Sir William Temple did, of irregularity and imitations of nature in the gardens or grounds of the Chinese. The former is certainly true : they are whimsically irregular, as European gardens are formally uniform and unvaried : but, with regard to nature, it seems as much avoided as in the squares and oblongs and straight lines of our ancestors. An artificial perpendicular rock starting out of a flat plain, and connected with nothing, often pierced through in various places with oval hollows, has no more pretension to be deemed natural than a lineal terrace or a parterre.

' Having thus cleared our way by ascertaining what have been the ideas of gardening in all ages, as far as we have materials to judge by, it remains to show to what degree Kent invented the new style, and what hints he had received to suggest and conduct his undertaking. We have seen what Moor Park was, when pronounced a standard. But, as no succeeding generation in an opulent and luxurious country contents itself with the perfection established by its ancestors, more perfect perfection was still sought; and improvements had gone on, till London and Wise had stocked all our gardens, with giants, animals, monsters, coats of arms, and mottos, in yew, box, and holly. Absurdity could go no farther, and the tide turned. Bridgman, the next fashionable designer of gardens, was far more chaste; and whether from good sense, or that the nation had been struck by the admirable paper in the Guardian, No. 173, he banished verdant sculpture, and did not even revert to the square precision of the foregoing age. He enlarged his plans, disdained to make every division tally to its opposite; and though he still adhered much to straight walks with high clipped hedges, they were only his great lines; the rest he diversified by wilderness, and with loose groves of oak, though still within surrounding hedges. As his reformation gained footing, he ventured, in the royal garden at Richmond, to introduce cultivated fields, and even morsels of forest appearance, by the sides of those endless and tiresome walks that stretched out of one into another without intermission. But this was not till other innovators had broke loose too from rigid symmetry. But the capital stroke, the leading step to all that has followed, was the destruction of walls for boundaries, and the invention of fosses-an attempt then deemed so astonishing, that the common people called them IIa! Ha's! to express their surprise at finding a sudden and unperceived check to their walk. No sooner was this simple enchantment made, than levelling, mowing, and rolling, followed. The contiguous ground of the park without the sunk fence was to be harmonised with the lawn within; and the garden in its turn was to be set free from its prim regularity, that it might assort with the milder country without. The sunk-fence ascertained the specific garden; but that it might not draw too obvious a line of distinction between the neat and the rude, the contiguous out-lying parts came to be included in a kind of general design; and, when nature was taken into the plan, under improvements, every step that was made pointed out new beauties, and inspired new ideas. At that moment appeared Kent; painter enough to taste the charms of landscape, bold and opinionative enough to dare and to dictate, and born with a genius to strike out a great system from the twilight of imperfect essays. He leaped the fence, and saw that all nature was a garden. He felt the delicious contrast of hill and valley changing imperceptibly into each other, tasted the beauty of the gentle swell or concave slope, and remarked how loose groves crowned an easy eminence with happy ornaments; and, while they called in the distant view between their graceful stems, removed and extended the perspective by delusive comparison.

' Thus the pencil of his imagination bestowed all the arts of landscape on the scenes he handled. The great principles on which he worked were perspective, light, and shade. Groups of trees broke too uniform or too extensive a lawn; evergreens and woods were opposed to the glare of the champaign; and where the view was less fortunate, or so much exposed as to be beheld at once, he blotted out some parts by thick shades, to divide it into variety, or to make the richest scene more enchanting by reserving it to a farther advance of the spectator's step. Thus selecting favorite objects, and veiling deformities by screens of plantations; sometimes allowing the rudest waste to add its soil to the richest theatre : he realised the compositions of the greatest masters in painting. Where objects were wanting to animate his horizon, his taste as an architect could bestow immediate termination. Ilis buildings, his seats, his temples, were more the works of his pencil than of his compasses. We owe the restoration of Greece and the diffusion of architecture to his skill in landscape. But of all the beauties he added to the face of this beautiful country, none surpassed his management of water. Adieu to canals, circular basins, and cascades tumbling down marble steps, that last absurd magnificence of Italian and French villas. The forced elevation of cataracts was no more. The gentle stream was taught to serpentize seemingly at its pleasure; and, where discontinued by different levels, its course appeared to be concealed by thickets properly interspersed, and glittered again at a distance, where it might be supposed naturally to arrive. Its borders were smoothed, but preserved their waving irregularity. A few trees scattered here and there on its edges sprinkled the tame bank that accompanied its meanders; and when it disappeared among the hills, shades descending from the heights leaned towards its progress, and framed the distant point of light under which it was lost, as it turned aside to either hand of the blue horizon.

' Succeeding artists have added new masterstrokes to these touches; perhaps improved or brought to perfection some that have been named. The introduction of foreign trees and plants contributed essentially to the richness of coloring so peculiar to our modern landscape. The mixture of various greens, the contrast of forms between our forest trees and the northern and West Indian firs and pines, are improvements more recent than Kent, or but little known to him. The weeping willow and every florid shrub, each tree of delicate or bold leaf, are new tints in the composition of our gardens. But just as the encomiums are that have been bestowed on Kent's discoveries, he was neither without assistance nor faults. Pope undoubtedly contributed to form his taste. The design of the prince of Wales's garden at Carlton House was borrowed from the poet's Twickenham. There was a little of affected modesty in the latter, when he said, of all his works, he was most proud of his garden. And yet it was a singular effort of art and taste to impress so much variety and scenery on a spot of five acres. The passing through the gloom from the grotto to the opening day, the retiring and again assembling shades, the dusky groves, the larger lawn, and the solemnity of the termination at the cypresses that aed up to his mother's tomb, were managed with exquisite judgment; and though lord Peterborough assisted him

' To form his quincunx, and to rank his vines.' those were not the most pleasing ingredients of his little perspective.'

Having routed professed art (for the modern gardener exerts his talents to conceal his art), Kent, like other reformers, knew not how to stop at the just limits. He had followed nature, and imitated her so happily, that he began to think all her works were equally proper for imitation. In Kensington Garden he planted dead trees, to give a greater air of truth to the scene -but he was soon laughed out of this excess. His ruling principle was, that nature abhors a straight line. His mimics, for every genius has his apes, seemed to think that she could love nothing but what was crooked. Yet so many men of taste of all ranks devoted themselves to the new improvements, that it is surprising how much beauty has been struck out, with how few absurdities. Still in some lights the reformation seems to have been pushed too far. Though an avenue crossing a park or separating a lawn, and intercepting views from the seat to which it leads, are capital faults; yet a great avenue cut through woods, perhaps before entering a park, has a noble air. In other places the total banishment of all particular neatness immediately about a house, which is frequently left gazing by itself in the middle of a park, is a defect. Sheltered, aml even close walks, in so very uncertain a climate as ours, are comforts ill exchanged for the few picturesque days we enjoy; and whenever a family can purloin a warm and even something of an old fashioned garden, from the landscape designed for them by the undertaker in fashion, without interfering with the picture, they will find satisfaction on those days which do not invite strangers to come and see their improvements.'

Thus we have brought down the history of this elegant art to the present period. And from what has been said, it must be evident that gardening, in the perfection to which it is now brought in Britain, is entitled to a place of considerable rank among the liberal arts. ' It is,' says Mr. Wheatley, 'as superior to landscapepainting as a reality to a representation : it is an exertion of fancy; a subject for taste; and being released now from the restraint of regularity, and enlarged beyond the purposes of domestic convenience, the most beautiful, the most simple, the most noble scenes of nature, are all within its province. For it is no longer confined to the spots from which it takes its name; but regulates also the disposition and embellishments, of a park, a farm, a forest, &c., and the business of a gardener is to select and apply whatever is great, clegant, or characteristic, in any of them ; to discover, or to show all the advantages of the place upon which he is employed; to supply its defects, to correct its faults, and to improve its beauties.'

Enough nas been said upon the large scale o^c ornamental gardening. We shall now restrict ourselves to the description of such a plan of gardening as will be found to answer best for those who prefer the utile to the dulce, and regard usefulness and convenience more than ornament.

Sect. II.—Of the Choice of Ground for a Garden

When you have the choice of a place proper for a garden, the most essential points to be considered are, general situation, soil, exposure, water, and prospect.

The situation ought to be moderately elevated: if a garden be too high it will be exposed to the winds, which are very prejudicial to trees; if it be too low, the dampness, the vermin, and the creatures that breed in ponds and marshy places will add much to its insalubrity. The best situation is on the side of a hill, especially if the slope be easy; if a good deal of level ground be near the house; and if it abound with springs: for being sheltered from the fury of the winds, and the violent heat of the sun, a temperate air will be enjoyed; and the water that descends from the hill, either from springs or rain, will not only supply fountains, & e. for ornament, but, when it has performed its office, will water the adjacent valleys.

A good *soil* is next to be considered; for it is scarcely possible to make a fine garden in a bad soil. There are indeed methods of meliorating ground, but they are expensive; and sometimes, when the expense has been bestowed of laying good earth three feet deep over the whole surface, a garden has been ruined, when the roots of the trees have reached the natural bottom. To judge of the quality of the soil, observe whether heath, thistles, or such like weeds, grow spontaneously in it; and, if there be large trees near, whether they grow crooked and ill shaped; and are of a faded green, and full of moss, or vermin: in all such cases the place is to be rejected But, if it be covered with grass fit for pasture, the depth of the soil may be tried by digging holes three or four feet deep; and if there be three feet of good earth it will do very well, but less thar two will not be sufficient. The quality of good ground is neither to be stony nor too hard to work; neither too dry, too moist, nor too sandy and light; nor too strong or clayey, which is the worst of all for gardens.

The next requisite is *water*; the want of which is one of the greatest inconveniences that can attend a garden, and will bring a certain mortality upon whatever is planted in it, especially in the droughts that often happen in a hot and dry situation in summer; add to this, its usefulness in making fountains, canals, cascades, &c., which are the greatest ornaments of any garden. The last thing to be considered is the *prospect*

The last thing to be considered is the *prospect* of a fine country; and, though this is not absolutely necessary, yet it is one of the most agreeable accompaniments of a garden; besides, if a garden be planted in a low place that has no kind of prospect, it will not only be disagreeable but unwholesome.

Sect. III.—Of Laying out and Planting Gardens.

Gardens are usually distinguished into Flower, Fruit, and Kitchen Gardens. The first, being designed for pleasure and ornament, is generally placed next the back front of the house; and the two latter, being designed for use, are less conspicuous. But, though the fruit and kitchen gardens are here mentioned as distinct, they are often united; they equally require a good soil and exposure, and should both be placed out or the view of the house. According to Miller, the area of a handsome garden may take up thirty or forty acres, but no more; and the following rules should be observed in the disposition of it. There ought always to be a descent of at least three steps from the house; this will render the house more dry and wholesome, and the prospect on entering the garden more extensive. The first thing that should here present itself should be an open lawn of grass; which ought to be considerably broader than the front of the building; and, if the depth be one-half more than the width, it will have a better effect : if on the sides of the lawn there are trees planted irregularly, by way of open groves, the regularity of the lawn will be broken, and the whole rendered more like nature.

For the convenience of walking in damp weather, this lawn should be surrounded with a gravel walk, on the outside of which should be borders three or four feet wide for flowers; and from the back of these the prospect will be agreeably terminated by a slope of ever-green shrubs; which, however, should never be suffered to exclude agreeable prospects, or the view of handsome buildings. These walks may lead through the different plantations, gently winding about in an easy natural manner; and, as no garden can be pleasing where there is a want of shade or shelter, they should lead as soon as possible into plantations

Narrow rivulets, which have a constant stream,

if they are judiciously led about the garden, have a better effect than large stagnating ponds or canals. When wildernesses are intended, they should not be cut into stars and other ridiculous figures, nor formed into mazes or labyrinths, or any thing which in a great design might appear trifling.

In a word, the several parts of a garden should be diversified; but, in places where the eye takes in the whole at cnce, the two sides should be always the same. The general disposition of a garden and of its parts ought to be accommodated to the different situations of the ground, to humor its inequalities, to proportion the number of sorts of trees and shrubs to each part, and to shut out from the view of the garden no objects that may become ornamental.

Practical attention to a garden is by some esteemed a degrading employment. It is true, indeed, that pastoral and agricultural manners, if we may form a judgment from the dignified descriptions of Virgil, are greatly degenerated. The employments of shepherds and husbandmen are now become mean and sordid, and the work of the garden is usually left to a peasant. Bnt the operations of grafting, of inoculating, of pruning, of transplanting, are curious experiments in natural philosophy; and, that they are pleasing as well as curious, those can testify who remember what they felt on seeing their attempts in these branches of practical gardening attended with success. Among the employments suitable to old age, Cicero has enumerated the superintendance of a garden. It requires no great exertion of mind or body; and its satisfactions are of that kind which please without violent agitation. Its beneficial influence on health is an additional reason for an attention to it at an age when infirmities abound.

A very limited tract, properly attended to, will furnish ample employment for an individual. Nor let it be thought a mean care; for the same hand that raised the cedar, formed the hyssop on the wall. Even the orchard, cultivated solely for advantage, exhibits beauties unequalled in the shrubbery; nor can the green-house produce an appearance to excel the blossom of the apple and the almond.

The kitchen garden ought to be situated on one side of the house, near the stables, whence the dung may be easily conveyed to it; and, after having built the wall, borders should be made under them, which, according to Mr. Miller, should be eight or ten feet broad. Upon these borders, exposed to the south, many sorts of early plants may be sown; and, upon those exposed to the north, may be sown some late crops; taking care not to plant any deep-rooting plants, especially beans and peas, too near the fruit trees.

Next proceed to divide the ground into quarters; the best figures for these are a square or an oblong, if the ground will admit of it. The size of these quarters should be proportioned to that of the garden; if too small, the ground will be lost in walks, and, the quarters being enclosed by espaliers of fruit trees, the plants will draw up slender, for want of a more open exposure. The walks should also be proportioned to the

size of the ground : these in a small garden should be six feet broad, but m a large one ten, and on each side of the walk there should be allowed a border three or four feet wide between it and the espalier. In these borders may be sown small sallads, or any other herbs that do not take deep root or continue long; but they should not be sown or planted with the same plants two years together.

In the quarter nearest to the stables, and best defended from the cold winds, should be the hotbeds, for early cucumbers, melons, &c., and to these there should be a passage from the stables, and a gate through which a small cart may enter. The most important points of general culture consist in well digging and manuring the soil, and giving a proper distance to each plant, according to their different growths: as also in keeping them clear from weeds; for which purpose, always observe to keep the dunghills free from them, otherwise their seeds will be constantly brought in and spread with the dung.

SECT. IV.—THE GARDENER'S KALENDAR.

Under this head we proceed to point out what is proper to be done in the different months of the year, in the Kitchen-Garden, Flower-Garden, Orchard, &c. The arrangement is drawn up for the climate of the midland counties of England; but will suit more northern parts where the climate is mild, equally well, upon allowing a difference of ten or twelve days later for sowing or planting. Where the seasons are still more backward, a proportional allowance will be made by the judicious gardener.

JANUARY.

In January every thing should be done that the weather and circumstances will permit (even if not absolutely necessary), in order to lessen the work of next month, which, when it happens to be an open season, is a very important one, in which the loss of a single day is of consequence.

Kitchen garden .- Asparagus, in this season, being one of the greatest rarities which the art of gardening affords, ought to be planted every month, to have a regular succession of it till April, as it is above three weeks before it will be fit to cut, and the fourth hot-bed should now be made. Beans of the early mazagan sort must be planted for the second crop. Beets and cabbages of every sort, intended to procure seed from, should now be planted, if this was omitted in October. Carrots, to draw young, for the first crop, should now be sown; and those intended for seed should be planted. Cauliflower plants under glasses and frames should be covered with peastraw, or mats, to defend them from the frost. Celery should be digged up as soon as the frost begins, for daily use, and the other covered with straw. Cress, mustard, radish, and rape, should be sown every week on a hot-bed. Cucumbers, for the first crop, to come early in March, should now be sown. As soon as they are three or four days' old put each into a small pot, and every week sow more to have plenty of plants. Dung should be wheeled into the kitchen-garden in frosty weather, when other work cannot be done. Endive should be digged up, like the celery, as soon as the frost begins, and the rest covered with straw. Ground lying vacant should be digged up, if omitted in October, and thrown up into ridges. Hot-beds and loam should be prepared for asparagus, cucumbers, and melons. Lettuces under glasses should be examined, and, if they be killed, sow more on a hot-bed. Mint should be planted in pots, and, if there be no hot-bed, it will grow in a warm room. Mushroom beds will require regular attendance, and frost and rain must be kept out by dry straw and mats. Onions, to draw young, should be sown on a warm border. Peas under the south wall, for the first crop, should have the earth drawn up to them in a dry day, and sticks placed to them to defend them from the violence of the winds; and sow the second crop. Plant asparagus for the fourth crop. Beans for the second crop of Mazagans. Beets, cabbages, carrots, parsnips, for seed. Mint and potatoes on a hotbed. Onions for eschalions and seed. Radishes for the second crop, sow in a warm situation, and the first crop on a hot-bed. Small sallading, as cress, mustard, rape, radishes, sow every week on a hot-bed. Sow carrots for the first crop, and the second of peas. Sow on hotbeds, carrots and cucumbers for the first crop. Cress, mustard, radish, and rape for sallads : sow likewise turnips.

Flower garden and shrubbery.---Anemones which were planted in the autumn, will require to be covered with pea-straw, rotten tan, or mats. Auricula and polyanthus seeds may now be sown in boxes or pots in mild weather. Auriculas should be sheltered from violent rains and frost by mats; and at the end of the month fresh earthed. Beds for bulbous roots should be digged and thrown up into ridges, that they may be planted the first fine weather, if any roots remain unplanted; but it is bad policy not to plant them in October or the beginning of November. Bulbous rooted flowers in boxes or glasses should be removed in frosty weather, before night, from the windows; nor should they be set on chimney-pieces until they are in flower, for shade draws all flowers up very weak. Boxes under five inches deep, eight wide, and sixteen long, filled with light sandy earth, without any dung, are better than glasses, and will not require so much trouble. Stir up the earth often with a table fork. Carnations must be sheltered from violent rains and frost by mats. Plant at the end of the month, or sooner if the weather be mild, all sorts of bulbous roots, as crocuses, jonquilles, narcissuses, polyanthus-narcissuses, snowdrops, tulips, &c. Plant flowering shrubs, which are hardy, and flower early, as almonds, doubleflowering cherries, honeysuckles, lilacs, mezereons, roses, &c. Shrubs and trees of all sorts may be planted at the end of this month.-Trenches should be cut to carry off the water, if it stands any where after heavy rains.

Fruit garden and orchard.—Apple-trees should be pruned as soon as the violent frosts are over. Espaliers ought always to be repaired before the buds of the trees begin to open. The fruit room should be often examined, to pick out all fruit which begins to decay; and nail mats before the windows to keep out the frost. Ground for planting should be prepared by digging the holes ready; and, if wettish, a cart load of good loam should be brought for each standard tree, and formed into a little hill before the tree be planted. Scrape off the moss from all fruit trees. Orchards in general are much neglected, by not cutting out the dead wood and branches that cross each other, Pear-trees require pruning, both standards, espaliers, and against walls, as soon as the weather becomes mild. Prune currants, gooseberries, and raspberries. Strawberries in pots may be placed on hot-beds for forcing. Vines should not be pruned till towards the end of the month.

Greenhouse.-Air may be given to the plants, if the weather be mild. Fire must be made if it freezes, and particularly when it begins to thaw, or if it is foggy weather, to dry the house; for dampness is as prejudicial as cold; and, if there be no flue, light a few candles in frosty weather. To know for a certainty when it begins to freeze, set a pan of water near the windows. Leaves, which are any way decayed should be constantly picked off, particularly from the geraniums. Succulent plants, such as aloes, ficoides, &c., should not have any water this month. Water for all sorts of plants should be the softest that can be got; rain-water is the best; the chillness should be taken off by letting it stand in the house some days before it is used; and this month it should be given very sparingly. Windows in frosty weather should be kept very close, by pasting strips of paper where the wind blows in, for that contributes to the frost; and, if the windows must be covered with mats, take them down in the daytime to admit the light; for, if plants be shut up in the dark, their leaves will soon fall off; and the outward door should be opened as seldom as possible; but, to have it proper, there should be another door leading through a shed.

FEBRUARY.

When the ground can be conveniently worked, this is a very busy month, and no time should be lost, nor hands spared, that every thing may be done in its carliest season. The last week is particularly important; some full crops should then be sown, and many other things be done which are frequently neglected.

Kitchen garden .- Asparagus should have the mats taken off the glasses, except when it snows; for without light it will not be green; and the fifth and last crop should be planted on a hotbed. Beans of the early sorts must now be planted for the third crop, and at the end of this month the first crop of the large sorts, as Windsor, long-podded, &c. Sow beets, but let the ground be digged very deep. Boorcole or kale, and broccoli, will want earthing up, but let the dead leaves be first picked off. Sow cabbages, for the second crop of sugarloaf, and the first of red, and plant out those sown in August. Sow carrots at the end of the month for the general crop, on a deep sandy soil. Cauliflowers under glasses must be examined, all the dead leaves picked off, and the earth stirred up. In mild weather give them air, and plant some out, leaving only the two strongest under each glass.

Sow the second crop on a gentle hot-bed. Sow celery for the first crop on a gentle hotbed, and draw earth up to blanch what remains in the ground, in dry weather. Sow coleworts for the first crop: cress and mustard every week on hot-beds. Cucumber beds must be constantly attended to, to keep them up to a proper heat, and another made for the plants raised last month : when they have three or four rough leaves, plant them out, three or four to each light, and sow more seed. Tie up endive for blanching, and plant out some for seed. Eschalots, garlic, and rocambole, should not be deferred planting, or the roots will be very small. Ground lying vacant should be digged and thrown up into ridges, to prepare it ready for sowing. Horse-radish should now be planted. Hot-beds for cucumbers, melons, and small salluding, prepare, and have plenty of dung. Sow leeks, and mark some for seed. Plant out lettuces from under glasses, if the weather be mild, and sow the second crop. Give plenty of air to the forced ones. Sow melons at the beginning of the month for the first crop, and, when about three days old, plant each in a small pot. Plant mint in pots on a hot-bed. Defend mushroom beds from wet. Sow onions at the end of this month or beginning of the next for the general crop: weed those sown in autumn, and plant some for seed. Sow parsley for edgings, and some curled, very thin on a bed, to grow large for garnishing of dishes, and the large rooted. Sow parsnips on ground dig-ged very deep. Peas out of the ground should have the earth drawn up to them, as they advance in dry weather, and will require sticking. Sow marrowfats and other large sorts, and the third crop of hotspurs. Plant asparagus for forcing, for the last crop: beans for a third crop: Windsors for the first : cauliflowers from under the glasses : endives for blanching and seed : eschalots, garlic, and rocambole : horse-radish : lettuces from under glasses : leeks, onions, and parsley for seed : potatoes in hot-beds for the first crop. Uncover radishes in mild weather, and put the straw on again at night. Sow fennel. Sow on hot-beds, cauliflowers, celery, cress, cucumbers, melons, mustard, radish, rape for sallads. Sow spinach, the first crop, and hoe the winter crop if it be too thick. Water should be carried away, if it stands after heavy rains, by cutting trenches.

Flouer garden and 'shrubbery .- Anemones and ranunculuses should not be deferred planting the first mild weather, or they will flower weak; and the beds should be prepared some time beforehand. Hardy annual flowers, such as sweet-peas, lark-spurs, candy-tuft, alysson, corn-bottles, persicarias, and some few others, may be now sown, and they will flower very early. Auriculas must be defended by mats from wet, the decayed leaves constantly pulled off, and fresh earthed. Box for edgings may be planted in mild weather. Bulbous roots of every kind unplanted should not be deferred the first opportunity which offers of mild weather; and let the beds be thrown up into ridges beforehand. Bulbous roots in boxes, pots, or glasses, require a regular attention to water them; and

the earth should be stirred up once a week, Carnations must be fresh potted, and sheltered from heavy rains by mats. Flowering shrubs and forest trees of all sorts, except ever-greens, may be planted at the end of the month. Grass walks, if intended to be made next month, should have the ground prepared by levelling it. Hot-beds for sowing amaranths, balsams, and other tender annuals, should be prepared, and the seed sown at the end of the month. Hyaeinths which are above ground should be covered with mats supported by hoops. Mignonette must be sown on a hot-bed, or it will do in a pot placed in a warm room where the sunshine comes; but let the seed be sown very thin. Perennial-rooted flowers at the end of the month may be removed from the seed-beds. and the old roots transplanted. Plant anemones and ranunculuses. Shrubbery should be digged over and raked smooth, to destroy the young weeds beginning to shoot; but the trees should first be pruned. Shrubs of all sorts should have the suckers taken off, and, if small, be planted in beds a foot asunder until they are stronger; and any sorts may now be planted.

Fruit garden and orchard.-Apple and pear trees should be finished pruning the first mild weather. Plant cuttings of currants and gooseberries. Prepare grafts of apples and pears. Place hurdles against peaches, nectarines, and apricots, in the beginning of the month; they should be about two feet higher than the walls, that they may be set sloping; and must be fastened with stakes, and remain there till the fruit is set. Sow kernels of apples and pears, for stocks. Planting all sorts of fruit-trees should be finished early in the month, and the roots covered with mulch. Pruning wall-trees should be finished. Strawberries may be planted at the end of the month, and the old beds dressed; those on hot-beds must be frequently watered. Vines, finish pruning before they bleed. Wall-trees, as apricots, nectarines, peaches, plums, pears, should be finished pruning in the month, and those done in Octoher must be examined, and the dead ends cut off.

Greenhouse.-Admit air very freely in mild weather. Earth the top of the pots, but first take out the old an inch deep. Fire must be made in foggy weather to dry the house. Leaves this month decay very fast; therefore they will require picking off almost every day, but especially from the geraniums. Myrtles, oranges, winter cherries, and some others, water frequently, but not too much at a time. Succulent plants, as aloes, ficoides, &c., must not have any water given them in this month, for it will cause them to rot. Water the plants which require it frequently, but very sparingly; for too much moisture in the house will injure the plants. Windows may be opened for a few hours in the middle of the day, but should be shot again about two o'clock, or whenever it begins to be foggy.

MARCH.

The first week in this month, like the last in February, is very valuable to the good gardener and must be used industriously if he would have things in season. Necessary assistance must not be spared. Nature now waits for us, let us not neglect to attend upon her.

Kitchen garden.—Alisanders sown in autumn, should be hoed to a foot asunder, and more seed sown. Aromatic shrubs and herbs on beds, weed and fresh earth, early in the month; and sow and plant more of all sorts. Dress artichokes, and take the suckers off for a fresh plantation. Asparagus seed must now be sown to raise roots for forcing, and for fresh beds : at the end of about twelve years destroy the old beds, but take up the roots and force them : by now and then making one new bed, a constant succession may be kept up in full vigor. Plant out that which was sown last year. Fork up the beds, and rake them smooth, but do not leave the alleys above six inches lower than the top of the bed. Water the beds in a morning in dry weather, early in the month, with the drainings from a dunghill, to forward them. Make fresh plantations in moist weather. Plant beans for the fourth early crop, and the second of Windsors: cut off the tops of those in flower. Finish sowing beets. Sow boorcole of various sorts for the first crop. Sow broecoli of the early sort for the first crop. Cabbages; sow the third crop of sugarloaf, the second of red, and the first of savoys. Sow carrots now for the principal crop. Sow capsicums, for pickling, on a hot-bed. Cauliflowers must be planted out, leaving two only of the strongest to each glass: draw earth up to the stems, and prop up the glasses. Prick out those sown last month, and sow the third crop. Prick out the last crop of celery from the seed-bed, and sow the second. Chardons must be sown, and cives planted. Prick out the first crop of colewort. Cress, mustard, radish, and rape, may now be sown in the open ground for sallading; and eover the seed for a few days with a mat, or place handglasses over it. Sow cress and mustard very thin for seed. Cucumber beds must be kept to a good heat, by cutting off some around the · sides, and adding fresh hot dung instead of it. Plant out the second erop on a fresh bed. About the 20th sow seeds of the Turkey, and some for bell-glasses. Prepare hot-beds for planting cucumbers and melons. Plant Jerusalem artichokes. Sow leeks. Sow kidney-beans at the end of the month, on a warm border. Plant out lettuces, from under the glasses. Sow the third crop of Cos or other sorts. Plant out melons from the first hot-bed. Sow cantaleupes for the second crop, and some on a tan-bed, and for bell-glasses. Mint beds, weed and earth, and plant more. Mushroom beds make for summer use. Nasturtiums for pickling, sow at the end of the month. Carefully weed onion beds before the weeds are high; and finish sowing the principal crop. Sow parsley, both curled and large rooted. Finish sowing parsnips. Earth up peas in dry weather, and stick. Sow the second crop of marrowfats. Plant artichokes, asparagus, beans, cives, cucumbers, Jerusalem artichokes, lettuces, melons, mushrooms, potatoes, and tarragon. Plant aromatic herbs' and shrubs; as balm, camomile, lavender, mint, pennyroyal,

rosemary, rue, sage, savory, thyme, &c, Pot and sweet-herbs should now be sown. Slip potmarjoram, savory, and thyme. Weed potatoes, and plant the principal crop. Sow radishes, the fourth crop, and rampions. Sow angelica, basil, borage, burnet, celeriac, chervil, clary, corianders, cucumbers, dill, fennel, hyssop, marjoram, marygolds, melons, purslane, rampions, salsefy, savory, scorzonera, sea-kale, skirrets, sorrel, spinach, tarragon, thyme, tomatoes. Weed spinach, and sow the second crop. Plant tarragon, and sow tomatoes. Turnips, sow the first crop. Sow water-cresses, in a moist place, or where it may be constantly supplied with waste water from the pump. Destroy weeds while small, which will save future trouble.

Flower garden and shrubbery.-Anemones and ranunculuses, if any remain unplanted, must not be deferred longer than the first mild day. Anemones in flower should be covered with mats in windy or rainy weather. Annual flowers which are tender, if sown early in the month, will require a second hot-bed to be transplanted into; and, if not sown, should not be deferred any longer, to have them early and strong. Sow those also mentioned in sect. II. of the general catalogue, on a moderate hot-bed. Annual flowers of all the hardy sorts in the catalogue may be sown about the middle of the month in small patches where they are to remain; hollow the earth out in the form of a basin, fifteen inches over, and an inch deep, and sow the seeds very thin all over it, and not a small patch in the middle, as is too frequently the custom. Auriculas should be removed into the stand, and, if some flat oyster-shells be laid on the earth, they will keep it moist, and save trouble in watering them. Borders of the flower-garden will require to be hoed over or weeded, to destroy weeds which are beginning to shoot, and then raked, that they may appear neat. Box for edgings, in mild weather. Bulbous roots in beds should be covered with mats in rainy or stormy weather, and the earth stirred gently up with the fingers to destroy the weeds; those also in the house must be constantly attended to. Carnations, if not potted last month should be done the beginning of this. Evergreen shrubs, and trees of all sorts, may be planted in mild weather; then cover the roots with turf turned downwards, moss, fern, pea-straw, or some such things, to keep the ground moist, which is better, and gives less trouble than watering. Plant flowering shrubs and forest-trees of all sorts, early in the month, and cover the roots. Grass walks must be swept and rolled. Gravel walks will need turning and rolling, after being weeded, and cleaned from moss with a birch broom. Hyaeinths must be covered with mats or canvas, to prevent their flowers from being spoiled, but not kept too close. Larkspurs, in beds or patches, must be thinned and not left nearer than eight or ten inches. Mignonette, sown last month, should be transplanted, and more of it sown. Myrtles, winter cherries, and other hardy greenhouse plants, planted against walls, should have the mats rolled up in fine weather, and the dust washed off from their leaves, but covered again at night. Perennial and biennial flowers must

be sown on beds, very thin, that they may be strong; those sown last year should be transplanted, and the old roots of the perennials divided. Plant annuals from the first hot-bed: biennials and perennials from the seed-bcd: evergreens of all sorts : perennials, by dividing their roots, and seedlings of last year's sowing : shrubs and trees early in the month: strawberries and thrift for edging. Shrubberies should be pruned early in the month: the suckers taken off, and planted a foot at least asunder, and the rows two feet apart : the ground hoed or digged, and then raked over, that it may appear neat and clean. Plant strawberries, for an edging to the shrubbery, at six inches asunder; the flowers make a pleasing appearance and afterwards you will have very large fruit by their being in a single row. Plant strawberry trees, against a south wall, which will preserve the flowers, and ripen the fruit. Constantly destroy weeds by hoeing while small, with a Dutch hoe, made to cut both ways, by which method you may always keep your shrubbery in order, with very little trouble.

Fruit garden and orchard .- Apricot, nectarine, and peach trees, should have hurdles placed before them, to defend the blossoms from hail; or else stick branches of yew, fern, or fir, amongst them, but hurdles are the best. Fig trees which have mats nailed over them should have them taken away by degrees, by first unnailing them at the bottom, towards the end of the month. Graft trees, and cut down the bud-ded ones. Peach and nectarine trees ought to be finished pruning at the beginning of the month, if omitted till then; the heads of those lately planted should be cut off. Planting of all sorts should be finished at the beginning ot the month. Strawberry beds should now be attended to; hoe them first to destroy the weeds, and stir up the earth between them; then spread some very rotten dung and earth over them. Those on hot-beds want frequent watering, and the dead leaves should be constantly picked off, to let the sun come to the fruit. New plantations may now be made. Vines may now be layered: draw some strong bearing branches through the bottom of the pot, and plunge the pot into the ground; and then they may be transplanted the next season, and produce fruit the first year; plant cuttings. Finish pruning wall trees, and mulch those lately planted.

Greenhouse.-Give air freely in the middle of the day, except the wind be very cold. Place geraniums near the windows to prevent their being drawn up weak. Myrtles, winter cherries, and other hardy plants, will want fresh potting, and, if the weather be mild, may be taken out to make more room, but set them in a sheltered place at first. Orange trees, if their leaves be mildewed, will want washing with a sponge and warm water. Those with ill shaped heads should be cut down, and placed on a strong hot-bed. Sow kernels in pots, good strong seed, and, if they are set an inch asunder, they will grow faster. Succulent plants may now have a little water, but not much at a time. Water the plants in the middle of the day, and only when the sun shines; but the water should be set in

APRIL.

If by any means the proper early cropping of the ground has been prevented, make no delay to finish and to get the garden into a complete state of cultivation. Let nothing now be met with that appears sloyenly or disgusting.

Kitchen-garden .- April being the latest time for sowing the principal crops of the kitchen garden, if any thing directed to be performed last month was omitted, or the weather would not permit, let it be done early in this. Aromatic herbs and shrubs of all the following sorts should now be planted, as balm, camomile, pennyroyal, peppermint, spearmint, tansey, lavender, rosemary, rue, sage, southernwood, wormwood, &c. Finish both sowing and planting asparagus early in the month. Let the beds be forked and raked smooth, and watered twice a-week with drainings of a dunghill. Cut off every bud, however small; for, if they be left on, they weaken the others; this method is in general only practised by the London kitchengardeners. Never suffer any weeds to remain after they are an inch high, for they weaken the asparagus very much. Beans in flower should have their tops cut off; and draw the stalks of the first crop close to the wall by strings, and earth them up. Plant the third crop of Windsors. Kale and broccoli should have the first crop pricked out, and the second sown. Cabbages of the early sort should have their leaves tied up to forward their cabbaging. Prick out from the seed-bed the third crop of sugarloaf, the second of red, and the first of savoys. Prick out capsicums from the seed-bed, to prevent their growing weak, upon another hot-bed. Weed carrots, thin the first crop, and sow the second to draw young. Search for caterpillars, upon cabbages and appletrees particularly. Cauliflowers should have the earth drawn up very high to raise the glasses, and a piece of brick put under each corner, and at the end of the month taken quite away. Break down the leaves when the flowers of any begin to appear; earth the second crop, and prick out the third. Celery, prick out the second crop, and sow the third. Sow cress and mustard every week. Cucumber beds must be attended to, and plenty of air given them, when mild; and, if the heat declines, fresh dung must be added to the sides. Make a gentle hot-bed within the ground for those that are to be under bell or hand glasses, and plant them on it at the end of the month. Sow more seed, that you may have plenty of plants. Endive planted out for seed should be earthed up, and the first crop sown. Sow finochio, in drills a foot asunder, for the first crop. Hot-beds for sowing of melons for bell glasses must be prepared, and loam and rotten dung procured, to be ready. Sow kidney beans, the second crop, and the first of the scarlet flowering. Tie up lettuces, to assist their cabbaging; those in beds should be thinned to a foot distance; others planted out, and the fourth crop sown very thin in an airy place. Melon

beds will require to be kept up to a good heat, and the second and third crops planted out. Finish making mushroom beds early in the month, which will last till September. Onion beds must be attended to, to keep clear from weeds as soon as any appear, and sow the second crop to draw young. Thin parsley for garnishing dishes, and leave those plants which have the best curled leaves. Sow the large-rooted. Earth up peas frequently, and stick them as soon as any tendrils appear. Sow the third crop of marrowfats. Plant beans and mushrooms. Plant cucumbers and melons on fresh hot-beds. Potatoes should now be finished planting. Pot and sweet herbs may still be sown and planted ; and weed and earth the beds. Sow purslane on a warm border in rich earth. Sow radishes for a fifth crop in a cool place. Slip and plant out last year's rosemary, rue, sage, savoy, and thyme. Search often for snails and slugs. Sow aromatic herbs and shrubs. Sow on a hot-bed cucumbers and melons. Sow spinach, the third crop, in a cool place. Turnips, hoe the first crop and sow the second. Weed all the beds of seedlings, while the weeds are small, and any other crops also.

Flower garden and shrubbery. - Anemones in stormy weather will still require covering with mats. Annual flowers on hot-beds will require thinning, and some of the strongest must be planted into single pots. Hardy annuals, if not already sown as directed in March, should be deferred no longer, and sown very thin. Auriculas in bloom must be constantly attended to, and defended from violent winds, but yet have plenty of air in mild weather; the seed-beds will want frequent and gentle waterings. Balm of Gilead may be sown or slipped, but the strongest plants will be raised from seed. Biennial and perennial flowers, finish sowing early in the month. Weed or hoe the borders of the shrubbery and flower-garden, and rake frequently. Still plant box for edgings in mild weather. Bulbous rooted flowers, which were planted in boxes or glasses, as soon as the flowers are decayed, should be planted in the ground to strengthen the roots. Carnation seed may now be sown, and stir up the earth frequently of those in pots. Crocus leaves are by many persons cut off; but it greatly weakens the young roots, for the old ones decay, and new roots are formed every year; if they hang over in the walks tie them up in a knot. Finish planting evergreen trees and shrubs, and sow the seed. Grass walks must be swept, rolled, and mowed; if any places be bare, lay down some pieces of fresh turf, or sow some hay seeds. Prepare the ground by levelling, early in the month, where fresh walks are to be made. Gravel walks must be frequently rolled in dry weather, and turned if the top be dirty, but sweep them well first. Hyacinths in bloom, shade with mats or canvas. Kidney beans, with searlet flowers, will form a pleasing shady walk towards the end of the summer; they must be sown on each side of the walk three or four feet wide, at six inches asunder, and sticks of eight or nine feet long placed to them, or sticks of five feet long will do with some osiers to form the arch at the top. Lark- air. On beds, four feet wide, plant four rows

spurs must now be thinned for the last time, and left eight or ten inches asunder; if taken up carefully with a trowel, they may be planted again; by this method the flowers will be strong, and the seed abundant. Layer laurustinuses and various other shrubs, but omit the rose trees till June. Sow mignonette, on a warm border. Myrtles and hardy greenhouse plants against walls, towards the end of the month, may have the mats taken away, and fresh ones planted where necessary. Those from the seed-beds transplanted, and the old roots of the perennials divided. Plant the olive-leaved phillyreas, to make nosegays, as the leaves greatly resemble myrtle. Plant annuals from the hot-beds into pots, and plunge them into another hot-bed : biennials and perennials on the borders: myrtles, heaths, and other hardy green-house plants: hollies and quick for hedges: strawberries and thrift for edgings : shrubs and trees of all sorts early in the month: tuberoses in pots on a hothed. Water seedling beds of flowers, shrubs, and trees, often, but very little at a time. Shrubberies should be finished digging and raking, and frequently hoed when any weeds appear. Shrubs or flowers in pots are best to be set in pans, which will save much trouble in watering. Sow balm of Gilead in pots : carnations and pinks in boxes or pots: evergreen shrubs and trees : mignonette ; scarlet kidney beans : perennial flowers of all sorts : shrubs and trees of every kind on shady borders, or in boxes. Mix seeds which are small, first with some dry earth, that they may not be sown too thick. Sow tobacco very thin in a bed of fine rich earth. Plant tuberoses on pots on a hot-bed. Turf should be finished laying, and often watered in dry weather. Water seedling beds and shrubs lately planted, in a morning, during this month, on account of the frosts. Weeds should be destroyed while very small, to prevent their running up to seed, especially on beds of seedlings.

Fruit garden and orchard .- Apricots commonly growing in clusters require to be thinned three different times: as soon, therefore, as they are the size of a horse bean, it is proper to begin. Budded fruit-trees, such as apricots, cherries, nectarines, peaches, plums, must be examined to pull off all the shoots which come from the stock. Caterpillars may now be readily found in their webs, but more particularly on apple trees. Grafted fruit-trees, as apples, cherries, pears, must often be examined to take off the shoots below the grafts; and replace any elay which has cracked or fallen off. Apply hog's dung to any fruit-trees which are blighted. Take away hurdles when the fruit is set. Finish planting and pruning nectarines and peaches. Planting and pruning should be entirely finished early in the month ; and, if any trees be removed so late, it should be those which have been planted in baskets and trained. Search for snails in the holes of walls. Finish dressing and planting strawberry beds, but plant only strong runners of the last year, and at the following distances-for, in general, they are planted too close, which causes the fruit to be mouldy for want of one foot asunder, ot the scarlet, alpine, wood, and green: hautboys, three rows, at sixteen inches asunder. Bath Chili, Devonshire Chili, Carolina and pine-apple Chilis, three rows, and each plant twenty inches asunder. Chilis, three rows at two feet asunder at least: these are but little known; the Carolina are generally taken for them, which are pale, hollow in the centre, and frequently woolly: when there are three rows, plant them in quincunx order in the following manner:—

> ຍ ຍ ຍ ຍ ຍ ຍ ູຍ ຍ ຍ ຍ ຍ ຮູຍ ຍ ງ ນ ຍ

Decayed leaves from the forced ones should be constantly picked off, and frequently watered. Vines should be examined when they first begin to shoot, and all buds pulled off which grow in improper places. Plant cuttings early in the month. Wall trees of all sorts should not be deferred pruning longer than the beginning of the month.

Greenhouse .- Give air, very freely by keeping the windows open all day, except in storms of hail. American aloes may have water very often, and should be fresh potted. Earth the tops of all the pots, with the compost which each plant requires ; and shift those which are in too small pots. Geraniums should be removed as near as possible to the windows, to prevent their being drawn up weak; branches which begin to rot must be cut off, and decayed leaves constantly pulled off. Inarch orange and lemon trees. Constantly pull off decayed leaves from all plants, but especially the geraniums. Myrtles, if prevented from being set out last month, may be removed in this, but should be in a sheltered place. Prune and fresh-pot any plants that may need it. Orange trees must be fresh-potted after the myrtles are taken out; leaves which are mildewed must be cleaned with a sponge and water a little warm, and the stems well brushed. Seeds of any sort which are ripe may still be sown on a hot-bed. Succulent plants will require frequent watering, but give very little at a time. Water the plants only when the sun shines, and keep the windows shut for two or three hours after. Windows may be opened on all fine days, from about nine in the morning till four, except when it hails

MAY.

Let this delightful month be ushered in with due respect by the gardens being in excellent order, to which end let no help be spared, when the gardener is not competent to perform the work himself. It is often too much for the most industrious man. We now gather vegetables that have stood the winter, and have been the cure of many months, with some of the products of spring also.

Kitchen garden.—Aromatic herbs and shrubs may still be sown and planted. Artichokes should have the young shoots pulled off, lest they rob the principal one. Asparagus beds ought to be frequently weeded, as it prevents seeing the buds so readily, if the weeds be not pulled up; and in very dry weather watering them will be proper. Beans will require to have their tops cut off as they come into flower, and the

earth drawn up to their stems. Prick out the second crop of kale, and be sure to have plenty of plants, for in all long frosty winters its utility is fully proved. Cabbages will often want hoeing and earthing up. Plant the second crop, and the first of red. Sow the fourth crop, and the second of savoys. Cabbage turnips, turnip-rooted cabbages, American and white Scotch cabbages, and Anjou boorcole, must now be sown; whether they are intended for feeding cattle, or for eating. They are most profitable when very large, therefore sow the seed very thin. Plant out capsicums, where they are to flower, and tomatoes into rich ground, or between the bell glasses of cucumbers. Carrots should be weeded before the weeds overtop them, and thinned by hoeing. Caterpillars may now be readily found in the webs, and particularly on apple trees. Cauliflowers to be cut from October to December and plant out the second crop. Prick out the third crop of celery, and sow the fourth. Plant out the first of cole-Sow cress and mustard every week on worts. a cool border; and hoe that which is intended for seed. Cucumbers for the fourth crop may be planted out, and let some be against walls, both for seed and superior flavor. Sow now in the open ground. If plants be attacked with black flies, fumigate them with tobacco smoke. Endive, thin the first crop and sow the second. Eschalots, garlic, and rocambole, may have a few roots taken up for present use. Sow finochio for the second. Hoe or weed the beds of beets, carrots, leeks, lettuces, onions, parsley, parsnips, turnips, &c., and thin them before they are too crowded. Sow kidney beans the third crop of dwarfs, and the second of runners. Thin lettuces in beds, and then sow the fourth crop. Melons on the tan-bed must be thinned. Sow seed for an autumn crop; prick out each into a small pot, as soon as the rough leaves appear. Fumigate with tobacco smoke any that are attacked with red spiders. Mushroom beds will want frequently gentle waterings. Thin nasturtiums to a foot asunder, and place some sticks amongst them to prevent their trailing upon the ground. Those planted for seed will require stakes and strings to support them. Sow the third crop to draw young. Parsley for garnishing dishes, thin to eight or ten inches asunder. Sow peas, the fourth crop of marrowfats, and earth and stick those which require it. Hoe the ground before the potatoes appear. Pot-herbs and sweet herbs in beds must be frequently weeded, particularly seedlings. Prick out from the seedbeds, broccoli, cabbages, kale and melons. Radishes for seed should now be planted. Choose only the straight well shaped ones, and which are of a good color. Sage must still be slipped and planted. Seeds of all sorts nearly ripe will often require staking, and defending from birds. Slugs and snails may easily be found and destroyed after rain, or early in the morning. Sow broccoli, cauliflowers, cucumbers, melons, onions, purslane, and radishes. Sow spinach, the sixth crop, in a cool place. Sow turnips, the third crop, and hoe the other. Water often, in dry weather, beds of seedlings. Weeds of no sort should be suffered to seed, and many sorts when

cut down will still ripen their seeds, if not raked up and carried away. Weed, before the young weeds overtop the young plants, the seed-beds and crops of broccoli, cabbages, carrots, endive, finochio, kale, leeks, lettuces, onions, pot-herbs, spinach, and turnips.

Flower garden and shrubbery .- Annuals from the hot-beds should be removed into larger pots, and encouraged in their growth as much as possible, by being constantly watered. Annuals sown on borders will require thinning, weeding, watering in dry weather, and the earth drawn up to support them; but leave a ridge round them to retain the water. Auriculas out of bloom, and the seed boxes, should be removed into a shady place. Weed biennial and perennial flowers in the seed-beds, and thin if necessary. Hoe the borders of the shrubbery and flower garden, and frequently rake them, that they may always look neat. Bulbous roots, which flower early, as aconites, anemones, crocuses, irises, snow-drops, and several others, should be taken up as soon as the leaves are withered, and before they entirely disappear, for then they are more readily found. Those in boxes or glasses, which have done flowering, should be put into the ground to strengthen the roots. Carnations will require sticks to be placed to them as soon as they begin to spindle, and the earth should be often stirred up. Evergreen shrubs and trees lately planted must be frequently watered, and they may also be layered. Weed, roll, and mow the grass walks often. Gravel walks will require frequent rolling. Ilyacinths, as soon as the leaves begin to decay, should be taken up, then laid on a ridge of earth with their leaves downwards, and covered with earth two or three inches thick, to harden and ripen the roots. Insects of various sorts, as earwigs, caterpillars, snails, &c., should be searched for and destroyed. Mignonette may be sown in the open ground, for a succession in the autumn. Myrtles, heaths, and other hardy greenhouse plants against walls, will often require watering. Plant annuals into larger pots, and on the borders; and cover them with a pot till they have taken root. Ranunculuses should be weeded, and the earth gently stirred with the fingers. Rosetrees infected with green flies or grubs must be constantly examined ; wash off the flies with water, and pinch those leaves which have grubs in them with the finger and thumb. To have roses late in autumn, cut off every flower-bud which now appears, from two or three trees, and water them well for about ten days afterwards. Seeds of every sort of flowers which are ripe should be gathered. Shrubberies should be often hoed with a Dutch hoe, to destroy the young weeds; and shrubs and flowers in pots should be set in pans, and often watered. Sow annuals to flower late in autumn; as alyssons, candy-tufts, cornbottles, yellow fumitories, larkspuis, lavateras, yellow lupines, mignonette, poppies, dwarf stocks, pansies, and sweetscented peas. Still plant tuberoses, to flower late in autumn. Tulips, if out of bloom, should have their seed-vessels broken off, and the early ones taken up. Water annuals, seedlings newly planted, and shrubs and trees, very often in dry weather. Weeds should particularly be pre-

vented from going to seed: the most expeditious method is to cnt them up with a Dutch hoe, made to cut both ways; and, if neatly done, the borders will not require raking afterwards, if cut while very small.

Fruit garden and orchard .- Apricots should be thinned for the second time, and all foreright shoots pulled off. Blighted trees should have hogs' dung spread over the border ; then fork up the ground and water it well. Pull off curled leaves, water the trees all over, and strew tobacco dust on the leaves ; or fumigate them with tobacco smoke, which will greatly help to destroy the insects. Examine budded trees often, and pull off improper shoots. Caterpillars must be searched for upon apple trees, and destroyed. Disbud all the wall trees, by pulling off buds which come out in improper places. Espalier trees should be examined to disbud them and train in the shoots. Grafted trees should have the clay taken off, if properly united. Nectarines and peaches will require thinning for the first time, and the trees to be disbudded. Forced strawberries should have the dead leaves pulled off and be frequently watered. Those which are beginning to flower, or have lately been planted, must be often watered in dry weather. It is not generally known that hautboys and chili strawberries do not, like all the other species, produce hermaphrodite flowers, but male and female flowers on separate plants; and persons ignorant of this fact allege their hautboys are blind; whereas those flowers which turn black in the middle are male plants, and never will produce fruit. To make a plantation properly, let a person skilled in botany examine them when in flower; he will then easily distinguish them by the male stamina above a quarter of an inch high. Most of them should be pulled up, and the male ones marked with a stick; for they cannot be distinguished when out of flower. The females indeed will produce fruit, but neither so large nor well flavored, and often illshaped; and the seed will not grow, unless im-pregnated by the male flowers. In making a new plantation, do it in the following manner:-

> * * * * * * m * m * m * * * * *

The male plants may be transplanted when in flower, if covered with a flower-pot for a few days after: three males will do for every fourteen females. Vines will require a constant attendance to pull off weak shoots, especially where two come together, and to nail the branches. Water trees lately planted, or any infected with insects.

Greenhouse.—Air must be given freely except on cold nights. American aloes must be often watered and placed near the windows. Take out geraniums towards the end of the month, except those with variegated leaves. Turn myrtles which are small out of the pots, and plant them in a bed of light rich earth. Orange trees must be fresh potted, if not done last month; and, as soon as the leaves of mulberry trees are the size of a half crown, it shews that the weather is settled, and they may safely be set out. Water constantly the young trees sown in March, or any on the hot-beds. Seedling plants should be attended to, and shaded with mats, when the sun is hot in the middle of the day, and be often watered. Succulent plants should be earthed at the top, but not shifted; and may still remain in the house towards the windows, and be often but sparingly watered. Water plants frequently, and a little at a time, rather than too much at once. Windows may be kept open all day, and, towards the end of the month, all night, to inure the plants by degrees to the open air.

JUNE.

In this month the gardener begins to find some pause to his labor. The ground is now fully cropped, as to principals, and the chief business is to see that the various plants according to their different ages and growth have necessary attention and assistance.

Kitchen garden .- Aromatic herbs, flowers, and shrubs, for drying and distilling, gather when dry; they are in the greatest perfection just as the flowers begin to open. Beans will still require earthing, and the tops of those which are in flower should be cut off. Beets should be thinned to their proper distance of ten or twelve inches at least. Plant the first crop of kale, and sow the third. Broccoli, plant the first, prick out the third, and sow the fourth crop. Cabbages, plant the third crop, prick out the fourth and sow the fifth. Red cabbages, plant the second crop, and sow the third. Savoys, plant the first, prick out the second, and sow the third. Cabbage-turnips, &c., for cattle, as described under last month, sow for the second crop. Carrots and parsnips, finish hoeing, and leave them at eight or ten inches distance at least. Capsicums, finish planting out, and hoe and water them often in dry weather; for in late seasons they will not ripen unless brought very forward early. Search for caterpillars on cabbages and apple trees. Cauliflowers, plant the third crop, and prick out the fourth. Plant the first crop of celery, prick out the fourth, and sow the fifth. Colesced and rape may now be sown, if the ground be in proper order. Sow the second crop of coleworts. Cress and mustard intended to stand for seed should now be hoed for the last time; the cress left at six inches distance, and the mustard at eight. Nail up or stick cucumbers against walls. Thin and draw up earth to the stems of those under bell glasses, and water them frequently. Plant out the first crop of endive, thin the second, and sow the third. Sow the third crop of finochio or Italian fennel. Hoe or weed the beds of beets, carrots, leeks, lettuces, onions, parsley, parsnips, turnips, &c., to their proper distances. Kidney beans, sow the fourth crop, and place sticks to the runners. Plant lavender, rosemary, rue, and sage nuttings, in the shade. Hoe and thin leeks to about four inches distant, to be ready for transplanting in July. Sow the sixth erop of lettuces in a cool place, and thin those for seed to a foot distant. Cover melons in frames with mats in the middle of the day, and lay pieces of broken earthen plates or dishes under the fruit. Plant out those for the oiled

papers. Examine often the mushroom beds, that they do not want water. Thin the onions to six or eight inches distant. Thin parsley in beds for garnish, and the large rooted to eight or ten inches. Parsnips must be thinned to ten or twelve inches. Sow the last marrowfat peas in a cool place. Plant lettuces and melons. Weed pot-herbs and sweet-herbs often, and gather for drying, just before they begin to flower: then tie them up in small bunches, and hang them across lines in a shady room to dry. Prick out broccoli, cabbages, cauhflowers, and celery. Sow turnips and turnip-radishes. Sow radishes the seventh crop, and turnip-rooted, and black Spanish, in a cold place. Rape and coleseed may now be sown. Seeds of all sorts must be gathered as they ripen, and defended from birds. Sow spinach, the fifth crop; thin in a cool place. Thin the follow-ing crops, and leave them at their proper distances. Leeks may be left at four inches, and transplanted in July. Lettuces intended for seed, at least a foot asunder; but fifteen inches will be better. Turnips at six or eight inches. Sow the fourth crop of turnips, and hoe the others. Water all beds of seedlings and cuttings frequently. Weeding the young crops is of the utmost consequence this month, especially if it be a rainy season, and must not on any account be omitted; nor let any weeds run to seed.

Flower garden and shrubbery .- Take up anemones before their leaves are quite withered, and they will be more readily found. Annuals from the hot-beds will require fresh potting, and may be placed in the open air if it be settled and warm, but will want frequent watering. Annuals on the borders should have the earth stirred up with a hoe, and be often watered, and more sown to flower in autumn, as described under last month. Hoe and rake borders of the flower garden and shrubbery frequently. Box may be clipped, but always do it in moist weather. Bulbous rooted flowers of every sort, whose leaves are nearly withered, should be taken up before the leaves entirely disappear, and put into shallow wooden boxes, as directed for hyacinths, as soon as dry. Carnations require to be examined frequently and tied up to the sticks. Search for the ear wigs. Evergreens may be clipped in moist weather. Grass and gravel walks will often require weeding, but it should be done after rain, for then the roots may be drawn out without breaking: they will often want mowing and rolling also. Ilyacinths, as soon as dried, should be taken out of the ground, then rubbed with a woollen cloth to clear them entirely from earth, and laid in shallow wooden drawers; but they should never be put into flower-pots, earthen pans, or laid on brick floors, for they will contract a mildew or mouldiness, which will make them rot. Insects of all sorts should be sought for and destroyed. Kidney beans will want earthing, sticking, and the runners to be trained to the sticks. Mignonette, from the seed-beds, should be transplanted into small pots, and only three put into each; it will then be ready to put into larger pots, or upon the borders. Myrtles, and other greenhouse

VOL. XI.

plants against walls, should be often watered, all fore-right shoots pulled off while small, and the others nailed to the walls with long narrow shreds of fine cloth. Plant out perennials and biennials from the seed-beds in showery weather ; and, if the sun should be very hot soon after, cover each plant with a flower-pot, until they have taken root. Pinks may now be increased by making pipings or cuttings, but a glass must be placed over them. Plant out all annuals from the seed-beds and hot-beds: pipings of carnations, and pinks. Attend to ranunculuses, and take them up as soon as the leaves are quite withered. Rose trees may now be layered and budded, and some very rotten dung spread on the ground, and digged in, and often watered; the flies and grubs must also be attended to. Seedlings of trees, shrubs, or flowers, should be covered with mats in the day-time, and often watered; but, if in pots, remove them into the shade. Seeds of all sorts which are ripening should be attended to, and gathered before they drop out of the pods. By a little attention to them, in most seasons, enough may be got for the next year, and the expense of buying saved. Shrubberies ought frequently to be looked over; all straggling branches should be cut off or tied up; and the grounds stirred with a Dutch hoe. Shrubs in pots may be set in pans, and watered Sow annuals, as described under last often. month, to flower in autumn, in any vacancies that may be on the borders of the shrubbery or flower garden. Tulips should be taken up before their leaves are quite decayed, that they may be found more readily; and, if any of the offsets be very small, plant them again directly, and lay the roots to dry in shallow boxes. Tulips produce new bulbs every year, and the old ones decay entirely; therefore they should never be taken up until the new bulbs are quite Water annuals in pots constantly; formed. seed-beds of all sorts; and shrubs and trees lately planted. Weeds, in this month, it is of the utmost consequence to destroy before they flower. When cut down they should be raked up and carried away, for many sorts will otherwise ripen their seeds lying on the ground.

Fruit garden and orchard .- Apple trees in espaliers must be often examined; all fore-right shoots should be taken off while small, and the others regularly trained to their proper distances. Search for eaterpillars. If the standard apple trees be infected with caterpillars, light some damp straw, and with a fork direct the smoke through the tree, and they will soon be suffocated, and instantly drop down. Apricots must be thinned for the third and last time, and the shoots frequently nailed up. Blighted trees must be constantly attended to, as directed last month. Bud apricot, cherry, and peach trees. Cherry trees against walls should be covered with nets, to defend the fruit from birds. Look over the espalier trees often, and train the shoots in regular order. Nail up fig trees with very strong shreds. Nail up every week shoots of wall trees. Nectarines and peaches will require thinning the second time, nailing up the shoots and pinching off the ends where vacancies want filling up. Nail up pears and plums as they shoot, and pull

off all fore-right shoots. Keep stocks, intended to be budded, free from weeds. Strawberries in flower will need frequent watering in dry weather. Lay tiles or wheat straw under the fruit of the scarlets, and pull off all decayed leaves; this will keep the fruit clean, and cause it to ripen sooner by several days. Cut off all runners as fast as they shoot. To make some fresh beds, reserve the first runners, as they are the strongest. Attend the flowering of the hautboys, as directed under last month. Vines require constant attendance, in rubbing off improper buds, and nailing up the shoots. Water those trees frequently which are blighted: and all newly planted trees in dry weather.

Greenhouse .-- Air may now be given very freely in the greenhouse, and the windows may be kept open all night. Fresh earth aloes, and place near the windows, but take out the Americans. Plant cuttings of various sorts, under bell or hand glasses, at the end of the month. Earth all the plants every month at top, if not shifted. It makes them look neater, and grow better. Geranium seedlings sown in March will now require pricking out, and cuttings planted under glasses. Inarch jessamines, lemons, and oranges. Layer jessamines, oleanders, &c. Plant myrtle cuttings at the end of the month under glasses, but never take them off till they have grown two inches. Orange trees, if not taken out at the end of last month, will require it at the beginning of this. Clean well the leaves which are mildewed, or have insects on them, with a sponge and warm water. Inarching may now be performed. Those on hot-beds, and the young seedlings, must be attended to, and the stems of the old trees should be frequently washed. Often water seedling plants of all sorts; shade them in the middle of the day, and prick out the strongest to make room for others. Succulent plants may now be shifted, the offsets taken off, placed near the windows, and be often watered. Watering some of the plants will be necessary almost every day.

JULY.

In the month of July there is a cessation from the great bustle and more laborious works of gardening; yet 'its many cares' still find employment for the willing hand: perfection will not be attained without perseverance in the means. Let nothing, therefore, be omitted that may lend to crown the gardener's credit with a continued production of fine vegetables, fruits, and flowers.

Kitchen gurden.—Aromatic herbs, flowers, and shrubs, gathered last month, if hung on lines, will soon be dried. It is then better to strip off the leaves and flowers from the stalks, and put them into paper bags, which will preserve their flavor better, and keep them free from dust. Continue to gather them before their flowers are too much opened. Asparagus, if wished for in autumn, must be attended to at the beginning of this month; the stalks must be cut down, and, if it be dry weather, the beds must be very well watered with the draining from a dunghill. Next day fork them up lightly, and rake them smooth; if the weather continues dry, water them every night for a week, and in about eight or ten days thev

403

will be fit to cut. If this be done every year, leave two or three beds uncut at spring, and make some more beds to allow for this double crop. Beans: plant the fifth crop of Mazagan, and the fourth of Windsor, for late crops. Finish thinning of beets to their proper distance. Plant the second crop of kale, prick out the third, and the first of Anjou. Plant out the third crop of broccoli, and prick out the fourth. Plant the fourth crop of cabbages, and prick out the fifth. Prick out the third crop of red cabbages. Plant the second crop of Savoys, and prick out the third. Cabbage turnips, &c., for cattle, prick out the first crop. Sow carrots to draw young, the third crop. Earth up capsicums, and often water them. Plant out the fourth crop of cauliflowers. Plant the second of celery, and prick out the Finish sowing coleseeds, coleworts, and fifth. Prick out the second crop of coleworts. rape. Stick cucumbers on the open ground, with branches of elm or other sticks. Lay tiles on endive, or tie up the first crop; plant the second, thin the third, and sow the fourth very thin. Take up some eschalots and garlic for present use. Sow finochio, the fourth crop. Sow kidney beans, on a south border, the fifth and last crop. Still plant lavender and rosemary cuttings. Plant out leeks in double rows, at six inches distance, and a foot between the rows. Sow the seventh crop of lettuces in a cool place; and hoe those intended for seed. Melons must be frequently attended to. Water mushrooms in dry weather. Pull onions, when their leaves begin to wither, out of the ground. Sow the first crop of Welsh onions, and the last crop to draw young. Sow the third crop of parsley near a south wall. Peas sown last month will want sticking. Sow the fourth crop of hotspurs. Plant red cabbages, rosemary, and Savoys. Prick out broccoli, cab-bages, celery, coleworts, and boorcole. Sow radishes, the eighth crop; also turnip-rooted, and black Spanish; and hoe the first. Seeds of all sorts must be attended to, and gathered as they ripen. Sow rape and turnip-radishes. Sow spinach, the sixth crop, and the first of prickly, in a cool place, very thin. Sow turnips, the fifth and principal crop for winter use, and hoe the other crops. Water beds of seedlings, and all young crops. Weeds must be constantly attended to, and raked off the ground, or else many sorts will ripen as they lie on the ground.

Flower garden and shrubbery.-Annuals in pots require a constant attention, lest they should want water; and those on the borders require sticking and tying. Seeds nearly ripe must be watched and gathered, else many sorts will be Annuals, to flower late in autumn, may still be sown. Auriculas and polyanthuses from the seed bed should be transplanted upon a shady border, and, if possible, in rainy weather. Finish cutting of box and evergreen shrubs. Bud the curious sorts of jessamines, roses, &c. Bulbous roots must still be attended to, to take up dry and clean, and then put in shallow wooden boxes. Saffron, croeus, and many other sorts, which flower in autumn, may now be planted. Carnations must be constantly watered, carwigs searched for, and layers and pipings made. Evergreens, if required, may now be transplant-

ed; but it should be done in rainy weather, and let the ctipping be finished. Grass and gravel walks must be frequently weeded, mowed, and rolled. Hyacinths should be examined to see that there is no mouldiness among them; and, if any be decayed, they must be taken away. Kidney beans must be examined, if they are trained to the sticks, and watered in dry weather. Lilies of many sorts, if they have done flowering, may be taken up; but the roots are so full of moisture, that the small off-sets must be planted again directly. Mignonette should now be sown to flower in winter, and more put into pots. Myrtles, and other greenhouse plants against walls, will require frequent nailing and watering. - Finish planting perennials and biennials for the seed beds. Pinks: finish making pipings or cuttings. Plant auricula and polyanthus seedlings : biennial and perennial seedlings : cuttings of scarlet lychnis and pinks: off-sets of lilies: off-sets of autumnal flowering bulbs: pipings of carnations and pinks: saffron-crocus. Ranunculuses must be taken up, and laid in the shade to dry; then well cleaned from earth, and laid in shallow boxes, or put into paper boxes. Finish layering and budding of rose trees. Seedling trees, shrubs, and flowers, must be properly shaded and watered. Seeds now begin to ripen very fast; and therefore must be constantly attended to and gathered. Shrubberies will require frequent attention in pruning or hoeing. Sow the last crop of hardy annuals. Tulips should be finished taking up, and as soon as dry the earth should be rubbed off, and then laid in shallow boxes. Water frequently young trees, and shrubs planted this spring. Weeds, if it be rainy this month, grow very fast; the ground should therefore be fre-quently hoed, and no weeds suffered to run to seed.

Fruit garden and orchard.—Destroy ants, flies, and wasps, as soon as they appear, by hanging bottles half filled with sugar or honey and water. Often look over apricot trees; pull off all foreright shoots, and nail those which are to remain. Attend to blighted trees, and water the borders often. Budding of apricots, cherries, and peaches, finish. Currants intended to be preserved till autumn should now be covered with mats. Often examine espalier trees, and train in the shoots. Fig trees require nailing up as they shoot, with strong nails and long shreds. Fruit should be gathered in the morning, as soon as the sun has dried the dew from it, and before it is heated, and then laid in a cool room. The fruit room should now be prepared; it should be situated to the south, the shelves neat and clean, the walls covered with tiles, or else white-washed or painted white. Destroy insects of all sorts. Nail up every week the shoots of wall trees. Thin nectarines and peaches for the third and last time, and nail up the shoots. Water strawberries in flower constantly in dry weather, and pull off decayed leaves. Tie up the fruit of the hautboys and other large sorts to sticks. Cut off all runners after the first, and these should be planted out as soon as some rain falls. Vines must be very often attended to, to nail up the shoots, and pull off all improper buds. Wall trees require constant attention, to nail up and water in very dry

2 D 2

weather. Water the blighted and newly planted trees, strawberries in flower or runners latery planted.

Greenhouse .- African aloes, and other succulent greenhouse plants, may now be set out in the open air. Cuttings of asters, geraniums, myrtles, &c., should now be planted under bell or hand glasses, which should not be taken off until they have grown an inch. Earth the tops of all the pots, first taking a little out. In planting geranium cuttings, prick out the seedlings before they are too thick. Those with variegated leaves do best in alcoves or under a little shelter. Paint and white-wash the greenhouse. Inarching and layering various sorts may still be performed. Plant myrtle cuttings under glasses, and water frequently near the glasses, without taking them off. The small ones may be planted in beds. Orange trees must be examined: if there be insects under the leaves wash them off. Shade and water those on hot-beds often. Plant stocks, when four inches high, in separate pots. Pans should be placed under all the pots, as it is better for the plants, and saves much trouble in watering. Shade, water, and prick out seedling plants. Succulent plants, as aloes, cereuses, ficoides, and Indian figs, torch-thistles, &c., may now be set abroad. Watering the plants must be attended to every day.

AUGUST.

In this month (as in some measure before) the gardener anticipates the product of the future year, and sows various vegetables in autumn to stand the winter, for spring and summer use; so that in this and other respects August is an important season, as will be seen by the work directed to be done. The times for the different sowings should be exactly observed to secure success.

Kitchen garden .- Sow alisanders, angelica, and chervil. Asparagus cut down last month will require constant watering. Beans planted last month will also want watering. Boorcole, broccoli, cabbages, cauliflowers, and coleworts, lately planted, will require hoeing around them, and earth must be drawn up to their stems. Plant out the third crop of broccoli. Cabbages, for the first crop at spring, should be sown about the 10th or 12th day of the month. Prick out the second crop of cabbage turnips. Weed carrots sown last month as soon as they appear. Sow cauliflowers, for the first spring crop, about the 20th in rich earth, but shade them in the middle of the day by mats. Earth the crop of celery for blanching, and plant out the third. Plant out some of the second crop of coleworts. Sow corn sallad on beds. Cucumbers for pickling, either large or small, to have them fine, should now be gathered; and they will be free from spots and save much trouble in greening. Train them regularly into the sticks. Often tie up endive for blanching; plant out the third crop, and thin the fourth. Take up eschalots. garlic, and rocambole, if the stalks be quite withered: clean them from earth, and keep them in a dry place. Kidney beans, sown for the last crop, must be watered in dry weather. Finish planting out leeks. Lettuces for standing through

the winter, and for forcing, must now be sown very thin at three different times in the month : and plant out those last sown on the south border. Melons, in rainy weather, must be defended from wet by putting hand glasses over them, and sticks placed for the pickling melons to run up. Prepare mushroom beds, by having dung and spawn ready for the next month. Onions must be frequently turned, that they may be well dried. Sow the second crop of Welsh onions. Gather peppermint, for distilling, as soon as it begins to flower. Sow some hotspur peas, on a south border, for the fifth and last crop. Plant celery, endive, lecks, and lettuces. Prick out Anjou, Brussels boorcole, cabbage-turnips, and turnip-rooted cabbages. Sow radishes, the ninth and last crop. Seeds, nearly ripe, must be guarded from birds, particularly radish seeds. Sow cress, fennel, mustard, and sorrel. Sow the second crop of prickly broadcast spinach; and then, at spring, hoe it into beds four feet wide, with paths of eighteen inches between the beds. Hoe, and sow the sixth crop of turnips. Water seedling beds in the morning. Weeds grow very fast in moist weather, and therefore must be hoed frequently, raked together, and carried away.

Flower garden and shrubbery.-Annuals in pots will want frequent watering, those on borders sticking and tying, and the seeds gathering of those nearly ripe. Anemone and auricula seeds are sown this month by many, but they do better in January or February. Slip and fresh pot the auriculas. Balsams in pots, from which seed is intended to be raised, must be removed into shelter. Plant bulbous roots, that flower in autumn, early in the month. Bulbous roots of all sorts should have their off-sets planted at the end of the month. Take off carnation layers, and plant out the pipings from under the glasses. Finish clipping of evergreen trees and shrubs. Grass walks and lawns require frequent mowing. Gravel walks must be weeded and rolled. Take up lilies if their leaves be decayed; but the offsets must be planted again directly. Plant mignonette in pots to flower in winter, and place them under a south wall. Myrtles and greenhouse plants against walls must be pruned and nailed, and constantly watered. Plant out the pipings of pinks if they have struck roots. Plant Guernsey lilies in pots. Attend to seeds of all sorts of flowers and shrubs, and gather them as they ripen. Remove seedlings in pots to places where they will have the morning sun. Shrubberies will want frequent hoeing to keep down the weeds. Strawberry runners will require to be constantly taken off as they shoot out, to keep the borders and walks neat. Water plants in the morning at the end of the month. Weeds must be frequently destroyed to prevent their running to seed.

Fruit garden and orchard.—Destroy ants, flies, and wasps, by supplying fresh bottles of sugar, or honey, and water. Apple trees on espaliers will require frequent examining. Finish the budding of all trees, and pull off buds and shoots from the stocks. Currants intended to be preserved, finish covering with mats. Examine espalier trees, constantly, to train in the shoots. Nail up fig trees with strong nails. Gather fruit early in the morning, and lay it in a cool room. Finish the fruit room, by white-washing or painting, and putting the shelves in order. Destroy insects of all sorts. Nail up every week the fruit trees. Nail up nectarines and peaches frequently. Attend to pear and plum trees, both on walls and against espaliers, constantly. Transplant strawberry runners, if rooted, in rainy weather, and cut off all the others as they shoot. Vines must be constantly nailed up, as they shoot very fast, and the bunches of grapes begin to be heavy, and all weak shoots must be constantly taken off. Water strawberry runners lately planted, or any blighted fruit trees.

Greenhouse .- Take off the offsets of aloes, both African and American, and plant them in separate pots. Often water the cuttings of myrtles, geraniums, &c. Earth the tops of all the pots. Water geraniums and myrtles constantly, but pour on the water gently. Oranges still bud till the middle of the month. Prune any which require it, as this is the season of their shooting. Water the young stocks and those on hot-beds. Finish the painting and white-washing of the greenhouse. Finish picking out seedling plants, and water and shade them. Shift the plants which require it into large pots, and earth the others. Succulent plants should be shifted, and, if the end of the month be rainy, take them in. Water very freely, if the weather be dry, but do it in the morning.

SEPTEMBER.

Gardens begin now to fail of their wonted beauty, and therefore dying flowers, all litter, and every thing unsightly, should be removed, and the ground frequently cleaned, that every thing may look neat if not gay.

Kitchen garden .- Aromatic herbs and shrubs should have their decayed stalks cut down to strengthen them; and transplant them. Beans planted in July must be earthed up, and the tops pinched off as soon as they begin to flower. Plant out the third crop of kale and the first of Anjou; hoe the other crops, and earth them up. Plant out part of the fourth crop of broccoli, and earth up the other crops. Plant out the fifth crop of cabbage; prick out the first crop, on a south border, and earth up any that want it. Plant out the third crop of Savoys and red cabbages; and the first crop of cabbageturnips. Hoe carrots sown in July, and leave them at six inches distance. Cauliflowers sown last month must be pricked out, watered, and shaded until they are rooted. Earth up the fourth crop, and break down the leaves if they begin to flower. Plant out the fourth crop of celery, and earth up the first and second to blanch. Chardons will also require blanching. Plant out more of the second crop of coleworts, a few at a time, to thin the bed. Sow cress and mustard every week, and at the end of the month under glasses. Cucumbers for pickling should be finished gathering; which will show the advantage of sticking them, and pickling early. Plant out a little of the fourth crop of endive to thin it, and give the rest more room. Tie up some to blanch. Eschalots, garlie, and rocam-

bole, should have the off-sets and small roots planted. Lettuces must be thinned early in the seed-bed, if sown thick, and pricked out on a south border to about four or five inches asunder. Melons for pickling will now be fit to gather. Make mushroom beds, at the beginning of the month. Gather nasturtiums for pickling. Finish sowing onions early in the month, the second crop of Welsh. Weed those sown last month before the weeds are high. Plant water-cresses. Prick out cabbages, cauliflowers, lettuces. Gather seeds constantly as they ripen. Sow cress, mustard, turnips, and water-cresses. Finish sowing spinach for spring use, and hoe that sown last month. Plant tarragon roots. Hoe and thin turnips, turnip radishes, and black Spanish radishes. Water in dry weather any crops lately planted out. Weeds must be particularly attended to amongst the onions, carrots, and lettuces, while they are small.

Flower garden and shrubbery .- Plant anemones, single flowered, at the end of the month to flower early. Annuals in pots must be frequently watered to ripen the seeds. Remove auriculas, that they may have the morning sun, and finish slipping them. Balsams, cockscombs, egg-plants, or other curious annuals in pots, which are wished to raise seeds from, must be placed under shelter in an alcove, greenhouse, or room fronting the south, and then the seeds will ripen. Prepare beds for planting bulbous roots early in the month. Plant box for edgings at the beginning of the month, or as soon as any rain falls. Plant bulbous roots of all sorts early in the month; but the off-sets, and lilies, and crown imperials, first. Plant evergreens at the end of the month, if the ground be moist. Grass walks may now be repaired, or new ones made. Weed and roll gravel walks often. Plant hyacinths, jonquilles, lilies, narcissuses, polyanthus-narcissuses, &c., at the end of the month. Plant laurel cuttings in the shade. Layer laurustinuses and other shrubs. Take up lillies which flower late, as soon as their leaves are decayed, but plant the off-sets again directly, and all other sorts of lilies. Place mignonette in pots, under shelter. Myrtles and greenhouse plants against walls must be constantly watered in dry weather. Plant out perennial seedlings, and divide the old roots. Plant box for edgings; evergreens, crown imperials, and lilies, early in the month; cuttings of laurel, honeysuckles, jessamines, shrubs, and trees of all sorts; but not until after there has been some rain. Strawberries and thrift for edgings. Gather seeds in the middle of the day. Weed and earth seedling beds. Prune, hoc, and rake shrubberies. Sow hardy annuals, as combottles, larkspurs, panseys, persicarias, poppies, sweet peas, &c., to flower early in spring. Constantly take off' strawberry runners, and replace any of the edgings which want ; dig up entirely the old plants; then take away some of the earth, and bring in fresh loam. Plant tulips, and all sorts of bulbous roots, the off-sets first. Lay down turf for grass walks. Constantly hoe and rake weeds off the ground ; in dry weather the sceds will ripen, and in wet weather the roots will strike again.

Fruit garden and orchard .- Destroy ants, flies, wasps, and insects of all sorts constantly. Sow cherry kernels on beds. Plant currant and gooseberry cuttings and trees. Nail up fig-trees frequently with strong shreds. Attend to the fruit room, and pick out the rotten pears, or any other sorts which begin to decay. Put grapes into bags of crape, gauze, or paper. Plant currants, gooseberries, raspberries, strawberries. Strawberries should be planted early in the month, and then they will be well rooted before the frost begins. Dress the beds, and plant some strong roots in pots to force. Plant some alpines in pots, and put them under a frame, and they will bear fruit till January. Topdressing, in cold wet weather, of soot, salt, or ashes, is proper to be spread on the borders of fruit trees. Vines will require frequent nailing ; take of all the weak shoots, that the grapes may not be too much shaded.

Greenhouse .-- Remove aloes into the greenhouse in the beginning of the month, but leave out the American ones till the end. Plant cuttings and seedlings in separate pots, and earth the tops of all the pots. Set in geraniums with variegated leaves early in the month, and leave off watering the leaves. Take myrtles out of the ground and pot them. Fresh earth orange trees, thin the fruit, or most of it will fall off, and take them into the house at the end of the month. Take in succulent plants of all sorts early in the month, and give them very little water. Take in aloes, variegated geraniums, and succulent plants, at the beginning of the month; orange trees and tender plants at the end; but myrtles and hardy plants may remain out till the beginning of the next month, unless there is an appearance of frosty nights. Water in the morning, and keep the windows open all night; leave off watering the geraniums over the leaves.

OCTOBER.

This is the chief month of the year for planting trees, shrubs, &c. No part of it should be lost, in either working the ground well for the purpose, or putting in the plants as soon as possible. Early planting, if the ground be fit, is of more consequence than many are willing to admit.

Kitchen garden.-As October is the only time to crop a kitchen garden before winter, omit not any thing ordered now, till next month, and if it can be done at the beginning, instead of the end of the month, it will be much better, lest rain should come on. Weed aromatic herbs and shrubs in beds, and spread some earth over them. Cut down asparagus stalks, hoe the weeds, and spread earth from the paths on them, but first a little rotten dung. Prepare hot-beds for forcing, and plant three-year old plants for the first crop. Beans; the early Mazagan must be planted on a south border, for the first crop. Plant out Anjou boorcole, the second crop early in the month, and hoe the ground around the others. Plant out broccoli, the rest of the fourth crop. Plant out half the cabbages sown in August, of the early sorts, in a warm situation.

Plant cabbage-turnips early in the month, and earth up the others. Finish hoeing carrots, sown in July. Attend to cauliflowers, beginning to flower, by breaking down the leaves. Those intended for glasses will want planting out; let there be six to each glass, and the rest in a frame, or under a south wall. Plant out celery, the fifth and last crop, and earth up the second to blanch. Finish planting coleworts, Sow cress, mustard, and radish, under glasses, and on a hot-bed at the end of the month. Tie up endive, to blanch, or lay tiles on it, and plant more. Plant eschalots, garlic, and rocambole. Throw up vacant ground into ridges. Hoe boorcole, broccoli, cabbages, and cabbage-turnips; and draw up earth to their stems. Hoe carrots. Prepare hot-beds, for forcing asparagus and lettuces. Plant out lettuces, cabbage and brown Dutch, on asparagus beds, some under glasses. and others on hot-beds for forcing. Finish gathering melons for pickling. Plant mint in pots, on a hot-bed. Cover mushroom beds well with straw and mats, to defend them from rain. Onions will require to be very well weeded, and should be examined two or three times in the month. Sow peas, the early hotspurs on a south border near the wall, for a first crop. Plant on hot-beds asparagus for the first crop, and lettuces, and mint. Plant out to stand for seed beets, cabbages, carrots, parsley, parsnips, turnips. Weed pot-herbs and sweet herbs on beds; stir up the earth, and spread some over them. Seeds of all sorts should be threshed out, dried, and put into bags. Sow peas on a south border. Hoe spinach for the last time before winter. Destroy weeds in every part of the garden.

Flower garden and shrubbery .- Any thing ordered last month, if omitted, finish early in this, as the beginning of this month is the proper time when the flower garden and shrubbery should be put into order before the winter. Finish planting anemones, to flower early, the first week in the month. Remove auriculas and carnations into shelter, and in wet weather cover them with mats. Balsams, cockscombs, eggplants, &c., intended to raise seed from, must be constantly attended to, to hasten the ripening of the seed. Turn over beds and composts for bulbous roots frequently. Finish planting box for edgings, early in the month. Plant bulbous roots for forcing in pots or boxes, and finish planting all others before the rain sets in. Plant crocuses, aconites, snow-drops, and any bulbous roots which flower early in the spring, at the beginning of the month. Plant evergreens of all sorts early in the month. Finish laying grass walks, and repair any difficult places. Weed gravel walks, and roll them in dry weather. Plant hyacinths, jonquilles, lilies, narcissuses and polyanthus-narcissuses, early in the month. Finish layering of shrubs. Take off layers and suckers, if rooted. Mignonette should be removed under glasses, or else into a greenhouse or warm closet. Finish planting perennials. Plant bulbous roots early in the month; as aconites, amaryllises, cornflags, crown-imperials, daffodils, garlie moly, irises, martagons, pancratiums, ranunculuses, snow-drops, star of Beth.ehem, tulips, &e. Plant also perennials at the beginning of the month: shrubs and trees of all sorts: strawberries and thrift for edgings: place seedlings in pots, under a south wall in the ground; and weed and earth seedlings in beds. Gather seeds in the middle of the day. Finish pruning and hoeing shrubberies, to lie neat for the winter. Finish planting shrubs and Take off suckers and layers; and, if trees. small, plant them in beds two feet asunder, to be ready against the next season. Finish planting tulips early in the month, and all sorts of bulbous roots. Finish laying turf early in the month. Hoe and rake off weeds, or they will root again. If possible leave nothing ordered this month unfinished, on account of the uncertainty of the weather in the succeeding month.

Fruit garden and orchard .- Gather apples and pears in the middle of fine dry days. Plant apple trees at the end of the month. Plant currants, gooseberries, and raspberries. Examine grapes in bags, to see that they are not mouldy or decayed. Gather nectarines and peaches in the middle of the day. Orchards, or fruit trees intended to be planted, should have the ground prepared, and the holes digged some weeks before-hand; if the soil be very good, some loam and rotten dung should be mixed together, and the trees planted in it. If the orchard be wet, bring a cart load of earth at least for each tree; form the earth into a little hill, about a foot high, and plant the tree upon it, but dig up the tuft first a foot deep in a circle of four or five feet over. Gather peaches in the middle of the day, and, if not ripe, lay them in the sun for a few days in a window; they are much improved by roasting gently like apples, and eating them with sugar and wine. Plant peach trees at the end of the month. Plant fruit trees of all sorts. Prune all sorts of wall trees, but sweep off all the leaves first with a birch broom. Finish dressing strawberry beds, and water the alpines frequently under the frames. Vines in pots should be transplanted; make the holes ready, pour water into them, and then gently turn them out of the pot, or place the pot in the hole and break it, and then the roots cannot be disturbed, and you will have fruit the next year. Finish pruning and planting wall trees, early in the month.

Greenhouse.—Give air very freely in the day time, and leave some of the windows open at night, until the end of the month. Earth the tops of the pots. Take in geraniums early in this month, if not done the last; water them sparingly, or they will begin to shoot afresh, and pick off constantly all decayed leaves. Clean leaves well, before the plants are set in order, and pick off dead ones. Take in myr-tles towards the end of the month. Orange trees should not remain out this month; examine the leaves before setting them in, for insects, which fasten themselves underneath, and pick them off; if any leaves be mildewed, wash them with warm water and a sponge. Water succulent plants sparingly. Water myrtles, orange-trees, winter cherries, and all woody plants often. Open the windows, every fine day, but keep them shut in foggy weather.

Though the last is the better month for planting, yet this is the time more commonly adopted; it certainly must not now be delayed. The leaves not being all off should be no obstacle.

Kitchen garden .- Cut down artichoke stalks, and earth them up. Asparagus on hot-beds must have air given to it; and make and plant the second bed; cut down the stalks, and finish dressing the beds. Finish planting beans for the first crop. Plant beets, cabbages, and car-rots for seed. Take up carrots and lay them in sand. Give some air to cauliflowers under glasses and frames, in the middle of fine days. Earth up celery when dry, to blanch. Sow cress, mustard, and radishes on hot-beds. Take up endive, not planted out, and plant on the south side of a ridge, raised up two feet high. Throw up vacant ground into ridges. Prepare hot-beds for forcing asparagus and lettuces. Attend to lettuces in hot-beds, and give them air in the middle of the day. Guard mushroom beds from wet. Take up parsnips and large rooted parsley. Draw earth to the peas and beans above ground, and place traps to eatch mice. Plant asparagus on a hot-bed for the second crop: endive on the south side of a ridge: and beets, cabbages, and carrots, for seed. Dig up potatoes, sort them, pick out the damaged ones, and reserve the best for use in winter. Sow early short-topped radishes about the tenth day, and spread wheaten straw over the beds. Dig up salsafy, skirrets, and scorzoneras. Sow cress, mustard, and radishes on hot-beds for small sallading. Hoe spinach again, if it be too thick. Drain off stagnant water; weed all the crops; and take off the weeds to prevent their rooting again.

Flower garden and shrubbery .- November being generally a very rainy month, if any thing happened to be omitted last month, let it be done early in this. Bulbous roots, intended for blowing in water early, may now be placed on the glasses, and let all others be finished planting at the beginning of the month. Those in pots or boxes must be frequently watered, and placed as much in the sun and light as possible; for in the shade they will draw up weak. Composts wanted for flowers in spring should now be collected ; such as loam, sand, willow-earth, rotten tan, dung, &c. Let them be laid in dry sunny places, and be frequently turned over, but by no means in cold wet places. Gravel walks near the house should be rolled a little when the weather will permit; their being kept hard prevents weeds from growing; but never throw them up into ridges. Leaves should be constantly swept up as they fall, or they will spoil the walks. Myrtles planted against walls should have two boards about six inches wide fixed, one at each side, with a third at the top, on which a mat should be nailed, to roll up and down occasionally. Plant early in the month all bulbous roots; particularly those for forcing. Shrubberies should be pruned, and digged or hoed. All sorts of shrubs and trees should be finished planting early in the month; and long litter, straw, or turf, turned downwards, should be laid over the roots to keep out the frost.

Trenches should be digged, and drains made to carry off the water wherever it stands; a large flower pot, placed downwards in the earth, will carry off a great quantity of water.

Fruit garden and orchard.—Finish gathering apples and pears; after they have lain together and sweated, the most valuable sorts, which keep long, should be wiped dry with a cloth. Prune and plant apple and pear trees. Prune, and pull off the green figs. Attend to the fruit room; pick out every leaf, and all specked and decayed apples or pears. Finish planting orchards at the beginning of this month, and stake the trees. Finish planting and pruning of espaliers, standard and wall trees, early in the month. Place strawberries in pots for forcing, under frames; and attend to the alpines. Finish pruning and planting of wall trees.

Greenhouse.—Give air in the middle of the day, unless when very foggy. Earth the tops of any of the pots, when any mould appears on them. Constantly pick off geranium leaves as they decay more than any others, and give them water very sparingly : also, all decayed leaves, as they corrupt the air of the house very much. Succulent plants, as aloes, ficoides, &c., will require but very little water; large aloes the most. Water woody plants often, but give them only little at a time; as dampness is more prejudicial in a greenhouse than cold.

DECEMBER.

The garden is no longer decorated with flowers or verdure; but it contains many things of promise, which demand attention. There are still some works of labor; and, where there is plenty of dung and frames, hot-beds may be made use of; and spring anticipated.

Kitchen garden .- Asparagus must be planted for the third crop, and give it both light and air to color it. If the beds be not warm enough, line them with fresh dung. Boorcole, broccoli, and cabbages must be well earthed up, to keep them upright, and all decayed leaves picked off. Cauliflower plants must have air while the weather is mild, and pick off dead leaves. Earth up celery when dry, for blanching. Sow cress, mustard, and radishes, on hot-beds every week. Weed and turn over dunghills in frosty weather. Tie up endive for blanching. Hot-beds must be attended to, and plenty of hot dung and loam provided for cucumbers and melons. Lettuces under glasses must have air given them in the middle of mild days. Mushroom beds must have dry straw. Earth up peas and beans above ground. Roots preserved in sand, as carrots, potatoes, &c., should be finished before the frost sets in. Search for snails in the holes of the walls. Sow cress, mustard, and radishes, on hot-beds every week. Repair, grind, and put in order tools. Set traps to catch mice in; and make trenches to drain off the water.

Flower garden and shrubbery.—Examine auriculas frequently, and pick off all decayed leaves. Bulbous roots for forcing must be constantly attended to, to give them water, which should always be soft; and change that in the glasses when foul. Carnations in pots should be plunged into the ground; but, if ashes or saud

be put between the pots, it will keep them dryer than earth. Flowers and shrubs in pots should be plunged into the ground, to keep the frost from the roots. Forest trees may still be planted, if there be not much frost; otherwise it is better to defer it till spring. Shrubs and trees may still be pruned; and long litter, &c., laid over the roots of those lately planted. Trenches and drains should be made wherever the water stands.

Fruit garden and orchard.—Examine apples and pears in the fruit room; pick out such as appear the soundest of the best sorts, and wrap each in a piece of paper. This will cause them to keep several weeks longer. Repair espaliers; prune the trees; spread some rotten dung on the border, and fork it in. Finish pruning fig trees. Guard the fruit room from frost, but give it some air, when the weather is not very damp nor frosty. Examine the orchard, and take care that the newly planted trees are well staked and mulched; and cut out the dead wood from the standard trees. Finish pruning and planting wall trees early in the month.

Greenhouse .- Air must be given whenever the weather is mild and will permit it. Earth the tops of the pots, but first take out a little of the old. Frost must be guarded against, by keeping the doors and windows close, when it begins to freeze. Constantly pick off decayed leaves. Myrtles and other greenhouse plants against walls will require to have mats placed before them; and in the middle of fine days, before the frost is set in, rolled up, but let down again at night. Long litter, or rotten tan, should also be laid over the roots to preserve them from the frost. Myrtles may also be preserved in deep pits made against a south wall, and covered in very frosty weather with mats and straw nearly a foot thick. Many are preserved in the nurseries near London, with only hurdles laid over the pit, without any glass, and covered very thick in frost with straw and mats. Succulent plants will require but very little water. Water those plants which require it very sparingly. Open the windows for three or four hours in the middle of the day.

SECT. V.-MODERN .MPROVEMENTS IN HORTI-CULTURE.

Thus far the general directions we have given will enable the reader to superintend the ordinary occupations of the garden throughout the year. Certain considerable improvements in this art within the last few years demand a more particular description. We shall class them alphabetically under the same general divisions of horticultural labor that pervade our calendar, viz. the kitchen, flower, and fruit garden :--

I. In the KITCHEN GARDEN—1. An early purple variety of *broccoli*, called the *Cape* broccoli, first attracts our notice. It is of a very superior flavor, but apt in cultivation to start into flower; clever management, however, will obviate this. Two crops are sown in the middle of April and May, the first on any border of light soil. The plants may be removed in a month into sandy loam, manured; and should not stand nearer than two feet apart. Frequent hoeing is necessary. The second crop should be planted in pots directly from the seed bed. Then sink the pots until the broccoli heads are formed. If these pots in the end of November, are placed in a glass frame, very fine broccoli may be had in the depth of winter.

2. Cale, Sea .- Sea-cale is now cultivated on a very superior principle, and is an important market vegetable at Covent Garden. It should be trenched at least two feet deep in a light soil, and having a dry hottom. Recent dung or coarse manure must not be added, the shoots being apt to imbibe a disagreeable flavor from them : sea-weed or rotten leaves are best as manure. The plant may be propagated by offsets, or by small pieces of the root, having eyes or buds attached to them; but it rises freely from seed, sown in patches in March, and leaving fully two feet between each patch. During the first two years, it must be well hoed and weeded. At the approach of winter, some gardeners throw a little light stable dung, or a covering of fresh sandy soil, over the whole bed. In the third year, the plants are fit for blanching; and, if the bed be well managed, it will continue productive for several years. It is proper, however, to sow a small bed yearly to ensure a succession of young and vigorous plants. Fresh seed may be kept in readiness, by allowing two or three plants to produce their flowers and seeds each year; the flowers, which are white and smell of honey, appear in May, and the seeds in September.

In the first volume of the Memoirs of the Caledonian Horticultural Society, Sir George Mackenzie describes an excellent method of blanching. The sea-cale bed is covered early in the spring with clean and dry oat-straw, which is removed as often as it becomes musty. The shoots rise through the straw, and are at the same time pretty well blanched. Mr. Barton, gardener at Bothwell Castle, employed treeleaves for this purpose. He found that a thin covering of stable dung, sufficient only to keep the leaves from being blown about, was useful in forwarding the production of the sea-cale shoots, a slight fermentation being thus induced. The shoots rise sweet and tender among the leaves, in the early part of spring; but it must evidently be difficult in this way to regulate the heat of fermentation. Another method consists in placing over each plant a flower-pot of the largest size, inverted; and blanching-pots, constructed for this express purpose, are described by Mr. Maher, in the first volume of the Transactions of the Horticultural Society of London. Each pot, during the season, will, upon an average, furnish a dish and a half of shoots.

By means of these pots sea-cale is forced with great facility. In autumn vigorous seakale is dressed off in the open border, that is, the stalks are cut over, and all decayed leaves are removed. The ground is at the same time loosened around the plants, and a thin covering of fine gravel, or sifted ashes, laid on the surface. A pot with a moveable lid is now placed over each plant, or patch of plants, if two or more have remained together, and stable litter is closeiv packed all round the pots, and pressed firmly down, to the depth of a foot or more; but the fermentation produced should never exceed 60° Fahrenheit. In the space of a month shoots will be ready for cutting; and successive shoots may be thus obtained throughout the winter. This method of forcing sea-kale, has universally superseded the plan of planting it in hot-beds, under glass frames, where it has been tried.

3. Cauliflower plants have been of late preserved through the winter in the following way :— At the end of October the firmest and best shaped are lifted with a ball of earth attached to the roots, and arranged round the borders of the peach-house, or vinery, close together, but without touching. The larger outside leaves are removed, and any points of leaves that immediately overhang the flower. While the houses are kept without fire, in the first part of the winter, mats and straw are used to cover the cauliflower plants from frost. You may also plant them in hot-bed frames, and draw off the glass in mild days; covering them with mats, &c., as the weather becomes severe, and carefully removing the decayed leaves.

4. Cress, America. This is, in fact, a biennial variety of ours, erysimum pracox, and much resembles the common winter cress, E. barbarea, but its leaves have a pleasanter and milder while warm taste. It has latterly become a favorite sallad, and may be sown at two or three times during the summer, either broadcast, or in drills a foot asunder, on a light soil. When the outer leaves are gathered it should be so managed, that the new ones are regularly produced. Make a late sowing in August or September, on a sheltered border, and the plants will afford leaves until March.

5. Melons. The ingenious and scientific Mr. Knight has given some useful cautions to gardeners respecting preserving the leaves of melons. Many old horticulturalists have stripped the plant of them, as he contends, most injudiciously, the fineuess of the fruit often being sacrificed thereby. He recommends the employing pegs more freely both to keep the plant, the roots particularly, in its place, and the leaves upright and steady. The Valentia and the Salonica melon are modern favorites. The former will keep many weeks, and has reached us in our late intercourse with the Peninsula. It is, generally speaking, to be managed like the common melon: the fruit gathered when nearly ripe, and suspended in a dry airy room, will keep till February. It is of a lozenge or long oval shape; the skin thin, and of a dark green color; the pulp whitish, firm, and juicy. The Salonica is nearly spherical, with a smooth face, and of a gold color; the pulp of the same general appearance as the Valentia, but more abundant in saccharine.

6. Mushrooms are thus raised by what is called Oldacre's method. For the compost he obtains fresh short dung, which has neither been exposed to wet nor fermentation; to which is added about a fifth part of sheep's droppings, or of the cleanings of a cow-honse; the whole being well nixed and incorporated. The beds are now formed in coarse wooden boxes. (1.) A stratum of the prepared mixture, about three inches thick, is beaten together on the bottom with a flat wooden

mallet; then another layer beaten as before; and this is repeated till the beds are half a foot thick, and very firm. (2.) The boxes are now placed in the mushroom-house, or any place where a slight increase of temperature can be procured. (3.) When fermentation takes place, and the beds are about milk-warm, holes are dibbled in the mass, about nine inches apart, for receiving the spawn, which is of course to be previously prepared. (4.) These holes are left open until the heat is on the decline, and before it is quite gone a piece of spawn is thrust into each, and they are closed with the compost. (5.) A week afterwards the beds are covered with a coating of rich mould, mixed with about a fifth part of horse-droppings, and beaten down with the back of a spade. (6.) The place is now kept as nearly and equally at 55° Fahrenheit as it can be. When the boxes become dry, it is found necessary to sprinkle over them a little soft water, but this must be done with circumspection. The more free air can be admitted, so as to exclude the frost, the better for the flavor of the mushrooms.

7. Onions are much improved, it has been found, by transplanting. Mr. Knight's plan is to sow the seed (preferring the variety named white Portugal onion), at the usual spring season, thick under the shade of trees, and in a poor soil. In the autumn the bulbs being small, but of firm texture, are taken from the ground, and preserved till the succeeding spring, when they are planted at equal distances, perhaps six inches from each other. The plants thus produced possess superior strength and vigor to those raised directly from the seed, owing to the quantity of previously generated sap being greater in the bulb than the seed. In Spain and Portugal they can accomplish this in one summer.

8. Mr. Knight some years ago obtained a new and most beautiful pea, by pollen taken from different varieties of blossom, white and gray, the plant generally rising to the height of eight or ten feet. In exposed situations it is apt to be injured by the winds; but in sheltered places, and with the aid of stakes, it proves extremely productive. The blossoms are large and white, and both the legumes or cods, and the seeds or peas, are large. The peas are of a cream color : as they begin to dry, they shrivel or contract in some degree; from which circumstance the name of wrinkled pea has been given them among seedsmen. The flavor, when boiled, is peculiarly rich, no pea indeed has hitherto been found to yield an equal quantity of saccharine, and it retains its flavor in autumn uncommonly well. It should not be sown before April or May.

9. Potatocs have been improved under the auspices of the Horticultural Societies of the country, but a hardy growth of them is yet wanted. An important fact in the cultivation of potatoes was noticed about the year 1806, by Mr. Thomas Dickson of Edinburgh, viz. that the most healthy and productive plants were to be obtained by employing as seed-stock tubers which had not been thoroughly ripened, or even by planting only the wet, or least ripened ends of long-shaped potatoes. Mr. Knight has also shown the advantage of using, as seed-stock,

potatoes which have grown late in the preceding year, or have been only imperfectly ripened. It is likewise important to observe that it seems established, if a valuable kind is exhausted, or has lost its good qualities, it may be restored merely by plauting the tubers late in the summer, and preserving the produce of this late planting for seed-stock.

Supplies of young potatoes are often produced, during winter, in boxes placed in the mushroomhouse, in the shade at the back of a hot-house, or in a common cellar, out of the reach of frost. Old potatoes are placed in October in layers, alternating with a mixture of tree leaves, sand, and light mould. Vegetation soon proceeds; and, there being no opportunity for the unfolding of stems and leaves, the energies of the plants are expended in the production of young ones. Before mid-winter these attain the usual size and appearance of early potatoes; but they are inferior and of a watery taste.

10. No modern addition to our horticultural productions has been more extensively approved than that of *rhubarb* stalks, and they are every year improving. We do not find them adopted in any other country; but they are an important article of trade to the green-grocers both of London and Edinburgh. By the employment of young seedling plants, say of Rheum rhaponticum, hybridum, compactum, or Sibiricum, the proper removal of leaves, and the keeping of the plants from flowering, the succulent stalk, when peeled, cut down, and baked into tarts, has the appearance of apples, and a mild sweetness preferred by many people. In the open ground the stalks are produced from April till midsummer. Vegetation may be hastened during March, by throwing over the plants some loose haum, care being taken not to injure the shoots. Rhubarb may be forced much in the manner of sea-kale; but the stalks thus become not only of a lighter color, but have less of the peculiar flavor of the plant. Mr. Knight mentions a method of forcing rhubarb by planting it in pots. In the beginning of winter a number of roots of rhubarb are dug up, and placed in some large and deep pots, each being made to receive as many as it will contain. Some fine sandy loam is then washed in, so as closely to fill the interstices between the roots, the tops of which are so placed as to be level with each other, and about an inch below the surface of the mould in the pots. The pots are placed in any kind of hot-house; and other pots of the same size are inverted over them. If water be freely supplied, vegetation proceeds very rapidly: three successive crops of leafstalks may generally be obtained. The shaded spaces of vineries or peach-houses, which are generally wholly unoccupied, are exceedingly well suited for this operation.

11. Sprouts, called Brussels sprouts (the chou à jets of that neighbourhood), are the smaller rosettes of the stem leaves of this kind of cabbage, resembling the Savoy. They are very delicate eating, and are cultivated much in the manner of coleworts in general. The seed is to be sown in Spring, and seedlings planted out before midsummer on showery days. The plants grow as high as three feet, and the sproutsform a narrow

pyramidal growth round the stem. In October the plants should be furnished round the roots with additional earth. The earliest sprouts become fit for use in November; and, if the weather be mild, they continue good, or even improving till March. Two or three of the best plants, with the rosettes small and closely set, should be allowed to run to flower, in order to secure a supply of seed. In the London Horticultural Transactions, vol. iii., Mr. Van Mons of Brussels states, that, by successive sowings, the sprouts are there obtained for the greater part of the year. The tops of the plants are cut off a fortnight before beginning to gather the sprouts; which, it is thought, promotes the production of rosettes. The sprouts are preferred when small or young; if they be more than half au inch in diameter, they are thought too large. In the spring, when the plants have a tendency to run to flower, their growth is checked, by transplanting them to a cool situation.

2. Turnips .- The navew, or navet of the French, is a variety of our brassica napus, first cultivated in this country during the late war. The cultivation is similar to that of other turnips; but the root, which is carrot-shaped, is of a much higher flavor. It is put whole into soups, after being scraped. The Maltese turnip, a fine yellow variety of a round shape and very smooth skin, has also been much cultivated of late: it is best preserved in sand during winter. The Aberdeen yellow turnip is something similar to it in appearance. The Swedish ruta baga is also now preferred by many for the winter, on account of its rich flavor and agreeable sweetness. It may either be stored in sand, or, being a hardy plant, may remain in the ground till wanted. Powdered quick-lime sprinkled over the young plants has been found an excellent remedy against the ravages of the turnip fly.

II. In the FLOWER GARDEN and SURUBBERY we may notice the additions which have been made of late years to the rose tribes cultivated in this country. These have been largely increased from China, as in Lady Banks', the blush, the crimson, and the Macarincy rose. Some varieties of the crimson China rose, with semi-double flowers, are particularly beautiful. Varieties of the Scots and Ayrshire roses have also extended themselves over England. The latter grows with remarkable rapidity, and has been found useful in covering walls or paling. It is the R. capreolata of Don.

Several Japan shrubs have been also adopted as highly ornamental. We may enumerate, 1. The Japan *apple*, (Pyrus Japonica); the *gold plant* (Aucuba Japonica); and the *corchorus*, or Kerrea Japonica.

From Ireland, within these few years, have been brought three very ornamental evergreens. 1. The most important is a broad-leaved *Irish ivy*, the most superior plant of that tribe. It both grows more freely, and has leaves three or four times larger, as well as of a much brighter green, than the common ivy. 2. The next plant we shall mention is a kind of *yew*, remarkable for its upright growth, and fine dark foliage. 3. The *Irish furze*, also remarkable for its upright growth. The Siberian lilac is a pretty shrub of late introduction. The size of the leaf is between that of the two old species. It seems to be the varia of the French. Ribes aureum, or the yellowflowered currant, makes also a fine appearance when in blossom. It requires shelter, or to be trained. The tree-peony, or moutan, is also planted in a sheltered situation, and forms a beautiful ornament to the garden or shrubbery when in flower.

The cultivation of *dahlias*, we may add, has become very fashionable; and the showy geraniums have greatly increased. *Acacias* have been yielded from New Holland in great abundance; while the *heaths* of the Cape of Good Hope have become so numerous, and are so beautiful, that upwards of 200 species of them are already adopted.

" III. The FRUIT GARDEN and NURSERY operations have received more attention and improvement of late years, perhaps, than any other branch of horticulture. We shall first notice the chief new varieties of fruit that have been introduced.

1. Of Apples .- Mr. Knight has distinguished himself in the culture both of the apple and pear. We owe to him, or his improved methods of cultivation, the yellow Ingestrie pippin, the Scotck nonpareil and the Braddock nonpareil. The Downton pippin, so named after Mr. Knight's seat, has been long known. The Wormsley pippin is a variety of the latter, and a very fine large juicy fruit. The *russet nonpareil* was raised at Pitmaston near Worcester, from [seeds of the nonpareil. The blossom is more hardy than that of the parent variety, and the fruit compressed of a dull green, and much covered with russet; the pulp is of a pleasant and very aromatic consistence. The martin nonpareil is another fine dessert species raised near Worcester America has of late yielded, the important addition of the Newtown pippin of Long Island, a fine dessert apple, similar to the rennet; it keeps well, is in perfection in January, but continues good till March or April. In this country the tree requires a wall with a good aspect. The Spitzenberg apple has somewhat of the pine-apple flavor : the tree requires a sheltered west situation and good soil; the fruit is of fine appearance. The American nonpareil, or pomme de grise, is a high-flavored apple, introduced only a few years ago: and also flourishes best on a west The Canadian rennet may be added as wall. a good wall apple.

2. The *Elton* cherry was produced by Mr. Knight from the pollen of the white heart and the blossom of the graffion. It has a deep crimson tinge on the petals, and very long fruit stalks. The *black eagle* he obtained from the graffion and mayduke. The *Waterloo* and *carly black* cherry were similarly produced. All these are great improvements in regard to handsome and juicy fruit.

3. The *cranberry* of America (Vaccinium Macrocarpum) is a useful recent addition to our hardy fruit. It is large for a cranberry, grows freely, and to a good height, and is distinguished by the smoothness of its stem. It flourishes most in a damp situation or near water.

4. In currants nothing exceeds the large Dutch white and the Champagne, an intermediate currant

between red and white, but larger and more juicy than the red. The *Pollock white* is an excellent and very sweet variety, raised from the seed, at the garden of Sir John Maxwell, Bart.

5. Gooseberries have been considerably improved in Lancashire, where they speak highest of the Warrington, the Captain, the Old Ironmonger, and the red Champagne. Wilmot's early red likewise deserves mention: it is early ripe, large, and of excellent flavor; in May, it is better for tarts and sauces than most others, the skin melting down with the rest of the berry. It is easily cultivated and very productive.

6. Grapes are too important for an incidental notice like the present, see VINE. But we may here mention that Mr. Knight has successfully mingled the pollen of the Aleppo grape with the flower of the white chassilas, and produced one of the best of the new varieties of the grape, the variegated chasselas.

7. The Woodhall is the only new variety of *acctarine*; and is so named from its having been raised at Woodhall, near Holyton in Scotland, by Mr. Walter Henderson, a successful cultivator of the citrus and erica tribes. The fruit, which is very successful, generally approaches to the elruge; but it is more juicy, and of a higher flavor. The tree has never shown the slightest symptom of mildew. The blossom is small, early, and hardy.

8. In the Orangery large trees are not now so frequently found as formerly. The citron and the lemon are preferred for training on trellises, or for covering the back wall of a hot-house. Mr. Benham of Islesworth, and Mr. Henderson of Woodhall, are considered, we believe, among the most successful cultivators of the orange tribes, and have lately introduced the Malta or sweet Philippine orange. It is of a beautiful round shape, reddish-yellow rind, and crimson juice. The fruit is small. The shaddock sometumes attains in England a large size, the fruit weighing from four pounds to eight pounds or upwards; but it is not fit to be eaten in a raw state.

9. Mr. Knight meets us again as a successful cultivator of *peaches*. He planted several trees in large pots, and paid every attention to bringing them to a state of high health and vigor; he then applied to the pistil of one good kind the autheræ of another; each tree was allowed to bring not more than three peaches to perfection; and thus he produced the *Acton* and *Spring Grove* peach, both of a beautiful bright color, and firm but melting vinous pulp. Braddick's American peach is recommended in the London Horticultural Transactions, vol. ii. It is a large yellow fruit, red next the sun; the pulp yellow, nor does the tree freely produce.

10. In pears the Wormsley Berganot, and the Bon Chretien, much cultivated near London, are the only important new varieties. The Wormsley Bergamot has been raised by Mr. Knight from the blossom of the antumn bergamot, dusted with the pollen of the St. Germain. The sickle pear of America is also an addition to our fruit gardens.

11. In the third volume of the London Horticultural Transactions, Mr. Hooker has described Wilmot's new early Orleans plum. It resembles generally the common Orleans; but the fruit ripens three weeks before that fruit; while the blossom expands later than in almost any of the plum tribe. The fruit resembles the Orleans, but is more juicy, and of finer flavor; the tree is vigorous and fertile. Coe's golden drop is also a new variety. The leaves are uncommonly large, and this is the principal character of the variety. When the fruit is ripe, the pulp is of a gold yellow color; it is dotted next the sun with violet and crimson. The fruit may be kept for many weeks hung up in a dry place. The trees require a west wall.

Improvements in the rearing of fruit trees.— Mr. Knight, in his treatise on the apple and pear, notices the fact that some of the finest cider and perry fruits of the seventeenth century have become extinct, and observes that, as each variety of fruit springs from an individual at first, it is by means of grafting or budding, that the individual has been extended. Whatever tendency to decay and extinction existed in the individual at first, must, he remarks, exist in all the extensions of that individual accomplished by means of buds or grafts. By careful management, or fortunate situation, the health and life of a particular individual or original tree, therefore, may be prolonged; and, in like manner, some buds or grafts, placed on vigorous stocks and nursed in favorable situations, may long survive the other buds or grafts from the same tree, or may long survive the original unengrafted tree. Still, in all of them, there is a progress to extinction; the same inevitable fate awaits them : the only renewal of an individual, the only true reproduction, is by seed. Mr. Knight's doctrine, in this respect, seems now to be established, and the importance of acquiring new varieties of our staple fruits is generally acknowledged.

Our author has taken uncommon pains to procure promising seeds for this purpose. For example, he prepared stocks of the best kinds of apple capable of being propagated by cuttings, and planted these stocks against a wall in a rich soil; these were next year grafted with the golden pippin. In the course of the following winter the young trees were raised from the ground, and, the roots being shortened, they were replanted. By this mode of treatment they were brought into a bearing state at the end of two Only two apples were suffered to reseasons. main on each tree; these consequently attained a large size and perfect maturity; and the seeds thus procured were sown to procure seedlings allied to the golden pippin.

Mr. Knight, Mr. Macdonald, and others, have also been at great pains to bring the pollen of one kind of approved fruit in contact with the pistils of others; an operation of great nicety. Mr. Knight opened the unexpanded blossom of the variety destined to be the female parent of the new progeny, and with a pair of small pointed scissors cut away all the stamina while the anthers were yet unripe, taking great care to leave the style and stigmata uninjured. The full blown blossoms of the other variety were afterwards applied. The fruits resulting from such artificial impregnation have been of the most promising character. He has often remarked in the progeny a strong prevalence of the constitution and habits of the female parent. In this country, therefore, in experimenting on pears, the pollen of the more delicate French kinds, as the crasanne, colmar, or chaumontelle, should be dusted upon the flowers (always deprived of stamina) of the muirfowl egg, the gray achan, the green yair, or others that are hardy or of British origin. By these means, it may be hoped that, in the course of another generation, excellent winter pears may be obtained in abundance from our standard trees; for at present we are nearly destitute of hardy winter pears.

We find ourselves indebted to the ingenuity of Mr. Knight at every step of our progress through the nursery and fruit garden. Observing how slow some trees, as the mulberry and walnut for instance, are in bearing, he has ascertained, that if cions be taken from prolific branches of bearing trees, the young trees may be made to anticipate the course of nature many years. If indeed the stocks be planted in pots, and grafted by approach, they will generally afford fruit in three years.

In training young trees, of the peach and pear kinds, Mr. Knight's plants are headed down as usual, a year after being grafted; two shoots only are allowed to each stem, and these are trained to an elevation of about 5°. A branch trained upright, it is well known, grows much more luxuriantly than one confined to an horizontal position. Advantage is taken of this law of vegetation, and, in order to procure the shoots of equal length, the stronger is depressed and the weaker elevated. All lateral shoots are carefully removed. Next season as many branches are encouraged as can be laid in without overshading each other; and care is taken in the spring to select the strongest and earliest buds near the termination of the year-old branches, to be trained lowest, and the weakest and latest buds near the base of the branches to be trained inclining upwards : the result is, that, at the end of the season, each annual shoot comes to be nearly of equal vigor. In the following winter half of the shoots are shortened, and the other half left at full length, one shoot being left and the other cut alternately. In the third year, the central part of a peach-tree will consist of bearing wood. The size and general health, and equality of vigor in every part, of young trees trained by these rules, evince a very regular distribution of sap; and the rules at any rate are simple and of easy observance. Such trees, as they advance, are trained in the fan mode, always preferable where the walls are of a sufficient height.

We may here notice, as connected with this subject, that it has been found to promote, the growth of fruit in trees to bend the extreme branches of them, in training, downwards. It checks the tendency to produce wood. It is also a modern practice to conduct the extreme branches of fruit-trees from one side of a wall to the other. Sir Joseph Banks having a Gansel's bergamot pear-tree on a north aspect, where the fruit did not succeed, caused some branches to be turned over to the south side, and trained downwards, when they not only produced fine fruit, but abundance of it. The roots of the May-duke cherry, and some others, require to be in a cool soil. On the north side of a wall, therefore, such trees thrive best; but it has been found, that if their extreme branches be turned over the wall, and trained downwards on the south side, they are not only brought into plentiful bearing, but yield their fruit earlier.

Decorticating, or cleansing the skins of trees by stripping off the bark and washing them, has long been practised. Mr. Lyon, of Edinburgh, has lately invented several simple instruments for facilitating the removal of the bark, and carried the practice much farther than his predecessors. He recommends its being adopted even for young and bearing trees much more frequently, and not merely, as heretofore, in case of the bark appearing diseased or insect-eaten.

The decortication of vines has been revived, and strongly recommended of late, in a pamphlet by Sir John Sinclair.

For improvements in various horticultural erections, see Hot-Houses, PINE-Stoves, &c.

SECT. VIICAT	TALO	GUE OF FLOWERS, SHRUBS,

AND TREES USUALLY CULTIVATED.

1. Tender Annual Flowers.

To be sown on a strong hot-bed the last week in February, or first in March, transplanted afterwards upon another at four inches distance; then planted in small pots in May; afterwards in larger, and at the end of June placed in the open air.

6. Humble plant

8. Sensitive plant

9. Stramoniums.

7. Ice plant

- 1. Amaranths
- 2. Balsams
- 3. Cockscombs
- 4. Egg-plants
- 5. Glocest. amaranths

2. Annual Flowers.

To be sown on a moderate hot-bed in March or April, transplanted afterwards, before they are too thick, in rich light earth, and covered with mats; and in a month or six weeks into pots, or borders of the flower-garden.

- 8. French marygold 1. African marygold 9. Marvel of Peru
- 2. Browallia, blue
- 3. Capsicum

- 4. Cape marygold
 - 11. Nolana
- 5. Chinese aster 12. Palma Christi 6. Chinese or Indian 13. Stock Julyflower

10. Mignonette

- 14. Sultan, yellow pink
- 15. Zinnia. 7. Chrysanthemum

In sowing them, fix numbers to them, corresponding with these, to distinguish each sort when they appear.

3. Hardy Annual Flowers.

To be sown in March or April on the borders of the flower garden. Those marked thus+, being very hardy, may be sown in the beginning of February, to flower early. Hollow the earth out in form of a little basin, about a foot over, and two inches deep; draw a circle near the edge half an inch deep, and drop a few seeds in it; thin them soon after they appear, and leave them

at six inches distance, but the large sorts wider. In dry weather they will want frequent watering. Gather the seeds as they ripen, and you may save the expense of buying in another season.

23. Mallow

24. Mignonette

25. Nasturtium⁺

- 38. Venus's looking-
- glass+
- 39. Venus's navelwort 40. Xeranthem
- In July sow again annual stock, candy-tuft,

convolvulus minor, cornbottles, Lobel's catchfly, and yellow lupines, and they will flower until the frost kills them.

4. Biennial Flowers.

To be sown in March or April in beds very thin; as soon as the plants touch one another thin them, and leave them at four or six inches asunder; those drawn out, plant at the same distance. In July transplant them all upon beds, at eight inches asunder; there to remain till the end of September, when they must be planted upon the borders of the flower garden, and they will produce their flowers the next summer, after which they will perfect their seeds and die.

- 1. Canterbury bell
- 2. Colutea, Æthiopian 8. Rocket
- 3. French honeysuckle 9. Scabious

The following method may be taken for preserving the blossoms of fruit trees in spring. Procure some sheep-hurdles made of hazel or willow branches, about two or three feet higher than the walls. At spring, just before the blossoms of the fruit-trees begin to open, place these before the trees, and fasten them in windy weather with stakes, and, by their being taller than the walls are high, they may be set sloping about two feet from the bottom of the walls, which will keep them steady. When the fruit is set, and entirely out of danger, take them quite away, and by keeping in a dry place they will last many years, and will be always worth one-third of the first cost for lighting fires, when unfit for any other use.

In an experiment that was made, the hurdles were placed before the trees in December; they also defended a crop of peas, and both seemed to be much benefited, particularly the peas. Possibly vines might also thus be defended in spring, and come forwarder ; at least it is worth trying where the walls are not too high.

14. Hardy Greenhouse Plants.

To be planted against a south wall, in the open ground, the roots covered with tan or long litter. These will not be killed except in very severe frosts, and then they generally shoot up afresh from their roots. By this method, many curious plants, formerly only kept in greenhouses, will now ornament the walls, where they will appear in greater vigor and beauty, and many may produce both flowers and fruit, which they will not do when confined in pots in a greenhouse.

HORTUS SICcus, a dry garden, an appellation given to a collection of specimens of plants, dried and preserved. The value of such a collection is evident, as a thousand minutiæ may be preserved in the well-dried specimens of plants, which the most accurate engraver would overlook.

HORUS, a renowned deity of ancient Egypt. He was an emblem of the sun. Plutarch, in his treatise De Iside et Osiride, says, ' that virtue which presides over the sun, whilst he is moving through space, the Egyptians called Horus, and the Greeks Apollo.' Job also calls Ur or Orus, the sun-'If I gazed upon the sun (Ur, Orus) when he was shining, or on the moon (Jarêcha) walking in brightness,' &c. Ch. xxxi. ver. 26, 27, 28. The interpretation left by Hermapion of the hieroglyphics engraved on the obelisk of Heliopolis (according to Ammianus Marcellinus) is in these remarkable words : ' Horus is the supreme lord and author of time.' He is called Invisible in winter, Jupiter in the spring, the Sun in summer, and towards the end of autumn The Egyptians represented the tender Jao. him borne on lions, which signified the sun's entrance into the sign of the lion. They who presided over the divine institutions then placed sphynxes at the head of the canals and sacred fountains, to warn the people of the approaching inundations. Plutarch, in his Treatise of Isis and Osiris, relates the sacred fable of Horus; that he was the son of Osiris and Isis; that Typhon, after killing his brother Osiris, took possession of the kingdom: that Horus, leaguing with Isis, avenged the death of his father, expelled the tyrant from his throne without depriving him of life, and reigned gloriously in Egypt. A person who has travelled in Egypt easily discovers natural phenomena hid under this veil of fable. As the philosophers acknowedged the influence of the moon over the state ' the atmosphere, they united Isis with this od, to drive the usurper from the throne. The riests, considering Osiris as the father of time, light bestow the name of his son Horus on the an, who reigned three months in the year. his, according to Mr. Savary, is the explication f this allegory. HOSAN'NAH, n. s. Gr. ogavva. An excla-

nation of praise to God.

O thou ! that art so faire and ful of grace, Be thou min advocat in that high place, Ther as withouten ende is songe Osanne, Thou Cristes mother doughter of dere Anne.

Chaucer. The Second Nonnes Tale. Through the vast of heaven

It sounded, and the faithful armies rung Hosanna to the Highest. Milton.

The public entrance which Christ made into Jerualem was celebrated with the hosannas and acclaations of the people. Fiddes.

HOSANNA, in the Hebrew ceremonies, was a prayer rehearsed on the several days of the feast of tabernacles; thus called, because there was frequent repetition therein of the word הושענא, i.e. save us, we pray. There are many of these hosannahs. The Jews call them hoschannoth, i. e. the hosannahs : and style them hosanna of the first day, hosanna of the second day, &c., according as they are rehearsed.

HOSANNA RABBA, or grand hosanna, is a-name given to the feast of the tabernacles, which lasts eight days; because during the course thereof they are frequently calling for the assistance of God, the forgiveness of their sins, and his blessing on the new year; and to that purpose they make great use of the hoschannoth above mentioned .- The Jews also apply the term hosanna rabba more peculiarly to the seventh day of this feast, because they more immediately on that day invoke the divine blessing, &c.

HOSE, n. s. HOSE, n. s. Sax. þora, plur. hosen; Ho'sier, n. s. Welsh, hosan; Erse, ossan; Sax. pora, plur. hosen; Ho'SIERY, n.s.) plur. ossanen; Fr. chausse. Applicable either to breeches or stockings. Hosier, one who sells stockings. Hosiery, stockings and other articles of worsted, cotton, or silk.

These men were bound in their coats, hosen, hats, and other garments, and cast into the midst of the burning fiery furnace. Dan. iii. 21.

He being in love, could not see to garter his hose, and you, being in love, cannot see to put on your Shakspeare. hose.

Guards on wanton Cupid's hose. Id. Here's an English taylor come hither for stealing out of a French hose. Id.

He cross examined both our hose,

And plundered all we had to lose. Hudibras.

Will she thy linen wash, or hosen darn,

And knit thee gloves ? Gay's Pastorals. As arrant a cockney as any hosier in Cheapside. Swift. HOSEA, the son of Beeri, one of the minor

prophets, lived in the kingdom of Samaria, and delivered his prophecies under Jeroboam II. and his successors, kings of Israel ; and under Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. His principal design is to publish the gross idolatries of the people of Israel and Judah, to denounce the divine vengeance against them, and to fortel the captivity in Assyria.

VOL. XI.

HOS PITABLE, adj. HOS'PITABLY, adv. HOS'PITAL, n.S. HOSPITAL'ITY, n. s. HOS'PITALLER, n. S. HOS'PITATE, v.a. Ноѕт, п. s. & v. a. HOS'TEL, n.S. HOS'TELRY, n.S. Hos'TESS, n. s. Hos'TESS-SILLP, n. s. HOS'TLER, n. s. HOS'TRY, n. s.

Fr. hospital, hospitalité, hospitalier, hoste; Lat. hospitabilis, hospitalis, hospitor, hospes. These words signify places and persons, where and by whom kindness and entertainment are given to strangers, or relief to the sick; together with the corresponding dispositions of

generosity and liberality, as hospitable, hospital, hospitality : host has not only this meaning, but is also the landlord of an inn. Hostel, hostelry, an inn. Hostess-ship, a landlady of an inn. Hostler, one who takes care of horses at an inn. Hostelry, and hostry, the place where the horses of guests were kept. These words were formerly applied to gratuitous liberality shown to strangers and others by persons of opulence; but, with the exception of hospitality, are now generally used in reference to inns, where accommodations are purchased by the traveller. 'Hospitallers are religious persons of both sexes, who attended the sick in hospitals.'- Chaucer's Glossary.

And bade our Hoste he shulde to him say, That alle we, to tell his tale him pray. Our Hoste had the wordes for us alle; Sire Preest, quod he, now faire you befalle Say what you list and we shul gladly here.

Chaucer. Prologue to the Persones Tale. But ley as still as any stone, remembryng his foly That he wold trust a Tapster of a common hostry. Chaucer. The Pardonere and Tupstere.

Saint Austin saith a man may be In houses that han properte, As Templars and Hospitelers.

Id. Romaunt of the Rose.

They spyed a goodly castle, placed

Foreby a river in a pleasant dale,

Which chusing for that evening's hospital,

They thither marched. Facrie Queene.

The cause why they are now to be permitted is want of convenient inns for lodging travellers on horseback, and *hostlers* to tend their horses by the Spenser on Ireland. way.

The Lacedemonians, forbidding all access of strangers into their coasts, are, in that respect, deservedly blamed, as being enemies to that hospitality which, for common humanity's sake, all the nations on the earth should embrace. Hooker.

Go, hear it to the centaur, where we host ; And stay there, Dromio, till I come to thee.

Shakspeare.

My master is of a churlish disposition, And little recks to find the way to heaven By doing deeds of hospitality.

Id. As You Like It.

It is my father's will I should take on me The hostess-ship o' the' day : you're welcome, sirs. Shakspeare.

Time's like a fashionable host,

That slightly shakes his parting guest by the hand ; But with his arms out-stretched, as he would fly, Grasps in the comer. Id Troilus and Cressida.

Ye were beaten out of door,

And railed upon the hostess of the house.

Shakspeare.

I'm your host :

With robbers' hand my hospitable favour You should not ruffle thus.

Fair and noble hostess,

We are your guests to-night. Id. Macbeth. Here, father, take the shadow of this tree

Id. King Lear. For your good host.

Homer never entertained either guests or hosts with long speeches, till the mouth of hunger be stopped. Sidney.

Undistinguished civility is like a whore or a hostess. Temple.

Swift rivers are with sudden ice constrained, And studded wheels are on its hack sustained; An hostry now for waggons, which before Tall ships of burden on its bosom bore.

Dryden's Georgics.

Id.

Receive the shipwrecked on your friendly shore ; With hospitable rites relieve the poor. Dryden. Be as kind an hostess as you have been to me, and

you can never fail of another husband. Id. That always chuses an empty shell, and thus hos-

pitates with the living animal in the same shell. Grew's Musæum.

I am about to build an hospital, which I will endow handsomely for twelve old husbandmen. Addison. Ye thus hospitably live,

And strangers with good cheer receive. Prior.

They who were so careful to bestow them in a college when they were young, would be so good as to provide for them in some hospital when they are old. Wotton.

The first they reckon such as were granted to the hospitallers in tituluin beneficii. Ayliffe's Parergon.

The former liveth as piously and hospitably as the Swift. other.

How has this spirit of faction broke all the laws of charity, neighbourhood, alliance, and hospitality. Id.

HOSPITAL, or spital, is formed of the Latin hospes, a host or stranger. See Host. In the first ages of the church the bishop had the im-mediate charge of all the poor, also of the widows, orphans, strangers, &c. When the churches came to have fixed revenues, it was decreed that at least one-fourth part thereof should go to the relief of the poor; and, to provide for them the more commodiously, divers houses of charity were built, since denominated hospitals. They were governed wholly by the priests and deacons, under the inspection of the bishop. In course of time separate revenues were assigned for the hospitals; and many, from motives of piety and charity, gave lands and money for erecting hospitals. When the church discipline began to relax, the priests, who till then had been the administrators of hospitals, converted them into a sort of benefices, which they held at pleasure, reserving the greatest part of the income to their own use; so that the intentions of the founders were frustrated. To remove this abuse, the council of Vienne expressly prohibited the giving any hospital to secular priests in the way of a benefice ; and directed the administration thereof to be given to sufficient and responsible laymen, who should take an oath for the faithful discharge thereof, and be accountable to the ordinaries. This decree was confirmed by the council of Trent. In Britain hospitals are buildings properly endowed, or otherwise supported by charitable contributions, for the reception and support of the poor, aged, infirm, sick, or helpless. A charitable foundation, laid

thus for the sustenance of the poor, is to continue for ever. Any person seised of an estate in fee, may, by deed enrolled in chancery, erect and found an hospital, and nominate such heads and governors therein as he shall think fit; and this shall be incorporated, and subject to the inspection and guidance of the heads and visitors nominated by the founder. Likewise such corporations shall have, take, and purchase lands, so as not to exceed £200 a year, provided the same be not held of the king; and to make leases, reserving the accustomed yearly rent. For a list of the principal hospitals in this country, see ENGLAND.

HOSPITAL (Michael de l'), chancellor of France in the sixteenth century, was born at Auvergne in 1505. Although, from political motives, he opposed all severe measures against the Protestants, yet, to prevent the introduction of the inquisition, he agreed to the edict of Romorantin. The spirit of toleration he evinced made him much suspected by the Roman Catholics, and extremely odious to the court of Rome. His pacific views being disliked by Catharine de Medicis, who had contributed to his advancement, she excluded him from the council of war. Ile retired in 1568 to his country seat at Vignia, but his privacy was cruelly interrupted by the massacre of St. Bartholomew. When a troop of horse approached his house he was asked if he would defend himself by fire-arms; 'By no means,' said he, ' if the wicket is not wide enough to admit the assassins, set open the great gates.' The men, however, who were sent on the bloody errand, were overtaken by a message from the king, announcing that l'Hospital was not among the proscribed, and he was told that the authors of the deed had pardoned him his constant opposition to their plans; 'I did not indeed know,' said the old chancellor, ' that I had merited either death or pardon.' He died in 1573, aged sixtyeight. He published some excellent speeches, memoirs, and poems.

HOSPITAL (William Francis Antony), marquis de St. Merne, a celebrated mathematician, born in 1661. He was a geometrician almost from his infancy; but, at the age of nineteen, entered the army, and was made a captain of horse. He however soon gave up his commission, in order more closely to follow his favorite pursuit. In 1693 he was made an honorary member of the academy of sciences at Paris; and he published a work upon Sir Isaac Newton's calculations, entitled, L'Analyse des Infinimens Petits. He engaged afterwards in another work, in which he included Les Sections Coniques, les Lieux Geometriques, la Constructions des Equations, et Une Theorie des Courbes Mechaniques : but a little before he finished it he was seized with a fever, of which he died, February 2d, 1704, aged forty-three. It was published after his death.

HOSPITALLERS, an order of religious knights, who built an hospital at Jerusalem, wherein pilgrims were received. To these pope Clement V. transferred the effects and revenues of the templars; whom, by a council held at Vienne, he suppressed for their misdemeanours. These hospitallers were called knights of St. John at Jerusalem; and are now called knights of Malta. See MALTA.

HOSPODAR, a title borne by the princes of Walachia and Moldavia, who receive the investiture of their principalities from the grand seignior.

HOST, n. s. & v. n. HOS'TAGE, n. s. HOS'TILE, adj.

419

Fr. hostilité ; Lat. hostis, hostilis. An army ; numbers assembled in HOSTIL'ITY, n. s. Manuel's assumption HOSTINGS, n. s. Host, to encounter in battle; to review or muster. Hostage, one left

in pledge for security of performance of conditions. Hostile, adverse; opposite. Hostility, the practices of an open enemy; open war; opposition in war.

Octavian, that wode was of this dede,

Shope him-an hoste on Anthony to lede,

Al utterly for his destruction,

With stoute Romaines, cruel as lion.

Chaucer. Legende of Good Women. Therfor he made bis chalenge his yen for to have Or els he shuld for them fyne yf he wold them have, And ligg for them in hostage till the fynaunce came, This was the sotilte of the blynde man.

Id. The Merchantes Second Tale. Lords have had the leading of their own followers to the general hostings. Spenser on Ireland.

He has now at last Given hostile strokes, and that not in the presence Of dreaded justice, but on the ministers

That do distribute it. Shakspeure. Give to a gracious message

An host of tongues ; but let ill tidings tell Themselves, when they be felt.

Id. Let every soldier hew him down a bough,

And bear't before him ; thereby shall we shadow

The numbers of our host. Id. Macbeth. Your hostages I have, so have you mine ;

And we shall talk before we fight. Shakspeare.

Do this message honourably; And, if he stand on bostage for his safety,

Bid him demand what pledge will please him best.

Neither by treason nor hostility

To seek to put me down, and reign thyself. Id.

He that hath wife and children, hath given hostages to fortune; for they are impediments to great enterprises, either of virtue or mischief. Bacon.

Hostility being thus suspended with France, prepa-

ration was made for war against Scotland. Hayward. What peace can we return,

But, to our power, hostility and hate,

Milton. Untamed reluctance and revenge?

Strange to us it seemed

At first, that angel should with angel war, And in fierce hostings meet. Id.

'Twixt host and host but narrow space was left A dreadful interval, and front to front

Presented stood in terrible array

Of hideous length. Fierce Juno's hate, Id.

Id.

Added to a hostile force, shall urge thy fate.

Dryden.

After these came, armed with spear and shield, 11. An host so great as covered all the field.

New authors of dissension spring from him, Two branches, that in hosting long contend

Philips. For sovereign sway. We have shewed ourselves fair, nay, generous ad-

versaries; and have carried on even our hostilities with humanity. Atterbury.

They who marry give hostages to the publick, that they will not attempt to ruin or disturb the peace of it. Id.

The Romans, having seized a great number of hostages, acquainted them with their resolution.

Arbuthnot on Coine.

Blast their design

Great God of *Hosts* ! nor let thy creatures fal! Unpitied victims at ambition's shrine.

Porteus's Death.

420

One effort more to break the circling host ! They form—unite—charge—waver—all is lost !

Byron. Corsuir. But Hassan's frown and furious word

Are dreaded more than hostile sword.

Id. Giaour.

The question was this—is there less *hostility* in a Portuguese army crossing the frontier, when avowedly in the pay and service of Spain? *Canning.*

HOST, n.s. Fr. hostue; Lat. hostia. The sacrifice of the mass in the Romish church; the consecrated wafer.

Pope Gregory IX, first decreed a bell to be rung, as the signal for the people to betake themselves to the adoration of the *host*. The vessel wherein the *hosts* are kept is called the cibory; being a large kind of covered chalice. Dr. A. Rees.

Host is a term of mutual relation, applied both to a person who entertains another, and to the person thus lodged. It is formed of the Latin hospes, thus called quasi hostium, or ostium petens; for ostium was anciently written with the aspirate. It was a custom among the ancients, when any stranger asked for lodging, for the master of the house and the stranger, each of them to set a foot on their own side of the threshold, and swear they would neither of them do any harm to the other. It was this ceremony that raised so much horror against those who violated the law of hospitality on either side; as they were considered as perjured.

Host is also used by way of abbreviation for hostia, a victim or sacrifice offered to the deity. Hence host, in the church of Rome, is a name given to the elements used in the eucharist, or rather to the consecrated wafer; which they offer up every day, a new host or sacrifice for the sins of mankind. They pay adoration to the host, upon the presumption that the elements are no longer bread and wine, but transubstantiated into the real body and blood of Christ. See TRANSUBTANTIATION. The vessel wherein the hosts are kept is called the cibory; being a large kind of covered chalice.

HOSTE (Paul I'), an eminent French mathematician, born in 1652. He was a Jesuit, and professor of mathematics at Toulon. He wrote, 1. Traité des Evolutions Navales, folio, 1727. Traités des Mathematiques les plus necessaires à un Officier, 3 vols. 12mo. He died at Toulon, in 1700.

HOSTIA, Host, in antiquity, a victim offered in sacrifice to a deity. The word is formed from hostis, an enemy; it being the custom to offer up a sacrifice before they joined battle, to render the gods propitious; or, after the battle was over, to give them thanks. Some derive the word from hostio, q. d. ferio, I strike. Isidore remarks, that the name hostia was given to those sacrifices which they offered before they marched to attack an enemy, antequam ad hostem pergerent, in contradistinction from victima, which were properly those offered after the victory. Hostia also signified the less sorts of sacrifice, and victima the larger. A. Gellius says, that

every priest, indifferently, might sacrifice the hostia, but that the victima could be offered by none but the conqueror himself. But we find these two words promiscuously used by ancient writers. We read of many kinds of hostiæ: as II. ambarvales, victims sacrificed after having been solemnly led round the fields at the ambarvalia: H. ambegna, or ambiegne, sacrifices of cows or sheep that had brought forth twins : 11. amburbiales, victims slain after the amburbium : II. bidentes, animals of two years old : II. caviares, or caneares, victims sacrificed every fifth year by the pontiffs, in which they offered the part of the tail called caviar: H. harugæ, victims offered to predict future events from: II. mediales, black victims offered at noon : H. prodigæ, sacrifices in which the fire consumed all, and left nothing for the priests : H. puræ, pigs or lambs ten days old : II. succedancæ, sacrifices offered after others which had exhibited some ill omen.

HOT, adj.
Hot'LY, adv.
HOT'NESS, n. s.
HOT'BRAINED, adj.
Hot'HEADED, adj.
Hot'nouse, n.s.
Hot'MOUTHED, adj.
Hot'spur, n.s.
Hot'spurred, adj.
Hot'BED, n. s.

Sax. bar; Scot. hat; Heb. wx, fire; Germ. heiss; Lat. cestus. Having the power to excite the sense of heat; contrary to cold; fiery; applied figuratively to temper and disposition, as ardent; zealous; eager; violent; vehement;

lustful; piquant; acrid: as applied to substances, most of the compounds are sufficiently expressive. Hot-house, a place to rear plants and exotics; a hagnio; a brothel. Hot-mouthed, headstrong and ungovernable. Hotspur, a violent and passionate man; a pea of speedy growth. Hotbed, a bed of earth made hot by the fermentation of dung.

But I n'ot how it happed, sodainly As, about none, the sonn so fervently

Waxe *hote* that the pretty tender floures

Had lost the beauty of hir fresh collours.

Chaucer. The Floure and the Leafe.

The enemy, now at hand, began hotly to skirmish in divers places with the Christians.

Knolles's History.

Now she professes a hothouse, which is a very ill house too. Shakspeare. Measure for Measure.

My nephew's trespass may be well forgot ;

It hath the excuse of youth and heat of blood,

A harebrained hotspur governed by a spleen. Shakspeare.

What is thy name?

-Thou'lt be afraid to hear it.

-No, though thou call'st thyself a *hotter* name Than any is in hell. Id. Macbeth I do contest

As hotly and as nobly with thy love,

As ever in ambitious strength I did

Contend against thy valour. Id. Coriolanus.

Come, come, lord Mortimer, you are as slow, As hot lord Percy is on fire to go. Shakspeare.

The great breezes which the motion of the air in great circles, such as are under the girdle of the world. produceth, do refrigerate; and therefore, in those parts, noon is nothing so hot as about nine in the forenoon. Bacon.

The bed we call a *hotbed* is this : there was taken horsedung, old and well rotted ; this was laid upon a bank half a foot high, and supported round about with planks, and upon the top was cast sifted earth two fingers deep. Id.

Where lately harboured many a famous whore,

A purging bill, now fixed upon the door,

Tells you it is a hothouse ; so it may,

And still be a whorehouse : th' are synonyma. Ben Jonson.

Wars are begun by hairbrained dissolute captains, parasitical fawners, unquiet hotspurs, and restless innovators. Burton.

To draw Mars like a young Hippolytus, with an effeminate countenance, or Venus like that hotspurred Harpalice in Virgil, this proceedeth from a senseless judgment. Peacham.

Nature to youth *hot* rashness doth dispense, But with cold prudence age doth recompense.

Denham.

She has, quoth Ralph, a jointure, Which makes him have so hot a mind t'her. Hudibraz.

The stag was in the end so hotly pursued, that he was driven to make courage of despair. Sidney.

Though this controversy be revived, and hotly agitated, I doubt whether it be not a nominal dispute. Boyle.

I fear my people's faith,

That hotmouthed beast that bears against the curb, Hard to be broken. Dryden's Spanish Friar.

You shall find 'em either hotbrained youth, Or needy bankrupts. Id.

Our army

Is now in hot engagement with the Moors. Dryden.

Voracious birds, that *hotly* bill and breed, And largely drink, because on salt they feed. *Id*.

Hot and cold were in one body fixt; And soft with hard, and light with heavy mixt.

Id.

It is no wonder that men, either perplexed in the necessary affairs of life, or *hot* in the pursuit of pleasures, should not seriously examine their tenets.

Locke.

Of such peas as are planted or sown in gardens, the *hotspur* is the speediest of any in growth.

Mortimer.

Preserve the hotbed as much as possible from rain. Evelyn.

Black substances do soonest of all others become hot in the sun's light, and burn; which effect may proceed partly from the multitude of refractions in a bittle room, and partly from easy commotion of so very small corpuscies. Newton.

One would not make the same person zealous for a standing army and publick liberty; nor a hotheaded crackbrained coxcomb forward for a scheme of mode-ration. Arbuthnot.

HOTBEDS, in gardening, are made with fresh horse-dung, or tanners' bark, and covered with glasses to defend them from cold winds. By the skilful management of hot-beds, we may imitate the temperature of warmer climates; by which means the seeds of plants brought from any of the countries within the torrid zone may be made to flourish even under the poles. The hot-beds commonly used in kitchen-gardens are made with new horse-dung mixed with the litter of a stable, and a few sea-coal ashes, which last are of great service in retaining the heat of the dung. This should remain six or seven days in a heap; and being then turned over, and the parts mixed well together, it should be again cast into a heap; where it may continue five or six days longer, by which time it will have acquired a due heat. The hot-beds are thus made: -In some sheltered part of the garden dig out a trench of a length and width proportionable to the frames you intend it for; and, if the ground be dry, about a foot, or a foot and a half deep; but, if it be wet, not above six inches; then wheel the dung into the opening, stirring every part of it with a fork, and laying it exactly even and smooth on every part of the bed, with the bottom part of the heap, which is commonly free from litter, upon the surface. If it be designed for a bed to plant out cucumbers to remain, make a hole in the middle of the place designed for each light about ten inches over and six deep, which should be filled with good fresh earth, thrusting in a stick to show the places where the holes are; then cover the bed all over with the earth that was taken out of the trench, about four inches thick, and put on the frame, letting it remain till the earth be warm, which commonly happens in three or four days after the bed is made, and then the plants may be placed in it. If the hot-bed be designed for other plants, there need be no holes made in the dung; but, after having smoothed the surface with a spade, cover the dung about three or four inches thick with good earth, putting on the frames and glasses as before. Settle the dung close with a fork, and, if it be pretty full of long litter, it should be trod down equally on every part. During the first eight or ten days after the bed is made, cover the glasses slightly in the night, and in the day-time carefully raise them, to let out the steam. As the heat abates the covering should be increased; and, as the bed grows cold, new hot dung should be added round the sides of it. The hot-bed made with tanners' bark is, however, much preferable to that described above, especially for all tender exotic plants and fruits, which require an equal degree of warmth for several months, which cannot be effected with horse-dung. They are thus made :- Dig a trench about three feet deep, if the ground be dry; hut, if wet, it must not be above a foot deep at most, and must be raised two feet above the ground. The length must be proportioned to the frames intended to cover it; but it should never be less than ten or twelve feet, and the width not less than six. The trench should be bricked up round the sides to the height of three feet, and filled in the spring with fresh tanners' bark that has been lately drawn out of their vats, and has lain in a round heap, for the moisture to drain out of it, only three or four days. As it is put in, gently beat it down equally with a dung-fork; but it must not be trodden, which would prevent its heating, by settling it too close; then put on the frame, covering it with glasses; and in about ten or fourteen days it will begin to heat; at which time plunge your pots of plants or seed into it, observing not to tread down the bark in doing it. These beds will continue three or four months in a good temper of heat; and if you stir up the bark pretty deep, and mix a load or two of fresh bark with the old when you find the warmth decline, you will preserve its heat two or three months longer. Many lay hot horse-dung in the bottom

of the trench under the bark; but this ought never to be done unless the bed is wanted sooner than the bark would heat of itself, and even then there ought only to be a small quantity of dung at the bottom. The frames which cover these beds should be proportioned to the several plants they are designed to contain. If they are to cover the ananas or pine-apple, the back part should be three feet high, and the lower part fifteen inches; if the bed be intended for taller plants, the frame must be made of a depth proportionable to them; but, if it be for sowing of seeds, the frame need not be above fourteen inches high at the back, and seven in the front; by which means the heat will be much greater.

Hot-Houses. The changes that have of late years taken place in these important adjuncts to scientific gardening it will be impossible to enumerate in the compass of this article. Their form and general structure have been much varied and the spherical shape largely introduced. A considerable improvement in the mode of glazing hot-houses deserves also to be mentioned. It consists in making the upper and lower edges of the panes segments of a circle, instead of heing rectilinear or horizontal; the upper edge being made concave, the lower convex. For a pane eight inches wide, a curvature five-eighths of an inch deep in the centre is sufficient. The advantages of this circular form must be evident. The rain ' which falls, or moisture which collects on the exterior of the glass, gravitates to the centre of the pane, and runs down in a continued line, instead of passing along the sides of the bars, and being partly detained by the capillary at-traction of the two surfaces, at the overlapping of the panes. The extent to which one pane overlaps another can, at the same time, therefore, be much lessened; one-eighth of an inch is found sufficient. This narrowness of the lap, again, prevents breakage from the lodging of moisture, and the sudden expansion produced by freezing during the variable weather of winter. When these circular panes are cut from whole sheets of glass, the expense is scarcely greater than for oblong squares. It is proper that the glass should be flat or equal; and the kind known by the name of patent crown glass is preferred. In stoves or hot-houses, where a high temperature must be maintained, the laps are puttled. In this case, a small central opening is left in the putty, by inserting a slip of wood at first, and withdrawing it when the pane is pressed down to its bearing; by this little aperture the condensed vapor generated within escapes without dropping on the plants. Mr. Loudon uses thin sheet lead in place of putty for closing the laps; he thus avoids all risk of expansion from frost, and the lap car thus be made exceedingly narrow.

Heating of hot-nouses oy steam.—But of all the recent improvements in gardening, the most important, perhaps, is the use of steam for communicating the artificial heat, in place of depending, as formerly, on the passage of heated air through flues, aided in particular houses, called stoves, by the fermentation of tanner's park. The advantage arising from the use of

steam consists in this, that an equable high temperature can thus be maintained for a length of time with great ease and certainty, and the plants can scarcely ever be liable to suffer a scorching heat; ladies and gentlemen visiting the house are also much less apt to be annoyed with the smoke. It has been found also that seven bushels of coal go as far in keeping up steam heat, as ten bushels do in maintaining an equal temperature the other way. It fortunately happens too, that steam may very advantageously be resorted to in aid of the common flues conveying smoke and heated air. A steam-apparatus may be appended to any ordinary hot-house, without incurring any material expense, or any considerable alteration in structure, thus: a boiler is erected over the usual furnace, the smoke of which passes through the flues as formerly. Metal, generally copper, pipes are laid along the top of the brick-flues. A square shape is sometimes preferred; and the pipes are set on edge, so that any condensed vapor trickling to the bottom may occupy little room, or present only a small surface, till it make its way back to the boiler, to which a gentle inclination is given. The boiler as in the common steam-engine, is supplied from a cistern above, and is made to regulate itself by a simple contrivance; in the feed-head is a valve which is opened by the sinking of a float, which descends in proportion as the water is dissipated in steam; and being balanced by a weight, whenever a sufficient quantity of water is admitted, rises again and shuts the valve. A safety-valve is added, loaded according to the strength of the boiler; and there is another valve for admitting atmospheric air, in case of the condensation of the steam causing a vacuum in the boiler. Instead of these steam operations requiring more of the time and attention of the gardener, he will be greatly relieved, and have several additional hours a day which he may devote to other concerns. If the furnace be duly charged, and the boiler properly prepared, the hot-house may be left with confidence for eight or even ten hours together, the temperature continuing equal for that length of time. Where forcing is practised, the gardener is thus also relieved from much auxiety and night-watching.

For heating stoves, conservatories, and greenhouses, steam is likewise well adapted. The difficulty of maintaining continually a high temperature in a large stove has, no doubt, been one cause of the comparative neglect into which the cultivation of fine tropical plants has fallen. By means of steam, this is most effectually removed.

For the conservatory and green-house, if the steam be in action from three to nine o'clock P. M. the temperature will be kept constantly within a proper range, in ordinary winter weather. In severe frosts the steam must, of course, be longer applied. The most extensive steam apparatus for the heating of plant-houses is to be seen at the grounds of Messrs. Loddiges, near Hackney, where glazed houses to the extent of almost 1000 feet in length, and forming three sides of a square, are heated solely by steam from a single boiler, of an oblong shape, measuring eleven feet by four, and made of malleable iron. In narrow houses, intended for green-house plants, a single steam-pipe is found sufficient. In other houses, of considerable height and breadth, or where a higher temperature is required, as in the palmhouse, the steam-flue is made to describe two or three turns. The pipes at Hackney are of iron, of a round shape, and four inches bore. They are flanched and screwed together with bolts and nuts. When they make returns within the house, the joints are formed with iron cement on milboard dipped in white lead.

Where steam is employed in the principal suite of hot-houses, it will be found easy to convey it also to the melon ground; the melon pits or frames must, however, in this case, have their side-walls of brick.

HOTCOCK'LES, n. s. Fr. hautes coquilles. A play in which one covers his eyes, and guesses who strikes him.

The chytindra is certainly not our *hotcockles*; for that was by pinching, not by striking.

Arbuthnot and Pope.

As at hotcockles once I laid me down, And felt the weighty hand of many a clown, Buxoma gave a gentle tap, and I Quick rose, and read soft mischief in her cye.

Gay.

HOTCH'POT, n. s. Fr. haché en poche, or HOTCH'rorcu. S haché en pot, as Camden has it, as being boiled up in a pot; yet the former corruption is now generally used. A mingled hash; a mixture; a confused mass.

Such patching maketh Littleton's *hotchpot* of our tongue, and, in effect, brings the same rather to a Babellish confusion than any one entire language.

Camden's Remains.

A mixture of many disagreeing colours is ever unpleasant to the eye, and a mixture or *hotchpotch* of many tastes is unpleasant to the taste. Bacon.

Nor limbs, nor lones, nor carcass would remain; But a mash'd heap, a *hotchpotch* of the slain.

Dryden.

HOTMAN (Francis), a learned civilian of the sixteenth century. He first took up the profession of the law at Bourges; but, becoming a protestant, was obliged to retire to Geneva, where he read lectures on civil law with great applause. He also wrote several works against the persecution of heretics. He died at Basil in 1590. His Franco-Gallia is well known, having been translated into English by lord Molesworth. He is said to have been the author of Vindiciæ contra Tyrannos. All his works were printed at Geneva in 1590, in 3 vols. folio.

HOTTENTOTS, a people once inhabiting a considerable district of South-eastern Africa, bordering on the Cape of Good Hope. Their country extended to the territory of the Caffres, and was bounded on the north by the Orange River. Found by Europeans in a very low state of civilisation, they have not only undergone no material improvement, but have been for the greater part reduced to a state of wretched servitude, and are now principally to be found as menial servants within the colony of the Cape.

Considered as a whole they are a singularly insulated people; being as distinct, in their persons and manners, from the negro of the west, as

they are from the Caffre of the eastern shores, of this continent. Their number has been lately estimated at about 12,000; the greater part (perhaps 10,000 of them) being found in the Graff Reynal district. Mr. Barrow regards them as approaching the nearest to the Chinese and Tartar races, in their color, and the construction of their features, but particularly in the shape of the eye. The name Hottentot is of wncertain etymology; they call themselves Quaiquæ, and were formerly divided into the distinct hordes of the Attaquas, Hessaquas, Houtiniquas, Namaquas, and Coranas. But, while they retain most of their personal peculiarities, they are annually sinking out of being as a nation.

No distinct kraals, or villages, such as Kolben states himself to have found in the neighbourhood of Camtoos River, are now seen in any part of the colony, nor even twenty independent individuals in whole districts where they most abound. They have been wholly subdued by the Dutch, to a sort of service worse than slavery; and have purchased the enjoyment of some few European indulgencies, not only at the price of every thing dear to man in society, but almost at the forfeiture of the necessaries of his physical existence. They are the menials of every sort of establishment at the Cape; and while the slaves, from their price, and the circumstance of their being transferable property, are said to be treated better than many European servants, and to live in much more comfort than the peasantry of many civilised states, the Hottentot, in the remoter parts, is exposed to as cruel usage as any of the West Indian slave-drivers can exercise. If he be killed by his master, society does not seem to have any property in him, and the master feels only the personal loss of his services, as the price of his vengeance. Small shot are frequently fired into his legs by way of punishment; and one of the ordinary modes of chastisement is to lash him with heavy thongs of the hide of a rhinoceros, while his more savage proprietor smokes a certain number of pipes.

From many similar instances of cruelty, re-corded by Mr. Barrow, we extract the following : 'We had scarcely parted from these people, when, stopping at a house to feed our horses, we, by accident, observed a young Hottentot woman, with a child in her arms, lying stretched on the ground in a most deplorable condition. She had been cut from head to foot with one of those infernal whips, made from the hide of a rhinoceros or sea cow, known by the name of sambocs, in such a barbarous and unmerciful manner, that there was scarcely a spot on her whole body free from stripes; nor had the sides of the little infant, in clinging to its mother, escaped the strokes of the brutal monster. The only crime alleged against her was the attempt to follow her husband, who was among the number of those of his countrymen that had determined to throw themselves upon the protection of the English.'

A pamphlet, published by Baron de P., private secretary to governor Jansen, during the peace of Amiens, gives an account of fifteen poor Hottentots going to a farm to beg tobacco, being most inhumanly tortured tc extort from them the confession of a crime they never contemplated,

viz. that they came to rob the colonists-and that then they were shot in cold blood. Of another instance, equally inhuman, we give the following translation :- 'As soon as the English had abandoned the fort (at Algoa Bay), a boor, named Ferrara, of a Portuguese family, made himself master of it, and kept possession till the arrival of a detachment of troops, which government sent thither, under the command of major Von Gelter. The Caffres, fully persuaded that the late peace had put an end to all disturbances between them, sent to the new commander of the fort a hullock to be slain, as the test of reconeiliation and friendship. The Caffre, sent on the occasion, put himself under the guidance of a Hottentot; and Ferrara, by way of returning the kind intention, laid hold of the Caffre and broiled him alive; bound the poor Hottentot to a tree, cut a piece of flesh out of his thigh, made him eat it raw, and then released him.'

Their field occupations are to guard the numerous herds and flocks of these districts, to scour the country with them oftentimes for food or water, and endure all the extremes of the climate on scorching plains and snowy heights, covered by a single sheep-skin. Some, regarded as free by the law, and who were bargained with by the boors from year to year, at the rate of an ox, a couple of cows, or a dozen sheep, for their services, had their wages, up to a late period, stopped upon every pretext that occurred; and the loss of an ox or sheep of the master's was sure to be visited on the poor Hottentot. Should no such accidents occur (in a country peculiarly exposed to them) the wretched hireling would often have a bill for tobacco or spirits brought in against his wages to the full amount. Such was the general lot of the unmarried, and those who were the least wretched in their condition.

Those who have families generally live in straw huts, at a short distance from the farm houses, in which their children are early seen to be running about; and, by an old law of the colony, any Hottentot child who has eaten the bread of a farmer becomes his property until he is twenty-five years of age. This is interpreted in the most literal way, so far as to get the children into their service, but the period of his emancipation the Hottentot is either too ignorant to reckon, too inured to the yoke to feel any desire for its removal, or too old (for he is an aged man at thirty) for such liberty as would be afforded him to be a blessing. This part of the law, therefore, is only resorted to occasionally, when the starving wretch is set adrift on the world without prospect or possession of any kind. This at least is the shocking picture of their condition drawn from several recent accounts; and we can find only general assurances of the improvements introduced by government of late. and of the superior vigilance with which the laws are now administered, as a ground of hope that their situation has been uruly ameliorated of late years.

It needs not much philosophy to account for the listless disposition, and gradual diminution of such a race. Entailing nothing but misery on their posterity, they have no rational motives for marriage; and many more of them remain single

than is common in uncivilised tribes. Those who marry have not usually more than two or three children, and very many of their women are wholly barren. The mode of confining their marriages to their own immediate kraal or horde has been thought to have a tendency to deteriorate their race; but certain it is, that, in their marriages with each other, the physical powers of nature seem exhausted, and their very name, without some radical change in their condition. seems likely to be soon forgotten. The children of the Hottentot women, who marry Europeans, are, on the other hand, numerous, active, and robust. These are called baastards by the Dutch colonists, and are becoming an important part of the population.

In personal appearance the Hottentot has been often caricatured by travellers. His face, generally speaking, is certainly far from what an European would reckon handsome, though it differs materially in different families, the nose being in some particularly flat, and in others as remarkably raised. Their cheek-bones are high, their chin small and pointed, and their eyes placed at a remarkable distance from each other. The general color of their eyes is a deep chestnut, their teeth beautifully white. The color of the skin resembles that of a faded leaf, being of a yellowish-brown, but many are nearly as white as Europeans. The hair, which has the appearance and feel of a hard shoe-brush, grows in singular tufts at a distance from each other, and does not cover the whole surface of the scalp, but, if suffered to grow long, it hangs in the neck, in hard twisted tassels. Their limbs are extremely well-proportioned and delicate, but there is nothing to indicate muscular strength: yet it is rarely that a cripple or deformed person is seen amongst them, and, though not long lived, their health is generally firm. Many of the women, when quite young, might serve as perfect models of the human figure, so exquisite is their form; their hands and feet are small and delicate, and they move in an easy and graceful manner. Their charms, however, are quickly dissipated by child-bearing, and their whole frame undergoes a more complete revolution than that of any other human female. The abdomen protrudes, the breasts grow flaccid, and at last enormously distended, while the posteriors acquire immense masses of fat, that give the whole figure a very awkward appearance, especially in walking. There is another peculiarity in the Hottentot female, which Mr. Barrow fully ascertained to be a natural appendage, both in the Bosjesman women (whom he regards as a part of the same race) and the common Hottentot; the elongation of the nymphæ, from three to five inches and a half.

The Hottentot *dress* is simple, and ill contrived for some of the purposes they seem to have in view. A belt cut from the skin of some animal is fastened round the body of the man, to which is attached a curious kind of a bag in front, made of the skin of a jackal. Behind hangs a triangular piece of dried skin, with the broad part downwards, and designed originally to flap and cool the body, as well, perhaps, as to rid it of insects. A sheep-skin in winter is all the addition that is ever made to this belt; it is worn with the wool inwards, or outwards, according to the weather, and serves at night for a bed and bedding. The female wears a longer apron attached to the belt in front, made of skin cut into threads, and variously ornamented with shells, metal buttons, glass beads, and other trinkets. The whole of the body behind she covers with a sheep's skin which reaches down to the calf of her leg; and thus attired she makes a singular noise in moving from place to place.

The unctuous matter with which the Hottentots anoint themselves has often been remarked upon. This custom, though filthily practised, is evidently conducive to the suppleness of their skin and their general health in a hot climate. It is suffered to accumulate from month to month, occasionally melting and being removed; or, covered with dust, it gathers a complete black coating which hides the natural color of the skin, except on the face and hands. These are said to be rubbed frequently with the dung of cattle as their best means of clearing off the grease.

The Hottentot is as remarkably patient of hunger as he is voracious in his manner of taking and preparing food. In his native state he is content to live on roots, gums, and the larvæ of insects, and sometimes makes bread from the pith of the palm tree; he indulges, however, in animal food as often as he can procure it. An ox is no sooner slain than he rushes upon the carcase with his knife, and slashes out of it an immense steak; this he again divides spirally, as a whip-maker cuts his thongs, by introducing his knife at the edge and bringing it repeatedly round to the middle, until he has converted it into some yards of flesh, which he coils round his hand and throws upon the hot ashes of his wood fire. When the meat is just warmed through, he takes it with both hands, and beginning at one end of the length soon devours the whole, considering the ashes that adhere to it as a substitute for salt. His napkin is equally characteristic; its offices are performed by rubbing his hands on different parts of his person. Ardent spirits and tobacco have been the snares, and are the present curse, of this people. Duped out of their lands by the gratifications of this description which the first Dutch settlers offered them, they retain a passionate fondness for both, as the only sort of enjoyment that relaxes the rigor of their oppression. Scarcely at any other time than when taking them are they seen to smile; and the nocturnal dances, in which the Bosjesman delights, are banished from the customs and recollection of the tribes within the colony. A few musical in-struments remain amongst them. A kind of guitar called the gabowie, which consists of three strings, stretched over a hollow piece of wood, with a long handle; a wind instrument, called the gowra, made of a piece of gut or sinew twisted into a cord, and fastened to a wooden pipe about three feet long; and a flute made of the bark of trees.

The *arts* practised amongst the Hottentots are few; comprising only the sewing of skins together for their winter dress; the manufacturing of a coarse kind of earthenware; and the pre-

paration of their weapons, the hassagai or javelin, and the bow and arrow. All the tribes are good marksmen; and those that are free, and who occasionally resort to other tribes on the borders, are still very dexterous in the use of their ancient means of warfare. The hassagai is made of a head of iron, about a foot in length, attached to a shaft of wood about four feet long, and is thrown by the finger and thumb, grasping it. firmly in the middle. The bow is a plain piece of wood, sometimes tapered at the ends, and measuring about a yard in length. The string is composed of the muscles of animals of the antelope species, twisted into a cord; and the stem of an aloe forms a quiver for the arrows. These are not above two feet long, and consist of a reed, into one end of which is inserted a piece of hard bone, about four inches long, and fixed by strings of gut to a small piece of iron having a triangular point. These strings contain the poison with which they are frequently armed, and which has the appearance and consistence of a sort of varnish. They also conceal a piece of quill pointed toward the opposite end of the arrow, and designed to lacerate the wound it makes. The Hottentot gathers this poison from several vegetables, and sometimes from the serpents of his native shores. The latter, indeed, mixed with the juices of certain bulbous rooted plants, is his principal resource; he lays it on with a brush which he keeps in his quiver, which is furnished with about a dozen arrows, and a sand-stone to sharpen the points. If he has killed an animal, which he wants for eating, with one of these arrows, he immediately cuts away the flesh that surrounds the wound, and squeezes the blood as much as possible from the body, when it is found to be perfectly harmless food.

His knowledge of physical nature is very confined. He only distinguishes among the heavenly bodies, the sun and moon, and the stars generally; denoting the time of day in which any particular event happened by pointing to the place which the sun then occupied in the heavens. Past events they pile one upon another, when they have to reckon beyond a day, and state that such a circumstance transpired before some other, in a very confused way. Mr. Barrow declares that he could find none of them in the remote part of the colony who could count beyond five, or put two numbers together without the aid of the fingers. The seasons they reckon by the moons before and after the roots of the iris edulis are fit for food : but they cannot fairly be reckoned as a stupid people; they learn the Dutch language with great facility; and perform any kind of domestic service with as much address as a European servant.

In their general *character*, indeed, considering them as an uncivilised people, the observations of all recent travellers have united to place them high. Partaking for ages the phlegmatic indolence of their Dutch masters, who are fond of a train of servants to perform the duties of a few, they exhibit at Cape Town an inveterate habit of sloth; but where any sort of effort has been made to cultivate their powers, and give them a

feeling of hope and liberty in their occupations, they have been found active, intelligent, and useful. Better soldiers are not trained from the lower orders of any country. A corps of about 500 of them had been formed into a regiment in the Dutch service prior to the British attack on this settlement in 1795, and they are said to have acted with more spirit on that occasion than any other part of the troops. This regiment was afterwards adopted into the British service by Sir James Craig, and additional numbers enlisted into it. 'It is therefore, with the op-portunity of knowing them well,' says this officer, that I venture to pronounce them an intelligent race of men. All who bear arms exercise well, and understand immediately, and perfectly, whatever they are taught to perform. Many of them speak English tolerably well. We were told that so great was their propensity to drunkenness, we should never be able to reduce them to order or discipline; and that the habit of roving was so rooted in their disposition, we must expect the whole corps would desert the moment they had received their clothing. With respect to the first, I do not find they are more given to the vice of drinking than our own people; and, as to their pretended propensity to roving, that charge is fully confuted by the circumstance of only one man having left us since I first adopted the measure of assembling them, and he was urged to this step from having accidentally lost his firelock. Of all the qualities,' he adds, 'that can be ascribed to a Hottentot, it will be little expected that I should expatiate upon their cleanliness; and yet it is certain that, at this moment, our Hottentot parade would not suffer in a comparison with that of some of our regular regiments. Their clothing may, perhaps, have suffered more than it ought to have done. in the time since it was issued to them, from their ignorance of the means of preserving it; but those articles which are capable of being kept clean by washing, together with their arms and accoutrements, which they have been taught to keep bright, are in good order. They are likewise cleanly in their persons; the practice of smearing themselves with grease being entirely left off. I have frequently observed them washing themselves in a rivulet, where they could have in view no other object but cleanliness.'

The efforts of the Moravians would seem to confirm this account of their capabilities as a people. No congregation in England appears more desirous to be neat and clean on a Sunday than the Hottentots at the churches of their settlements. Other missionaries have recently endeavoured to ameliorate the condition of some of the wilder tribes who inhabit the north and north-west of the colony, and some degree of success appears to have resulted from an experiment of this kind even among the Bosjesman part of their race. On the whole they will be regarded by the philanthropist as an amiable and most interesting people. To much faithfulness and honesty they add a decided regard to truth in all their statements, and a remarkable frankness when accused of faults. To each other they are kind and generous; much attached to children; patient of pain and injuries; and

almost entirely devoid of the cunning and malignity of savage tribes. In their field occupations they are uncommonly expert, and seem to have a sort of peculiar instinct in tracing a passage over the deserts; in following game, which they can discover at a great distance; and with regard to the general resources of their country. They will even follow the flight of a bee with the eye to an incredible length of way, and can distinguish the foot marks of their master or companions from a thousand with which they may be intermingled. A better race of agricultural servants, to be cheaply obtained, and permanently attached to a settler's household, no man can desire to find.

It is remarkable that all traces of a national religion are entirely lost among this people. Kolben asserts, that in his time they believed in a deity whom they described ' as an excellent man, who does ill to no one, and lives far beyond the moon; but that they regarded him, like some modern Christians, as too remote a being to be worshipped. When the moon is at the full they made sacrifices to her, he adds, accompanied with prayer for favorable seasons, with dancing, leaping, and violent grimaces. They had also a malignant divinity, little, deformed, and ill-natured, to whom they offered sacrifices by way of softening his temper. Modern travellers find none of these notions or usages remaining. Marriages and funerals are equally conducted without any sort of ceremony. On the death of a chief, or near relation, they shave their heads, but inter all their dead without any further observance than piling a heap of stones over the grave, and being very scrupulous ever after not to pass it without throwing on an additional stone. The heads of young girls are always shaved on their showing the first signs of maturity, their ornaments taken off, and the whole person carefully cleaned. They kill their cattle, ordinarily, by piercing the spinal marrow, immediately behind the horns, and cutting the throat to let off the blood. They also, toward the north of the colony, observe a strange custom of the South Sea islanders, as a remedy in some diseases, that of cutting off the first joint of the little finger. Beyond these there are no customs of this people of any particular note.

Their language is of the most extraordinary construction. A sudden retraction or clacking of the tongue, not unlike the noise of a hen in a farm yard, may be said to constitute its chief peculiarity, and will describe their mode of pronouncing most of their monosyllables, and the This leading syllable of compound words. sound is varied according to the signification of the word about to be uttered; for the same sound, with the dental, will have a very different meaning with the palatial retraction of the tongue. The noise of the former is precisely that by which we commonly express disappoint-ment or impatience; and is not an insulated movement, which precedes or follows a syllable, but at the same moment is incorporated and thrown out with it. The Hottentot seems thus to have performed all that is essential to language by a very limited number of compound

words, aided by a peculiar mode of enunciating them. He does not make a bad imitation of nature in some cases. We may easily trace the croaking of the frog in kroaak, or kraaic; the lowing of the ox in 'mnuo; the mewling of the cat in meau; the neighing of the horse in hahæ; and the breaking of the sea upon the shore in hurroo. On first seeing a gun they called it kaboo, and will pronounce this word so emphatically to a stranger that he cannot mistake their meaning. The ka is thrown out with a strong palatial stroke of the tongue, in imitation of that of the flint against the cover of the pan; and with outstretched lips, a full mouth, and prolonged sound, the boo sends forth the report. At first it appears next to impossible for an European to acquire this language, but, as the chief difficulty arises from a proper action of the tongue, it is soon overcome. Many of the Dutch peasantry not only speak it, but introduce into their own language a similar clacking of the organ.

We add a short vocabulary of some principal words, and what is commonly called the Lord's prayer, as a specimen of the language.

Surrie,	the sun.	Hoonooei,	lightning
Ka,	the moon.	Qua,	wind.
Koro,	the stars.	Tookai,	rain.
Koo,	the earth.	Quaina,	a man.

HOTTENTOT'S HOLLAND, a small interior district of the colony of the Cape of Good Hope, extending inland from False Bay. It produces wine, brandy, poultry, fruits, &c., for the Cape market.

HOTTINGER (John Henry), a native of Zurich in Switzerland. He was born in 1620, and taught the oriental languages at Leyden. He was drowned with part of his family, in the river Lemit, in 1667. He wrote a prodigious number of works; the principal of which are, 1. Exercitationes Anti-Morinianæ de Pentateucho Samaritano, 4to.; in which he defends the Hebrew text against father Morin. 2. Historia Orientalis 4to. 3. Bibliothecarius quadripartitus. 4. Thesaurus Philologicus Sacræ Scripturæ, 4to. 5. Historia Ecclesiastica. 6. Promptuarium, sive Bibliotheca Orientalis, 4to.

HOTTONIA, water violet; a genus of the monogynia order, and pentandria class of plauts; natural order twenty-first, preciæ. cor. salvershaped; the stamina placed in the tube of the corolla: cAPS. is unilocular. There is but one species, viz.

H. palustris, with a naked stalk. It grows naturally in the standing waters in many parts of England. The leaves, which are for the most part immersed in water, are finely winged and flat like most of the sea plants, and at the bottom have long fibrous roots, which strike into the mud: the flower-stalks rise five or six inches above the water, and towards the top have two or three whorles of purple flowers, terminated by a small cluster of the same. These flowers have the appearance of those of the stock gilliflower, and make a pretty appearance on the surface of the water. It may be propagated in deep standing waters by procuring its seeds when they are ripe, from the places of their na-tural growth; which should be immediately dropped into the water in those places where they are designed to grow, the spring follow-ing they will appear; and, if they are not disturbed, they will soon propagate themselves in great plenty. Cows eat this plant; swine refuse it.

HOUBIGANT (Charles, Francis), a learned divine, born at Paris in 1686. He was celebrated for his knowledge of the Hebrew; and translated the whole of the Old Testament from that language into Latin: published with notes at Paris in 1753, in 4 vols. folio. He also translated some English works into French. He died in 1783.

HOUBRAKEN (Jacob), a celebrated portrait engraver. His works are distinguished by an admirable softness and delicacy of execution. They are pretty numerous; and, most of them being for English publications, are sufficiently known in this country. The greater part of the portraits of illustrious men published in London by I. and R. Knapton, were his workmanship.

HOVE, the preterite of heave; hoven, part. passive.

Tom Piper hath hoven and puffed up cheeks;

If cheese be so hoven, make Cisse to seek creeks.

Tusser.

HOVEDON (Roger de), of an illustrious family in Yorkshire, is said to have been born at Hovedon, now called Howdon, in the reign of Henry I. He studied the law, and became domestic chaplain to Henry II., who employed him to transact several ecclesiastical affairs, in which he acquitted himself with honor. His most meritorious work was his Aunals of England, from A. D. 731, when Bede's ecclesiastical history ends, to A. D. 1202. It is one of the most voluminous of our ancient histories, and is more valuable for the sincerity with which it is written, and the great variety of facts it contains, than for its style or arrangement.

HOV'EL, n. s. & v. a. Sax. pope. Diminutive of house. A shed open on all sides, and covered over head; a mean habitation : to take shelter in a hovel.

So likewise a hovel will serve for a roome,

To stack on the pease, when harvest shall come. Tusser.

And was't thou fain, poor father,

To hovel thee with swine and rogues forlorn,

In short and musty straw ? Shakspeare. If you make a hovel, thatched, over some quantity of ground, plank the ground over, and it will breed Bacon. saltpetre.

Your hay it is mowed, your corn it is reaped, Your barns will be full, and your hovels heaped.

Dryden.

428

The men clamber up the declivities, dragging their kine with them, where they feed them and milk them, and do all the dairy-work in such sorry hovels and sheds as they build to inhabit during the summer.

Ray on the Creation.

HOVEN CATTLE, in husbandry, black cattle or sheep swollen by eating too voraciously of clover, on any other succulent food. The animal, when not quickly relieved, dies in half an hour. An extraordinary quantity of air being taken down with the clover, in its passage from the intestines upwards, forces the broad leaves of the clover before it, till they close up the passage at the entrance, and thus prevent the wind from returning. The common method of relief is to stab the beast into the paunch, but this is always dangerous and often fatal. Mr. Richard Eager of Graffham, near Guildford, received fifty guineas from the Society for the Encouragement of Arts, &c., for publishing the following method practised by him for curing hoven cattle :-- ' Let the farmer have always ready smooth knobs of wood, of different sizes, fixed to the end of a flexible cane, which for oxen should be at least six feet long, and for sheep three feet. When a beast is hoven let one person take hold of him by the nostril and one horn; let another hold his tongue fast in one hand, putting the cane down his throat with the other. Be careful not to let the animal get the knob of the cane between his grinders; observe also to put the cane far enough down: the whole length will not injure. You will find the obstacle at the entrance of the paunch : push the cone hard, and when you perceive a smell to come from the paunch, and the animal's body to sink, the cure is performed.'

HOV'ER, v. n. Welsh hovio ; Teut. hie ofer. To hang over; to hang in the air overhead; to stand in suspense or expectation; to wander about one place.

O Night ! alas ! why wilt thou ore us hove As long as Alcmena laie with Jove !

Chaucer. Troilus and Creseide. The landlord will no longer covenant with him ; for that he daily looketh after change and alteration, and hovereth in expectation of new worlds.

Spenser on Ireland. Some fiery devil hovers in the sky, And pours down mischief.

Shakspeare. King John. Ah, my poor princes! ah, my tender babes! If yct your gentle souls fly in the air,

And be not fixed in doom perpetual, Hover about me with your airy wings, And hear your mother's lamentation.

Id. Richard III.

She that will but now discover Where the winged wag doth hover,

Shall, to-night, receive a kiss,

How, or where, herself would wish. Jonson. A hovering mist came swimming o'er his sight, And sealed his eyes in everlasting night. Dryden.

The truth and certainty is seen, and the mind fully possesses itself of it; in the other, it only hovers about Locke. it.

We see so warlike a prince at the head of so great an army, hovering on the borders of our confederates.

Addison.

Great flights of birds are hovering about the bridge, and settling upon it. Id.

'Till as the earthly part decays and falls, The captive breaks her prison's mouldering walls;

Hovers a-while upon the sad remains,

Which now the pile, or sepulchre, contains,

And thence with liberty unbounded flies,

Prior. Impatient to regain her native skies. Some less refined, beneath the moon's pale light, Hover, and catch the shooting stars by night. Pope.

I alone, With bended bow, and quiver full of arrows, Hovered about the enemy, and marked

The road he took. Home's Douglas.

HOUGH, n. s. & v. a. Sax. poz; Fr. huë. The lower part of the thigh; an adz; a hoe: to hamstring; to disable by cutting the sinews; to cut up; to hawk.

Thou shalt hough their horses. Josh ii. 6. Blood shall be from the sword unto the belly, and dung of men unto the camel's hough.

2 Esd. xiii. 36.

Did they really believe that a man, by houghs and an axe, could cut a god out of a tree ? Stillingfleet.

Neither could we hough or spit from us; much less could we sneeze or cough. Grew.

HOUGH, in the manege, is the joint of the hind leg of a beast which connects the thigh to the leg

Hough (John), a prelate of the church of England justly celebrated for his spirited and prudent resistance to the arbitrary measures of James 11., with regard to the presidency of Magdalen College Oxford. He was the son of a citizen of London, descended from the Houghs of Cheshire, and born in 1650. Ile received his education at Magdalen College, of which he became a fellow in 1675. In 1681 he was appointed chaplain to the duke of Ormond, lord lieutenant of Ireland; and returned to England the next year with that nobleman; through whose influence he was made a prebendary of Westminster, and presented to the living of Tempsford, Bedfordshire. He graduated B. D. in 1687, and soon after encouraged the fellows of his college to reject the mandamus of the king in favor of one Anthony Farmer, who had not been fellow either of Magdalen or of New College, as required by the statutes. As a statutable majority now concurred in electing Mr. Hough president, he accepted the office in defiance of the royal order; his election was confirmed by the bishop of Winchester, the visitor of the college, and he was admitted D.D. This was the commencement of that clerical resistance to the tyrannical proceedings of James,

so creditable to the established church, and which so materially contributed to the revolution of In vain did the king's ecclesiastical com-1688. missioners deprive him in form of the president-ship, and install Dr. Parker, Catholic bishop of Oxford, by proxy, in his room. The fellows refused to sign a submission to their new president, and to the number of twenty-five, with Dr. Hough, they were in consequence expelled the college, and declared incapable of any ecclesiastical dignity or benefice. James, however, on the appearance of the prince of Orange's declaration, meanly retracted these illegal proceedings, and restored our courageous divine and his companions to their rights. In April, 1690, Dr. Hough was made bishop of Oxford: and, in 1699, he was translated to the see of Litchfield and Coventry. Lastly, in 1717, he removed to that of Worcester, which he held for twenty-six years. His death took place on the 8th of March 1743. He was a munificent benefactor both to Magdalen College and his various sees, and his private charities were great. Dr. Hough only published during his life-time eight occasional sermons, and left strict orders that nothing should be printed from his MSS.

HOUGHTON, MAJOR, celebrated for his travels in the interior of Africa, was a captain in the sixty-ninth regiment of foot, and, in 1779, acted as fort-major in the island of Goree, under general Rooke. In 1789, hearing that the . African Association wished to penetrate to the Niger by the way of Gambia, he offered his services to execute their plan. His offer being accepted he left England on the 16th of October 1790, and arrived at the mouth of the Gambia on the 10th of November, where he was kindly received by the king of Barra, whom he had formerly visited when at Goree, and who offered him all the assistance in his power. From this place he proceeded to Junkiconda, and thence to Medina, where he met with an equally favorable reception from the king of Woolli, of which kingdom Medina is capital : he next journeyed 150 miles to the country of the Foolies; thence to Bondou; and thence to Ferbanna, the capital of Bambouk, where he was seized with a fever and delirium, but met with the utmost kindness and humanity from the king and his subjects. From Ferbanna he intended to travel to Tombueto and Houssa, the utmost limits of the proposed journey; but, having reached Jarra, he fell in with some Moors, who were travelling to Tisheet, a place in the Great Desert, who, under pretence of conducting him on his journey, robbed him of every thing and left him to perish at a place called Farra; where Mungo Park (the latest traveller to Africa) was shown the spot to which his body had been dragged, but could not learn whether he died of hunger or was murdered by the Mahommedan Moors. Thus perished, in the prime of life, a man whose travels and enquiries greatly enlarged the sphere of European knowledge respecting Africa, and who, had he lived, would have continued to throw much light on these unknown countries. His last despatch to the association was dated from Ferbanna, July 14th 1791.

HOULIERES (Antoniette de Lagarde des), a

French lady, whose poetry is highly esteemed. She was born at Paris in 1638. She was the pupil of Henault, and adopted his sceptical principles. Her works and those of her daughter have been collected and printed together. The daughter obtained the poetic prize in the French Academy against Fontenelle. Both these ladies were members of the academy of Ricovatri; the mother was also a member of the academy of Arles. Her life is prefixed to her works in the Paris edition of 1747, in 2 vols. 12mo. She died in 1694; and her daughter in 1718.

HOULT, n. s. Sax. polz. A small wood. Obsolete.

Or as the wind, in hoults and shady greaves, A murmur makes among the boughs and leaves.

Fairfax.

HOUND, n. s. & v. a. Sax. pure, Swed. and Teutonic, Swed. and Teutonic, A Soot, hund. A HOUNDS'TONGUE, n. s. $\int hund$; Scot. hund. A HOUND'TREE, n. s. $\int dog used in the chase.$ Hound, to set on chase; to hunt; to pursue. Hound-fish, a kind of fish. Houndstongue, a plant. Ilound-tree, a kind of tree.

And I herde, goynge up and downe,

Men, horses, houndes, and other thinge;

And al men speken of huntinge.

Chaucer. Boke of the Duchesse. This duk wol have a cours at him, or twey,

With houndes swiche as him lust to commande.

Hounds and greyhounds, mungrels, spaniels, curs, Are cleped all by the name of dogs.

Shakspeare. Macbeth.

God is said to harden the heart permissively, but not operatively nor effectively; as he who only lets loose a greyhound out of the slip, is said to hound him at the hare. Bramhall.

Jason threw, but failed to wound

The boar, and slew an undeserving hound,

And through the dog the dart was nailed to ground. Dryden.

If the wolves had been hounded by tygers, they should have worried them. L'Estrange.

The kind spaniel and the faithful hound,

Likest that fox in shape and species found,

Pursues the noted path and covets home. Prior.

Let hares and hounds in coupling straps unite, The clacking hen make friendship with the kite.

Gay.

HOUND. See CANIS. Among sportsmen it is generally understood that hounds of the middle size are the most proper, all animals of that description being stronger than such as are either very small or very large. The shape ought to be particularly attended to; for, if the hound be not well proportione t, he can neither run fast nor do much work. His legs ought to be straight, his feet round and not very large, his shoulders back, his breast rather wide than narrow, his chest deep, his back broad, his head small, his neck thin, his tail thick and bushy and well carried. None of those young hounds which are out at the elbows, or such as are weak from the knee to the foot, should ever be taken into That the pack may look well the the pack. hounds should be as much as possible of a size: and, if they be also handsome, the pack will then be perfect. This, however, contributes nothing to the goodness of a pack; for very unhandsome

Id. The Knightes Talc.

430

packs, consisting of hounds entirely different in size and color, often afford very good sport. It is only necessary that they should run well together; to which indeed a uniformity in size and shape seems to contribute. The pack that can run ten miles, or any other considerable space, in the shortest time, may be said to go fastest, though the hounds taken separately might be considerably inferior to others in swiftness. A pack of hounds, considered in a collective body, go fast in proportion to the excellence of their noses and the head they carry. Packs com-posed of hounds of various kinds seldom run well. When the packs are very large the hounds are seldom sufficiently hunted to be good ; twenty or thirty couple therefore, or at most forty, will be sufficient for the keenest sportsman in this country, as thus he may be enabled to hunt three or even four times a week. The number of hounds to be kept must, however, in a considerable degree, depend on the strength of the pack and the country in which they hunt. They should be left at home as seldom as possible: and too many old hounds should not be kept. None ought to be kept above five or six seasons, though this also is somewhat uncertain, as we have no rule for judging how long a hound will last. In breeding of hounds considerable attention ought to be paid to the dog from which you breed. All such are to be rejected as have a tender nose, as are babblers or skirters. An old dog should never be put to an old bitch. January, February, and March, are the best months for breeding; late puppies seldom thrive. After the females begin to grow big with young, it will not be proper to let them hunt any more, or indeed to remain for a much longer time in the kennel. Sometimes these animals will have an extraordinary number of whelps. Mr. Beckford informs us, that he has known a bitch have fifteen puppies at a litter; and he assures us, that a friend of his informed him, that a hound in his pack brought forth sixteen, all alive. In these cases it is proper to put some of the puppies to another bitch, if you want to keep them all; but, if any are destroyed, the best colored ought to be kept. The bitches should not only have plenty of flesh, but milk also; and the puppies should not be taken from them till they are able to take care of themselves: their mothers will be relieved when they learn to lap milk, which they will do in a short time. After the puppies are taken away from their mother, the litter should have three purging balls given them, one every other morning, and plenty of whey the intermediate day. If a bitch bring only one or two puppies, and you have another that will take them, by putting the puppies to her the former will soon be fit to hunt again. She should, however, be first physicked, and it will also be of service to anoint her dugs with brandy and water. Whelps are very liable to the distemper, to which dogs in general are subject, and which frequently makes great havock among them at their walks. Young hounds should be fed twice a-day, as they seldom take kindly to the kennel-meat at first, and the distemper is most apt to seize them at this time. It is impossible to determine how many young hounds

ought to be bred in order to keep up the pack, as this depends altogether on contingencies. The deficiencies of one year must be supplied by the next; but it is probable, that from thirty to thirty-five couple of old hounds, and from eight to thirty-five couple of young ones, will answer the purpose, where no more than forty couple are to be kept. A considerable number, however, ought always to be bred; for it is undoubtedly and evidently true, that those who breed the greatest number of hounds must ex-pect the best pack. After the hounds have become acquainted with the huntsman, and answer to their names, they ought to be coupled. and walked out among sheep; and two dogs should not be coupled together, when you can avoid it. As young hounds are awkward at first, a few ought only to be set out at a time with people on foot, and they will soon afterwards follow a horse. With regard to the first entering of hounds to a scent, our author gives the following directions :- 'You had better enter them at their own game; it will save you much trouble afterwards. Many dogs, I believe, like that scent best which they were first blooded to: but, be this as it may, it is most certainly reasonable to use them to that which it is intended they should hunt. Hounds ought to be entered as soon as possible, though the time must depend on the nature of the country in which they are. In corn countries hunting may not be practicable till the corn is cut down; but you may begin sooner in grass countries, and at any time in woodlands. Hounds at their first entrance cannot be encouraged too much. When they are become handy, love a scent, and begin to know what is right, it will then be soon enough to chastise them for what is wrong; in which case one severe beating will save a great deal of trouble. When a hound is flogged, the whipper-in should make use of his voice as well as his whip. They should be low in flesh when you begin to hunt; the ground being generally hard at that time, so that they are very liable to be shaken. Sometimes the huntsman turns down a cat before them, which they kill; and, when the time of hunting approaches, he turns out young foxes or badgers; taking out some of the most steady of his old hounds to lead on the young ones. Small covers and furze brakes are drawn with them to use them to a halloo, and to teach them obedience. If they find improper game, and hunt it, they are stopped and brought back; and, as long as they will stop at a rate, they are not chastised. To render fox-hunting complete, no young hounds should be taken into the pack the first season ; a requisite too expen-sive for most sportsmen. The pack should consist of about forty couple of hounds, that have hunted one, two, three, four, or five seasons. The young pack should consist of about twenty couple of young hounds, and an equal number of old ones. They should have a separate establishment, and the two kennels should not be too near one another. When the season is over, the best of the young hounds should be taken into the pack, and the draft of old ones exchanged for them. Many must be bred to enable a sportsman to take in twenty couple of young hounds every season. It will always be easy to keep up the number of old hounds; for, when your own draft is not sufficient, drafts from other packs may be obtained, and at a small expense. When young hounds are hunted together for the first season, and have not a sufficient number of old ones along with them, it does more harm than good.'

HOUP, n.s. Lat. upupa. The pewet or lapwing.

HOU-QUANG, a province of China, in the centre of the empire; divided into two parts by the Yang-tse-kiang. The greater part of it is level, and watered by lakes, canals, and rivers; which render it so fertile that the Chinese call it the storehouse of the empire; and it is a saying among them, that 'the abundance of Kiang-si could furnish all China with a breakfast; but the province of Hou-quang could maintain all its inhabitants. Some princes of the race of Hongyou formerly resided in this province; but that family was entirely destroyed by the Tartars when they conquered China. The people here boast much of their cotton cloths, simples, gold mines, wax, and paper made of the bamboo-reed. The northern part of the province contains eight cities of the first class, and sixty of the second and third. The southern comprehends seven of the first class, and fifty-four of the second and third, exclusive of forts, towns, and villages, which are numerous.

HOUR, n. s. HOUR', n. s. HOUR'GLASS, n. s. HOUR'PLATE, n. s. HOUR'S N. S.

Hours, n.s. J space of sixty mi nutes; a particular time; the time as marked by the clock. Hourglass, a glass filled with sand, which, by running through a narrow hole, marks the time; the space of time. Hourly, happening every hour; frequently; often repeated. Hour-plate, the dial; the plate on which the hours pointed by the hand of a clock are inscribed. Hours, personification of imaginary beings.

Ther shal not perishe an here of his hed, ne a moment of an *houre* ne shall not perishe of his time, that he ne shal yeve thereof a rekening.

Chaucer. The Persones Tale.

The thridde *houre* inequal that Palamon Began to Venus' temple for to gon, Up rose the Sonne and up Emelic, And to the temple of Diane gan hie.

Id. The Knightes Tale. Whose silver gates (by which there sate an hory Old aged sire with hower-glasse in hand Night tyme) she entred, were he lief or sory. Spenser's Faerie Queene.

Then came the *Howres*, faire of high love, And timely Night, the which were all endewed With wondrous beauty fit to kindle love; But they were virgins all, and love eschewed That might forslack the charge to them fore-shewed By mighty love; who did them porters make Of heaven's gate (whence all the gods issued) Which they did dayly watch and nightly wake By even turnes, ne ever did their charge forsake.

Vexation almost stops my breath, That sundered friends greet in the hour of death. Shakepeare. See the minutes how they run : How many makes the hour full compleat, How many hours bring about the day, How many days will finish up the year, How many years a mortal man may live. Shakspeare. The hour runs through the roughest day. Our estate may not endure Hazard so near us, as doth hourly grow

Out of his lunacies. Id. Hamlet. When we can intreat an hour to serve,

We'll spend it in some words upon that business, If you would grant the time. Id. Macbeth.

In sickness, the time will seem longer without a clock or hourglass than with it; for the mind doth value every moment. Bacon.

We, within the *hourglass* of two months, have won one town, and overthrown great forces in the field.

Id.

Eliza till this *hour* might reign, Had she not evil counsels ta'en;

Fundamental laws she broke,

And still new favourites she chose,

Till up in arms my passions rose

And cast away her yoke. Cowley. They with ceaseless cry

Surround me, as thou sawest; *hourly* conceived, And *hourly* born, with sorrow infinite

To me! Milton's Paradise Lost.

Next morning, known to be a morning better by the hourglass than the day's clearness. Sidney.

Great was their strife, which *hourly* was renewed, Till each with mortal hate his rival viewed.

Dryden.

Alcyone

Computes how many nights he had been gone, Observes the waining moon with *hourly* view, Numbers her age, and wishes for a new. Id. Love reckons *hours* for months, and days for years,

And every little absence is an age. *Id.* Shake not his *hourglass*, when his hasty sand

Is ebbing to the last. Id. Spanish Friar. The conscious wretch must all his arts reveal, From the first moment of his vital breath,

To his last hour of unrepenting death. Id. Eneid.

If eyes could not view the hand, and the characters of the *hourplate*, and thereby at a distance see what o'clock it was, their owner could not be much benefited by that acuteness. *Locke*.

Our neighbour let her floor to a genteel man, who kept good hours. Tatler.

They are as loud any *hour* of the morning, as our own countrymen at midnight. Addison.

We must live in *hourly* expectation of having those troops recalled, which they now leave with us.

Swift.

No more in vain conjecture let me wear My hours away, but seek the hermit's cell;

'Tis he my doubt can clear, perhaps my care dispel.

Beattie.

Thine are the hours and days when both are cheering

And innocent! Byron. Within few hours I shall not call in vain—

Yet in this hour I dread the thing I dare:

Until this hour I never shrunk to gaze

On spirit good or evil, now I tremble,

And feel a strange cold thaw about my heart.

Id. Manfred.

I have epigrams that want nothing but the sting; conundrums, that need nothing but an explanation; rebusses and acrostics, that will be complete with the addition of the name only. These being in great request may be had at an *hour's* warning.

Cunning. Microcosm.

431

Hour. An hour, with us, is a measure of time, equal to a twenty-fourth part of the natural day, or the duration of the twenty-fourth part of the earth's diurnal rotation. It answers nearly to fifteen degrees of the equator. It is divided into sixty minutes; the minute into sixty seconds, &c. The division of the day is very ancient; as it is shown by Kircher. The most ancient hour was the twelfth part of the day. Ilerodotus, lib. ii., says that the Greeks learnt from the Egyptians the method of dividing the day into twelve parts. The division of the day into twenty-four hours was not known to the Romans before the first Punic war. Till that time they only regulated their days by the rising and setting of the sun. They divided the twelve hours of the day and night into four watches, containing three hours each. See CHRONOLOGY.

Houns, horæ, in the Romish church, are certain prayers performed at stated times of the day; as matins, vespers, lauds, &c. The less hours are, prime, tierce, sixth, and none. They are called canonical hours, being rehearsed at certain hours prescribed by the canons, in commemoration of the mysteries accomplished at those hours; these hours were anciently called also courses, cursus. The first constitution, enjoining the observation of the canonical hours, is of the ninth century, in a capitular of Heito, bishop of Basil, enjoining the priests never to be absent at the canonical hours by day or night.

HOURIS, in Mahommedan theology, females promised to the faithful in paradise; formed for this purpose, with eternal beauty and undecaying charms.

HOUSATONICK, a river of Connecticut, United States, which rises in Berkshire county, and runs a south-east course along the whole breadth of the state; emptying itself into Long Island Sound, between Stratford and Milford. It is navigable to Derby about twelve miles; and above that is well adapted for machinery. A bar of shells at its mouth obstructs the navigation of large vessels. Between Salisbury and Canaan is a cataract, where the whole water of the river, which is 150 yards wide, falls sixty feet perpendicularly.

HOUSE, n. s., v. a. & v. n.	Sax. bur; Bel.
	huys; Scott. huse.
Hous'LING, udj.	A place of human
	aboda: a place

a place where studious or religious persons live in common, as a monastery; a college: the manner of living; station of a planet astrologically considered; family of ancestors; descendants and kindred; a body of parliament assembled, as lords or commons. House, to harbour ; shelter ; to reside, or take up one's abode; to have an astrological station in the heavens. Housing, quantity of inhabited building. From Fr. houseuux, heuses, or houses. Cloth originally used to keep off dirt, now added to saddles as ornamental. Housling, a house warming; something provided for entertainment at first entrance into a house. House has the same meaning with housing, but is an obsolete word. House is frequently used in composition, as in the examples which follow :---

I wol you all the shape devise Of House and cite; and al the wise Howe I gan to this place approche.

Chaucer. The House of Fame.

In the subarbes of the town, of chambres and of halles.

And all other howseing that to a lord belongit; Wos noon wythyn the cete, ne noon so wele behongit. With docers of highe pryse, ne wallid so aboute, As was a Senatours hous wythyn and eke wythoute.

Id. The Merchantes Second Tale.

Ne suffer it to house there half a day. Hubberd's Tale.

Oh, can your counsel his despair defer, Who now is housed in his sepulchre? Sandys.

His own two hands the holy knot did knit, That none but death for ever can divide ;

His own two hands, for such a turn most fit.

The housling fire did kindle and provide. Faerie Queene.

The red rose and the white are on his face,

The fatal colours of our striving houses.

Shakspeare. Graze where you will, you shall not house with me. Id.

Slander lives upon succession,

For ever housed where it gets possession. Id.

Houses are built to live in, not to look on; therefore let use be preferred before uniformity, except where both may be had. Baeon.

As we house not country plants to save them, so we may house our own to forward them. Id.

Mere cottagers are but housed beggars. Id. Upon the North-sea a valley houseth a gentleman, who hath worn out his former name. Carew.

Nor were the crimes objected against him so clear, as to give convincing satisfaction to the major part of both houses, especially that of the lords.

King Charles.

Summers three times eight, save one,

She had told; alas ! too soon, After so short time of breath,

To house with darkness and with death. Milton.

These must assist her in her countermines

To overthrow the Derby-house designs. Marvell. Palladius wished him to house all the Helots.

Sidney.

Pure spiritual substances we cannot converse with, therefore have need of means of communication, which some make to be the celestial houses: those who are for the celestial houses worship the planets, as the habitations of intellectual substances that animate them. Stillingfleet.

By delaying my last fine, upon your grace's accession to the patrimonies of your house, I may seem to have made a forfeiture. Dryden.

Wit in northern climates will not blow,

Except, like orange trees, 'tis housed from snow. Id. In fear of this, observe the starry signs,

Where Saturn houses, and where Hermes joins. Id. I, housing in the lion's hateful sign,

Bought senates; and deserting troops are mine.

Id.

In expectation of such times as these,

A chapel housed 'em, truly called of ease. Id. Six lions' hides with thongs together fast,

His upper parts defended to his waist ;

And where man ended, the continued vest,

Spread on his back, the hours and trappings of a Id. beast.

A poet is not born in every race ;

Two of a house few ages can afford,

One to perform, another to record.

Id. Fables.

432

Theodosius arrived at a religious house in the city, where now Constantia resided. Addison.

He kept a miserable house, but the blame was laid wholly upon madam. Swift.

In a house the doors are moveable, and the rooms square; yet the house is neither moveable nor square. Watts.

Is thy face like thy mother's my fair child !

Ada' sole daughter of my house and heart. Byron. Childe Harold.

By what shadow of argument could the House of Lords be maintained in equal authority and jurisdiction with the House of Commons, when once that House of Commons should become a mere deputation, speaking the people's will, and that will the rule of government. Canning's Speeches.

House. See Arcuitecture. Among the Jews, Greeks, and Romans, houses were flat on the top for walking on, and had usually stairs on the outside, by which they might ascend and descend without coming into the house. Each house was so laid out, that it enclosed a quadrangular area or court; which being open to the sky, gave light to it. This was the place where company was received, and for that purpose it was strewed with mats or carpets, for their better accommodation. It was paved with marble or other materials, according to the owner's ability, and provided with covering to shelter them from the inclemency of the weather. This part of their houses, called by the Romans impluvium, or cava ædium, was provided with channels to carry off the water into the common sewers. The level roof was covered with a strong plaster by way of terrace. Hither, especially among the Jews, it was customary to retire for meditation, private converse, devotion, or the enjoyment of the evening breezes. It is surprising that so few modern houses are built with this convenience. The Grecian houses were usually divided into two parts, in which the men and women had distinct mansions. The apartment of the men was towards the gate, and called Avdowning; that of the women was the farthest part of the house, and called Turaikwritic.

HOUSE, in astrology, is the twelfth part of the heavens. The division of the heavens into houses is founded upon the pretended influence of the stars, when meeting in them, on all sublunary bodies. These influences are supposed to be good or bad; and to each of these houses particular virtues are assigned, on which astrologers prepare and form a judgment of their horoscopes. The horizon and meridian are two circles of the celestial houses, which divide the heavens into four equal parts, each containing three houses; six of which are above the horizon, and six below it; and six of these are called eastern, and six western houses. Thus a scheme or figure of the heavens is composed of twelve triangles, in which are marked the stars, signs, and planets, so included in each of these circles. Every planet has likewise two particular houses, in which it is pretended that they exert their influence in the strongest manner; but the sun and moon have only one, the house of the former being Leo, and that of the latter Cancer. See ASTROLOGY.

HOUSE ISLAND, an island of England, one mile and sixty-eight chains from the coast of Vol. XI.

Northumberland. It is the largest of the Farn Islands. Farn is about a mile in compass, and has a fort and a lighthouse. It contains about six or seven acres of rich pasture ; and the shore abounds with good coals which are dug at the ebb of tide. St. Cuthbert is said to have passed the last two years of his life on this island. A priory of Benedictines was afterwards established in it for six or eight monks, subordinate to Durham. A square tower, the remains of a church, and some other buildings, are still to be seen on this island; and a stone coffin, said to be that of St. Cuthbert. At the north end of the isle is a chasm, from the top to the bottom of the rock, communicating with the sea; through which, in tempestuous weather, the water is forced with great violence and noise, and forms a fine jet d' eau of sixty feet high. It is called by the inhabitants of the opposite coast, the Churn.

HOUSE'BREAKER, n.s. House and break. Burglar; one who makes his way into houses to steal.

All housebreakers and sharpers had thief written on their foreheads. L'Estrange.

HOUSE'BREAKING, n.s. House and break. Burglary.

When he hears of a rogue to be tried for robbing or housebreaking, he will send the whole paper to the government. Swift.

HOUSE'DOG, n. s. House and dog. A mastiff kept to guard the house.

A very good housedog, but a dangerous cur to strangers, had a bell about his neck. L'Estrange.

You see the goodness of the master even in the old housedog. Addison.

HOUSE'HOLD, n. s. House and hold. A family living together.

Two households, both alike in dignity,

In fair Verona, where we lay our scene,

From ancient grudge break to new mutiny.

Shakspeare.

A little kingdom is a great household, and a great Bacon's Advice to Vil. household a little kingdom. Of God observed

The one just man alive, by his command, Shall build a wondrous ark, as thou beheldest, To save himself and household from amidst Milton.

A world devote to universal wreck. He has always taken to himself, amongst the sons of men, a peculiar household of his love, which at all times he has cherished as a father, and governed as a master: this is the proper household of faith: in the first ages of the world, 'twas sometimes literally no more than a single household, or some few families. Sprat.

Great crimes must be with greater crimes repaid, And second funerals on the former laid ; Let the whole household in one ruin fall, And may Diana's curse o'ertake us all.

Dryden's Fables.

Learning's little household did embark, With her world's fruitful system in her sacred ark. Swift.

In his own church he keeps a seat, Says grace before and after meat ;

And calls, without affecting airs,

His household twice a-day to prayers. Family life; domestic management.

An inventory, thus importing The several parcels of his plate, his treasure, Rich stuffs, and ornaments of household.

Shakspeare.

KJ.

² F

It is used in the manner of an adjective, to signify domestic; belonging to the family.

Cornelius called two of his household servants. Acts x. 7.

For nothing lovelier can be found In woman than to study household good; And good works in her husband to promote.

Milton

It would be endless to enumerate the oaths among the men, among the women the neglect of *household* affairs. Swift.

We sacrifice to dress, till household joys And comforts cease. Cowper.

HOUSEHOLD, PRINCIPAL OFFICERS OF HIS MAJESTY'S. These are the lord steward, lord chamberlain, the groom of the stole, the master of the great wardrobe, and the master of the The civil government of the king's house horse. is under the care of the lord steward, who, being the chief officer, has authority over all the other officers and servants, except those of his majesty's chapel, chamber, and stable; and he is the judge of all crimes committed either within the verge or the court. Under him are the treasurer, the comptroller, cofferer, the master of the household, the clerks of the greencloth, and the officers and servants belonging to the accounting house, the marshalsea, the verge, the king's kitchen, the household kitchen, the acatery, bake-house, pantry, buttery, cellar, pastry, &c. Next to him is the lord chamberlain, who has under him the vice-chamberlain, the treasurer, and comptroller of the chamber; forty-eight gentlemen of the privy-chamber, twelve of whom wait quarterly; the gentleman usher, the grooms of the great chamber, the pages of the presence chamber; the macebearers, cup-bearers, carvers, musicians, &c. The master or keeper of the great wardrobe has under him a deputy, comptroller, clerk of the robes, brusher, &c.; and a number of tradesmen and artificers, who are all sworn servants to the king. The master of the horse has under his command the equerries, pages, footmen, grooms, coachmen, farriers, saddlers, and all the other officers and tradesmen employed in his majesty's stables. Next to the civil list of the king's court, is the military, consisting of the band of gentlemen pensioners, the yeomen of the guard, and the troops of the household.

HOUSE'HOLDER, n. s. From household. Master of a family.

A certain householder planted a vineyard.

Matt. xxi. An howeholder, and that a grete was he. Chaucer. Prologue to the Canterbury Tales.

HOUSE/HOLDSTUFF, n. s. Household and stuff. Furniture of house; utensils convenient for a family.

In this war that he maketh, he still flieth from his foe, and lurketh in the thick woods, waiting for advantages : his cloke is his bed, yea, and his householdstuff. Spenser on Ireland.

A great part of the building was consumed, with much costly householdstuff. Bacon. A woman had her jest for her householdstuff.

L'Éstrange.

HOUSE'KEEPER, n. s. House and keep. Householder; master of a family.

To be said an honest man and a good housekeeper, goes as fairly as to say a graceful man and a great scholar. Shukspeare.

If I may credit housekcepers and substantial tradesmen, all sorts of provisions and commodities are risen excessively. Locke.

One who lives in plenty; one that exercises hospitality.

The people are apter to applaud housekeepers than houseraisers. Wotton.

One who lives much at home.

How do you both ? You are manifest housekeepers. What are you sewing there ? Shakspeare. Coriolanus.

A woman servant that has the care of a family, and superintends the other maid servants.

Merry folks who want by chance A pair to make a country-dance, Call the old *housekeeper*, and get her, To fill a place for want of better. Swift.

A house-dog. Not in use.

Distinguish the housekeeper, the hunter.

Shakspeare.

HOUSE'KEEPING, adj. House and keep. Domestic; useful to a family.

His house for pleasant prospect, large scope, and other housekeeping commodities, challengeth the preeminence. Carew.

HOUSE'KEEPING, n. s. Hospitality; liberal and plentiful table.

I hear your grace hath sworn out housekeeping.

Shakspeare.

His table was one of the last that gave us an example of the old *housekeeping* of an English nobleman: an abundance reigned, which shewed the master's hospitality. *Prior.*

HOUSE'LEEK, n. s. House and leek. A plant.

The acerbs supply their quantity of cruder acids; as juices of apples, grapes, the sorrels, and houseleek.

Floyer.

HOUSE'LESS, adj. From house. Wanting abode ; wanting habitation.

Poor naked wretches,

How shall your houseless heads and unfed sides, Your looped and windowed raggedness, defend

you. Shakspeare. This hungry, houseless, suffering, dying Jesus, fed

many thousands with five loaves and two fishes. West.

The stranger's step profaned his desolate halls

An exile, outcast, *houseless*, nameless object, He fled for life, and scarce by flight did save it.

Maturin's Bertram.

HOUSE'MAID, n. s. House and maid. A maid employed to keep the house clean.

The housemaid may put out the candle against the looking-glass. Swift.

HOUSE'ROOM, n.s. House and room. Place in a house.

Houseroom that costs him nothing, he bestows; Yet still we scribble on, though still we lose.

Dryden.

HOUSE'SNAIL, n. s. A kind of snail.

HOUSE'WARMING, n. s. House and warm. A feast of merry-making upon going into a new house.

HOUSE'WIFE, n. s. House and wife. This is now frequently written huswife, or hussy.

The mistress of a family.

You will think it unfit for a good housewife to stir in or to busy herself about her housewifery.

Spenser on Ireland. I have room enough, but the kind and hearty housewife is dead. Pope to Swift.

A female economist.

Fitting is a mantle for a bad man, and surely for a bad housewife it is no less convenient; for some of them, that be wandering women, it is half a wardrobe. Spenser on Ireland.

Let us sit and mock the good housewife, Fortune, from her wheel, that her gifts may henceforth be dis-Shakspeare. oosed equally.

Farmers in degree,

He a good hasband, a good housewife she. Dryden.

Early housewives leave the bed,

When living embers on the hearth are spread. Id. The fairest among the daughters of Britain shew themselves good stateswomen as well as good house-Addison. wives.

One skilled in female business.

He was bred up under the tuition of a tender mother, till she made him as good an housewife as herself : he could preserve apricocks, and make jellies.

Addison.

HOUSE'WIFELY, adv. From housewife. With the economy of a careful woman.

HOUSE'WIFERY, n. s. From housewife. Skill in the arts becoming a housewife; domestic or female business; management becoming the mistress of a family.

You will think it unfit for a good housewife to stir in or to busy herself about her housewifery.

Spenser on Ireland.

He ordained a lady for his praise, Generally praiseful; fair and young, and skilled in housewiferies. Chapman's Iliad.

Little butter was exported abroad, and that discredited by the housewifery of the Irish in making it up. Temple.

Female economy.

Learn good works for necessary uses; for St. Paul expresses the obligation of Christian women to good housewifery, and charitable provisions for their family and neighbourhood. Taylor.

HOUS'EL, n. s. & v. a. Sax. purl, from Goth. hunsel, a sacrifice; or Lat. hostia, dimin. hostiola. The holy eucharist : to give or receive the eu-Both the noun and verb are obsolete. charist.

> But for as moche as man and wife Shuld shew hir parish priest hir life, Once a yere, as saith the boke Er any wight his housel toke Than have I privileges large That maie of mochel thing discharge.

Chaucer. Romaunt of the Rose. And, certes, once a yere at the lest way it is lawful to be houseled, for sothely ones a yere all thinges in the erthe renoveten. Id. The Persones Tale.

HOUSING, or HOUSE-LINE, in the sea-language, a small line, formed of three fine strands or twists of hemp, smaller than rope yarn. It is chiefly used to seize blocks into their strops, to bind the corners of the sails, or to fasten the bottom of a sail to its bolt-rope, &c. See Bolr ROPE.

Housing, among bricklayers, a brick which is warped, or cast crooked or hollow in burning.

HOUSSA, or HAOUSSA, an extensive central kingdom of Africa, on the shores of the Niger, having a capital also of this name. It appears, from the accounts of Park and others, to be the most civilised of any of the native states of Africa; and the city is the great mart to the eastward of Tombuctoo, two days' journey to the north of the Niger. The African merchants speak of it as larger and more populous than Tombuctoo.

The country is said to be an extensive region, comprehending various inferior states; particularly Cano, Guber, Daura, Cabi, Nyffe, and Noro. The inhabitants are negroes, but not quite black, and the most intelligent people in the interior of Africa. They have an extraordinary delight in dancing and singing. Their agricultural system is remarkably perfect. They manufacture also a great quantity of cotton cloths, with which they supply Fezzan; and can dye all colors except scarlet. According to Mr. Bowdich, Houssa is situated some days journey to the north of the branch or tributary of the Niger called the Gambaroo.

HOU-TCHEOU, a city of China, in the province of Tche-kiang. It is a city of the first class, and is situated on a lake, from which it takes its name. The quantity of silk manufactured here is almost incredible. To give some idea of it, we shall only say, that the tribute paid by a city under its jurisdiction, named Tetsin-hiem, amounts to more than 500,000 ounces of silver. Its district contains seven cities, one of which is of the second, and six of the third class.

HOUTEVILLE (Claud Francis), a French author, born in 1689. He was secretary to the French Aeademy, and wrote a work entitled La Verité de la Religion Chretienne prouvée par les Faits. He died in 1743, aged fifty-four.

HOUTHOVE, a town of France, in the department of Lys, and late province of Austrian Flanders ; six miles north-west of Bruges.

HOW, adv. Howbe'it, adv. How'BE, adv.

Sax. hu; Belgic and Teut. wie, hoe. 'These > several words are adver-How he, adv. Howsoev'er, adv. Sative conjunctions: they join sentences together

that stand more or less in opposition to each other.'-Crabb. How, to what degree; in what manner; for what reason; by what means; in what state. It is used in a sense marking proportion; it is used also in exclamation and affirmation. Howbeit and howbe, nevertheless; notwithstanding: they are nearly obsolete. However, whatsoever manner or degree ; at all events ; nevertheless. Howsoever, relates entirely to manner.

How is it thou hast found it so quickly ?

Gen. xxvii. How long wilt thou refuse to humble thyself before ine? Exodus. How are the mighty fallen !

Sam. How doth the city sit solitary as a widow '

1 Lam.

How oft is the candle of the wicked put out ! And how oft cometh their destruction upon them ! Job.

O how I love thy law! it is my meditation. Psalms.

2 F 2

Howe false was, eke, duke Theseus,

That as the storie telleth us,

How he betrayed Adrianc.

Chaucer. The House of Fame. Siker thou speakest like a lewd lorrel,

Of heaven to deemon so,

Howbe I am but rude and borrel,

Yet nearcr ways I know. Sponser. There is a knowledge which God hath always revealed unto them in the works of nature : this they honour and esteem highly as profound wisdom, howbeit this wisdom saveth them not. Hooker.

Things so ordained are to be kept, howbeit not necessarily, any longer than till there grow some urgent cause to ordain the contrary. Id.

Marked you not,

How that the guilty kindred of the queen Looked pale when they did hear of Clarence's death ? Shakspeare.

This ring he holds

In most rich choice; yet in his idle fire,

To buy his will, it would not seem too dear,

Howe'er repented of. Id. The man doth fear God, howsoever, it seems not in

him. Id.

How now, my love? Why is your cheek so pale? How chance the roses there to fade so fast? Id.

Berosus, who, after Moses, was one of the most ancient, howsoever he hath been since corrupted, doth in the substance of all agree. Raleigh's History.

Thick clouds put us in some hope of land, knowing how that part of the South Sea was utterly unknown, and might have islands or continents. Bacon.

There was no army transmitted out of England, howbeit the English colonies in Ireland did win ground upon the Irish. Davies.

A great division fell among the nobility, so much the more dangerous by *how* much the spirits were more active and high. *Hayward*.

How many children's plaints and mothers' cries ! How many woeful widows left to bow

To sad disgrace ! Daniel's Civil War. Prosecute the means of thy deliverance

By ransom, or how else. Milton's Agonistes. To trace the ways

Of highest agents, decmed however wise.

Milton.

How could the Dutch but be converted when The Apostles were so many fishermen. Marvell.

Consider into how many differing substances it may he analysed by the fire. Boyle.

Our chief end is to be freed from all, if it may be, however, from the greatest evils; and to enjoy, if it may be, all good, however the chiefest. Tillotson.

In your excuse your love does little say;

You might howe'er have took a fairer way.

Dryden.

Whence am I forced, and whither am I borne ? How, and with what reproach shall I return ? Id.

We examine the why and the how of things.

L'Estrange. 'Tis much in our power how to live, but not at all how or when to die.

Its views are bounded on all sides by several ranges of mountains, which are however at so great a distance, that they leave a wonderful variety of beautiful prospects. Addison on Italy.

It is pleasant to see *how* the small territories of this little republick are cultivated to the best advantage.

Id.

I do not build my reasoning wholly on the case of persecution; however I do not exclude it. Atterbury. By how much they would diminish the present extent of the sea, so much they would impair the fertility, and fountains and rivers of the earth. *Bentley.*

Few turn their thoughts to examine how those diseases in a state are bred, that hasten its end; which would, however, be a very useful enquiry. Swift.

Fain would I sing what transport stormed his soul How the red current throbb'd his veins along,

When, like Pelides, bold beyond controul, Without art graceful, without effort strong,

Homer raised high to heaven the loud, the impetuous

song. Beattie. Loud complaint, however angrily

It shakes its phrase, is little to be feared, And less distrusted. Byron.

HOWAKIL, a bay on the coast of Abyssinia, containing several islands, the principal of which, also called Howakil, has its eastern point in lat. 15° 1'. Mr. Salt here found numerous portions of the opsian, or obsidian stone of the ancients, which he was told were more abundant up the country. He thinks it the bay which is noted for this mineral in the Periplus of the Erythrean Sea.

HOWARD (Charles), an able statesman and experienced seaman, was the son of lord William Howard, baron of Effingham, and born in 1536. He served under his father, who was lord high admiral of England, till the accession of queen Elizabeth. In January, 1573, he succeeded his father in title and estate : after which he became chamberlain of the household; and in 1585 was made lord high admiral, when the Spaniards were sending their armada to conquer England. When he received intelligence of the approach of the Spanish fleet, he the first night left the port with six ships. The next morning, though he had only thirty sail, and those the smallest of the fleet, he attacked the Spanish navy; but first despatched his brother-in-law, Sir Edward Hobby, to the queen, to desire her to make the proper disposition of her land forces for the security of the coast, and to hasten as many ships as possible to his assistance. His valor was conspicuously displayed in his repeated attacks of a superior enemy. The queen expressed her high sense of his merit, and granted him a pension for life. In 1596 he commanded the naval forces sent against Spain; and upon his return, in 1597, he was created earl of Nottingham. The next eminent service in which he was engaged was in 1599, when the Spaniards seemed to me-ditate a new invasion. The queen, however, drew together, in a fortnight's time, such a fleet, and army, as took away all appearance of success from her foreign and domestic foes; and she gave the earl the sole and supreme command of both the fleet and army, with the title of lord lieutenant general of all England, an office unknown in succeeding times. When age and infirmity had unfitted him for action he resigned his office, and spent the remainder of his life in retirement, till his decease; which happened in 1624, in the eighty-seventh year of his age.

HOWARD (Henry), earl of Surry, a soldier and a poet, the son and grandson of two lords treasurers, dukes of Norfolk, was born about 1520, and educated in Windsor Castle, with young Fitzroy, earl of Richmond, natural son to king

Henry VIII. Wood says, that he was for some time a student at Cardinal College, Oxford. In his youth he became enamoured of the fair Geraldine, whom his sonnets have immortalised; and whose superlative beauty he maintained, in the romantic spirit of the times, in various tournaments in the principal cities of Italy, ' against all comers, whether Christians, Jews, Saracens, Turks, or cannibals,' and was victorious in them all; as well as in one fought in 1540 at Westminster, against Sir John Dudley, Sir Thomas Seymour, and others. In 1542 he marched, under his father, against the Scots; but was, on his return, confined in Windsor Castle for eating flesh in Lent, contrary to the king's proclamation. In 1544, on the expedition to Boulogne, he was appointed field-marshal of the English army; and after taking that town, in 1546, made captain-general of the king's forces in France; but, attempting to intercept a convoy, he was defeated by the French, and soon after superseded in his command by the earl of Hertford. He married Frances, daughter of John, earl of Oxford; and, after her death, had the boldness to propose himself to the princess Mary. For this the Seymours, rivals of the Norfolk family, and now in favor with the king, accused him of aspiring to the crown. Accordingly Surry and his father, the duke, were committed to the tower in December, 1546; and, on the 13th of January following, Surry was tried at Guildhall, and beheaded on Tower Hill on the 19th, nine days before the death of the king. The accusations brought against this amiable and innocent young nobleman on his trial, were so extremely ridiculous, that one is astonished how it was possible, even in the most despotic reign, to find a judge and jury so pusillanimously villanous as to carry on the farce of justice on the occasion. Walpole speaks of him as 'an almost classic author, the ornament of a boisterous, yet not unpolished court; a man, as Sir Walter Raleigh says, no less valiant than learned, and of excellent hopes.' His poems were published in 1557, 12mo.; and in 1565, 1574, 1585, and 1587, 8vo.

HOWARD (John), esq., commonly characterised by the epithet of the philanthropist, was the son of an upholsterer in St. Paul's Church Yard. He was born at Hackney in 1726; and was put apprentice to a grocer in Watling Street. His father died in 1742, leaving only this son and a daughter, to both of whom he bequeathed handsome fortunes. His constitution being very weak, the remaining time of his apprenticeship was bought up, and he applied himself to the study of medicine and natural philosophy. Falling into a nervous fever, while he lodged with a widow lady, Mrs. Sarah Lardeau, he was nursed with so much care and attention, that he resolved to marry her out of gratitude. In vain did his friends expostulate with him upon the extravagance of such a proceeding, he being about twenty-cight and she about fifty-one years of age; nothing could alter his resolution, and they were privately married about 1752. She was possessed of a small fortune which he presented to her sister. His wife died November 10th, 1755, aged fifty-four, and about this time he was elected F. R.S. In 1756 he embarked

in a Lisbon packet, to make the tour of Portugal, when the vessel was taken by a French privateer. 'Before we reached Brest,' says he in his Treatise on Prisons, p. 11, 'I suffered the extremity of thirst, not having for above forty hours one drop of water, nor hardly a morsel of food. In the castle at Brest I lay six nights upon straw; and observing how cruelly my countrymen were used there and at Morlaix, whither I was carried next, during the two months I was at Carhaix upon parole, I corresponded with the English prisoners at Brest, Morlaix, and Dinan; at the last of those towns were several of our ship's crew, and my servant. I had sufficient evidence of their being treated with such barbarity, that many hundreds had perished, and that thirty-six were buried in a hole at Dinan in one day. When I came to England, still on parole, I made known to the commissioners of sick and wounded seamen the sundry particulars, which gained their attention and thanks. Remonstrance was made to the French court; our sailors had redress; and those that were in the three prisons mentioned above were brought home in the first cartel ships. Perhaps,' adds Mr. Howard, ' what I suffered on this occasion increased my sympathy with the unhappy people whose case is the subject of this book.' He afterwards made the tour of Italy; and at his return settled at Brokenhurst, a pleasant villa in the New Forest, near Lymington, in Hampshire, having in 1758 married a daughter of Edward Leeds, esq., of Croxton, Cambridgeshire, king's serjeant. This lady died in 1765 in childbed, and after her death Mr. Howard left Lymington, and purchased an estate at Cardington, near Bedford. Being appointed, in 1773, sheriff of Bedfordshire, this office brought the distress of prisoners more immediately under his notice. He personally visited the county jail, where he observed such scenes of calamity as he had before no conception of. He inspected the prisons in some neighbouring counties, and, finding in them equal room for complaint, he determined to visit the principal prisons in Eng-The farther he proceeded the more land. shocking were the scenes he discovered, which induced him to exert himself to the utmost for a general reform in those places of confinement; considering it as of the highest importance, not only to the wretched objects themselves, but to the community at large. Upon this subject he was examined in the house of commons in March 1774, when he had the honor publicly to receive their thanks. This encouraged him to proceed. He revisited all the prisons in the kingdom, together with the principal houses of correction. In 1775 he enlarged his circuit by going into Wales, Scotland, and Ireland, where he found the same need of reformation. One of his principal objects was, to put a stop to the jail fever; which raged so dreadfully in many of the prisons as to render them to the last degree dangerous : a distemper by which more had been taken off than by the bands of the executioner; and which, in several instances, had been communicated from the prisoners into the courts of justice, and had proved fatal to the magistrates and judges, and to multitudes of persons

who attended the trials, as well as to the families of discharged felons and debtors. Another end he proposed was, to procure the immediate release of prisoners, who upon trial were acquitted, but who often continued long to be unjustly detained for not being able to pay the accustomed fees. But the greatest object was, to introduce a thorough reform of morals into our prisons; where he had found the most flagrant vices to prevail in such a degree, that they were become seminaries of wickedness and villany, and the most formidable nuisances to the community, in consequence of the promiscuous intercourse of prisoners of both sexes, and of all ages and descriptions; whereby the young and less experienced were initiated, by old and hardened sinners, into all the arts of villany and the mysteries of iniquity. For the attainment of these great objects, Mr. Howard spared neither pains nor expense, and cheerfully exposed himself to much inconvenience and hazard; particularly from that malignant distemper, of which he saw many dying in the most loathsome dungeons, into which none who were not obliged, besides himself, would venture. "I have been frequently,' says Mr. Howard, 'asked what precautions I use to preserve myself from infection in the prisons and hospitals which I visit. 1 here answer, next to the free goodness and mercy of the Author of my being, temper-ance and cleanliness are my preservatives. Trusting in Divine Providence, and believing myself in the way of my duty, I visit the most noxious cells; and, while thus employed, I fear no evil. I never enter an hospital or prison before breakfast; and, in an offensive room, I seldom draw my breath deeply.' His laudable endeavours he had the pleasure to see, in some instances, crowned with success; particularly in regard to the healthiness of prisons, some of which were rebuilt under his inspection. With a view to a more general and happy regulation, and the reformation of criminals, Mr. Howard resolved to visit other countries, in hopes of collecting some information which might be useful in his own. For this purpose he travelled into France, Flanders, Holland, Germany, Switzerland, Prussia, and Austria, and visited Copenhagen, Stockholm, Petersburg, Warsaw, and some cities in Portugal and Spain. On his return, he published in 1777 The State of the Prisons in England and Wales, with Preliminary Observations, and an Account of some foreign Prisons, 4to. And in 1778 he took a third journey through the Prussian and Austrian dominions, and the free cities of Germany and Italy. The observations made in this tour were published in 1780 with remarks respecting the management of prisoners of war, and the hulks on the Thames. In 1781 he again revisited Holland, some cities in Germany, and the capitals of Denmark, Sweden, Russia, and Poland; and in 1783 some cities in Portugal and Spain, and returned through France, Flanders, and Holland. The substance of all these travels was afterwards thrown into one narrative, published in 1784. He also published a curious account of the Bastile, in 8vo. He next visited the lazarettos in France and Italy, to obtain information 'not to survey the sumptuousness of palaces, or

concerning the best methods to prevent the spreading of the plague. He then proceeded to Smyrna and Constantinople, where that most dreadful of human distempers prevailed, and, though he actually caught the plague, ' that merciful Providence,' as he remarks, 'which had hitherto preserved him, was pleased to extend his protection to him in this journey also, and to bring him home once more in safety.' In his return he revisited the chief prisons and hospitals in the countries through which he passed, and afterwards went again to Scotland; and thence to Ireland, where he inspected the Protestant Charter Schools, in some of which he had ob-served shameful abuses, which he had reported to a committee of the Irish house of commons. At Dublin he was created LL.D. by the university. At Glasgow and Liverpool he was enrolled among their honorary members. Upon his return, having again inspected the prisons in England, and the hulks on the Thames, to see what alterations had been made, he published the result of his last laborious investigations, in An Account of the principal Lazarettos in Europe with various Papers relative to the Plague, together with further Observations on some foreign Prisons and Hospitals, and additional remarks on the present State of those in Great Britain and Ireland, with a great number of plates. He also published the Grand Duke of Tuscany's New Code of Criminal Law, with an English Translation. He concluded his Account of Lazarettos with announcing his ' intention again to quit his country, revisit Russia, Turkey &c., and extend his tour to the East.' Accordingly, he set out in summer 1789 on this hazardous enterprise; the principal object of which was to administer James's Powder, a medicine in high repute in malignant fevers, under a strong persuasion that it would be equally efficacious in the plague. In this second tour in the East, having spent some time at Cherson, a Russian settlement on the Dnieper, he caught a malignant fever, in visiting the Russian hospital, which carried him off on the 20th of January, after an illness of about twelve days. He was buried, as he desired, in the garden of a villa, belonging to a French gentleman from whom he had received much kindness, by his faithful servant who had attended him in his former journeyings. While absent on his first tour to Turkey, &c., his character for active benevolence had so much attracted the public attention, that a subscription was set on foot to erect a statue to his honor, and in no long space above £1500 were subscribed for that purpose. But in consequence of two letters from Mr. Howard himself to the subscribers (inserted in the Gentleman's Magazine) the design was laid aside. The testimony of public respect, which he refused when living, has however been conferred on his memory, and his monumental statue was one of the first placed in the cathedral of St. Paul's. And surely if the devotion of time, strength, fortune, and finally life, to the sole service of his fellow creatures merits a token of public esteem, it was deserved by one who (to adopt the expressive words of Burke) visited all Europe and the East,

the stateliness of temples; not to make accurate measurements of the remains of ancient grandeur, nor to form a scale of the curiosity of modern art; not to collect medals, or to collate MSS.; but to dive into the depth of dungeons; to plunge into the infection of hospitals; to survey the mansions of sorrow and of pain; to take the gauge and dimensions of misery, depression, and contempt; to remember the forgotten; to attend to the neglected; to visit the forsaken; and to compare and collate the distresses of all men in all countries. His plan is original; and it is as full of genius as it is of humanity. It is a voyage of discovery, a circumnavigation of charity ; and already the benefit of his labor is felt more or less in every country.

HOWARD (Sir Robert), an English historian and poet of the seventeenth century. He was a younger son of Thomas earl of Berkshire, and educated at Magdalen College, Oxford. He suffered much during the civil war, but on the Restoration was knighted, and elected M. P. for Stockbridge, in Hants, in 1661. He was afterwards appointed auditor of the Exchequer; but, upon James II.'s accession, became a zealous friend to the Revolution. He wrote, 1. The History of the reigns of Edward II. and Richard II. in 8vo. 1690. 2. The History of Religion ; 8vo. 1694: and some Poems and Plays. He also translated Statius's Achilles, and the fourth book of Virgil's Æneid, 8vo. 1660. He died about 1699.

HOWDEN, a town in the East Riding of Yorkshire, 180 miles from London, on the north side of the Ouse. It has a market on Saturday, and four fairs. Here was formerly a collegiate church of five prebendaries, erected in the sixteenth century; adjacent to which the bishops of Durham have a palace. One of them built a very tall steeple to the church, whither the inhabitants might retire in case of inundations; to which it is very liable from the great freshes that come down the Ouse sometimes at ebb. It is sixteen miles south-east of York, and twenty-three west of Hull.

HOW'DYE. Contracted from how do ye. In what state is your health? A message of civility.

I now write no letters but of plain business, or plain howd'ye's, to those few I am forced to correspond with. Pope.

HOWE (John), a learned English nonconformist divine, born in 1630. He became minister of Great Torrington in Devonshire, and was appointed household chaplain to Cromwell; but finally offended him by preaching against the doctrine of particular faith. When Oliver died he continued chaplain to Richard; and, when Richard was deposed, he returned to Torrington, where he continued till the act of uniformity set him aside. He afterwards settled at Utrecht, until the declaration for liberty of conscience was published by king James II., under shelter of which he returned to London, where he died in 1705. He published a great number of sermons and religious works, which have been reprinted in 2 vols. folio.

Howe (John), esq. an eminent English statesman and writer, was the brother of Sir Scroop Howe, and born in Nottinghamshire. He was M. P. for Cirencester in the convention parliament 1688-9, and was re-elected for that town or for Gloucestershire in the three last parliaments of king William III., and the three first of queen Anne. He was a zealous friend of the Revolution, and wrote a panegyric on king William, but afterwards opposed his measures, and it was chiefly owing to Mr. Howe, that, in 1699, the house agreed to allow half-pay to the disbanded officers. In 1702 he was made a member of the privy-council, vice-admiral of Gloucester, and paymaster-general of the guards; in which last he was succeeded by Mr Walpole in 1714. He died at his seat of Stowell in 1721. He was author of several poems. His son was created lord Chidworth.

Howe (Richard), earl Howe, a late brave English admiral, born in 1725. He entered the naval service very young, and when only twenty was appointed captain of the Baltimore sloop of war, in which he attacked and beat off two French frigates of thirty guns each. In this action he was dangerously wounded in the head; but recovering was made a post-captain in the Triton frigate. After this he obtained the command of the Dunkirk of sixty guns, when he took a French sixty-four gun ship, off the coast of Newfoundland. In 1757 he served under admiral Hawke on the French coast, and in 1758 was appointed commodore of a squadron with which he destroyed a great number of ships and magazines at St. Malo. In August 6th 1759 he took Cherbourg, and destroyed the basin. At the unfortunate affair of St. Cas, he displayed equal courage and humanity, by saving the retreating soldiers at the risk of his life. By the death of his brother, in 1758, he became lord Howe, and soon after had a share in the glorious victory over Conflans; for which he received the thanks of king George II. In 1763 he was appointed first lord of the admiralty, and in 1765 treasurer of the navy. In 1770 he was made rear-admiral of the blue, and commander-in-chief of the Mediterranean. During the American war he commanded the fleet on that coast. In 1782 he was sent to the relief of Gibraltar, which he accomplished in sight of the enemy's fleet, which he in vain challenged to combat. In 1783 he was made first lord of the admiralty, and continued in that high station till 1788, when he was created an earl. In 1793 he commanded the channel fleet, and on June 1st, 1794, obtained a decisive victory over the most powerful fleet even equipped by the French republic; for which he received the thanks of their majesties, who visited him on board of his ship at Spithead, when the king presented him with a magnificent sword, a gold chain and medal. He also received the thanks of both houses, and the freedom of the city of London. In 1795 he succeeded admiral Forbes as general of the marines, and in 1797 was made knight of the garter. He died in August 1799, aged seventy-four.

Howe's ISLAND, or LOND HOWE'S ISLAND, a small island in the neighbourhood of New South Wales, discovered February 17th, 1788. South lat. 31° 36' E., long. 159° 4'. It is of an arched figure, lying from north-west to southeast, the two extremities, including a space of about six miles, though, by reason of the curved figure of the island itself, it is near seven in length. It is deeply indented on the middle of the east part by a bay named Ross's Bay, and on the west has another named Prince William Henry's Bay; so that the whole appears like two islands joined together by an isthmus, in some places not above half a mile broad. On the south part of that division which lies most to the north are two considerable bays, named Callam's and Hunter's Bay; and on the south-west part of the other are two high mountains, the most southerly named Mount Gower, and the other Mount Lidgbird. The convex part of the island lies towards the north-east, and the concave side towards the south-west, is terminated by two points named Point King and Point Philip. No fresh water was found on the island; but it abounds with cabbage palms, mangrove, and manchineel trees, even up to the summits of the mountains; besides celery, spinach, and some other esculent plants. There are great numbers of gannets, and a land fowl of a dusky-brown color, with a bill about four inches long, and feet like those of a chicken. These were found to be fine meat, and were very fat. There are many large pigeons, and the white birds found in Norfolk Island were also met with in this one. The bill of this bird is red, and very strong, thick, and sharp pointed. Great numbers of fine turtles frequent this island in summer, but go northward in winter. The coast abounds with fish. About four leagues from this island is a remarkably high rock, named Ball's Pyramid. This island may be approached without danger; but about four miles from this pyramid there is a very dangerous rock, which appears above the surface of the water. The isthmus which joins the two parts has been formerly overflowed, and the island disjoined, as in the very centre large beds of coral rocks and great quantities of shells were seen. On the east, which seems in general to be the weather side, the sea has thrown up a bank of sand from twenty-five to thirty feet high, which serves as a barrier against future inundations. The island also appears to have suffered by volcanic eruptions, as great quantities of pu-mice stones were found upon it. Mr. Austin also found that the whole reef which shelters the west bay had been burnt up. The time he visited it was that of the incubation of the gannets, of which there were then prodigious numbers, their nests being only hollows made in the sand, there not being any quadrupeds on the island to disturb them. He also met with beautiful parrots and parroquets; a new species of coots, rails, and magpies; and a very beautiful small bird of a brown color with a yellow breast, and yellow on the wing, which seemed to be a species of humming bird. They found also a black bird like a sheerwater, having a hooked bill, and which burrows in the ground. The only insects met with were common worms and ants; which last were numerous.

Howe's ISLAND, is also an island in the South Pacific Ocean, discovered by Wallis in 1767, who observed cocoa-nuts growing on it. It is about sixty miles long, and four broad. It was

440

observed by captain Cook in 1774, who found it to be composed of several smaller islands, and appearing to have no inhabitants. By the natives it is called Mopetra. Long. 154° 7' W., lat. 16° 46' S.

HOWEL (Lawrence), a zealous nonjuring divine of the last century, was educated at Jesus College, Cambridge, and graduated M.A. in 1688. After keeping a school at Epping, he received ordination among the non-jurors from Dr. George Hickes, the titular bishop of Thet-ford. He published Synopsis Canonum SS. Apostolorum, Lond. 1708, folio; Synopsis Canonum Ecclesiæ Latinæ, 1710, folio; a View of the Pontificate to 1563, 1712, 8vo.; and a History of the Bible, with Engravings, by Sturt, 1716, 3 vols. 8vo. But he is chiefly remarkable as the author of a pamphlet, in 1716, entitled The Case of Schism in the Church of England. He was tried at the Old Bailey for this attack on the establishment, sentenced to be degraded from his clerical office, to pay a fine of $\pounds 500$, and to be twice whipped. The latter part of the sen-tence was afterwards remitted, in consideration of his clerical character, but the remainder was rigidly executed; he was stripped of his gown in open court, and, being unable to pay the fine, was detained in Newgate till his death, July 19th, 1720.

HOWITZ, or HOWITZER, a kind of mortar, mounted upon a field carriage like a gun. The difference between a mortar and a howitz is, that the trunnions of the first are at the end, and at the middle in the last. The invention of howitzers is of much later date than mortars, and had their origin from them. The construction of howitzers is as various and uncertain as that of mortars, excepting the chambers which are cylindric. They are distinguished by the diameter of the bore; for instance, a ten inch howitz is the diameter of that which is ten inches; and so of the smaller ones.

HOWL, v. n. & n. s. Belg. huglen and huil, Lat. ululo. To cry as a wolf or a dog; to utter cries of distress or pain; to speak in a belluine cry or tone: it is used poetically of many noises loud and horrid. Howl, the cry of a wolf or dog, or of a human being in agony.

He found him in a desert land, and in the waste howling wilderness. Deut. xxxii. 10.

Therefore will I howl, and cry out for all Moab. Jer. xlviii.

Methought a legion of foul fiends Environed me, and *howled* in mine cars Such hideous cries, that with the very noise I trembling waked. Shakspeare. Richard III.

If wolves had at thy gate howled that stern time, Thou should'st have said, Go, porter, turn the key.

Shakspeare. The damned use that word in hell,

Howlings attend it. Id. Romeo and Juliet. Each new morn

New widows howl, new orphans cry, new sorrows Strike Heaven on the face. Id. Macbeth.

I have words

That would be *howled* out in the desart air, Where hearing should not eatch them. Id. Murther,

Alarmed by his sentinel the wolf, Whose howl's his watch.

Id.

He and his monstrous route are heard to howl Like stable woulves, or tigers at their prey.

Milton's Comus.

441

As when a sort of wolves infest the night, With their wild howlings at fair Cynthia's light. Waller.

She raves, she runs with a distracted pace, And fills with horrid howls the public place. Druden.

The noise grows londer still,

Rattling of armour, trumpets, drums and atabelles; And sometimes peals of shout that rend the heavens.

Like victory : then groans again, and howlings Like those of vanquished men.

Dryden's Spanish Fryar. Peace, monster, peace! Go tell thy horrid tale To savages, and hovel it out in desarts! Phillips.

These and the like rumours are no more than the last howls of a dog dissected alive. Swift. Behold with berries smeared, with hrambles torn,

The habes now famished lay them down to die ; Amidst the howl of darksome woods forlorne,

Folded in one another's arms they lie, Nor friend nor stranger hears their dying cry.

Beattie.

The Hell of waters! where they howl and hiss And boil in endless torture. Byron. Childe Harold.

HOWTH, a promontory and small town of Ireland, which forms the north entrance of the bay of Dublin. It belongs principally to the earl of Howth; and it has continued in posses-sion of the family above 700 years. The shores off this hill are rocky and precipitous, affording, however, several harbours for small craft. It was formerly called Ben-hedar, i. e. the Birds' Promontory; and celebrated for having Dun Criomthan, or the royal palace of Criomthan, erected on it, he having been chief or king of this district, and memorable for making several successful descents on the coast of Britain against the Romans in the time of Agricola. Howth, now stripped of trees, was also formerly covered with venerable oaks, and a seat of the Druids, one of their altars still remaining in a sequestered valley on the east side of the hill. The town of Howth is seven miles east of the metropolis. On the top of the hill is a lighthouse, and another at the end of the new pier; the harbour is small, but has been recently improved at a great expense; steam-vessels, commanded by lieutenants in the navy, quit Howth daily for Holyhead. The town is extremely picturesque. Howth Castle or abbey is ancient, and stands in the middle of it. On the west shore are the ruins of St. Mary's church, with some ancient monuments of lord Howth's ancestors. See DUBLIN, COUNTY.

HOX, v. a. From Sax. boz. To hough; to ham-string.

Lodronius, perceiving the old soldier's meaning, alighted, and with his sword *hoxed* his horse, saying aloud, This day, valiant soldiers, shall you have me both your general and fellow soldier, fighting on foot as one of yourselves. *Knolles*.

HOY, n. s. Old. Fr. hou. A large boat sometimes with one deck.

He sent to Germany strange aid to rear : From whence eftsoons arrived here three hoys Of Saxons, whom he for his safety employs.

Facrie Queene.

To define a barge and hoy, which are between a boat and a ship, is hard. Watts's Loyick.

Hoy, a considerable island of the Orkney groupe, lying south from the mainland of Scotland. It is about fifteen miles long from southeast to north-west, and six miles and a half at its greatest breadth. The peninsula of Walls, on the south-cast, contains some fertile land; but the greater part of the island is mountainous and barren; encumbered with large rocks and almost inaccessible. The only crops are black oats, bear, and of late potatoes. The fishery and kelp-making add a little to the means of the inhabitants, but they are chiefly employed in the breeding and rearing of sheep. The dwarfie stone, a remarkable relic of antiquity found in this island, measures thirty-two feet in length, sixteen and a half in breadth, and seven and a half in height, hollowed in the inside into several apartments. Population between 500 and 600. Four miles west from Ronaldsay, and six north from Dunnet Head in Caithness.

HUAJOCINGO, or HUETJOCINGO, a large town of Mexico, in the intendancy of La Puebla de los Angelos. It once gave name to a small independent republic.

HUAHEINE, or AHEINE, which signifies woman, the easternmost of the groupe of the Society Islands. It is twenty-four miles in circumference, and divided into two peninsulas, by a narrow isthmus overflowed by the tides. In other parts of the island there are salt lakes. It has a very narrow stripe of fertile low land next the shore. The hills are strongly marked by volcanic fire, and in some parts cultivated. The productions are similar to those of Otaheite, but about a month earlier. Owharra, on the west coast, is a harbour of good anchorage in eighteen fathoms water, secure from winds. The inhabitants mix cocoa-nuts with yams, scraping both fine, and, having incorporated the powder, they put it into a wooden trough, with a number of hot stones, by which an oily kind of hasty pudding is made, called poe. They are larger and stouter than those of Otaheite. The women are also not so dark.

HUANTAJAYA, a mountain of Peru, in Arica, only two leagues from the Pacific Ocean, famous for its silver mines. They are surmounted with beds of rock-salt in a desert destitute of water; and furnish from 40,000 lbs. to 80,000 lbs. Troy, of native silver yearly.

HUAPENTÉ, a considerable river of Quito, in the province of Ambato. It rises in the mountains of Quelenda, covered with perpetual snow, and first runs due south; then it turns westward and joins the Ambato on the east, just before it enters the Pachantica.

HUB'BUB. n. s. Johnson conjectures from up up, or hob-nob. Mr. Thomson says, from Goth. opa up, to call out. See Hoor. A tumult; a riot.

People pursued the business with all contempt of the government; and in the *hubbub* of the first day there appeared nobody of name or reckoning, but the actors were really of the dregs of the people.

Clarendon.

Why worves raise a hubbub at her, And dogs howl when she shines in water. Hudibras. An universal hubbub wild

Of stunning sounds, and voices all confused, Borne through the hollow dark, assaults his ear With loudest vehemence. *Milton's Paradise Lost*.

HUBELY, or HOOBLY, a populous town of the province of Bejapore, Hindostan, surrounded by a mud wall and ditch. It carries on a considerable trade with Goa, and has manufactures of both silk and cotton. Formerly the English East India Company had a factory here. It was plundered by the Mahrattas in 1673, at which time it belonged to the king of Bejapore. But in 1685 it was taken by the Moguls, under the command of Muayem, the son of Aurungzebe; but soon after the death of that monarch, in 1707, it was again taken by the Mahrattas, under whose dominion it still continues. Long. 75° 10' E., lat. 15° 24' N.

HUBER (Ulric), a celebrated civilian of the seventeenth century, was born at Dockum in 1636. He became professor of law at Franeker; and wrote, 1. A Treatise De Jure Civitatis; 2. Jurisprudentia Frisica; 3. Specimen Philosophiæ Civilis; 4. Institutiones Historiæ Civilis; 5. Dissertationes de genuino ætate Assyriorum et Regno Medorum; and other works which are much esteemed. He died in 1694.

HUBER (Zacharias), the son of the preceding, was born at Francker in 1669, and succeeded his father in his professorship. He published, 1. De Vero Sensu Legis IXD. de lege Pompeia, 4to; Dissertationum Libri Tres, &c. He died in 1772.

HUBERT (St.), in heraldry, the name of an order of knighthood, instituted by Gerard V. duke of Juliers, in memory of a victory gained by him over Arnold of Egmont, on St. Hubert's day, in the year 1447. In 1709 it was revived by John William, elector-palatine of the Rhine. It was also used at Wurtemberg, where the reigning duke of Wurtemberg was grand master. The collar of the order is a chain of gold, to which a cross pattée, set with jewels, is sus-pended, from the angles of which issue rays of gold; on the centre is a medallion of gold enamelled, with a portrait of St. Hubert, kneeling before a crucifix, placed between the horns of a stag, all proper. The knights also wear, on the left side of their coat, a circle surrounded with rays, embroidered in gold; and, in the middle of it, a German motto, signifying, ' Keep firm in the Faith.' At all times, except festival days, they wear the cross tied to a red riband, which passes scarf-wise from the left shoulder to the right thigh.

HUBNER (John), a learned geographer of Germany, who taught geography at Leipsic and Hamburg with extraordinary reputation; and died at Hamburg in 1732, aged sixty-three. His principal works are, 1. Bibliotheca Historica, Hamburgensis; 2. Musœum Geographicum, printed at Basil in 1746, in 6 vols. 12mo.

HUCK'ABACK, n. s. A kind of linen on which the figures are raised.

HUCKLE'BACKED German hocker, a HUCK'LEBONE. S bunch; Dut. hucken. Crooked in the shoulders; the hip bone.

HUCK'STER, n. s. & v. n.) Germ. hoch, HUCK'STERER, n. s.) a pedlar; hockster, a she pedlar. One who sells goods by retail: figuratively, a trickish mean fellow. Huckster, to deal in petty bargains.

And now the Ape wanting his *huckster* man, That wont provide his necessaries, gan

To grow into great lacke, ne could upholde

His countenance in those his garments olde.

Spenser. Mother Hubberd's Tale.

God deliver the world from such guides, or rather such hucksters of souls, the very shame of religion. South.

There cannot be a more ignominious trade than the being *hucksters* to such vile merchandise.

Government of the Tongue.

Should thy shoe wrench aside, down, down you fall, And overturn the scolding *huckster's* stall;

The scolding huckster shall not o'er thee moan,

But pence expect for nuts and pears o'erthrown.

Gay.

There should be a confederacy of all servants, to drive those China hucksters from the doors. Swift.

Those hucksterers or money-jobbers will be found necessary, if this brass-money is made current. Id.

They must pay a shilling, for changing their piece into silver, to some *huckstering* fellow who follows that trade. Id.

HUDDERSFIELD, or HUTHERSFIELD, a market town of Yorkshire, sixteen miles from Leeds, thirty-nine from York, and 189 northwest from London. The manufactures consist chiefly of serges, kerseymeres, frieze, and narrow and broad cloths. The church is an ancient plain building. Here is a very extensive clothhall, erected by Sir J. Ramsden in 1765. It is built in a circular form, two stories high, divided into two courts. Over the entrance is a bell, placed in a handsome cupola,, to regulate the opening and closing of the market, which is held on Tuesdey from seven till twelve A. M. Here is also a dispensary, established in 1814, and a national-school in 1819. This town has a canal navigation for three miles to the river Calder, whence the river navigation is continued to Wakefield; and the Huddersfield canal passes on to Ashton-under-Line, and finally enters the Peak-forest and other canals. Two miles south of the town, on Castle-hill, are still visible the remains of the ancient Roman city of Camelodu-In the vicinity are several medicinal num. springs.

HUD'DLE, v. a., v. n. & n. s. Etymology uncertain. Probably from hood; to dress up so close as not to be discovered; to cover up in haste; to perform in a hurry; to throw together in confusion; to come in a crowd: huddle is tumult; confusion; obscurity.

Glance an eye of pity on his losses, That have of late so *huldled* on his back, Enough to press a royal merchant down.

Shakspeare. Brown answered after his blunt and huddling manner. Bacon.

Thyrsis, whose artful strains have oft delayed The huddling brook to hear his madrigal,

And sweetened every muskrose of the dale. Milton. Your carrying business in a huddle,

Has forced our rulers to new model. Hudibrus.

That the Aristotelian philosophy is a huddle of words and terms insignificant, has been the censure of the wisest. Glanville. Their eyes are more imperfect than others; for they will run against things, and, huddling forwards, fall from high places. Browne's Vulgar Errours.

I have given much application to this poem : this is not a play huddled up in haste. Dryden.

When continued rain

The labouring husband in his house restrain, Let him forecast his work with timely care, Which else is *huddled* when the skies are fair.

Id.

Nature doth nothing in a huddle. L'Estrange. Our adversary, huddling several suppositions together, and that in doubtful and general terms, makes a medley and confusion. Locke.

The understanding sees nothing distinctly in things remote, and in a huddle. Id.

Several merry answers were made to my question, which entertained us 'till bed-time, and filled my mind with a huddle of ideas. Addison.

At twelve she rose with much ado;

Her cloaths were huddled on by two. Prior. Now all in haste they huddle on

Their hoods, their cloaks, and get them gone.

Swift.

And reading what they never wrote, Just fifteen minutes *huddle* up their work, And with a well-bred whisper close the scene.

Cowper's Task.

HUDSON (Henry), an eminent English navigator, celebrated for his attempts, about the beginning of the seventeenth century, to find the north-west passage to India and China. This intrepid mariner, in searching after a north-west passage to the South Seas, discovered Hudson's straits, through which he hoped to find out a new way to Asia by America. He made altogether three voyages on this adventure; the first in 1607, and the second in 1608. In his third and last, in 1610, he entered the straits that lead into a new Mediterranean, and passing along the coast of Latrador, which he named New Britain, discovered a great part of the bay known by his His ardor for discovery not being name. abated by the difficulties he struggled with, in this empire of winter, he staid here till the ensuing spring, and prepared in the beginniug of 1611 to pursue his enterprize; but his crew, who suffered equal hardships, without the same spirit to support them, mutinied, seized upon him and seven of those who were most faithful to him, and committed them to the fury of the icy seas in an open boat. Hudson and his companions were either swallowed up by the waves, or gaining the inhospitable coast were destroyed by the savages, for they were never more heard of; but the ship and the rest of the men returned home.

HUDSON (Jeffery). See DWARF.

HUDSON (John), a learned English critic, born in 1662. He distinguished himself by several editions of Greek and Latin authors; and, in 1701, was elected head keeper of the Bodleian library at Oxford. In 1712 he was appointed principal of St. Mary's Hall, through the interest of the famous Dr. Ratcliffe; and it is said that the university of Oxford is indebted for the most ample benefactions of that physician to Dr. Hudson's solicitations. He died in 1719, while he was preparing for publication a catalogue of the Bodleian library, which he had caused to be transcribed in six folio volumes. HUDSON, or North River, a river of the state of New York, which rises in a mountainous country west of Lake Champlain, in the counties of Essex and Montgomery, about lat. 44° N., and communicates with the Atlantic, below New York city. The distances of principal places on it are :---

			Miles.	Whole distance.
From its source Sandy Hill, abou		3	100	100
Waterford			42	142
Troy .	•		4	146
Albany .			6	152
Hudson .			30	182
Poughkeepste			55	237
Newburgh			10	247
New York			65	312
The Narrows			12	$^{\circ}324$

It is navigable for the largest ships to Hudson, and for sloops to Troy. The tide flows up as far as Troy. It is remarkably straight for 200 miles, and is, on the whole, one of the finest rivers in America. There are upon its banks a number of handsome and flourishing towns; and in passing up the river there is exhibited much fine and picturesque scenery.

HUDSON, a city, port of entry, and the capital of Columbia county, New York. It stands on the east bank of the Hudson River, thirty miles south of Albany, 130 north of New York, and 336 miles from Washington. It was founded in 1784, and is pleasantly situated, regularly laid out, and well-built; the streets intersecting each other at right angles. It contains four houses of public worship; one for Presbyterians, one for Episcopalians, one for Quakers, and one for Methodists, an academy, and two banks. The city is considerable both for its trade and manufactures. The shipping owned here in 1816 amounted to 2761 tons. Claverack Creek, which flows on the eastern side of the town, and Abram's, or Factory Creek, on the northern side, afford good seats for various mills and manufactories. The woollen manufactory on Claverack Creek is said to be one of the most extensive in the state. Two weekly newspapers are published here.

HUDSON'S BAY, a large bay of North America, lying between 51° and 69° of N. lat., discovered in 1610 hy Henry Hudson. See HUDSON. The country lying round Hudson's Bay is called New Britain, or the country of the Esquimaux; comprehending Labrador, now New North and South Wales. See LABRADOR. The entrance of the bay from the ocean, after leaving to the north Cape Farewell and Davis's Straits, is between Resolution Isles on the north, and Button's Isles on the Labrador coast to the south, forming the eastern extremity of Hudson's Straits. The coasts are very high, rocky, and the eastern extremity of Hudson's rugged at top; in some places precipitous, but sometimes exhibit large beaches. The isles of Salisbury, Nottingham, and Digges, are also very lofty and naked. The depth of water in the middle of the bay is about 140 fathoms. From Cape Churchill to the south end of the bay are regular soundings; near the shore shallow, with muddy or sandy bottom. To the north of Churchill the soundings are irregular, the bottom

444

south-east by east of Buckingham House; in long. 106° 27' 20" W., lat. 53° 0' 32" N.

HUDSON'S STRAITS, the narrow sea between the Atlantic Ocean and Hudson's Bay, north of Labrador. See Hudson's BAY.

HUDSONIA, in botany, a genus of the monogynia order, and dodecandria class of plants: COR. none: CAL. is pentaphyllous and tubular: stamina fifteen : CAPS. unilocular, trivalvular, and trispermous. Species one only, a native of Virginia.

HUE, n. s. Sax. piepe. Color; dye. This word is significant of 'modes of color; as a faint, or blended color.'-Crabb.

But thus moche I dare saine, that she

Was white, rody, freshe, lifely hewed;

And, every day, hire beaute newed.

Chaucer. Boke of the Duchesse.

For never in that land

Face of fair lady she before did view, Or that dread lyon's look her cast in deadly hue.

Spenser. To add another hue unto the rainbow. Is wasteful and ridiculous excess.

Shakspeare. King John.

Drop, drop, you violets, change your hues,

Now red, now pale, as lovers use,

And on your death go out as well

As when you lived unto the smell ;

That from your odour all may say

This is the shepherds' holiday. Jonson. Flowers of all hue, and without thorn the rose.

Milton.

To whom the angel, with a smile that glowed Celestial rosy red, love's proper hue,

Id. Paradise Lost. Answered. And such appeared in hue, as when the force Of subterranean wind transports a hill

Torn from Pelorus, or the shattered side Of thundering Ætna, whose combustible And fuelled entrails thence conceiving fire Sublimed with mineral fury, aid the winds, And leave a singed hottom all involved With stench and smoke.

Milton.

Yours is much of the cameleon hue, To change the die with distant view. Dryden. - the snows above

The very Glaciers have his colours caught, And, sun-set into rose-hues, sees them wrought By rays which sleep there lovingly.

Byron. Childe Harold. Fr. huée, huer. A clamor; a HUER, n. s. Fr. huée, huer. A clamor; a HUER, n. s. legal pursuit; an alarm given to the country, as 'hue and cry:' huer, one whose business it is to give an alarm, or call out others.

Hue and cry, villain, go! Assist me, knight, I am undone : fly, run, hue and cry ! villain, I am undone. Shakspeare.

They lie hovering upon the coast, aud are directed by a balker or huer, who standeth on the cliff-side, and from thence discerneth the course of the pilchard. Carew's Survey.

Immediately comes a hue and cry after a gang of thieves, that had taken a purse upon the road. L'Estrange.

If you should hiss, he swears he'll hiss as high ; And, like a culprit, join the hue and cry. Addison.

The hue and cry went after Jack, to apprehend him dead or alive, wherever he could be found.

Arbuthnot's John Bull. HUE AND CRY, in law, the pursuit of a person who has committed felony on the highway. If a party robbed, or any in the company of one

or the bottom of the bay, to Cape Churchill, the land is flat, marshy, and wooded with pines, birch, larch, and willows. From Cape Churchill to Wager's Water the coasts are high and rocky to the very sea, and woodless, except the mouths of Pockerekesko and Seal rivers. The hills on their back are naked, nor are there any trees for a great distance inland. The mouths of all the rivers are filled with shoals, except that of Churchill, in which the largest ships may lie; but ten miles higher the channel is obstructed with sand-banks; and all the rivers, as they have been navigated, are full of rapids and cataracts from ten to sixty feet perpendicular. Down these rivers the Indian traders find a quick passage; but their return is a labor of many months. As far inland as the company have settlements is flat, nor is it known how far to the eastward the great chain seen by our navigators from the Pacific Ocean branches off. The eastern boundary of the bay is Terra di Labrador; the northern part has a straight coast facing the bay, guarded with isles innumerable. A vast bay, called the Archiwinnipy Sea, lies within it, and opens into Hudson's Bay by means of Gulph Hazard, through which the Beluga whales dart in great numbers. Here the company had a settlement for the sake of the fishery, and for trading with the Esquimaux; but deserted it as unprofitable about 1758 or 1759. For the climate, animals, and phenomena of the country adjacent to Hudson's Bay, see LABRADOR, and AMERICA, NORTH.

HUDSON'S BAY COMPANY. About sixty years after the intrepid Hudson had penetrated the great gulf, known by this name, the British government granted to a party of merchants, called the Hudson's Bay Company, the chartered possession of extensive tracts near the shores of this sea. The territories claimed by this company are stated by some writers to extend from the seventieth to the 115th degree of west longitude, and as far south as the fortyninth degree of latitude, thus comprehending a length of 1300 or 1400 geographical miles, by a medial breadth of 350 miles. Animated by a prospect of gain, the company have pushed their discoveries into the interior, and thus has a knowledge of these vast wilds been obtained, beyond what any other motives would possibly have supplied. Two of the principal journeys, performed by Messrs. Hearne and Mackenzie, have been mentioned in our article AMERICA. A rival body, called the North-west Company, has been recently established at Montreal. Both of them erect forts, and form settlements on the lakes and other favorable situations. Churchill Fort, or Fort Prince of Wales, on the west coast of Hudson's Bay, is the most northern settlement, while Hudson's Fort, on the river Suskashawan, in longitude 107 degrees west, is considered as the most western belonging to the Hudson's Bay Company.

HUDSON'S HOUSE, one of the Hudson's Bay Company's factories in North America, situated on the south-west side of Suskashawan River, 100 miles east of Manchester House, and 167

445

murdered or robbed, come to the constable of the various accretions of the deposited subthe next town, and require him to raise hue-andcry, or to pursue the offender, describing him, and showing, as near as he can, which way he is gone, the constable is forthwith to call for aid from the parish to seek the felon; and, if he is not found there, he is to give the next constable warning, till he be apprehended, or pursued to the sea-side.

And, that such hue-and-cry may more effectually be made, the hundred is bound by the same statute, cap. 3, to answer for all robberies therein committed, unless they take the felon, which is the foundation of an action against the hundred, in case of any loss by robbery. By stat. 27 Eliz. cap. 13, no hue-and-cry is sufficient, unless made with both horsemen and footmen. And, by stat. 8, Geo. II. cap. 16, the constable or like officer refusing or neglecting to make hue-and-cry, forfeits £5, and the whole district is still in strictness liable to be amerced, according to the law of Alfred, if any felony be committed therein, and the felon escape. Hueand-cry may be raised either by precept of a justice of a peace, or by a peace-officer, or by any private man that knows of a felony.

HUEN, or HUENA, an island in the Baltic, with a village, three miles from the coast of Sweden, eight in circumference, and fourteen north by east of Copenhagen; famous for Tycho Brahe's observatory. See BRAHE.

HUER, a name given to certain fountains in Iceland, forming at times jets d'eau of scalding water arising out of cylindrical tubes of unknown depths. The largest is that which is called Geyer or Geyser, in a plain rising into small hills, and in the midst of an amphitheatre, bounded by the most magnificent and variousshaped icy mountains; among which the threeheaded Hecla soars pre-eminent. Of this, as exemplifying the general appearance of these tremendous fountains, we extract the following description from the Travels of Dr. Henderson. " On our approach, the first thing we observed, says the doctor, ' was a large circular mound, formed of the decompositions of the fountain, justly distinguished by the appellation of the Great Geyser, from the middle of which a great degree of evaporation was visible. Ascending the rampart we had the spacious basin at our feet, more than half filled with the most beautiful hot crystalline water, which was just moved by a gentle ebullition, occasioned by the escape of steam from a cylindrical pipe or funnel in the centre. This pipe I ascertained, by admeasurement, to be seventy-eight feet in perpendicular depth. Its diameter is in general from eight to ten feet, but near the mouth it gradually widens, and opens almost imperceptibly with the basin, the inside of which exhibits a whitish surface, consisting of a siliceous incrustation, which has been rendered almost perfectly smooth by the incessant action of boiling water. The diameter of the basin is fifty-six feet in one direction, and forty-six in another; and, when full, it measures about four fect in depth, from the surface of the water to the commencement of the pipe. The borders of the basin, which form the highest part of the mound, are very irregular, owing to

stances; and at two places are small channels equally polished with the interior of the basin, through which the water makes its escape when it has been filled to the margin. The declivity of the mound is rapid at first, especially on the north-west side, but instantly begins to slope more gradually, and the depositions are spread all around to different distances, the least of which is nearly 100 feet. On leaving the mound, the hot water passes through a turfy kind of soil, and, by acting on the peat, mosses, and grass, converts them entirely into stone, and furnishes the curious traveller with some of the finest specimens of petrifaction.

' On hearing a sound resembling the discharge of distant artillery,' continues our author, ' I ran to the mound, which shook violently under my feet, and I had scarcely time to look into the basin, when the fountain exploded, and instantly compelled me to retire to a respectful distance on the windward side. The water rushed up out of the pipe with amazing velocity, and was projected by irregular jets into the atmosphere, surrounded by immense volumes of steam, which, in a great measure, hid the column from the view. The first four or five jets were inconsiderable, not exceeding sixteen or twenty feet in height. These were followed by one about fifty feet; which was succeeded by two or three considerably lower; after which came the last, exceeding all the rest in splendor, which rose at least to the height of seventy feet. The large stones which we had previously thrown into the pipe were ejected to a great height, especially one, which was thrown much higher than the water. On the propulsion of the jets they lifted up the water in the basin nearest to the orifice of the pipe to the height of a foot, or a foot and a half, and on the falling of the column it not only caused the basin to overflow at the usual channel, but forced the water over the highest part of the brim, behind which I was standing, the great body of the column (at least ten feet in diameter), rose perpendicularly, but divided into a number of the most superb curvated ramifications; and several smaller spoutings were severed from it, and projected in oblique directions, to the no small danger of the spectator, who is apt to get scalded, ere he is aware, by the falling of the jet. On the cessation of the eruption, the water instantly sunk, but rose again directly to about half a foot above the orifice, where it remained stationary at the temperature of 183° of This fountain has, however, by Fahrenheit. other travellers been observed to throw its water to the amazing height of 360 feet.' Dr. H. observed the Stocker, another of these huers, form a jet of 200 feet. These huers rise in the very sea, and form scalding fountains amidst the waves. Their distance from land is unknown; but the new volcanic isle, twelve miles off Reickenes, proves that the subterraneous fires and waters extend to that distance.

HUESCA, an old fortified town in the north of Arragon, in Spain, situated in a plain on the Isuela. Its works have gone into ruins, but it is still a bishop's see, has a university, two large schools, a cathedral, and 6800 inhabitants, with manufactures of cloth and leather. Thirty miles north-east of Saragossa.

HUET (Peter Daniel), a learned French writer, born at Caen in Normandy, February 8th, 1630. At an early age he began the study of philosophy, mathematics, the languages, and an-tiquities. He contracted a strict friendship with Bochart, and accompanied him to Sweden. Queen Christina would have engaged him in her service; but he, sensible of her inconstant temper, returned to France. All he brought with him was a copy of a MS. of Origen, which he transcribed at Stockholm. He refused several offers from Christina after she abdicated, and also from Charles X. her successor. In 1670, M. Bossuet being appointed preceptor to the dauphin, Louis XIV. chose M. Huet for his colleague, with the title of sub-preceptor. He formed the plan of the commentaries in usum Delphini, and directed the execution. He entered into holy orders at the age of forty-six; and soon after he was presented to the abbey of Aunay; and in 1685 to the bishopric of Soissons, which he exchanged for that of Avranches. After ten years he resigned, and was made abbot of Fontenay near Caen. He died in 1721, aged ninety-one. His principal works are, 1. De claris interpretibus, et de optimo genere interpretandi: 2. Origenis Commentaria; Gr. et Lat. cum notis: 3. A Treatise on the origin of the Romans: 4. Demonstratio Evangelica, fol.: 5. Questiones Alnetanæ de Concordia rationis et fidei : 6. Of the situation of the Terrestrial Paradise; in French: 7. A History of the Commerce and Navigation of the Ancients, which has been translated into English. 8. Commentarius de Rebus ad eum Pertinentibus : 9. Huetiana.

HUFF, n. s., v. a. & v. n. HUF'FER, n. s. HUF'FISH, adj.

HUF'FISHLY, adv.

From hove, or hoven, swelled. See To HEAVE. So in some provinces they say the bread huffs

HUF'FISHNESS, n.s. J say the bread huffs up, when it begins to heave or ferment: huff, therefore, may be ferment. To be in a huff is to be in a ferment. Sudden affront; anger, or arrogance; one swelled with a false opinion of his own value: huff, to swell; to puff; to treat with insolence; to bluster; storm; bounce about, and swell with indignation: a huffer is a bully; a blusterer; a petulant noisy person.

Quoth Ralpho, honour's but a word	
To swear by, only in a lord;	
In others it is but a huff,	
To vapour with instead of proof. Hudibras.	
His frowns kept multitudes in awe,	
Before the bluster of whose huff	
All hats, as in a storm, flew off. Id.	
Nor have I hazarded my art	
To be exposed i' the' end to suffer,	
By such a braggadocio huffer. Id.	
A thief and justice, fool and knave,	
A huffing officer and slave. Id.	
Huffing to cowards, fawning to the brave,	
To knaves a fool, to credulous fools a knave.	
Roscommon.	
210350/////0044	

A huffing, shining, flattering, cringing coward, A cankerworm of peace, was raised above him.

Otway. Now what's his end? O charming glory, say! What, a fifth act to crown his huffing play? Dryden. As for you, colonel huff-cap, we shall try before a civil magistrate who's the greater plotter. Id.

We have the apprehensions of a change to keep a check upon us in the very huff of our greatness. L'Estrange.

A Spaniard was wonderfully upon the huff about his extraction. Id.

What a small pittance of reason and truth is mixed with those huffing opinions they are swelled with !

Locke.

In many wild birds the diaphragm may easily be huffed up with air, and blown in at the wind-pipe. Grew.

This senseless arrogant conceit of theirs made them *huff* at the doctrine of repentance, as a thing below them. South.

Lewd shallow-brained huffs make Atheism and contempt of religion the sole badge and character of wit. Id.

No man goes about to ensnare or circumvent another in a passion, to lay trains, and give secret blows in a present huff. Id.

When Peg received John's message, she *huffed* and stormed like the devil.

Arbuinnot's History of John Bull.

Sax. bezian, to IIUG, v. a. & n. s. 2 HUG'GER-MUGGER, n. s. 5 hedge, to enclose; Germ. hagen. To press in close embrace; to fondle; to treat with tenderness; to hold fast; to gripe in wrestling : hug, a close embrace; a particular gripe, called a Cornish hug: huggermugger, corrupted perhaps from huger mocker, or hug in the dark. Morcker, in Danish, is darkness, whence our murky. It is written by Sir Thomas More hoker moker. Hôker, in Chaucer, is peevish, cross-grained, of which moker may only be a ludicrous reduplication. Hooke is likewise in German a corner, and moky is in English dark. We know not how to determine. Secrecy; bye-place.

Now hold in huggermugger in their hand,

And all the rest do rob of floods and land.

Hubberd's Tale.

And chalenge to ourselves our portions dew

Of all the patrimonie, which a few

Now hold in hugger-mugger in their hand,

And all the rest doo rob of good and land.

Spenser. Mother Hubberd's Tale.

He bewept my fortune,

And hugged me in his arms. Shakspeare.

I, under fair pretence of friendly ends,

And well placed words of glozing courtesy,

Baited with reasons not unplausible,

Wind me into the easy hearted man,

And hug him into snares. Milton's Comus. But if I can but find them out, '

Where e'er the' in huggermugger lurk,

I'll make them rue their handy work.

Hudibrar.

What would not he do now to *hug* the creature that had given him so admirable a serenade !

L'Estrange.

There's a distinction betwixt what's done openly and bare-faced, and a thing that's done in *huggermugger*, under a seal of secrecy and concealment. *Id.*

King Xerxes was enamoured upon an oak, which he would hug and kiss. Harvey on Consumptions.

We hug deformities, if they bear our names. Glanville.

Admire yourself,

And, without rival, hug your darling book. Roscommon. Even in that urn their brother they confess, And hug it in their arms, and to their bosom press. Dryden.

Though they know that the flatterer knows the falsehood of his own flatteries, yet they love the impostor, and with both arms hug the abuse. South.

Mark with what joy he hugs the dear discovery. Rowe,

Age makes us most fondly hug and retain the good things of life, when we have the least prospect of enjoying them. Atterbury.

How ever and anon awake the soul,

As with a peal of thunder, to strange horrors In this long restless dream, which idiots *hug*, Nay wise men flatter with the name of life.

Young's Brothers.

HUGE, adj. HUGE', ady. HUGE'NESS, n.s. HUGE'NESS, n.s. HUGE'NESS, n.s. HUGE'NESS, n.s. HUGE'NESS, n.s. HUGE'NESS, n.s. Huge is vast; immense; great, even to deformity: it is used figuratively in the sense of greatly; very much.

> That verely, anone I gan to fele An huge parte released of my smerte. Chaucer. Complaint of the Blacke Knightes.

She caught in hand an *huge* great yron mace, Wherewith she many had of life deprived.

Spenser. Faerie Queene.

In which his worke he had sixe servants prest, About the andvile standing evermore With *huge* great hammers, that did never rest From heaping stroakes which thereon soused sore, Id.

Let the estate of the people of God, when they were in the house of bondage, and their manner of serving God in a strange land, be compared with that which Canaan and Jerusalem did afford : and who seeth not what *huge* difference there was between them ?

Hooker.

My mistress exceeds in goodness the hugeness of your unworthy thinking. Shakspeare.

Who cries out on pride,

That can therein tax any private party?

Doth it not flow as *hugely* as the sea? Id. The patch is kind enough, but a *huge* feeder. Id.

This hugy rock one finger's force apparently will move. Carew's Survey of Cornwall.

Small Engines, lift huge weights; and we have heard

That one Wise man (though poore without regard) May save a City, when the Men of Warre, And all their Captaines, at a non plusare.

George Withers. .

Incensed with indignation, Satan stood Unterrified, and like a comet burned, That fires the length of Ophiuchus *huge*, In the' aretic sky, and from his horrid hair Shakes pestilence and war.

Milton's Paradise Lost. There leviathan,

Hugest of living creatures, on the deep, Stretched like a promontory, sleeps or swins, And seems a moving land, and at his gills Draws in, and at his trunk spouts out, a sea. Id.

I am hugely bent to believe, that whenever you concern yourselves in our affairs, it is for our good. Swift.

Through forests *huge*, and long untravelled heaths, With desolation brown he wanders waste.

Thomson,

HUGHES, (John), an English poet, born in 1677. In the earliest parts of his youth he cultivated poetry and music, in both of which he made great progress. Lord chancellor Cowper made him secretary for the commissioners of the peace, which he held till 1719, when he died on the same night in which his tragedy of The Siege of Damascus was first acted. He was then forty-two. He translated Fontenelle's Dialogues of the Dead, Vertot's revolutions of Portugal, and the letters of Abelard and Eloisa. He gave a very accurate edition of Spenser's works, with his life, glossary, and remarks ; and wrote several papers in the Spectator, Tatler, and Guardian.

HUGHES (Jabez), younger brother of the preceding, was born in 1685. He published, in 1714, a translation of Claudian's Rape of Proserpine, and Lucan's Sextus and Erictho: also Suetonius's twelve Cæsars, and some of Cervan tes's novels. He died in 1731.

HUGUES (Griffith), Rev. F. R. S., an English naturalist, minister of Lacy's parish, in the island of Barbadoes, circulated in 1749 proposals for publishing the natural history of that island. He appears to have been highly esteemed by Dr. Stephen Hales, and other men of science in England. The work appeared in 1750, in a folio volume, in ten books, with twenty-four engravings; and it was republished, with a larger number of plates, in 1760. This production contains a good account of the zoophytes, which here grow on the rocks by the sea side. Mr. Hughes also published a paper in the Philosophical Transactions on this subject.

HUGONIA, in botany, a genus of the decandria order and monadelphia class of plants; natural order malvaceæ.—Jussieu : cor. pentapetalous : fruit a plum with a striated kernel. Species three, tropical plants.

HUGONOTS, or HUGUENOTS, an appellation given to the Reformed Churches, or Protestants of France. The name had its first rise in 1560; but authors are not agreed as to its origin. One of the two following seems to be the least forced derivation. One of the gates of the city of Tours is called the gate Fourgon, by corruption from feu Hugon, i. e. the late Hugon. This Hugon was once count of Tours. Davila and others pretend, that the nickname of Huguenots was first given to the French Protestants, because they used to meet in the night-time in subterraneous vaults near this gate of Hugon; and what seems to countenance this opinion is, that they were first called Huguenots at Tours. Others say that the leaguers gave this name to the reformed, because they were for keeping the crown in the royal line of Hugh Capet; whereas the leaguers were for giving it to the house of Guise, as descended from Charlemagne. Others derive it from a faulty French pronunciation of the German word eidgnosser, signifying confederates, originally applied to that valiant part of the citizens of Geneva, who entered into an alliance with the Swiss cantons, to main their liberties against the tyrannical attempts of Charles III. duke of Savoy. These confederates were called Eignots, whence Huguenots. The persecution

which the Huguenots underwent has scarcely its parallel in civil or ccclesiastical history: though they obtained a peace from Henry III. in 1576, it was of short continuance; and their sufferings, mitigated by the famous edict of Nantes, granted to them in 1598 by Henry IV., were again renewed, after the revocation of this edict, by Louis XIV. in 1685. See FRANCE.

HUKE, n. s. Fr. huque; Belg. huik. A cloak.

As we were thus in conference, there came one that seemed to be a messenger, in a rich huke.

Bacon's New Atlantis.

HULK, n.s. & v.a. Sax. pule; Dut. hulcke; Teut. and Swed. holk. The body of a ship; any thing bulky or unwieldy: hulk, to exenterate, as to hulk a hare, that is, to take out its viscera.

And Harry Monmouth's brawn, the hulk Sir John, Is prisoner to your son. Shakspearc.

There's a whole merchant's venture of Bourdeaux stuff in him : you have not seen a hulk better stuffed Id. in the hold.

The custom of giving the colour of the sea to the hulks, sails, and mariners of their fly-boats, to keep them from being discovered, came from the Veneti. Arbuthnot.

They Argo's hulk will tax,

And scrape her pitchy sides for wax. Swift. The sooty hulk

Steered sluggish on. Thomson. Ah grievance sore, and listless dull delay, To waste on sluggish hulks the sweetest breeze !

Byron. Childe Harold.

A HULK is an old ship of war, fitted with an apparatus, to fix or take out the masts of the king's ships, as occasion requires. The mast is extremely high, and properly strengthened by shrouds and stays, to secure the sheers, which serve, as the arm of a crane, to hoist out or in the masts of any ship lying alongside. These sheers are composed of several long masts, whose heels rest upon the side of the hulk, and having their heads declining outward from the perpendicular, so as to hang over the vessel whose masts are to be fixed or displaced. The tackles, which extend from the head of the mast to the sheer-heads, are intended to pull in the latter towards the mast-head, particularly when they are charged with the weight of a mast after it is raised out of any ship, which is performed by strong tackles depending from the sheer-heads. The effect of these tackles is produced by two capsterns, fixed on the deck for this purpose.

HULL, n.s. & v.n.) Goth. hulga; Belg. hue; HUL'LY, adj. Scot. hule. The husk or integument; the outer covering; the body of a ship: it is now confounded with hulk, otherwise it properly signifies the mere skeleton of a vessel. The verb signifies to float; to drive to and fro without sails or rudder: hully is husky.

Will you hoist sail, sir ? here lies your way.

-No, good swabber, I am to hull here a little longer. Shakspeare.

He looked, and saw the ark hull on the flood. Milton.

They saw a sight full of piteous strangeness ; a ship, or rather the carcase of a ship, or rather some few bones of the carcase, hulling there, part broken, part burned, and part drowned. Sidney.

Deep in their hulls our deadly bullets light,

And through the yielding planks a passage find. Dryden.

People walking down upon the shore, saw some-nat come hulling toward them. L'Estrange. what come hulling toward them.

So many arts hath the Divine Wisdom put together, only for the hull and tackle of a thinking creature. Grew.

The tree will wither long before its fall ; The hull drives on, though mast and sail be torn.

Byron. Childe Harold.

HULL, or Kingston upon Hull, a borough, sea-port, and market town of the East Riding of Yorkshire, thirty-six miles south-east of York, and 170 from London, situate at the conflux of the Hull and Humber. The town is large and populous, containing two churches, several meeting houses, a free school, a charity school, and some hospitals. Among the latter is one called Trinity House, in which are maintained many distressed seamen, both of Hull and other places, that are members of its port. It is governed by twelve elder brethren and six assistants; and out of the former are chosen annually two wardens. and out of the younger brethren two stewards; and these have authority to determine questions between masters and seamen. A handsome infirmary is erected without the town to the north. Here are also an exchange and a custom-house, and over the Hull a stone bridge, consisting of fourteen arches. A good harbour was made here by Richard II. This town has not only the most considerable inland traffic of any port in the north of England, but a foreign trade superior to any in the kingdom, excepting the ports of London, Bristol, Liverpool, and Yarmouth. By means of the many large rivers that fall into the Humber, it trades to almost every part of Yorkshire, as well as to Lincolnshire, Nottinghamshire, Staffordshire, Derbyshire, and Cheshire; the commodities of which counties are brought hither, and exported to Holland, Hamburgh, France, Spain, the Baltic, and other parts of Europe. In return for those, are imported iron, copper, hemp, flax, canvas, Russia linen and yarn, besides wine, oil, fruit, and other articles. Quantities of corn are also brought hither by the navigable rivers. The trade of Hull with London, particularly for corn, lead, and butter, and with Holland and France, for those commodities, as well as for cloth, kerseys, and other manufactures of Yorkshire, is very considerable. But in the town itself there are no manufactures of any consequence, except several oil-mills in the neighbourhood worked by steam, and such as are attached to the marine for rope, tar, blockmaking, &c. This town returns two members to parliament, the right of election being in the burgesses, which right is held either by the sons of burgesses, or by having served seven years' apprenticeship to a freeman, by purchase, or from donation for public service. The entire civil authority over the town, and what is denominated the county, a district of more than cighteen miles in circumference, is, by various royal charters, particularly those of king Henry VII. and king Charles II., vested in the corporation, which consists of the mayor, the recorder, twelve aldermen, the sheriff, two chamberlains, a town clerk, a water-bailiff, and other officers, besides a high steward, who is generally some nobleman of rank. The mayor is admiral of the Humber, and possessed of the power of life and death over criminals within his jurisdiction. The mayor of Hull has two swords, one given by king Richard II. the other by Henry VIII. but only one is borne before him at a time; also a cap of maintenance, and an oar of lignum vitæ, as a badge of his admiralty jurisdiction within the limits of the Humber.

HULME (Nathaniel), F.R.S. and F.A.S., was a native of Yorkshire, and served an apprenticeship to an apothecary. He was afterwards a surgeon in the navy; and on the peace of 1763 became a student of medicine at Edinburgh, where he graduated as M.D. in 1765. He settled in London, and at first devoted his attention to midwifery; but in 1775 was, through the influence of lord Sandwich, elected physician to the Charter-house, which situation he retained till his death, in April, 1807, at the age of seventyfive. In 1800 he published, in the Philosophical Transactions, an account of a series of experiments on light spontaneously emitted. Some other papers, and several medical tracts, also proceeded from his pen. Among the latter are a treatise on a Puerperal Fever, and another on the Stone and Scurvy, which were translated into German.

HUL'VER, n. s. Holly.

This herber was all full of floures gendes ; Into the whiche as I beholde began-Betwixt an hulfere and a wodè bende,

As I was ware-I saw where laie a man

In blacke. Chaucer. Complaint of Blacke Knight. Save hulver and thorn, thereof flail for to make.

Id.

Id.

HUM, v. a., n. s. & interj. Goth, and B.... hum; Dut. homelan. HUM'DRUM, adj.

To make the noise for make an of bees; to make an

inarticulate and buzzing sound; to pause in speaking with an audible emission of breath; to make a dull heavy noise; to sing low; to applaud, because approbation in public assemblies was formerly expressed by a hum. In Hudibras it appears to be used for ham. The interjection is an expression of doubt or deliberation : humbird, the humming bird: hum-drum, dull; dronish; stupid: hummer, an applauder.

To black Hecat's summons

The shard-born beetle, with his drowsy hums, Hath rung night's yawning peal.

Shakspeare. Macbeth. Lct not your ears despise the heaviest sound That ever yet they heard.

-Hum! I guess at it.

HUM'MER, n.s.

From camp to camp, thro' the foul womb of night, The hum of either army still resounds. Shakspeare. These shrugs, these hums and haws.

When you have said she's goodly, come between,

Ere you can say she's honest. Id. Winter's Tale. I think he'll hear me : yet to bite his lip,

And hum at good Cominius, much unhearts me. Shakspeare.

Upon my honour, Sir, I heard a humming, And that a strange one too, which did awake me. Id. The cloudy messenger turns me his back,

And hums; as who should say, You'll rue.

The humming of bees is an unequal buzzing. Bacon. Towered cities please us then,

And the busy hum of men. Milton. Shall we, quoth she, still humdrum, VOL. XI

HUM

And see stout Bruin all alone, By numbers basely overthrown ? Hudibras. Having pumped up all his wit, And hummed upon it, thus he writ. Id. I still acquiest,

And never hummed and hawed sedition, Nor snuffled treason. And though his countrymen the Huns.

Did stew their meat between their hums,

And the horses' backs, on which they straddle,

And every man eat up his saddle.

All ages have conceived the wren the least of birds. yet our own plantations have shewed one far less; that is, the humbird, not much exceeding a beetle. Browne.

One theatre there is of vast resort,

Which whilom of requests was called the court ; But now the great exchange of news 'tis hight, And full of hum and buz from noon 'till night.

Dryden. Your excuses want some grains to make 'em current : hum and ha will not do the business. Id.

An airy nation flew,

Thick as the humming bees that hunt the golden dew In Summer's heat. Id.

So weary bees in little cells repose ;

But if night-robbers lift the well-stored hive,

An humming through their waxen city grows. Id.

The man lay humming and having a good while; but, in the end, he gave up himself to the physicians. L'Estrange.

Id

Id.

LI

You hear a hum in the right place. Spectutor. I was talking with an old humdrum fellow, and, before I had heard his story out, was called away by business. Addison.

Who sat the nearest, by the words o'ercome, Slept fast: the distant nodded to the hum. Pope.

See Sir Robert-hum!

And never laugh for all my life to come. Nor undelightful is the ceaseless hum,

Io him who muses through the woods at noon. Thomson.

And oh the little warlike world within !

The well-reeved guns, the netted canopy,

The hoarse command, the busy humming din,

When, at a word, the tops are manned on high.

Byron. Childe Harold.

HU'MAN, adj. HUMANE', adj. .HUMANE'LY, adv. HU'MANIST, n S. HUMAN'ITY, n. s. HU MANISE, v.a. HU'MAN-KIND, n.s.

Fr. humain; Lat. humanus. Having the qualities of man as contradis--tinguished from brutes; belonging to man: humane, kind; civil; benevolent; good-natured: } humanist, a philologer; a

HU'MANLY, adv. grammarian: humanity, the nature and feelings of man; the collective body of mankind: grammatical studies are called *literæ humaniores*, perhaps because they conduce to enlighten the mind and polish the manners: humanly, after the notions, and according to the power, of men; kindly; but this more properly belongs to humanity.

O noble Markis! you: humanitee

Assureth us, and yeveth us hardinesse

As oft as time is of necessitee,

That we to you now tell our hevinesse.

Chaucer. The Clerkes Tale. The king is but a man as I am : the violet smells to him as it doth to me; all his senses have but human conditions. Shakspeare.

If they would yield us the superfluity, while it were wholesome, we might guess they relieved us humanely. Id.

2 G

HUM

A rarer spirit never did steer humanity. Shakspeare. The middle of humanity thou never knewest, but

the extremity of both ends. Id.

Love of others, if it be not spent upon a few, doth naturally spread itself towards many, and maketh men become humane and charitable. Bacon.

For man to tell how human life began

Is hard; for who himself beginning knew? Milton.

Thee, serpent, subtilest beast of all the field I knew; but not with human voice indued. Id.

If he can untie those knots, he is able to teach all *humanity*, and will do well to oblige mankind by his information. Glunville.

To preserve the Hebrew intire and uncorrupt, there hath been used the highest caution humanity could invent. Browne.

Look to thyself : reach not beyond humanity.

All men ought to maintain peace, and the common offices of humanity and friendship, in diversity of opinions. Locke.

Intuitive knowledge needs no probation, nor can have any, this being the highest of all human certainty. Id.

Envy, malice, covetousness, and revenge, are abolished: a new race of virtues and graces, more diviue, more moral, more *humane*, are planted in their stead. Sprat.

How few, like thee, enquire the wretched out, And court the offices of soft *lumanity*? Like thee reserve their raiment for the naked, Reach out their bread to feed the erying orphan, Or mix their pitying tears with those that weep?

Rowe. Death is the privilege of human nature ;

And life, without it, were not worth our taking. Id. Fair Penitcat.

Was it the business of magick to humanize our natures with compassion, forgiveness, and all the instances of the most extensive charity? Addison.

Here will I paint the characters of woe,

And here my faithful tears in showers shall flow To humanize the flints whereon I tread. Wotton.

Thus the present happy prospect of our affairs, humanly speaking, may seem to promise. Atterbury.

Though learned, well bred; and though well bred, sincere;

Modestly hold, and humanely severe. Pope. Blest with a taste exact, yet unconfined;

A knowledge both of books and humankind. Id.

It will never be asked whether he be a gentleman born, but whether he be a human creature? Swift.

Affliction is the wholesome soil of virtue ;

Where patience, honor, swcet humanity,

Calm fortitude, take root, and strongly flourish. Mallet and Thomson's Alfred.

Some grudged the savage land her sacred dust; Stamped the cursed soil ;—and with *humanity* (Denied Narcissa) wished them all a grave.

Young's Narcissa. Fierce as the tiger, madder than the seas, Desperate, and armed with more than human strength. Armstrong.

I have ten thousand names, and twice

As many attributes ; but as I wear

A human shape, will take a human name.

Byron. Deformed Transformed. - a far hour shall wreak

The deep prophetic fulness of this verse,

And pile on human heads the mountain of my curse. Id. Childe Harold.

HUMBER, a river formed by the Trent, Ouse, Derwent, and several other streams. By the inland navigation it has a communication with the Mersey, Dee, Ribble, Severn, Thames, Avon, &c., which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester. The Humber divides Yorkshire from Lincolnshire, and falls into the German Ocean near Holderness.

HUM'BLE, adj. & v. a. HUM'BLEBEE, n. s. HUM'BLEBEE, n. s. HUM'BLEBES, n. s. HUM'BLER, n. s. HUM'BLER, n. s. HUM'BLE-MOUTHED, adj. HUM'BLE-PLANT, n. s. HUM'BLES, n. s. HUM'BLES, n. s. HUM'BLY, adv. HUMILIA'TION, n. s. HUMILIA'TION, n. s.

Fr. humble, humilitè; Lat. humilis, humus, the ground. Humble, and humility, are opposed to pride and selfconceit, and imply, not arrogant; low; modest; timnd; submissive: humble is applicable to persons, and sta-

tions; humility, to disposition: to humiliate is to degrade; to mortify; to humble with external circumstances of contempt, displeasure, or degradation: humblebee, and humblebeeeater; the former is a buzzing wild bee, also the name of a herb; the latter, a fly that eats the bee. What is the true etymology of this word is rather doubtful. The humblebee is known to have no sting. The Scotch call a cow without horns an humble cow; so that the word seems to signify inermis, wanting the natural Dr. Beattie. Humbler, one that submits, or subdues himself to others: humble-mouthed, mild and meek in speech : humble-plant, a sensitive plant : humbless, an obsolete expression for humility: humiliation, condescension; degradation or disgrace: 'humility is opposed to arrogance or assumption.'-Crabb.

Yet, sith I have mine owne penaunce isought, With humble spirite shal I it receve,

Though that the king of Love my life bereve.

Chaucer. The Court of Love.

'My Lorde,' quod she, 'I beseche you in alle humblesse, that ye wol not wilfully replie agein my resons, ne distempre your herte, though I speke thing that you displese.' Id. Tale of Melibeus.

Lady ! thy bountee, thy magnificence,

Thy vertue, and thy gret humilitee,

Ther may no tongue expresse in no science.

Id. The Prioresses Tale.

And with meek humbless, and afflicted mood, Pardon for thee, and grace for me intreat. Spenser. And mighty proud to humble weak does yield. Id.

When we make profession of our faith, we stand; when we acknowledge our sins, or seek unto God for favour, we fall down; because the gesture of constancy becometh us best in the one, in the other the behaviour of humility. Hooker.

The former was an *humiliation* of Deity, the latter an *humiliation* of manhood; for which cause there followed upon the latter an exaltation of that which was humbled; for with power he created the world, but restored it by obeclience. Id.

They were used to bend,

To send their smiles before them to Achilles, To come humbly as they used to creep to holy altars. Shahapeare. The honey bags steal from the humblebees,

And for night tapers crop their waxen thighs. Id. Now we have shewn our power,

Let us seem humbler after it is done,

Id. Coriolanus. Than when it was a-doing. Thy humble servant vows obedience,

And faithful service 'till the point of death.

Shakspeare,

I do not know that Englishman alive With whom my soul is any jot at odds, More than the infant that is born to-night;

I thank my God for my humility.

Id. Richard III.

451

The executionor

Falls not the axe upon the humbled neck,

But first begs pardon. Id. As You Like It. You are meek and humblemouthed : but your heart

Is crammed with arrogancy, spleen, and pride. Shakspeare.

It was answered by us all, in all possible humbleness, but yet with a countenance, that we knew he spoke it but merrily. Bacon.

What the height of a king tempteth to revenge, the humility of a Christian teacheth to forgive.

King Charles. A grain of glory, mixed with humbleness,

Cures both a fever and lethargickness. Herbert.

In process of time the highest mountains may be kumbled into vallies; and again, the lowest vallies exalted into mountains. Hakewill on Providence.

The' example of the heavenly lark,

Thy fellow-poet, Cowley, mark

Above the skies let thy proud musick sound,

Thy humble nest build on the ground. Cowley. We should be as humble in our imperfections and sins, as Christ was in the fulness of the spirit, great wisdom, and perfect life.

Taylor's Rule of Holy Living.

There are some that use

Humility to serve their pride, and seem

Humble upon their way, to be the prouder

At their wished journey's end. Denham's Sophy. The humility of the style gained them many friends. Clarendon.

Yearly injoined, some say, to undergo This annual humbling certain numbered days, To dash their pride and joy, for man seduced. Milton.

Thy humiliation shall exalt

With thee thy manhood also to this throne. Id. Why do I humble thus myself, and, suing For peace, reap nothing but repulse and hate?

Id.

With tears

Watering the ground, and with our sighs the air Frequenting, sent from hearts contrite, in sign Of sorrow unfeigned, and humiliation meek. Id.

I am rather with all subjected humbleness to thank her excellencies, since the duty thereunto gave me rather heart to save myself, than to receive thanks. Sidney.

With how true humbleness

They looked down to triumph over pride! Id. John fared poorly, according unto the apparel he wore, that is, of camel's hair; and the doctrine he preached was humiliation and repentance. Browne. Write him down a slave, who, humbly proud,

With presents begs preferments from the crowd. Dryden.

As high turrets for their airy steep Require foundations in proportion deep ; And lofty cedars as far upwards shoot, As to the nether heavens they drive the root; So low did her secure foundation lye, She was not humble, but humility. Id. You, if an humble husband, may request,

Provide and order all things for the best. Id This would not be to condescend to their capacities. when he humbles himself to speak to them, but to lose his design in speaking.

Locke. The humbleplant is so called, because, as soon as you touch it, it prostrates itself on the ground, and in a short time elevates itself again : it is raised in hotbeds. Mortimer.

It is an easy matter to extol humility in the midst of honour, or to begin a fast after dinner. South.

Ah ! prince, hadst thou but known the joys which dwell

With humbler fortunes, thou wouldst curse thy royalty ! Rowe.

We are pleased, by some implicit kind of revenge, to see him taken down and humbled in his reputation, who had so far raised himself above us. Addison

The mistress of the world, the seat of empire, The nurse of heroes, the delight of gods,

That humbled the proud tyrants of the earth.

Id. In midst of dangers, fears, and death,

Thy goodness I'll adore ;

And praise thee for thy mercies past,

And humbly hope for more.

Ten thousand trifles light as these,

Nor can my rage nor anger move :

She should be humble who would please;

Prior. And she must suffer, who can love. Let the sinner put away the evil of his doings, and humble himself by a speedy and sincere repentance; let him return to God, and then let him be assured that God will return to him. Rogers.

This puts us in mind once again of the humblebees and the tinder-boxes. Atterbury.

Fortune not much of humbling me can boast : Though double taxed, how little have I lost ! Pope.

It may serve for a great lesson of humiliation to mankind, to behold the habits and passions of men trampling over interest, friendship, honour, and their own personal safety, as well as that of their country. Swift.

Humble love,

And not proud reason, keeps the door of Heaven; Love finds admission, when proud science fails. Young.

How humble now Lies that ambition which was late so proud !

Smollet's Regicide.

Id.

"O pity great Father of Light!" then I cried, Thy creature who fain would not wander from thee, Lo humble in dust I relinquish my pride :

From doubt and from darkness thou only canst free.' Beattie.

- ' Vengeance is mine alone !'

So saith the Lord, and with all humbleness His servant echoes back the awful word.

Byron. Manfred.

Id.

- many a night on the earth,

On the bare ground, have I bowed my face, And strewed my head with ashes; I have known The fulness of humiliation, for

I sunk before my vain despair, and knelt

To my own desolation.

HUMBLE BEE. See BOMBYLIUS.

HUME (David), a celebrated historian, porn in Edinburgh, April 20th, 1711. He was destined for the bar, and passed through his academical courses in the university of Edinburgh: but never put on the gown, nor even took the introductory steps for that purpose. The writings of Locke and Berkeley had directed the attention of the generality of learned men towards metaphysics ; and Mr. Hume, having early

2 G 2

applied himself to studies of this kind, published in 1739 the first two volumes of his Treatise of Human Nature, and the third the following year. He had the mortification, however, to find his book generally decried; and to perceive that the taste for systematic writing was now on the decline. In 1742 he published two small volumes, consisting of Essays moral, political, and literary. These were better received ; but contributed little to his reputation as an author, and still less to his profit; and, his small patrimony being now almost spent, he accepted an invitation from the marquis of Annandale to visit him in England. With this nobleman he staid a year, and then received an invitation from general St. Clair, to attend him as secretary to his expedition against the coast of France. In 1747 he attended this general in the same station in his embassy to Vienna and Turin. In 1749 he returned to Scotland, and spent two years with his brother; where he composed the second part of his essays, entitled Political Discourses, which were published at Edinburgh in 1752. The same year also he brought out, in London, his Enquiry Concerning the Principles of Morals, which he esteemed the best of his performances. This year also he was appointed librarian to the Faculty of Advocates at Edinburgh ; which office gave him the command of a large library. He then planned his History of England; which he at first confined to that of Britain under the house of Stuart. This was almost universally condemned on its publication, but soon after seemed to sink in oblivion. Dr. Herring, archbishop of Canterbury, and Dr. Stone, primate of Ireland, were the only literati of the author's acquaintance who approved of the work. He next published his Natural History of Religion; to which an answer was speedily published, in the name of bishop Hurd, of which, however, he was not the sole author. In 1756 the second volume of the History of the Stuarts appeared. This was better received, and in some degree helped to retrieve the character of the former volume. Three years after his History of the llouse of Tudor appeared; which was, however, but little admired. But the author continued to finish at his leisure the more early part of the English history. This was published in 1761 with tolerable success. Mr. Hume being now above fifty, and having obtained by his works an independent fortune, retired to Scotland. He, however, soon after attended the earl of Hertford as secretary on his embassy to Paris in 1763. In 1765, the earl being appointed lord lieutenant of Ireland, Mr. Hume was entrusted with the management of the business of the state till the arrival of the duke of Richmond in the end of the year. ln 1767 he returned to Edinburgh, with a great increase of fortune, and again resolved on retire-Once more he was disappointed in this ment. by an invitation from general Conway, to become an under secretary of state. In 1769 he returned to Edinburgh, possessed of an income of about £1000 a year. In spring 1775 he was struck with a disorder in the bowels ; which at first gave him no alarm, but eventually proved incurable. He died on the 25th August, 1776; and was interred in the Calton burying-ground, Edinburgh, where

a plain monument was erected to his memory. ' In point of style,' says lord Gardenstone, ' Mr. Hume may be studied as a perfect model. Pure, nervous, eloquent, he is simple without weakness, and sublime without effort. In the art of telling a humorous story he can never be excelled; and, when he chose to exert himself, he was even a considerable master of the pathetic; but it was his misfortune to despise accuracy of research, and fidelity of citation. He was a bitter Tory ; and, while detection flashed in his face, he commonly adhered to whatever he had once written. His account of the house of Stuart is not the statement of an historian, but the memorial of a pleader in a court of justice. He sometimes asserts a positive untruth, contradicted by the very author whom he pretends himself to be quoting; but more commonly gains his purpose by suppressing the whole evidence on the opposite side of the question.'

HUMECT' v.a.

452

Fr. humccter; Lat. HUMECTATE, v.a. HUMECTATE, v.a. HUMECTATION, n.s. HUMECTATION, n.s. HUMECTATION, n.s. HUMECTO; Fr. humide; Humectation, the act of humectation, the act of

moistening: humidity, a state of dampness and moisture; also, that quality which we call moisture, or the power of wetting other bodies. It differs from fluidity, depending altogether on the congruity of the component particles of any liquor to the pores or surfaces of such particular bodies as it is capable of adhering to.

We'll use this unwholesome humidity, this gross watery pumpion. Shakspeare.

O blessing-breeding sun, ward from the earth Rotten humidity : below thy sister's orb

Infect the air! Id. Timon of Athens. Plates of brass applied to a blow, will keep it down from swelling : the cause is repercussion, without humectation, or entrance of any body.

Bacon's Natural History.

Her rivers are divided in sluices, to humectate the Howel's Vocal Forest. bordering soil.

Iris there, with humid bow,

Waters the odorous banks that blow

Flowers of more mingled hue

Than her purpled scarf can shew. Milton. The Nile and Niger do not only moisten and contemperate the air by their exhalations, but refresh and humectate the earth by their annual inundations.

Browne.

That which is concreted by exsiccation, or expression of humidity, will be resolved by humectation, as Id. earth and clay.

The queen, recovered, rears her humid eyes,

And first her husband on the poop espies. Dryden. If they slip easily, and are of a fit size to be agitated by heat, and the heat is big enough to keep them in agitation, the body is fluid; and if it be apt to stick to things, it is humid. Newton's Opticks.

The medicaments are of a cool humceting quality, and not too much astringent. Wiseman's Surgery.

Young animals have more tender fibres, and more humidity, than old animals, which have their juices Arbuthnot. more exalted and relishing.

The modest virtues mingled in her eyes,

Still on the ground dejected, darting all Their humid beams into the blooming flowers.

Thomson.

HU'MERAL, adj. Fr. humeral, from Lat. humerus. Belonging to the shoulder.

The largest crooked needle should be used, with a ligature, in taking up the humeral arteries in amputation. Sharp.

HUMERI Os, or HUMERUS, in anatomy, the uppermost bone of the arm, popularly called the shoulder-bone; extending from the scapula, or shoulder-blade, to the upper end of the cubitus, or elbow. See ANATOMY.

HUMICUBATION, n. s. Lat. humi and cubo. The act of lying on the ground.

Fasting and sackcloth, and ashes and tears, and humicubations, used to be companions of repeutance. Bramhall.

HUMILIATI, a congregation of religious in the church of Rome, established by some Milanese gentlemen on their release from prison, where they had been confined under the emperor Conrad, or, as others say, under Frederick I., in 1162. This order, which acquired great wealth, and had no fewer than ninety monasteries, was abolished by Pope Pius V. in 1570, for luxury and cruelty, and their houses given to the Dominicans and Cordeliers.

HU'MORAL, adj. Hu'MOROUS, adj. Hu'MOROUSLY, adv. Hu'MOROUSLY, adv. Hu'MOROUSLY, adv. Hu'MOROSMELY, adj. Hu'MORSOMELY, adv. HU'MORSOMELY, HU'MORSOMELY, HU'MORSOMELY, HU'MORSOMELY, HU'MORSOMELY, HU'MORSOMELY, HU'MORSOMELY, HU'MORSOMELY, HU'MOR

as these were formerly considered to be immediately connected with the state of temper, and the disposition of the animal spirits and moral feelings, it is figuratively used in a good and bad sense, for pleasurable feelings; jocularity; merriment; petulance; peevishness; a trick; caprice, or inclination: humoral retains only a literal signification, as proceeding from humors: humorist, one who gratifies his humor; has odd conceits, or peculiar passions: humorous, pleasant; jocose; full of odd images;—also, capricious; whimsical: humors, peevish; fickle; petulant: humor, to gratify; sooth by compliance; to indulge: the humor of a person is his present disposition or temper of mind.

The thridde spice of glotonie is whan a man devoureth his mete, and hath not rightful maner of eting. The fourthe is whan thurgh the gret abundanco of his mete, the *humours* in his body ben distempered. *Chaucer. The Persones Tale.*

And with fayre words, fit for the time and place, To feede the *humour* of her maladie,

Promist, if she would free him from that case,

He wold, by all good means, he might deserve such grace. Spenser. Facrie Queene.

I am known to be a *humorous* patrician; said to be something imperfect, in favouring the first complaint; hasty and tinder-like, upon too trivial motion.

Id. Coriolanus.

He's humorous as Winter, and as sudden As flaws congealed in the spring of day.

Shakspeare, Henry IV.

I like not the humour of lying : he hath wronged me in some humours : I should have borno the humoured letter to her. Shukspeare.

If I had a suit to master Shallow, I would humour his men; if to his men, I would curry with master Shallow. Id.

By a wise and timeous inquisition the precant humanus and humorists must be discovered and purged, or cut off: mercy in such a case, in a king, is true cruelty. Id. to Villiers.

In private, men are more bold in their own humours; and, in consort, men are more obnoxious to others' humours; therefore it is good to take both. Bacon.

O you awake then : come away,

Times be short, are made for play; The *humorous* moon too will not stay :

What doth make you thus delay?

Ben Jonson.

Another thought her noble humour fed. Fzirfax. This sort of fever is comprehended under continual humoral fevers. Harvey on Consumptions

To after age thou shalt be writ the man, That with smooth air could *humour* best our tongue.

Milton.

Believe not these suggestions, which proceed From anguish of the mind and *humours* black, That mingle with thy fancy. Id.

Their humours are not to be won,

But when they are imposed upon. Hudibras. As there is no humour to which impudent poverty cannot make itself serviceable, so were there enow of those of desperate ambition, who would build their houses upon others' ruins. Sidney.

There came a young lord, led with the humour of youth, which everthinks that good whose goodness he sees not. Id.

Examine how your humour is inclined,

And which the ruling passion of your mind.

Roscommon.

In conversation humour is more than wit, easiness more than knowledge. Temple.

He denied himself nothing that he had a mind to eat or drink, which gave him a body full of *humours*, and made his fits of the gout frequent and violent.

1d.

Tempt not his heavy hand ; But one submissive word which you let fall, Will make him in good humour with us all. Dryden.

'Tis my part to invent, and the musicians to humour that invention. Id. Preface to Albion.

Vast is his courage, boundless in his mind,

Rough as a storm, and humorous as the wind. Dryden.

They, who were acquainted with him, know his humour to be such, that he would never constrain himself. Id.

The aqueous humour of the eye will not freeze, which is very admirable, seeing it hath the perspicuity and fluidity of common water. Ray on the Creation.

Fountainbleau is situated among rocks and woods, that give a fine variety of savage prospects: the king has *humoured* the genius of the place, and only made use of so much art as is necessary to regulate nature. *Addison.*

A cabinet of medals Juvenal calls, very humorously concisum argentum in titulos facieque minutas. 1d. The wit sinks imperceptibly into an humorist.

Spectator.

In cases where it is necessary to make examples, it is the *humour* of the multitude to forget the crime, and to remember the punishment. Addison.

Some of the commentators tell us that Marsyas was a lawyer who had lost his cause; others, that this passage alludes to the story of the satyr Marsyas, who contended with Apollo, which I think is more Id. on Italy. humorous.

Is my friend all perfection, all virtue and discretion? Has he not humours to be endured, as well as South. kindness to be enjoyed ?

Thy humorous vein, thy pleasing folly,

Lies all neglected, all forgot;

And pensive, wavering, melancholy,

Thou dreadest and hopest thou knowest not what. Prior.

We resolve by halves, and unadvisedly; we resolve rashly, sillily, or humorously, upon no reasons that will hold. Calamy.

You humour me, when I am sick ;

Pope. Why not when I'm splenetick ?

Good humour only teaches charms to last, Still makes new conquests, and maintains the past. rd

Obedience and subjection were never enjoined by God to humour the passions, lusts, and vanities, of those who are commanded to obey our governours. Swift.

It has been humorously said, that some have fished the very jakes for papers left there by men of wit. Id.

Our science cannot be much improved by masquerades, where the wit of both sexes is altogether taken up in continuing singular and humorsome disguises. Id.

Children are fond of something which strikes their fancy most, and sullen and regardless of every thing else, if they are not humoured in that fancy.

Watts's Logick.

He that would learn to pass a just sentence on persons and things, must take heed of a fanciful temper of mind, and an humorous conduct in his affairs. Id.

The notion of the humorist is one that is greatly pleased, or greatly displeased, with little things; his actions seldom directed by the reason and nature of things. Watts.

The child had a humour which was cured by the waters of Glastonbury. Fielding.

Goth. and Swed. hump; HUMP, n.s.

Belg. homp. The pro-HUMP'BACK, n. s. HUMP'BACKED, adj.) tuberance formed by a crooked back.

These defects were mended by matches; the eyes were opened in the next generation, and the hump fell. Tatler.

The chief of the family was born with a humpback and very high nose. Id.

HUMPHREY (Dr. Lawrence), a celebrated English divine of the sixteenth century, who, on the persecutions of Mary, retired, with other Protestant refugees, to Zurich. He returned on the accession of queen Elizabeth; and was made president of Magdalen College, Oxford, dean of Gloucester, and dean of Winchester. He was an able linguist, and published, 1. De Religi-onis Conservatione et Reformatione, deque Primatu Regum. 2. De Ratione Interpretandi Auctores. 3. Optimates; sive de Nobilitate, Ejusque Origine. 4. Sermons, and other works. He died in 1590.

HUMULUS, the hop, a genus of the pentandria order, and diocia class of plants; natural order fifty-third, scabridæ : MALE CAL. pentaphyllous : COR. none : FEMALE CAL. monophyllous, patent obliquely, and entire : con. none; styles two : SEED one within the calyx, the latter consisting of one large leaf. There is only one species, viz. H. lupulus, sometimes found wild in hedges near houses and gardens, but probably not indigenous. The stalk is weak and climbing; it creeps up the support in a spiral, ascending always from the right hand to the left. The stalks and the leaves are rough to the touch; the upper leaves are heart-shaped, the lower ones divided into three lobes serrated on the edges, and grow in pairs on long foot-stalks. The male flowers grow on a distinct plant on branched peduncles; the females on peduncles in pairs of the form of a strobilus, or cone, composed of large imbricated calyces, containing each one or two seeds. See Hop.

HUNCH, v. a. Germ. husch; Teut. HUNCH, v. a. Germ. husch; Teut. HUNCH'BACKED, adj. hocker. To strike or punch with the fists; to crook the back: hence the substantive means crook-backed.

But I more fear Creon!

To take that hunchbacked monster in my arms,

The' excrescence of a man. Dryden's Oedipus. Thy crooked mind within hunched out thy back,

And wandered in thy limbs. Dryden His person deformed to the highest degree, flat-

nosed, and hunchbucked. L'Estrange.

Jack's friends began to hunch and push one another : why don't you go and cut the poor fellow down? Arbuthnot.

The second daughter was peevish, haggard, pale, with saucer-eyes, a sharp nose, and hunchbacked. Id. History of John Bull.

HUN'DRED, adj. & n.s.) Sax. pund, and HUN'DREDTH, adj. j þun opeo; Dut. honderd ; Goth. hund, ten ; perhaps, as Mr. Thomson conjectures, from haund, haunder, the hands. The number consisting of ten multiplied by ten: hundredth, the tenth part ten times told; the ordinal of a company consisting of a hundred: a hundred, a canton or division of a county, perhaps once containing a hundred manors. Old Fr. hundrede ; low Lat. hundredum.

An hundrede thousand hodies of mankind

Han rockes slain, al be they not in mind.

Chaucer. The Frankeleines Tale.

We shall not need to use the hundredth part of that time, which themselves bestow in making invectives. Hooker.

Imposts upon merchants do seldom good to the king's revenue ; for that that he wins in the hundred, Bacon. he loseth in the shire.

For justice they had a bench under a tree, where Ket sat, and with him two of every hundred whence their companies had been raised : here complaints were exhibited. Hayward

- One, bestowes

On pious-workes, the hundredth part, of those Ill-gotten goods, which from the poore he seazed, And thinkes his God in that his highly pleased. George Withers.

A hundred altars in her temple smoke,

A thousand bleeding hearts her power invoke. Dryden's Æneid.

Very few will take this proposition, that God is pleased with the doing of what he himself commands, for an innate moral principle : whosoever does so, will have reason to think hundreds of propositions innate. Locke.

Many thousands had seen the transactions of our Saviour, and many hundred thousands received an account of them from the mouths of those who were eye-Addison. witnesses.

If this medium is rarer within the sun's body than at its surface, and rarer there than at the *hundredth* part of an inch from its body, and rarer there than at the orb of Saturn, I see no reason why the increase of density should stop. Newton.

Lands, taken from the enemy, were divided into centuries or hundreds, and distributed amongst the soldiers. Arbuthnot.

HUNDRED was anciently so called either from its containing 100 families, or from its furnishing 100 able men for the king's wars. After king Alfred divided England into counties, and gave the government of each county to a sheriff, these counties were divided into hundreds, of which the constable was the chief officer. The grants of hundreds were at first made by the king to particular persons: but they are not now held by grant or prescription, their jurisdiction being devolved to the county court; a few only excepted, that have been by privilege annexed to the crown, and still remain in the nature of a franchise.

A HUNDRED COURT is only a larger court baron, being held for all the inhabitants of a particular hundred instead of a manor; and resembling the former in all points, except that it is of a greater jurisdiction. This is said by Sir Edward Coke to have been derived out of the county court for the ease of the people, that they might have justice done them at their own doors, without any charge or loss of time : but its institution was probably coeval with that of hundreds themselves, which were formerly observed to have been introduced, though not invented, by Alfred, being derived from the policy of the ancient Germans. The centeni were the principal inhabitants of a district composed of different villages, originally in number 100, but afterwards only called by that name; and who probably gave the same denomination to the district out of which they were chosen. Tacitus, who had examined their constitution still more attentively, informs us not only of the authority of the lords, but that of the centeni, the hundredors or jury; who were taken out of the common freeholders, and had themselves a share in the determination. * Eliguntur in conciliis et principes qui jura per pagos vicosque reddunt : centeni singulis, ex plebe comites, consilium simul et auctoritas adsunt.' This hundred court was denominated hæreda in the Gothic constitution. But this court, as causes are equally liable to removal from hence as from the common court baron, and by the same writs, and may also be reviewed by writ of false judgment, is therefore fallen into equal disuse with regard to the trial of actions.

HUNDSRUCK, a district of Germany, in the circle of the Upper Rhine, between the Rhine, the Moselle, and the Nahe; formerly belonging to the elector of Treves, the elector Palatine, and the prince; afterwards annexed to the French republic by the treaty of Luneville; but now included in the dominions of the king of Prussia.

HUNG, the preterite and part. pass. of hang. A murderer yonder was hang in chains, The sun and the wind had shrunk his veins; I bit off a sinew, I clipped his hair,

And brought off his rags, that danced i' the air.

Jonson.

A wife so *hung* with virtues, such a freight, What mortal shoulders can support?

Dryden's Juvenal.

On two near elms, the slackened cord I hung;

Now high, now low, my Blouzelinda swung. Gay. A room that is richly adorned, and hung round with a great variety of pictures, strikes the eye at once. Watts.

HUNGARY, a kingdom of Europe, forming an important part of the Austrian dominions. At different periods of the history of this country this name has been applied with a very different signification. In the fourteenth and fifteenth centuries Hungary comprised part of modern Poland and European Turkey, and was divided into ten separate governments, or kingdoms, viz. Hungary Proper, Croatia, Sclavonia, Dalmatia, Bosnia, Bulgaria, Moldavia, Galicia, and Lodomeria, besides the principality of Transylvania. Several of these provinces have long since been detached from Hungary; but that country has still a close political and military connexion with the Austrian provinces of Sclavonia, Croatia, and Dalmatia. Our article, however, will only have reference to Hungary properly so called.

This kingdom, for such it is still termed, is of a compact heptagonal figure, its length being about 370 miles, and its general breadth about 300. It is surrounded by mountains, except on the south, where its frontier is along the Danube and the Drave. It is bounded west by part of Germany, on the north by Galicia, on the east by Transylvania and Wallachia, on the south by Turkey, Sclavonia, and Croatia. It lies between 16° 5' and 27° 6' E. long., and 44° 13' and 49° 26' N. lat., and has a territorial extent of 84,500 square miles, which is greater than England and Scotland together. Its population, including Sclavonia and Croatia, has been thus stated :—

Extent in English		Population
Square Miles.		(1805.)
 Circle this side the Danuhe, Circle beyond the Danube, Circle this side the Theisa, 	23,595 16,896 15.510	2,194,390 1,662,239 1,442,626
4. Circle beyond the Theisa,	26,946	1,919,284
5. Province of Sclavonia,	3,570	287,868
6. Province of Croatja,	2,262	260,829
,	88,779	7,767,236

But this is the conscription list; and excludes therefore the nobility and clergy: Blumenbach takes the population in 1817 at 8,500,000. The circles above enumerated have superseded the old political division of Upper and Lower Hungary; they are divided into eountics, of which there are thirteen in the first circle, and eleven in each of the others.

The mountains of Hungary constitute its principal geographical peculiarity. The Carpathians form a semicircle, extending from the south-cast portion of the kingdom till it meets the Danube on the western frontier: but, in the course of the circle they describe, many projecting ranges extend themselves into level land. On the western side the Carinthians cover a considerable portion of the kingdom. The highest points in the Carpathian Mountains are the Lomnitzer Spitze, 8545 feet; the great Krywan, 8218; the Caesmark 8194; and the Uinacke 7597 feet above the level of the sea. The loftiest of the Carinthian range is the Terklou, elevated to 10,485 feet. To the eastward of this extend the Norischen and Rhetian Alps, the highest of whose summits within the Austrian dominions reaches the height of 14,814 feet. The greatest expanse of level land in Hungary is to the eastward of the Theisa, forming a rich plain of 20,000 square miles. Another level, called the Three Cornered Plain, is to the eastward of the Danube, beginning near Presburgh; its base line extends 150 miles in length.

First amongst the rivers of Hungary, though it has its source out of the kingdom, is the noble Danube; and next may be ranked the Drave, the Marosch, the March, the White Koresch, and the Izanos. In the Carpathian range originate the Theyss, the Waag, the Gran, the Poprace, and the Temes, which all fall into the Danube. The principal lakes are Balaton and Nieusiedl, west; Palitsch on the south-west, and Grunsee or the Gun lake among the Carpathians. There are also several extensive marshes here, as that of the Isle of Schut on the west, and that of Saxetje on the east of the kingdom. A great part of the county of Torontal on the frontier of the Bannat is composed of marshes, overflowed by the Danube and its tributaries.

The climate among the mountains is of course bleak; but in the south it is in general mild; in the sandy districts extremely hot; on the banks of the rivers and near the marshes there is much humidity: indeed it is a prevailing characteristic of the climate of the level part of Hungary. After the hottest days of summer, a copious and chilling dew falls. Rain is not, however, very frequent in the plains, On the through the prevalence of high winds. other hand, rain and hail occur frequently in the mountainous provinces. Except in the Bannat and other marshy parts, the inhabitants are healthy; but here agues and inflammatory diseases are frequent, and in some places the plica of Poland appears.

The mineral products of the mountains form an important part of the riches of Hungary. It is divided into four mining districts, viz. Upper and Lower Hungary, Nagy Banya, and the Bannat; each having its particular court for the decision of all questions relative to the mines. In the first the chief towns are Schemnitz, Cremnitz, New Sohl, Uj Banya, Herrengrund, and Libetho Banya. In the second most of the mines are in the county of Zyps, and the produce is chiefly copper. The district of Nagy-Banya adjoins Transylvania, and has several gold mines; but their produce is inconsiderable. Of the Bannat district the chief town is Oravitza. The whole annual produce of these mines is about 21,000 marks (each of 8oz.) of gold; 93,000 marks (ditto) of silver; 23,000 cwt. of lcad; 48,500 cwt. of copper; 41,000 cwt. of forged iron; and 500 cwt. of zinc. Gold is occasionally found in the sand of rivers, and is washed by the gypsies. Various precious stones are also discovered in the mountains; and in

the county of Marmarosch are sometimes found small crystals of great beauty. A more substantial description of mineral wealth consists in salt mines, which are abundant in Hungary, particularly in the counties of Saros and Marmarosch; and which belong exclusively to the government.

The soil of Hungary varies with its remarkable diversities of elevation. The mountains, and many tracts amongst them, are dry, sterile, and sandy, often exhibiting neither living creature, shrub, nor tree, for many miles; yet terraces bordering on them have fine pasturage; and the plains are of luxurious vegetation.

In the north, clay, stone, and gravel, prevail : and the ground produces at best but a scanty return for labor. In the south there are also many tracks unfit for agriculture. The extensive heaths of Debreczin and Ketszkemet are covered either with sand or the most scanty vegetation, and several other tracks are moving sands. To the north, corn is not produced in a sufficient quantity for the consumption of the inhabitants, and barley, common rye, and ikritza (a productive species of rye from Moravia), are most frequently sown; in the south, wheat, maize, millet, and, in the marshes of the Bannat, rice. From the south, wheat is exported in considerable quantity. Óats are cultivated through-out the kingdom. Potatoes are also raised by the Sclavonians and Germans, and pulse by the followers of the Greek church. Hemp, flax, tobacco, and saffron, are also cultivated. The climate is favorable to various kinds of fruit, but its culture is very little attended to. Agriculture indeed throughout Hungary is in an extremely backward state. The ground is ill-ploughed and ill-sown; a bundle of sticks or branches serve for the harrow, and the roller is unknown. Enclosure, drainage, and the irrigation of meadows, are also scarcely thought of here. When it is necessary to store corn, a hole, of sufficient width to admit a man, and to let it down, is dug to a certain depth, and the ground is then scooped out, so as to form a cavern of some size. When damp is apprehended, the bottom and sides are covered with straw, after which the corn is put in, and the neck, or opening, filled with earth. The north of Hungary, on the whole, though mountainous, is better cultivated than the fertile tracks in the south.

The extent of land employed in vineyards is very considerable; amounting, it is said, to nearly 1,000,000 acres; and the produce amounts to many hundred thousand hogsheads. But the Hungarian wines vary both in taste and strength : Tokay is the best, then come the wines of Rust, Odenburg, Menes, St. George, Buda, and Erlau. Hungary also abounds in wood : resinous trees are common in the north; in the south oak is plentiful. Here again, however, is great diversity in the different parts of the kingdom. The forest of Rakony, in the western counties of Veszprim and Szala, is more than seventy miles in length; and the counties of Tolna, Baranya, and Schumeg, in the west, are almost covered with forests; while a large track, extending from Pest to Debreczin on one side, and on the other into the Bannat, is totally destitute of wood. In

some places are immense woods of plum-trees : the inhabitants distil from the fruit a liquor called slivavicza.

Grellman makes the extent of land in Hungary 39,329,000 jochs, which are nearly equal to an English acre. Of this 23,905,126 jochs only are in cultivation; the remainder is sandy deserts, lakes, morasses, or mountains. The productive lands are thus divided :--4,897,218 arable, 638,767 gardens, 911,176 vineyards, 2,129,225 meadows, 5,536,000 pastures, 850,000 ponds, and 8,940,740 woods.

Breeding *cattle* is a very important branch of the rural economy. The horses are active and hardy, but small, and inferior to those of most other parts of the Austrian empire. They have, however, improved of late years. The whole number of them does not exceed 480,000. The horned cattle are much valued in other countries. The steppes between Debretzen, Temeswar, Neusatz, and Pest, are their native homes, and here their number has been taken at 886,900 oxen, and 1,508,100 cows, which, by sale to the surrounding countries, have produced annually nearly $\pounds 500,000$ sterling. The sheep'are stated to be upwards of 8,000,000. There are pro-digious flocks between the Darube and the Theisa. The wool is coarse, and the owners reckon on the cheese, milk, and flesh, more than the fleeces. In Western Hungary the flocks have been much improved of late years, by crosses with the Merino and the sheep of Padua. Wool to the value of $\pounds 500,000$ is here exported. Swine are reared in abundance; there are yearly from 200,000 to 250,000 exported. Goose feathers are also largely exported by the Jews; and in the Bannat, where the mulberry-tree flourishes, the breeding of silk-worms has been a good deal attended to of late.

Hungary is not a manufacturing country, such occupations being greatly disdained, and except for the preparation, in the first stage, of its minerals, tobacco, or potash, or such articles as essential oils from the resinous trees, or leather from the hide, there are very few establishments worth notice. At Sassin, in the north-west, is a cotton manufacture, which in 1800 gave employment to 20,000 persons; but is now in a neglected state; and at Caschau, in the north, there is a manufacture of coarse cloth; but the only place where fine cloth is prepared is Oedenburg. In the large towns indeed there are workmen in various departments, but few establishments of any importance, and manufactured goods are therefore imported in large quantities, from the other Austrian states. The commerce of the country is fettered by no internal taxes, a circumstance of which the Hungarians are very proud, but the Austrian government has environed it with custom houses, where a duty of 11 per cent. is gathered on all goods that pass into it from the other Austrian states. We may thus see that the encouragement of manufactures within the kingdom, will never, voluntarily, become the policy of that government. The external commerce of Hungary is carried on principally with Silesia, Poland, and the North of Italy: the first two drawing their wine, and the latter large sup-plies of corn from hence. Frume is the only good port of the kingdom : while the central

point of all its commerce is Pest, which has four great fairs annually that regulate in a great degree the prices for the year throughout the kingdom. Other places which have considerable trade are Presburg, Raab, Koman, and Oedenburg toward the German dominions of Austria; Kaschau, Eperies, and Leutschau towards Galicia; Debreczin, Ezegedin, and Temeswar toward Moldavia and Wallachia; and Semlin and Neutsatz toward Turkey.

The nobles, though differing in titles and rank, have all equal privileges; that is, the Magnates having personally a seat and vote in the diet; and the other nobles their representatives. The higher clergy are considered as nobles; and the nobility alone can possess free lands, or those enjoying the jus dominale, and they are exempt from taxes, tithes, and the quartering of soldiers; but, on the other hand, they are bound to perform personal military service, when the diet decrees the levy en masse.

The citizens, or burghers, are the inhabitants of those cities which own no superior lord under the monarch. They have similar privileges to the nobility, by which they are exempted from taxes and tithes, and from the quarterings of the military; and their deputies have seats in the diet. They are also governed by their own magistrates. They cannot, however, hold estates out of their cities, nor institute a suit against the nobles, except in the name of the corporation to which they belong.

The peasants are *slaves* generally, with a greater or less degree of servitude; but some few are qualified colonists, and free. The lot of this class has been of late years much improved. They are allowed to acquire property, to leave their estates to their heirs, and to become burghers, if they can do so. They are still, however, incapable of commencing suits against either the nobility or burghers. The majority of the Hungarians are Catholics, but other sects are established upon nearly an equality, and have their independent revenues and discipline. In 1805 the Catholics, including the Greek church and Armenians who had united with them, were The independent Greek church 4,647,832. were 1,161,138; the Calvinists, or Reformed, 1,002,490; the Lutherans 624,776; and the Jews 75,128 in number. The Catholic clergy consist of three archbishops, seventeen diocesan and nineteen titular bishops; besides abbots, priors, The Greek church has one archbishop, &c. seven bishops, eighteen deans, several abbots, and nearly 3000 priests. The Reformed have, in four superintendencies, 1300 ministers; and the Lutherans, in four superintendencies, 480 pastors. Each of the sects have their separate institutions, also, for educating those of their confession. The Catholics one university, five academies, one lyceum, two philosophical institutes, fifty-five gymnasia, six grammarschools, and nine schools for preparing teachers for the villages, whose number is 2690. The Greeks in union with the Catholics have 380 schools, and the same number of teachers The independent Greeks 1230 schools, and two gymnasia. The reformed three colleges, six gymnasia, and 1600 schools. The Lutherans one lyceum, one college, ten gymnasia, and 630 schools.

The constitution of Hungary is a mixed monarchy, in which the king, as the great executive magistrate, has ample prerogatives. He appoints to all the archbishoprics, bishoprics, and high ecclesiastical offices of the Catholic church, without any interference of the pope, though these dignitaries do not enter on their functions till confirmed in them at Rome. They cannot bequeath their property without the royal consent; and, if they die intestate, the crown is heir. The king has the farther power of suppressing monasteries, or religious orders, entirely. He is also regarded as the protector of the Protestants in their privileges. The executive government is administered by the Vienna chancery, in connexion with the statthalterey, or council of state, at Buda; and subordinate to it are the comitatus, or county meetings, held under a lord lieutenant. The great officers of state are, 1. The palatine, who is nominated by the diet out of four candidates proposed by the king, and whose office is for life; his powers as protector of the throne during a minority, and as occasional mediator between the king and the diet, are very great. 2. The locum tenens regius, or viceroy, who is now frequently the same person as the palatine. 3. The judex curiæ regiæ, a law officer of great influence. 4. The bannus, or governor of Croatia, Sclavonia, and Dalmatia. 5. The tavernicus, formerly director of the royal revenue, but now president of the sedes tavernicalis, or court of exchequer. These, and the inferior officers of state, such as the chamberlains, &c., are called barons of the kingdom, and they rank among the maginates.

The revenue is derived from the regalia, enjoyed by the crown in its own right, and the contributions or taxes granted by the diet. The regalia are, the crown lands; a monopoly of salt; the coinage; mines; tolls on imports and exports; fines and penalties; the income of the vacant bishoprics; the taxes paid by the Jews and the free towns; 5 per cent. on the salaries of certain pensions of office; the contributions of bishoprics and abbeys towards repairing of fortresses; the post-office; the lotteries; monti di pieta; and some others. The taxes voted periodically by the diet are on cattle, land, trades, the poll-tax, &c. For the collection of these, the country is divided into 621 opforten, or petty districts; and the produce of this part of the revenue is about £500,000; its total produce between £3,000,000 and £4,000,000 sterling, or nearly one-third of the whole revenue of the Austrian empire.

The military force of Hungary has also always been very important to the empire: it consists of twelve regiments of infantry of 3857 men each, and ten complete hussar regiments of 1698 men each, making together 63,364 regulars, recruited from time to time among the peasantry, and much increased in time of war, or when what is termed the *insurrectio* is called forth. In 1797 this irregular force was 18,000 cavalry and 35,000 infantry; in 1800 it was 11,000 horse and 26,000 foot; and in 1809, when the national spirit was fully roused, 18,000 horse and 21,000 foot. On the boundaries of the Turkish compire is a military colony which hold the lands they cultivate upon the terms of being

always ready for active service when a war breaks out with that power. They are all regimented, and have been drilled.

Though Hungary has a language of its own, it is not generally spoken, nor supposed to be understood by more than one-third of the people. Until within a very late period the only written language was Latin, and it is still the most common medium of communication. But when Maria Theresa formed her Hungarian guards, » number of young men of noble families were drawn to Vienna, and taught to feel the inferiority of their native country in not possessing a national literature. This stimulated them to the cultivation of the vernacular tongue, which was further promoted by the attempt of the emperor Joseph to introduce the German into their public transactions; and since that period the study of this language has produced some good poets and miscellaneous writers.

From the period of the settlement of the Magyars in this country, in the ninth century, we find it for a length of time governed by a duke, the elected head of various independent principalities. One of the last of these dukes was Geysa: who, becoming a proselyte to Caristianity, was baptised; after which he resigned the government to his son Stephen, who took the title of king, A.D. 1000. The disposal of the crown was now disputed between the Turkish and German emperors for nearly 200 years: bu. after 1527, when Ferdinand, archduke of Austria, was advanced to the throne, the Austrians found means to influence the elections in such a manner, as to keep the crown in their family till 1687, when it was settled hereditarily on their heirsmale; and now, in consequence of an act of the diet of Presburg in 1723, in case of the failure of heirs-male, it is to descend to females.

The present division of the kingdom into counties was introduced by Bela III., who died in 1196. His son Andrew II., infected with the rage of the crusades, allowed the nobles to deprive him of a considerable part of his prerogative; and the privileges which they thus obtained were incorporated under his successor, in 1222, into what is called the Golden Bull. Mary, grand-daughter of Bela IV., having married a prince of the royal family of France, the house of Anjou derived from her their claims to the crown of Hungary. Accordingly, a brother of Louis 1X. of France, named Charles, was crowned king of Hungary in 1310, and raised that country to its highest splendor. Having married a sister of Casimir, king of Poland, one of his sons succeeded to that crown; but the successors of this great prince were far inferior to him in talent: and for a century the history of Hungary presents little else than a series of disturbances. At last the archduke of Austria, having married the only daughter of king Sigismund, succeeded to the crown in 1437; and the house of Austria has ever since reigned in Hungary.

Of the manners and customs of this interesting people we cannot present a more faithful summary than from the pen of Dr. Bright.

The Hungarians, according to this writer, exhibit the martial spirit of their Sclavonian ancestors, and are, in all the ranks above the peasantry, very jealous of their peculiar privileges. They are tall and well made; and fond of athletic exercises. The dress of the higher classes consists generally of a fur cap, a close coat, girded with a sash, and covered with a mantle or cloak; this gives them an air of dignity, while the practice of not shaving the upper lip adds to it a sort of military effect. The females are in general handsome, and dress in dark colors with long sleeves.

The peasant appears in general void of 'all stimulus to invention, all excitement to extraordinary exertion. No one has proceeded in the arts of life and civilisation a step farther than his neighbour. When you have seen one you have seen all. From the same little hat covered with straw, falls the same matted long black hair, negligently plaited, or tied in knots; and over the same dirty jacket and trowsers is wrapped on each a cloak of coarse woollen cloth, or sheepskin, still retaining its wool. Whether it be winter or summer, week-day or sabbath, the Sclavonian of this district never lays aside his cloak, or is seen but in heavy boots. Their instruments of agriculture are throughout the same, and in all their habitations is observed a perfect uniformity of design. A wide muddy road separates two rows of cottages, which constitute a village. From amongst them there is no possibility of selecting the best or the worst; they are absolutely uniform. In some villages the cottages present their ends, in others their sides, to the road; but there is seldom this variety in the same village. The interior of the cottage is generally divided into three small rooms on the ground floor, and a little space in the roof destined for lumber. The roof is commonly covered with a very thick thatch, the walls are whitewashed, and pierced towards the road by two small windows. The cottages are usually placed a few yards distant from each other. The intervening space defended by a rail and gate, or a hedge of wickerwork towards the road, forms the farm-yard, which runs back some way, and contains a shed or out-house for the cattle. Such is the outward appearance of the peasant and his habitation.'

The Austrian government has, as we have stated, mitigated the lot of the peasants in some degree: this good work was commenced by Maria Theresa, who fixed the quantity of land upon each estate (called a *scsion*) which a peasant should possess, and the services be should render his lord in return. The peasants are not absolutely fixed to the soil, but may be dismissed if the superior finds cause; nor does the son always succeed the father, though this is usual; nor has the peasant any absolute claim to a whole session, but, if one-half or one third is awarded to him by the lord, only that proportion of the stipulated service can be required.

The services required of the father of a family, for the whole session, are 104 days of labor during the year, if he work without cattle, or fifty-two days if he bring two horses or oxen, or four, if necessary, with ploughs and carts. In this work he may either employ himself, or, if he prefer and can afford it, may send a servant. Besides this, he must give four fowls and twelve eggs, and one pfund and a half of butter; and every thirty peasants must give one calf yearly.

He must also pay a florin for his house—must cut and bring home a klafter of wood—must spin in the family six pfund of wool or hemp, provided by the landlord—and, among four pca sants, the proprietor claims what is called a long journey, that is, they must transport twenty centners, each 100 lbs. French weight, the distance of two days' journey out and home; and, besides all this, they must pay one-tenth of all their products to the church, and one-ninth to the lord.

Dr. Bright gives the following description of the interior of a Hungarian cottage :-- ' The door opens in the side of the house into the middle room or kitchen, in which is an oven constructed of clay, well calculated for baking bread, and various implements for household purposes, which generally occupy this apartment fully. On each side of the room is a door, communicating on one hand with the family dormitory, in which are the two windows that look into the road. This chamber is usually small, but well arranged; the beds in good order, piled upon each other to be spread out on the floor at night, and the walls covered with a multiplicity of pictures and images of our Saviour, together with dishes, plates, and vessels of coarse earthenware. The other door from the kitchen leads to the store-room, the repository of a great part of the peasant's riches, consisting of bags of grain, of various kinds, both for consumption and for seed, bladders of tallow, sausages, and other articles of provision, in quantities which would astonish us to find in an English cottage. We must, however, keep in mind, that the harvest of the Hungarian peasant anticipates the income of the whole year; and, from the circumstances in which he is placed, he should rather be compared with our farmer than our laborer. The yards or folds between the houses are usually much neglected, and are the dirty receptacles of a thousand uncleanly objects. Light carts and ploughs, with which the owner performs his stated labor, his meagre cattle, a loose rudely formed heap of hay, and half a dozen ragged children, stand there in mixed confusion, over which three or four noble dogs, of a peculiar breed, resembling in some degree the Newfoundland dog, keep faithful watch.'

For the following delineation of the people assembled at a Hungarian fair, by a native writer, we are indebted to the industry of Mr. Myers, and his valuable Geography :—

'The manner in which the Hungarian peasant conducts himself in the sale of his produce, is, when compared to that of the Sclavonian, the German, and the Jew, with whom he is surrounded, remarkable and interesting. The Sclavonian enlarges on the excellence and cheapness of his ware, with palpable and suspicious cagerness. The German dresses out his merchandise, turns it from one side to the other, and presents himself to the purchasers with a com-The Jew swears with manding self-sufficiency heart and soul that he will injure no man-and the Raitzer is stern, silent, and unaccommodating; but, on that account, his characteristic and fiery eye pleads with the greater eloquence. The Hungarian alone keeps himself perfectly passive in his dealings. He allows his goods to be in-spected answers shortly and directly to the

question, and attempts not to impose either by words or artifice. You perceive by his embarrassment that he is unaccustomed to low arts, his good temper evidently counteracts the feeling of poverty, which is therefore borne with ease and content. Shirt and skin, and little else, are to be seen, except his long hair, which hangs loosely over his shoulders; and all these are scarcely to be distinguished from each other, so disguised are they by filth and negligence. The appearance in drizzling weather of the Konigs-strass, which is the district of the Jews, is little more attractive than the quarter frequented by the peasants. Whoever feels inclined to study the character of this people will now find an ample opportunity. Here they swarm together like bees, fix themselves on the passenger who appears likely to trade with them, or traffic amongst themselves with affected grimaces and assumed appearance of activity; while they look with their eyes turned both towards the right and towards the left, on a hundred objects at a time.'

HUN'GER, n. s. & v. n. HUN'GERBIT, adj. HUN'GERBITTEN, adj. HUN'GERLY, adj. & adv. HUN'GERSTARVED, adj. HUN'GRED, adj. HUN'GRILY, adv. HUN'GRY, adj.

Sax. bunzen; Swed. hunger; Belg. honger. De-{ sire of food ; the pain felt from fasting; figuratively, any violent desire:) hungerbitten, pain-

ed, or weakened by hunger: hungerly, with keen appetite : hungry, in a figurative sense, is, not fat; not prolific; fruitful, or more disposed to draw from other substances than to impart to them.

Thou shalt serve thine enemies in hunger and in thirst. Deut. xxviii. 48.

His strength shall be hungerbitten. Job xviii. 12.

And in his herte anon, ther fell a thought, That they for hunger wolden do him dien; Alas ! quod he, alas that I was wrought.

Chaucer. The Monkes Tale.

Then came the autumne, all in yellow clad, As though he loyd in his plentious store, Laden with fruits that made him laugh, full glad That he had banisht hunger, which tofore Had by the belly oft him pinched sore.

Spenser. Faerie Queene.

Dost thou so hunger for my empty chair That thou will needs invest thee with my honours, Before thy hour be ripe? O, foolish youth,

Thou seek'st the greatness that will overwhelm thce,

Stay but a little. Shakspeare. Henry IV.

That face of his the hungry cannibals Would not have touched, would not have stained Shakspeare. with blood.

My more having, would be as a sauce

To make me hunger more. Shukspeare. Mucbeth. All my followers to the eager foe

Turn back, and fly like ships before the wind,

Or lambs pursued by hungerstarved wolves.

Shakspeare.

His heard

Grew thin and hungerly, and seemed to ask His sops as he was drinking. Id.

They are all but stomachs, and we all but food ; They eat as hungerly, and, when they're full, They belch us. Id.

You have saved my longing, and I feed Most hungerly on your sight. Id.

Odours do in a small degree nourish, and we see men an hungered love to smell hot bread. Bacon.

The more fat water will bear soap best; for the hungry water doth kill its unctuous nature. Id.

Widely they gape, and to the eye they roar, As if they hungered for the food they bore.

Cowley.

Milton.

Yea, povertie and hunger did produce, The best inventions, and, of chiefest use. G. Withers.

I content me, And from the sting of famine fear no harm, Nor mind it, fed with better thoughts that feed Me hung'ring more to do my Father's will.

Thyself

Bred up in poverty and straits at home ; Lost in a desert here, and hungerbit. Id. And when your loose desires once get dominion, No hungry churl feeds coarser at a feast :

Every rank fool goes down. Otway's Orphan. Thus much to the kind rural gods we owe, Who pitied suffering mortals long ago; When on harsh acorns hungrily they fed, And gave e'm nicer palates, better bread.

Dryden. Id.

For hunger of my gold I die. As to some holy house the afflicted came. The hungerstarved, the naked, aad the lame,

Want and diseases, fled before her name. Id_* The subacid part of the animal spirits, being cast off by the lower nerves upon the coats of the stomach, vellicates the fibres, and thereby produces the sense we call hunger. Grew.

But when the sun displays his glorious beams, And shallow rivers flow with silver streams, Then the deceit the scaly breed survey, Bask in the sun, and look into the day ; You now a more delusive art must try

And tempt their hunger with a curious fly

Gay's Rural Sports.

Something viscous, fat, and oily, remaining in the stomach, destroys the sensation of hunger.

Arbuthnot on Aliments.

She knew that the best feelings must have victual, And that a shipwrecked youth would hungry be; Besides being less in love she yawned a little,

And felt her veins chilled by the neighbouring sea;

And so she cooked their breakfast to a tittle.

Byron. Don Juan.

HUNGER is occasioned by long abstinence from food when the body is in health. See ABSTI-NENCE. In famine life may be protracted, with less misery, by a moderate allowance of water. For the acrimony and putrefaction of the humors are obviated by such dilution, the small vessels are kept permeable, and the lungs are furnished with that moisture which is essential to the performance of their functions. Redi, who made many experiments to ascertain the effects of fasting on fowls, observed that none were able to support life beyond the ninth day to whom drink was denied; whereas one indulged with water lived more than twenty days. Hippocrates has observed, that children are more affected by abstinence than young persons; these more than the middle-aged; and the middle-aged more than old men. The power to endure famine, however, must depend no less upon the state of health and strength than on the age of the sufferer.

To those who by their occupations are exposed to such dreadful calamities, it is of serious importance to be instructed in the means of al-

leviating them. The American Indians are said to use a composition of the juice of tobacco and the shells of snails, cockles, and oysters, calcined, whenever they undertake a long journey, and are likely to be destitute of provisions. It is pro-bable the shells are not burnt into quicklime, but only so as to destroy their tenacity, and to render them fit for levigation. The mass is dried and formed into pills, of a proper size to be held between the gum and lip, which, being gradually dissolved and swallowed, obtund the sensations both of hunger and of thirst. Tobacco, by its narcotic quality, seems well adapted to counteract the uneasy impressions which the gastric juice makes on the nerves of the stomach when it is empty; and the combination of testaceous powders with it may tend to correct the secretion that is supposed to be the chief agent in digestion, and which, if not acid, is always united with acidity. To prevent the calamity of famine, at sea, it has been proposed by Dr. Lind, that the powder of salep should constitute part of the provisions of every ship's company. This powder and portable soup, dissolved in boiling water, form a rich thick jelly; and an ounce of each of these articles furnishes one day's subsistence to a healthy full-grown man. Indeed, from Dr. Percival's experiments, it appears that salep contains more nutritious matter, in proportion to its bulk, than any other vegetable production now used as food. The following composition is greatly extolled by Avicenna, the celebrated Arabian physician :- Take sweet almonds and heef suet, of each 1 lh.; of the oil of violets 2 oz. : and of the roots of marsh mallows 1 oz.: bray these ingredients together in a mortar, and form the mass into boluses, about the size of a common nut.' Gum Arabic might be a good substitute for salep, in the composition already recommended; and, as it gives such firmness to the mass as to require manducation, the saliva, by these means separated and carried into the stomach, would further contribute to assuage the sensations both of hunger and of thirst.

With respect to the cause of hunger, it has been, by turns, attributed to the direct impulse of the vital principle, to the frictions of the sides of the stomach against each other, to the dragging of the liver upon the diaphragm, to the action of bile upon the stomach, to the acrimony and acidity of the gastric juice, to fatigue of the contracted fibres of the stomach, to compression of the nerves of this viscus, &c. &c.

Hunger arises, like all other internal sensations, from the action of the nervous system; it has no other seat than this system itself, and no other causes than the general laws of organisation. What very well proves the truth of this assertion is, that it sometimes continues though the stomach is filled with food; that it cannot be produced though the stomach has been some time empty; lastly, that it is so subject to habit as to cease spontaneously after the habitual hour of repast is over. This is true not only of the feeling which takes place in the region of the stomach, but also of the general weakness that accompanies it, and which, consequently, cannot be considered as real, at least in the first instant in which it is manifested

In attempting to recover those who have suffered from famine, great circumspection is required. Warmth, cordials, and food, are the means to be employed; and these may prove too powerful in their operation, if not administered with judgment. For the body, by long fasting, is reduced to a state of more than infantile debility; the minuter vessels of the brain, and of the other organs, collapse for want of fluids to distend them; the stomach and intestines shrink in their capacity; and the heart languidly vibrates, having scarcely sufficient energy to propel the scanty current of blood. Under such circumstances a proper application of heat seems an essential measure, and may be effected by placing on each side a healthy man in contact with the patient. Pediluvia or fomentations may also be used with advantage. The temperature of these should be lower than that of the human body, and gradually increased according to the effects of their stimulus. New milk, weak broth, or water gruel, ought to be employed both for the one and the other; as nutriment may be conveyed into the system this way, by passages probably the most pervious in a state of fasting, if not too long protracted. Wine whey will answer a good purpose, and afford an easy and pleasant nourishment. When the stomach has been a little strengthened an egg may be mixed with the whey, or administered under some other agreeable form. The yolk of one was, to Cornaro, sufficient for a meal; and the narrative of this noble Venetian, in whom a fever was excited by the addition of only two ounces of food to his daily allowance, shows, that the return to a full diet should be conducted with great cantion, and by slow gradations.

HUNGERFORD, a market town of Berkshire, seated on the Kennet, in a low and watery soil. It is a great thoroughfare in the Bath and Bristol road, sixty-four miles from London; and was formerly called Ingleford Charnham Street. The constable of this town, who is chosen annually, is lord of the manor, which he holds immediately of the crown. They have a horn here which holds about a quart, and appears by an inscription on it to have been given by John of Gaunt, together with a grant of the royal fishery, in a part of the river which abounds with good trout and craw-fish. Here is a market on Wednesday, and a fair in August.

HUNINGUE, or HUNINGUEN, a small, and not long since a very strong, town of the department of the Upper Rhine (Alsace, France), the chief place of a canton, in the arrondissement of Altkirch. It is a post town, and contains about 1000 inhabitants. This town is very advantageously situated on the left bank of the Rhine, near the frontiers of Switzerland, about a mile and a half from Bâle. It was dismantled in 1815. by order of the allied powers, and is now comparatively a heap of ruins: the inhabitants, discouraged by the injustice with which they regard their town as having been treated, have to a great extent abandoned it. The houses, which were burned and demolished during the siege, still remain in the same state as they were left by that terrible event. The last days previous to the destruction of Huminguen were marked by one of

the most astonishing deeds of arms (say the French) that has been witnessed in our age, so fertile in transactions of this kind. 'Blockaded by 25,000 Austrians, its feeble garrison consisting of 140 men, united with a few of the inhabitants, defended the place with the greatest courage. It was not until twelve days siege, and after having lost half of its defenders, that it made an honorable capitulation, by which the garrison was allowed to retire to the army of the Loire. The next day a platoon of infantry, two platoons of artillery, and five gendarmes, headed by general Barbaregre, with the officers of his staff, and followed by the wounded, came out of the place, with drums beating, in the presence of the enemy's army and an immense crowd of spectators, astonished that so feeble a company, which did not comprise more than fifty effective men, could have made so extraordinary a defence, and treated on equal terms with an army of 25,000.' Huninguen is twenty-one miles east of Altkirch, and twenty-seven south-east of Mulhausen.

HUNKS, n. s. Isl. hunsker, sordid. A covetous sordid wretch; a miser; a curmudgeon.

She has a husband, a jealous, covetous, old hunks. Dryden.

The old *hunks* was well served, to be tricked out of a whole hog for the securing of his puddings.

L'Estrange.

Irus has given all the intimations of being a close hunks, worth money. Addison.

HUNNIADES (John Corvinus), waywode of Transylvania, a general of the Hungarian armies, who was the terror of the Turks, and repeatedly defeated them under Amurath II. and Mahomet II. Ile forced both these bloody conquerors to raise the siege of Belgrade; but died, to the great grief of all Christendom, in 1456. See Con-STANTINOPLE,

HUNNS, or Huns, an ancient race, who formerly inhabited that part of Sarmatia bordering on the Palus Mæotis and the Tanais, the ancient boundary between Europe and Asia. Their country, as described by Procopius, lay north of Mount Caucasus, which, extending from the Euxine to the Caspian Seas, parts Asiatic Sarmatia from Colchis, Iberia, and Albania; lying on the isthmus between the two seas. Here they resided unknown to other nations, and themselves ignorant of other countries, till the year 376. At this time a hind pursued by the hunters, or, according to some authors, an ox stung by a gadfly, having passed the marsh, was followed by some Hunns to the other side, where they discovered a country much more agreeable than their own. On their return, having acquainted their countrymen with what they had seen, the whole nation passed the marsh, and falling upon the Alans, who dwelt on the banks of the Tanais, almost exterminated them. They next fell upon the Ostrogoths, whom they drove out of their country, and forced to retire to the plains between the Borysthenes and the Tanais, now known by the name of Podolea. Then, attacking the Visigoths, they obliged them to shelter themselves in the most mountainous parts of their country; till at last the Gothic nations, finding it impossible to withstand such an inundation of barbarians, obtained leave from the emperor Valens to settle

in Thrace. The Hunns thus became masters of all the country between the Tanais and Danube in 376, where they continued quietly till 388, when great numbers of them were taken into the pay of Theodosius I. They frequently passed the Danube, committing the greatest ravages in the western empire : sometimes they fell upon the eastern provinces, where they put all to fire and They were often defeated and repulsed sword. by the Romans, but the empire was now too weak to subdue or prevent them from making incursions; so that they continued to make daily encroachments, and became every day more formidable than before. In 441 the Hunns, under Attila, threatened the westerr empire with total destruction. This monarch, having made himself master of all the northern countries, from the confines of Persia to the banks of the Rhine, invaded Mæsia, Thrace, and Illyricum; and the emperor, not thinking himself safe in Constantinople, withdrew into Asia. Attila then attacked Gaul, where he destroyed several cities, massacring the inhabitants. At last he was driven out by Aetius the Roman general and Theodoric king of the Goths, and could never afterwards make any progress. About A. D. 452, or 453, Attila died, and his kingdom was split into a number of small states by his numerous children. who waged perpetual war with each other. The Hunns then ceased to be formidable, and became daily less able to cope with the other barbarous nations whom Attila had kept in subjection. Still. however, their dominion was considerable; and in the time of Charles the Great they were masters of Transylvania, Walachia, Servia, Carniola, Carinthia, and the greater part of Austria, together with Bosnia, Sclavonia, and that part of Hungary which lies beyond the Danube. In 776, while Charles was in Saxony, two princes of the Hunns, Caganus and Juganus, sent ambassadors to him, requesting an alliance with him. Charles received them with extraordinary marks of friendship, and readily complied with their request. However, they entered, not long after, into an alliance with Taffila of Bavaria, who had revolted from Charles. Accordingly Charles, having assembled a very numerous army, divided it into two bodies, one of which he commanded himself, and the other he committed to the care of his generals. The two armies entered the country of the Hunns at different places, ravaged their country far and near, burnt their villages, and took all their strong holds. This he continued for eight years, till the people were almost totally extirpated; nor did the Hunns ever afterwards recover themselves, or appear as a distinct nation.

The Hunns according to Marcellinus were a very savage and barbarous nation. They begin to practise their cruelty, says Jornandes, upon their own children, the very first day they come into the world, cutting and mangling the cheeks of their males, to prevent the growth of hair, and to strike terror into the enemy with their countenances, thus deformed and covered with scars. Their food was roots and raw meat, they being quite unacquainted with the use of fire, and having no houses, nor even huts; but living in the woods, and on the mountains, where, 463

from their infancy, they were inured to hunger, thirst, and all kinds of hardships; nay, they had such an aversion to houses, which they called the sepulchres for the living, that, when they went into other countries, they could hardly be prevailed upon to come within the walls of any house, not thinking themselves safe. They used even to eat and sleep on horseback, scarce ever dismounting; which induced Zosimus to assert that the Hunns could not walk. Day and night were indifferent to them as to buying, selling, eating, and drinking. They had no law, nor religion; but complied with their inclinations, without the least restraint. In war they began the battle with great fury, and a hideous noise: if they met with a vigorous opposition, their fury abated after the first onset; and, when once put into disorder, they never rallied, but fled in the utmost confusion. They were quite unacquainted with the art of besieging towns; and never attacked an enemy's camp. They were a faithless nation, and thought themselves no longer bound by the most solemn treaties than they found their advantage in observing them. Hence we often find them breaking into the Roman empire, in defiance of the most solemn engagements. Several corps of Hunns, after their coming into Europe, served in the Roman armies against the Goths and other barbarous nations; nay, they were ready, for hire, to fight against each other.

HUNNS, NEPHTHALITE, or the White Hunns, inhabited a rich country, bordering on the north of Persia, and a considerable distance from the Sarmatian or Scythian Hunns above described, with whom they had no intercourse nor the least resemblance either in their persons or manners. They were a powerful nation, and often served against the Romans in the Persian armies; but, in the reign of the emperor Zeno, being provoked by Perozes king of Persia laying claim to part of their country, they defeated the Persians in two pitched battles, slew their king, overran all Persia, and held it in subjection for two years, obliging Cabades, the son and successor of Perozes, to pay them a yearly tribute. These Hunns did not wander, like the others, from place to place; but, contented with their own country, which supplied them with all necessaries, they lived under a regular government, subject to one prince, and seldom made in oads, unless provoked, into either the Persian or Roman territories. They lived according to their own laws, and dealt uprightly with one another, as well as with the neighbouring people. Each of their great men used to choose twenty or more companions to enjoy with him his wealth, and partake of all his diversions; but, upon his decease, they were all buried with him in the same grave. The Nephthalites were, however, a far more civilised nation than the Scythian Hunns, who, breaking into the empire, filled most of the provinces of Europe with blood and slaughter.

HUNT, v.a., v. n., & n. s.) Sax. punzian,
HUN'TER, n. s.	from bundo, a
HUN'TING-HORN, n. s.	dog. The lead-
HUN'TRESS, n. s.	(ing idea in this
HUN'TSMAN, n. s.	word is searching
	J after; and in the

strictest sense for objects not within sight : as to chase wild animals; to pursue; search for direct, or manage hounds; to follow the chase ; hunt is a pack of hounds; a chase; a pursuit: hunter, either the individuals who are engaged in the chase, or the dog that scents the game : hunting-horn, a bugle : huntress, a woman that follows the chase : huntsman, one who delights in the chase, or the servant who manages it : huntsmanship, the qualifications of a hunter.

Wilt thou hunt the prey for the lion, or fill the appetite of the young lions? Job xxxviii. 39.

Evil shall hunt the violent man to overthrow him. Psalm cxl. Within a lodge out of the way,

Beside a well in a forest,

Where after hunting I toke rest,

Nature and kind so in me wrought,

That halfe on slepe they me ybrought.

Chaucer's Dreame.

Methought, I herde an hunter blowe T'essay his gret horne.

Chaucer. Boke of the Duchesse.

And therwithall Diane gan appeare With bowe in hond right as an hunteresse.

Id. The Knightes Tale.

Not certainly affirming any thing, but by conferring of times and monuments, I do hunt out a probability. Spenser

Like as a huntsman, after weary chace, Seeing the game escape from him away,

Sits down to rest him. Id. Sonnets.

And thou, thrice crowned queen of night, survey With thy chaste eye, from thy pale sphere above, Thy huntress' name, that my full life doth sway.

Shakspeare.

The hunt is up, the morn is bright and gray; The fields are fragrant, and the woods are green. Id.

The man that once did sell the lion's skin, While the beast lived, was killed in hunting him. Ia.

I've heard myself proclaimed;

And by the happy hollow of a tree, Escaped the hunt. Id. King Lear.

Of dogs, the valued file

Distinguishes the swift, the slow, the subtle,

The housekeeper, the hunter. Id. Macbeth. At court your fellows every day

Give the art of rhiming, huntsmanship, or play.

Donne.

The heart strikes five hundred sorts of pulses in an hour, and is hunted into such continual palpitations, through anxiety, that fain would it break.

Harvey on Consumptions.

Down from a hill the beast that reigns in woods, First hunter then, pursued a gentle brace,

Goodliest of all the forest, hart and hind. Milton. Shall I call

Antiquity from the old schools of Greece,

To testify the arms of chastity?

Hence had the huntress Dian her dread bow,

Fair silver-shafted queen, for ever chaste. Id.

Such game, whilst yet the world was new, The mighty Nimrod did pursue :

What huntsman of our feeble race,

Waller.

Or dogs, dare such a monster chace? The common hunt, though from their rage restrained

By sovereign power, her company disdained, Grinned as they passed.

Dryden. Hind and Panther.

Another's crimes the unhappy hunter bore, Glutting his father's eyes with guiltless gore. Id. Æneid.

Apply this moral rather to the huntsman, that managed the chace, than to the master. L'Estrange.

One followed study and knowledge, and another hawking and hunting. Locke.

Very much of kin to this is the *hunting* after arguments to make good one side of a question, and wholly to neglect and refuse those which favor the other side. Id.

This was the arms or device of our old Roman *Iunters*; a passage of Manilius lets us know the pagan *hunters* had Meleager for their patron.

Addison.

He hunts a pack of dogs better than any, and is famous for finding hares. Id.

We should single every criminal out of the herd, and *hunt* him down, however formidable and overgrown; and, on the contrary, shelter and defend virtue. Id.

On the old pagan tombs, masks, hunting matches, and Bacchanals are very common. Id. on Italy.

Whilst a boy, Jack ran from school,

Fond of his *hunting-horn* and pole. Prior. In vain malignant streams and winter fogs

Load the dull air, and hover round our coasts;

The huntsman ever gay, robust, and bold,

Defies the noxious vapor and confides

In this delightful exercise to raise

His drooping head, and cheer his heart with joy. Somerville's Chase.

Bold Nimrod first the savage chace began,

A mighty hunter, and his game was man. Pope. Let old Arcadia boast her ample plain,

The immortal huntress, and her virgin train; Nor envy Windser. Id.

Would Edwin this majestic scene resign

For aught the huntsman's puny craft supplies?

Ah! no : he better knows great nature's charms to prize. Beattie.

Mild was the morn, the sky serene,

The jolly hunting band convene,

The beagle's breast with ardour burns,

The bounding steed the champaign spurns,

And fancy oft the game descries

Through the hound's nose and huntsman's eyes. Id.

Behold me, earth, what is the life he hunts for, Come to my cave, thou human hunter come.

Maturin.

What is here ?

Who seems not of my trade, and yet hath reached A height which none even of our mountaineers, Save our best *hunters* may attain.

Byron. Manfred.

HUNT (Thomas), D. D., a learned oriental scholar of the last century, was born in 1696, and graduated at Oxford in 1721 as A. M. In 1738 he was elected Arabic professor in that university; and his inauguration address on this occasion has been printed. In 1744 he took his doctor's degree, and three years after became regius professor of Hebrew and canon of Christchurch. He wrote also Observations on the Proverbs, which with his Sermons were edited by Dr. Kennicott in 1774.

ILUNTER (Dr. William), a celebrated anatomist and physician, was born in 1718, at Kilbride in Lanarkshire. At fourteen his father sent him to the college of Glasgow, where he spent five years; and by his prudent behaviour and diligence acquired the esteem of the pro-

fessors. His father had designed him for the church; but, becoming acquainted with the celebrated Dr. Cullen, he resolved to devote himself to the profession of physic. His father having consented, he, in 1737, went to reside with Dr. Cullen, and at the end of three years it was agreed that he should prosecute his medical studies in Edinburgh and London. He accordingly set out for Edinburgh in November 1740; where he attended the lectures of the medical professors. Dr. Douglas soon after invited him into his family to assist in his dissections, and to superintend the education of his son; and by his friendly assistance enabled him to enter as a surgeon's pupil at St. George's Hospital under Mr. James Wilkie, and as a dissecting pupil under Dr. Frank Nichols. He soon became expert in dissection, and Dr. Douglas was at the expense of having several of his preparations engraved. In 1743 he communicated to the Royal Society an Essay on the Structure and Diseases of articulating Cartilages. At length an opportunity occurred for the display of his abilities as a teacher of anatomy. A society of navy surgeons had an apartment in Covent Garden, where they engaged the late Mr. Samuel Sharpe to deliver a course of lectures on the operations of surgery. Mr. Sharpe continued to repeat this course, till, finding that it interfered too much with his other engagements, he declined the task in favor of Mr. Hunter; who gave the society so much satisfaction, that, in the winter of 1746, they requested him to extend his plan to anatomy, and gave him the use of their room for his lectures. In 1747 he was admitted a member of the corporation of surgeons; and in the spring of 1748, soon after the close of his lectures, he set out in company with his pupil, Mr. James Douglas, on a tour through Holland to Paris. He returned to London early enough to begin his winter course of lectures about the usual time. Dr. Douglas had now acquired considerable reputation in midwifery; which induced Mr. Hunter to direct his views chiefly to the same practice; and he was elected surgeon, first to the Middlesex, and soon afterwards to the British Lying-in Hospital. In 1750 he obtained the degree of M. D. from the university of Glasgow, and began to practise as a physician; when he quitted the family of Mrs. Douglas and went to reside in Jermyn Street. In 1756 he was admitted a licentiate of the Royal College of Physicians. Soon after he was elected a member of the Medical Society; and to the Observations and Enquiries, published by that society, he at different periods contributed several valuable papers. In 1762, when the queen became pregnant, Dr. Hunter was consulted; and in 1764 he was appointed physician extraordinary to her In 1767 Dr. Hunter was elected majesty. F. R. S.; and in 1768 communicated to that learned body observations on the bones, commonly supposed to be elephants' bones, which have been found near the Obio in America. In 1768 he became a fellow of the Society of Antiquaries; and, at the institution of a Royal Academy of Arts, he was appointed by his majesty to the office of professor of anatomy. In

465

January 1781 he was unanimously elected president of the Medical Society. His name and talents were now known and respected in every part of Europe. In 1780 the Royal Medical Society at Paris elected him one of their foreign associates; and in 1782 he received a similar mark of distinction from the Royal Academy of Sciences in that city. The most splendid of his medical publications was the Anatomy of the Human Gravid Uterus. This great work, which had been begun so early as 1751, was delayed till 1775, by the author's desire of sending it into the world as perfect as possible. In 1755 he communicated to the Royal Society an Essay on the Origin of the Venereal Disease. In 1777 he joined with Mr. Watson in presenting to it a short account of the late Dr. Maty's illness, and of the appearances on dissection; and in 1778 he published his Reflections on the Section of the Symphysis Pubis. We must now notice the formation of the celebrated Hunterian Museum. Before Mr. Hunter had practised midwifery many years, he found he had acquired a fortune sufficient to place him in easy and independent circumstances. This he set apart as a resource, whenever age or infirmities should oblige him to retire from business. As his wealth continued to accumulate, he formed a laudable design of engaging in some scheme of public utility, and resolved to erect an anatomical academy. For this purpose he purchased a spot of ground in Great Windmill Street, where he erected a spacious house, to which he removed from Jermyn Street in 1770. He had formed already one of the finest anatomical museums ever seen, and he now extended his views to fossils, and to the promotion of literature. In a short time he became possessed of ' the most magnificent treasure of Greek and Latin books that has been accumulated by any person since the days of Mead.' A cabinet of ancient medals contributed likewise much to the richness of his museum. In 1781 it received a valuable addition of shells, corals, and other curious subjects of natural history, which had been collected by the late 'Dr. Fothergill, who had directed by his will, that his collection should be appraised after his death, and that Dr. Hunter should have the offer of it at £500 under the valuation. Accordingly Dr. Hunter purchased it for £1200. About two years after, 17th of March, 1783, he was seized with a violent attack of gout and nausea. On the 20th he found himself so much recovered, that he determined to give the introductory lecture to the operations of surgery. He accordingly delivered it, but was seized in consequence with a paralytic stroke, and died on Sunday the 30th. By his will, the use of his museum, under the direction of trustees, devolved to his nephew Matthew Baillie, B. A., and, in case of his death, to Mr. Cruikshank for thirty years, at the end of which period the whole collection was bequeathed to the university of Glasgow. The collection is now in Glasgow, and an elegant building has been erected for its reception. The sum of £8000 is left as a fund for the support and augmentation of it.

ther to the Dr. of that name, was born at Long Calderwood in 1728. He was at first apprenticed to a carpenter; but, hearing that his brother was then the most celebrated teacher of anatomy in London, he expressed a desire to assist him in his researches. The Dr., willing to serve him, invited him to London, where he arrived in September, 1748; and from this period he was seriously engaged in anatomy, under the instruction of his brother, and his assistant, Mr. Symonds. In the summer of 1749 he attended Mr. Cheselden, at Chelsea Hospital, where he learned the first rudiments of surgery. In 1751 he became a pupil at St. Bartholomew's. In 1752 he went to Scotland; and the following year entered, as a gentleman commoner, at St. Mary Hall, Oxford. In 1754 he became a surgeon's pupil at St. George's Hospital, where he continued during summer; and in 1756 was appointed house-surgeon. In 1755 his brother admitted him to a partnership in his lectures. The forming of anatomical preparations was at this time a new art, and little known; every preparation, therefore, skilfully made, was proportionably valuable, and in the construction of these Mr. J. Hunter was particularly clever. He studied human anatomy for ten years, during which period he traced the ramifications of the olfactory nerves upon the membranes of the nose, and discovered the course of some of the branches of the fifth pair of nerves. In the gravid uterus, he traced the arteries to their termination in the placenta. He was also the first who discovered the existence of the lymphatic vessels in birds. So eagerly did he attach himself to comparative anatomy, that he embraced every means of prosecuting it to advantage. He applied to the keepers of wild beasts for the bodies of those which died, and purchased all rare animals which he heard of. In October 1760 Mr. Adair, inspector-general of hospitals, appointed him a surgeon on the staff; and in spring 1761 he went with the army to Belleisle. On his return he settled in London; where he taught anatomy and surgery for several winters, and resumed his researches in comparative anatomy. On the 5th of February, 1767, he was chosen F. R. S. In 1768 he became a member of the corporation of surgeons; and in 1769 was elected one of the surgeons of St. George's Hospital. In May 1771 his Treatise on the Natural History of the Teeth was published: and in July he married Miss Home, daughter of Mr. Home, surgcon to Burgoyne's regiment. In 1776 he was appointed surgeon extraordinary to his majesty, and in 1783 was chosen a member of the Royal Society of Medicine, and the Royal Academy of Surgery in Paris. About this time he erected, at the expense of £3000, a building for his collection, in which there was a room fifty-two feet long, by twenty-eight feet wide, lighted from the top, and having a gallery all round, for containing his preparations. Under this were two apartments; one for his lectures, and the other for weekly meetings of medical friends during winter, under the title of Lyceum Medicum Londinense. At this period Mr. Hunter was at the height of his chirurgical career; his mind and body were both in full vigor.

2 H

HUNTER (John), a celebrated anatomist, bro-Vol. XI.

Some instances of his extraordinary skill may be added. He removed a tumor from the side of the head and neck of a patient at St. George's Hospital, as large as the head to which it was attached; and, by bringing the cut edges of the skin together, the whole was nearly healed by the first intention. He also discovered the present mode of performing the operation for the popliteal aneurism, by taking up the femoral artery on the thigh. In 1786 Mr. Hunter was appointed deputy surgeon-general to the army. He now published his work upon the Venereal Disease, which had a very rapid sale; and another entitled, Observations on certain Parts of the Animal Economy. Upon the death of Mr. Adair, in 1792, he was appointed inspector-general of hospitals, and surgeon-general to the army. He was also elected a member of the Royal College of Surgeons in Ireland. In 1792 he was elected an honorary member of the Chirurgo-Physical Society of Edinburgh, and was chosen one of the vice-presidents of the Veterinary College, then first established in London. The collection of comparative anatomy which Mr. Hunter has left, must be allowed to be a proof of talents, assiduity, and labor, which cannot be contemplated without admiration. It remains an unequivocal test of his perseverance and abilities, and an honor to the country. Mr. Hunter for many years of his life had been subject to attacks of angina pectoris particularly when irritated by any little accident. On October 16th 1793, when in his usual state of health, he went to St. George's Hospital, and, some of the minor arrangements irritating his mind, endeavoured to restrain his vexation, but turning round to Dr. Robertson, one of the physicians of the hospital, gave a deep groan and dropt down dead; being then in his sixtyfifth year.

HUNTER (Robert), esq., an English gentleman, author of the famous Letter on Enthusiasm, which, on its first appearance, was ascribed by some to lord Shaftesbury, and by others to dean Swift. In 1708 he was appointed governor of Virginia, but was made prisoner by the French on his voyage thither. In 1710 he was appointed governor of New York, and sent with 2700 Palatines to settle there. He returned to England in 1719, and on the accession of George II. was continued governor of New York and New Jersey. He was appointed governor of Jamaica in February, 1727, 1728, where he died March 31st, 1734. He also wrote a farce entitled Androboros.

HUNTER (Henry), D. D., a presbyterian divine was born at Cultoss in Perthshire in 1741, and at the age of thirteen sent to the university of Edinburgh. At seventeen be became tutor to a gentleman who was afterwards one of the lords of the session. The illness and death of his father having prevented him from retaining that situation, he now accepted one of the same kind in the family of lord Dundonald, at Cultoss. In 1764 he obtained a license to preach, and in 1766 was ordained minister of South Leith; but removed in 1771 to London, to become pastor to the Scottish church London Wall. His popular Sacred Biography, commenced in 1788,

466

and was extended to seven volumes, octavo. During the progress of this work Dr. Hunter became a convert to the physiognomical system of Lavater, and in 1787 made a visit to Switzerland, for the purpose of procuring intelligence from the author preparatory to an English trans-lation of his works. In 1790 he became secretary to the corresponding board of the Society for Propagating Christian Knowledge in the Highlands of Scotland. In 1795 appeared his Sermons preached on various Occasions, to which were subjoined illustrative memoirs and anecdotes; and in 1798 his Lectures on the Evidences of Christianity, in conjunction with those of the Rev. John Fell. He died at Bristol Hot Wells, October 27th, 1802. Dr. Hunter also translated from the French Euler's Letters on Natural Philosophy; St. Pierre's Studies of Nature; Saurin's Sermons; Sonnini's Travels; and Castera's Memoirs of Catharine II. of Russia. Two volumes of his Sermons, &c., with a biographical memoir, were published posthumously.

HUNTER, in the manege, signifies a horse qualified to carry a person in the chase. The hunter ought to have great care and indulgence in the stable; he ought to have much rest and quiet, and to be well supplied with good food, clean litter, and fresh water; he should be often dressed, and suffered to sleep as much as he pleases. He should be so fed, that his dung may be rather soft than hard, and of a bright color. Some sportsmen are for keeping their horses out at grass all the buck-hunting season, never taking them into the stable at all, but allowing them in the field as much oats with their grass as they will eat. The horse may be thus rid three days in the week for the whole season, and never injured by it. The whole shape of a horse intended for a hunter should be this :-- the ears should be small, open, and pricked; or, though they be somewhat long, yet if they stand erect like those of a fox, it is a sign of hardiness. The forehead should be long and broad, not flat; or, as it is usually termed, mare-faced, but rising in the middle like that of a hare; the feather should be placed above the eye, the contrary being thought by some to threaten blindness. The eyes should be full, large, and bright; the nostrils not only large, but looking red and fresh within; for an open and fresh nostril is always esteemed a sign of a good wind. The mouth should be large, deep in the wicks, and hairy. The wind-pipe should be large, and appear straight when he bridles his head; for if, on the contrary, it bends like a bow on his bridling, it is not formed for a free passage of the breath. The head should be set on to the neck, that a space may be felt between the neck and the chine; when there is no such space, the horse is said to be bull-necked; and this is not only a blemish in the beauty of the horse, but also occasions his wind not to be so good. The crest should be strong, firm, and well risen ; the neck should be straight and firm; the breast should be strong and broad; the ribs round like a barrel; the fillets large; the buttocks rather oval than broad ; the legs clean, flat, and straight; the mane and tail ought to be long and thin;

when short and bushy, they are counted marks of dulness. When a hunter is thus chosen, and has been taught such obedience that he will readily answer to the rider's signals of the bridle, hand, voice, calf of the leg, and spurs; that he knows how to make his way forward; has gained a true temper of mouth, and a right placing of his head; and has learned to stop and turn readily: if his age be sufficiently advanced, he is ready for the field. It is a rule with all staunch sportsmen, that no horse should be used in hunting till he is full five years old; some hunt them at four, but the horse at this age is not come up to his full strength and courage, and will not only fail at every tough trial, but will be much more subject to strains and accidents, than if he were a year older, when his strength would be confirmed. When he is five years old, he may be put to grass from May till August, for the weather between these is so hot, that it will be proper to spare him. When the horse has evacuated all his grass, and has been properly shod, and the shoes have had time to settle to his feet, he may be ridden abroad. During the time that he is used to hunting he must be allowed a more strengthening food, mixing some old split beans at every feeding with his oats.

HUNTERDON, a county of New Jersey, United States, forty miles long and thirty-two broad; bounded on the east by Somerset, southeast by Burlington, south-west and west by the Delaware, and north-west by Sussex county. It is divided into ten townships. On Muskonetcong Mountain, in this county, is a chalybeate spring much frequented. It falls into an artificial reservoir made so as to accomodate both bathers and drinkers. Trenton is the capital.

HUNTING, the diversion of pursuing four-footed beasts of game. These are hunted in the fields, woods, and thickets, in various ways. We find that among the earliest civilised nations hunting made one of their diversions ; and, among the wild and barbarous, it supplied them with food. The Roman jurisprudence established it as a law, that, as the natural right of things which have no master belongs to the first possessor, wild beasts, birds, and fishes, are the property of those who can take them first. But the northern barbarians who over-ran the Roman empire, bringing with them a stronger taste for the diversion, and the people being now possessed of other and more easy means of subsistence from the lands and possessions of those they had vanquished, their chiefs began to appropriate the right of hunting, and, instead of a natural right, to make it a royal one.

The hunting used by the ancients was much like that now practised for the rein-deer; which is seldom hunted at force, or with hounds; but only drawn with a blood hound, and taken with nets and engines. Thus they did with all beasts; whence a dog is never commended by them for opening before he has discovered where the beast lies. Their huntsmen, indeed, were accustomed to shout and make a great noise, as Virgil observes in his Georgics,

Ingentem clamore premes ad retia cervum.

But this was only to bring the deer to the nets

laid for him. Among the Sicilians of the mid-dle ages this diversion was greatly practised. The hunters, when informed which way a herd or deer passed, gave notice to one another, and every one brought with him a cross-bow or long bow, and a bundle of staves shod with iron, the heads bored, with a cord passing through them all: thus provided they came to the herd, and forming a large ring surrounded the deer. Then each, taking his stand, unbound his faggot, set up his stake, and tied the end of the cord to that of his next neighbour, ten feet from each other. Then taking feathers dyed in crimson, and fastened on a thread, they tied them to the cord ; so that with the least breath of wind they would whirl round. Those who kept the stands then withdrew, and hid themselves in the next covert. Then the chief ranger entering within the line, with hounds to draw after the herd, roused the game with their cry; which flying towards the line were turned off, and still gazing on the shaking and shining feathers wandered about as if kept in with a real wall. The ranger still pursued, and calling every person by name as he passed by their stand, commanded him to shoot the first, third, or sixth as he pleased : and if any of them missed, or singled out another than that assigned him, it was counted disgrace. By these means, as they passed by the several stations, the whole herd was killed by the several hands. Hunting formed the chief employment of the ancient Germans, and probably of the Britons also, when not engaged in war. Ancient historians tell us, that this was the case even so late as the third century with those unconquered Britons who lived beyond Adrian's wall; and that they subsisted chiefly by the prey that they took in this way. The great attachment shown by all the Celtic nations to hunting, however, proceeded most probably from its being a preparation for war. By it their youth acquired that courage, strength, swiftness, and dexterity in handling their arms, which made them so formidable to their enemies. By it, too, they freed their country from those mischievous animals which abounded in the forests, and furnished themselves with materials for those feasts which seem to have constituted their greatest pleasure. So strong and universal was the passion for hunting among the ancient Britons, that even young ladies of the highest rank and greatest beauty spent much of their time in the chase. They employed much the same weapons in hunting that they did in war, viz, long spears, javelins, and bows and arrows; having also great numbers of dogs to assist them in finding and pursuing their game. These dogs were much admired among other nations, on account of their swiftness, strength, fierceness, and exquisite sense of smelling.

Hunting was a favorite diversion of the celebrated Jenghiz Khan, and the East Indian princes still show the same inclination to the chase; and the Mogul princes were celebrated for their hunting expeditions. A circuit of between 400 and 600 miles was generally made; the hunters bending their course towards the skirts of the northern mountains, where the country is wild and uncultivated. The vizier took along with 2 H 2

him not only his court and seraglio, but a great part of the inhabitants of his capital, he was also followed by 500 or 600 horse, and several battalions of regular sepoys with their field pieces: 400 or 500 elephants also accompanied him; of which some were used for riding, others for fighting, and some for clearing the jungles and forests of the game. A great number of wheel carriages, drawn by bullocks, likewise attended for the convenience of the women. The animals used in the sport were principally about 300 greyhounds, 200 hawks, and a few trained leopards for hunting deer. A vast number of matchlocks were carried along with the company, with many English pieces of various kinds; and every article that could contribute to luxury or pleasure was likewise carried along with the army. Wild boars were sometimes started, and either shot, or run down by the dogs and horsemen. Hunting the tiger, however, was looked upon as the principal diversion, and the discovery of one of these animals was accounted a matter of great joy. The cover in which he is found is commonly long grass, or reeds of such a height as frequently to reach above the elephants; and it is difficult to find him in such a place, as he commonly endeavours either to steal off, or lies so close to the ground that he cannot be roused till the elephants are almost upon him. He then roars and skulks away, but is shot at as soon as he can be seen. If he be not disabled, he continues to sculk along, followed by the elephants. The elephants themselves are very much afraid of this terrible animal, and discover their apprehensions by shrieking and roaring as soon as they begin to smell him or hear him growl; generally attempting to turn away from the place where he is. When the tiger can be traced to a particular spot, the elephants are disposed of in a circle round him; in which case he will at last make a desperate attack, springing upon the elephant that is nearest, and attempting to tear him with his teeth or claws. Some, but very few, of the elephants, can be brought to attack the tiger; and this they do by curling up their trunks under their mouths, and then attempting to toss, or otherwise destroy him with their tusks, or to crush him with their feet and knees. It is considered as good sport to kill one tiger in a day; though sometimes, when a female is met with her young ones, two or three will be killed. The other objects of pursuit in these excursions are wild elephants, buffaloes, and rhinoceroses. An English traveller was present at the hunting of a wild elephant of vast size and strength. An attempt was first made to take him alive by surrounding him with tame elephants, while he was kept at bay by crackers and other fire-works; but he constantly eluded every effort of this kind. Sometimes the drivers of the tame elephants got so near him, that they threw strong ropes over his head, and endeavoured to detain him by fastening them around trees; but he constantly snapped the ropes like pack-threads, and pursued his way to the forest. Some of the strongest and most furious of the fighting elephants were then brought up to engage him; but he attacked them with such fury that they were all obliged to desist. In his struggle with one of them he

broke one of his tusks, and the broken piece, which was upwards of two inches in diameter, of solid ivory, flew up into the air several yards above their heads. Orders were now given to kill him, as it appeared impossible to take him alive; but even this was not accomplished without the greatest difficulty. He twice turned and attacked the party who pursued him; and in one of these attacks struck the elephant obliquely on which the prince rode, threw him upon his side, but then passed on without offering further injury. At last he fell dead, after having received, as was supposed, upwards of 1000 balls into his body.

Among the Mexicans also were similar hunting-matches, sometimes appointed by the king; at others to provide victims for sacrifices. A large wood, generally that of Zacatapec, near the capital, was pitched upon as the scene of these grand hunting-matches. Here they chose the place best adapted for setting a number of snares and nets. The wood was enclosed by some thousands of hunters, forming a circle of six, seven, or eight miles, according to the number of animals they intended to take. Fire was then set to the grass in a great number of places, and a terrible noise made with drums, horns, shouting, and whistling. The hunters gradually contracted their circle, continuing the noise till the game were enclosed in a very small space. They were then killed or taken in snares, or with the hands of the hunters. The first Spanish viceroy of Mexico, resolving to hunt in this manner, chose out a great plain in the country of the Otomies, lying between the villages of Xilotepec and S. Giovani del Rio; the Indians being ordered to proceed according to their usual custom. The viceroy, attended by a vast retinue of Spaniards, repaired to the place appointed, where accommodations were prepared for them in houses of wood erected for the purpose. A circle of more than fifteen miles was formed by 11,000 Otomies, who started such a quantity of game on the plain, that the viceroy was quite astonished, and commanded the greater part of them to be set at liberty, which was accordingly done. The number retained, however, consisted of upwards of 600 deer and wild goats, 100 cajotes, with an innumerable number of hares, rabbits, and other smaller animals. The plain still retains the Spanish name Cazadero (the place of the chase).

Chamois HUNTING is carried on principally for the sake of the leather formed from the hide of the chamois (cervus rupicapra of Linné); which is only found on the high peaks of the Alps. The chamois hunter generally sets out in the night, that he may reach by break of day the most elevated pastures where the goats come to feed before they arrive. As soon as he discovers the place where he hopes to find them, he surveys it with his glass. If he finds none of them there, he proceeds always ascending: whenever he descries any, he endeavours to get above them, either by stealing along some gully, or getting behind some rock or eminence. When he is near enough to distinguish their horns, which is the mark by which he judges of the distance, he rests his piece on a rock, takes his

aim with great composure, and rarely misses. This piece is a rifle-barrelled carabine, into which the ball is thrust. If he has wounded the chamois, he runs to his prey, and for security hamstrings it; if the road home is difficult, he skins the chamois, and leaves the carcase; but, if it is practicable, he throws the animal on his shoulders, and bears him to his village, though at a great distance, and often over frightful precipices: he feeds his family with the flesh, which is excellent, especially when the creature is young, and he dries the skins for sale. But if, as is the most common case, the vigilant chamois perceives the approach of the hunter, he immediately takes flight among the glaciers, through the snows, and over the most precipitous It is particularly difficult to get near rocks. these animals when there are several together; for then one of them, while the rest are feeding, stands as sentinel on the point of some rock that commands a view of the avenues leading to the pasture ; and, as soon as he perceives any object of alarm, he utters a sort of hiss, at which the others instantly gather round him to judge for themselves of the nature of the danger; if it is a wild beast, or hunter, the older ones put themselves at the head of the flock, and away they fly, ranged in a line, to the most inaccessible retreats. It is here that the fatigues of the hunter begin : instigated by his passion for the chase, he is insensible to danger; he passes over snows, without thinking of the horid precipices they conceal; he entangles himself among the most dangerous paths, and bounds from rock to rock, without knowing how he is to return. Night often surprises him in the midst of his pursuit; but he does not for that reason abandon it; he hopes that the same cause will arrest the flight of the chamois, and that he shall next morning overtake them. Thus he passes the night, not at the foot of a tree, like the hunter of the plain, nor in a grotto, softly reclined on a bed of moss, but at the foot of a rock, and often on the bare points of shattered fragments, without the smallest shelter. There, alone, without fire, without light, he draws from his bag a bit of cheese, with a morsel of oaten bread, which make his common food : bread so dry, that he is sometimes obliged to break it between two stones, or with the hatchet he carries with him to cut out steps in the ice. Having thus made his solitary and frugal repast, he puts a stone below his head for a pillow, and goes to sleep, dreaming on the route which the chamois may have taken. But soon he is awakened by the freshness of the morning; he gets up, benumbed with cold; surveys the precipices which he must traverse to overtake his game; drinks a little brandy, of which he is always provided with a small portion, and sets out to encounter new dangers. Hunters sometimes remain in these solitudes for several days together, during which time their families, their unhappy wives in particular, experience a state of the most dreadful anxiety: and yet the hunters are much attached to this kind of life. I knew, says M. Saussure, a wellmade, handsome man, who had just married a beautiful woman :- ' My grandfather,' said he to me, 'lost his life in the chase ; so did my father ;

and I am persuaded, that I too shall die in the same manner: this bag which I carry with me when I hunt I call my grave-cloaths, for I am sure I shall have no other; yet if you should offer to make my fortune on condition of abandoning the chase of the channois, I could not consent.' I made some excursions on the Alps with this man: his strength and address were astonishing; but his temerity was greater than his strength; and I have heard, that, two years afterwards, he missed a step on the brink of a precipice, and met with the fate he had expected.

HUNTING THE FOX makes a very pleasant exercise, and is either above or below ground. To hunt a fox with hounds, you must draw about groves, thickets, and bushes near villages. When you find one, stop up his earth the night before you design to hunt, about midnight; while he is out to prey. This may be done by laying two white sticks across in his way, which he will imagine to be some trap laid for him; or they may be stopped up with black thorns and earth mixed. The pack should consist of twenty-five couple. The hounds should be at the cover at sun-rising. The huntsman should then throw in his hounds as quietly as he can, and let the two whippers-in keep wide of him on either hand; so that a single hound may not escape them; let them be attentive to his halloo, and let the sportsmen be ready to encourage or rate as that directs. The fox ought on no account to be hallooed too soon, as in that case he would most certainly turn back, and spoil all the sport. Two things Mr. Beckford particularly recommends, viz. the keeping all the hounds steady, and making them all draw. Many huntsmen, says he, are fond of having them at their horse's heels; but they never can get so well or soon together as when they spread the cover; besides, I have often known, when there have been only a few finders, that they have found their fox gone down the wind, and been heard of no more that day. Much depends upon the first finding of your fox : for I look upon a fox well found to be half killed. People are generally in too great a hurry on this occasion. There are but few instances where sportsmen are not too noisy, and too fond of encouraging their hounds, which seldom do their business so well as when little is said to them. The huntsman ought to begin with his foremost hounds, and keep as close to them as he can. No hounds can then slip down the wind and get out of his hearing; he will also see how far they carry the scent, a necessary requisite; for without it he never can make a cast with any certainty. You will find it not less necessary for your huntsman to be active in pressing his hounds forward when the scent is good, than to be prudent in not hurrying them beyond it when it is bad. It is his business to be ready at all times to lend them that assistance which they so frequently need, and which, when they are first at a fault, is the most critical. A hound at that time will exert himself most; he afterwards cools, and becomes more indifferent about his game. Those huntsmen who do not get forward enough to take advantage of this eagerness and impetuosity, and direct it pro-

perly, seldom know enough of hunting to be of much use to them afterwards. Though a huntsman cannot be too fond of hunting, a whipper-in easily may. His business will seldom allow him to be forward enough with the hounds to see much of the sport. His only thought therefore should be to keep the hounds together, and to contribute as much as he can to the killing of the fox: keeping the hounds together is the surest means to make them steady. When left to themselves they seldom refuse any blood they can get; they become conceited : learn to tie upon the scent; and besides this they frequently get a trick of hunting by themselves, and are seldom good for much afterwards. Every country is soon known; and nine foxes out of ten, with the wind in the same quarter, will follow the same track. It is easy therefore for the whipper-in to cut short and catch the hounds again. With a high scent you cannot push on hounds too much. Screams keep the fox forward, at the same time that they keep the hounds together, or let in the tail hounds : they also enliven the sport ; and, if discreetly used, are always of service; but in cover they should be given with the greatest caution. Halloos seldom do any hurt when you are running up the wind, for then none but the tail hounds can hear you : when you are running down the wind, you should halloo no more than may be necessary to bring the tail-hounds forward; for a hound that knows his business seldom wants encouragement when he is upon a scent. Most fox hunters wish to see their hounds run in a good style. A pack of harriers, if they have time, may kill a fox, but I defy them to kill him in the style in which he ought to be killed ; they must hunt him down. If you intend to tire him out, you must expect to be tired also yourself; I never wish a chase to be less than one hour, or to exceed two: it is sufficiently long if properly followed, it will seldom be longer unless there be a fault somewhere, either in the day, the huntsman, or the hounds. Changing from the hunted fox to a fresh one is as bad an accident as can happen to a pack of fox-hounds, and requires all the ingenuity and observation that man is capable of to guard against it. Could a fox-hound distinguish a hunted 'fox as the deer hound does the deer that is blown, fox-hunting would then be perfect. A huntsman should always listen to his hounds while they are running in cover; he should be particularly attentive to the headmost hounds, and he should be constantly on his guard against a skirter; for, if there he two scents, he must be wrong. Generally speaking, the best scent is least likely to he that of the hunted fox : and, as a fox seldom suffers hounds to run up to him as long as he is able to prevent it, so, nine times out of ten, when foxes are hallooed early in the day, they are all fresh foxes. The hounds most likely to be right are the hard-running linehunting ones; or such as the huntsman knows had the lead before there arose any doubt of changing. With regard to the fox, if he break over an open country, it is no sign that he is hard run; for they seldom at any time will do that unless they are a great way before the hounds. Also, if he run up the wind; they

seldom or never do that when they have been long hunted and grow weak; and when they run their foil, that also may direct him. All this requires a good ear and nice observation; and indeed in that consists the chief excellence of huntsmen. When the hounds divide in two parts, the whipper-in, stopping, must attend to the huntsman and wait for his halloo, before he attempts to stop either : for want of proper ma-nagement in this, I have known the hounds stopped at both places, and both foxes lost. If they have many scents, and it is uncertain which is the hunted fox, let him stop those that are farthest down the wind; as they can hear the others, and will reach them soonest: in such a case there will be little use in stopping those that are up the wind. When hounds are at a check, let every one be silent and stand still. Whippers-in are frequently at this time coming on with the tail-hounds. They should never halloo to them when the hounds are at fault; the least thing does them harm at such a time, but a halloo more than any other. The huntsman, at a check, had better let his hounds alone, or content himself with holding them forward, without taking them off their noses. Should they be at a fault, after having made their own cast (which the huntsman should always first encourage them to do), it is then his business to assist them farther ; but, except in some particular instances, I never approve of their being cast as long as they are inclined to hunt. Gentlemen, when hounds are at fault, are too apt themselves to prolong it. They should always stop their horses some distance behind the hounds; and, if it be possible to remain silent, this is the time. They should be careful not to ride before the hounds or over the scent; nor should they ever meet a hound in the face unless to stop him. Should you at any time be before the hounds, turn your horse's head the way they are going, get out of their track, and let them pass by you. In dry weather, and particularly in heathy countries, foxes will run the roads. If gentlemen at such times will ride close upon the hounds, they may drive them miles without any scent. High-mettled foxhounds are seldom inclined to stop whilst horses are close at their heels. No one should ever ride in a direction which, if persisted in, would carry him amongst the hounds, unless he be at a great distance behind them. The first moment that hounds are at fault is a critical one. Those who look forward may perhaps see the fox; or the running of sheep, or the pursuit of crows, may give them some tidings of him. Those who listen may sometimes take a hint which way he is gone from the chattering of a magpie; or perhaps be at a certainty from a distant halloo: nothing that can give any intelligence at such a time ought to be neglected. Gentlemen are too apt to ride all together : were they to spread more, they might sometimes be of service; particularly those who, from a knowledge of the sport, keep down the wind : it would then be difficult for either hounds or fox to escape their observation. You should, however, be cautions how you go to a halloo. The halloo itself must in a great measure direct you; and, though it afford no certain rule, yet you may

frequently guess whether it can be depended upon or not. At the sowing time, when boys are keeping off the birds, you will sometimes be deceived by their halloo; so that it is best, when you are in doubt, to send a whipper-in to know the certainty of the matter. Hounds ought not to be cast as long as they are able to hunt. It is a common idea, that a hunted fox never stops; but Mr. Beckford informs us that he has known them stop even in wheel ruts in the middle of a down, and get up in the middle of the hounds. The greatest danger of losing a fox is at the first finding him, and when he is sinking; at both which times he will frequently run short, and the eagerness of the hounds will frequently carry When the fox is first them beyond the scent. found, every one ought to keep behind the hounds till they are well settled to the scent; and, when the hounds are catching him, they ought to be as silent as possible; and eat him eagerly after he is caught. In some places they have a method of treeing him; that is, throwing him across the branch of a tree, and suffering the hounds to bay at him for some minutes before he is thrown among them: the intention of which is to make them more eager, and to let in the tail-hounds; during this interval also they recover their wind, and are apt to eat him more readily. Our author, however, advises not to keep him too long, as he supposes that the hounds have not any appetite to eat him longer than while they are angry with him.

In case a fox escape so as to earth, countrymen must be got together with shovels, spades, pickaxes, &c., to dig him out, if they think the earth not too great. They make their earths as near as they can in ground that is hard to dig, as in clay, stony ground, or amongst the roots of trees; and their earths have commonly but one hole, and that is straight and a long way in before you come at their couch. Sometimes they take possession of a badger's old burrow, which has a variety of chambers, holes, and angles. To facilitate this way of hunting the fox, the huntsman must be provided with one or two terriers to put into the earth after him, that is, to fix him into an angle; for the earth often consists of many angles : the use of the terrier is to know where he lies; for as soon as he finds him, he continues baying or barking, so that which way the noise is heard that way dig to him. Your terriers must be garnished with bells hung in collars, to make the fox bolt the sooner; besides, the collars will be some small defence to the terriers. The instruments to dig with are, a sharp-pointed spade, which serves to begin the trench where the ground is hardest, and broader tools will not so well enter; the round hollowed spade, which is useful to dig among roots, having very sharp edges; the broad flat spade to dig with, when the trench has been pretty well opened, and the ground softer; mattocks and pickaxes to dig in hard ground, where a spade will do but little service; the coal-rake to cleanse the hole, and to keep it from stopping up; clamps, wherewith you may take either fox or badger out alive to make sport with afterwards.

HUNTING THE HARE. As of all chases the hare makes the greatest pastime, so it gives

no little pleasure to see the craft of this small animal for her self-preservation. If it be rainy, the hare usually takes to the highways; and if she come to the side of a young grove, or spring, she seldom enters, but squats down till the hounds have overshot her; and then she will return the way she came, for fear of the wet and dew that hangs on the boughs. In this case the huntsman ought to stay 100 paces before he comes to the wood side, by which means he will perceive whether she return as aforesaid; which if she do, he must halloo in his hounds, and call them back; and that presently, that the hounds may not think it the counter she came first. The next thing to be observed is the place where the hare sits, and upon what wind she makes her form, either upon the north or south wind : she will not willingly run into the wind, but upon, aside, or down the wind; but if she form in the water, it is a sign she is foul and measled; if you hunt such a one, have a special regard all the day to the brook sides; for there and near plashes, she will make all her crossings, doublings, &c. Some hares are so crafty that as soon as they hear the sound of a horn they instantly start out of their form, though it were at the distance of a quarter of a mile, and go and swim in some pool, and rest upon some rush-bed in the midst of it. Such will not stir thence till they hear the sound of the horn, and then they start out again, swim to land, and stand up before the hounds for hours before they can kill them, swimming and using all subtle-ties and crossings in the water. Nay, such is the subtlety of a hare, that sometimes, after she has been hunted three hours, she will start a fresh hare, and squat in the same form. Others, after being hunted a considerable time, will creep under the door of a sheep-cot, and hide themselves among the sheep; or, when they have been hard hunted, will run in among a flock of sheep, and will by no means be gotten out till the hounds are coupled up, and the sheep driven into their pens. Some of them will take the ground like a coney, which is called going to the vault. Some will go up one side of the hedge and come down the other, the thickness of the hedge being the only distance between the courses. A hare that has been sorely hunted, has got upon a quickset hedge, and ran a good way upon the top thereof, and then leapt off upon the ground; and they frequently betake themselves to furze bushes, and leap from one to the other, whereby the hounds are frequently in default. Having found where a large hare has relieved in some pasture or corn field, you must then consider the season of the year, and the weather: for, if it be in spring or summer, a hare will not then set in bushes, because they are often infested with pismires, snakes, and adders; but will set in corn fields and open places. In winter, they seat near towns and villages, in tufts of thorns and brambles, especially when the wind is northerly or southerly. Ac-cording to the season and nature of the place where the hare is accustomed to seat, there beat with your hounds, and start her; which is better sport than trailing her from her relief to her form. After the hare has been started, and is on

foot, step in where you saw her pass, and halloo in your hounds, until they have all undertaken it and go on with it in full cry; then recheat to them with your horn, following fair and softly at first, making not too much noise either with horn or voice; for at the first hounds are apt to overshoot the chase through too much heat. But when they have run an hour, and you see the hounds are well in with it, and stick well upon it, then you may come in nearer with them, because their heat will then be cooled, and they will hunt more soberly. But above all things, mark the first doubling, which must be your direction for the whole day; for all the doublings that she will make afterwards will be like the former; and according to the policies that you shall see her use, and the place where you hunt, you must make your compasses great or small, long or short, to help the defaults, always seeking the moistest and most commodious places for the hounds to scent in.

HUNTING THE HART OR STAG. Gesner, speaking of hart-hunting, observes, that this wild and subtle beast frequently deceives its hunter by windings and turnings. Wherefore the prudent hunter must train his dogs with words of art, that he may be able to set them on and take them off at pleasure. First he should encompass the beast in her own layer, and so unharbour her in the view of the dogs, that so they may never lose her slot or footing. Neither must he set upon every one, either of the herd or those that wander solitarily, or a little one; but partly by sight, and partly by the footing and fumets, make a judgment of the game, and also observe the largeness of his layer. The huntsman, having made these discoveries in order to the chase, takes off the couplings of the dogs; and some on horseback, others on foot, follow the cry with the greatest art, observation, and speed; remembering and intercepting him in his subtle turnings and headings; with all agility leaping hedges, gates, pales, ditches : neither fearing thorns, down-hills, nor woods, but mounting a fresh horse if the first tire. Follow the largest head of the whole herd, which must be singled out of the chase; which the dogs perceiving must follow, not following any other. The dogs are animated to the sport by the winding of But horns, and the voices of the huntsmen. sometimes the crafty beast sends forth his little squire to be sacrificed to the dogs and hunters, instead of himself, lying close the mean time. In this case the huntsman must sound a retreat, break off the dogs and take them in, that is, leam them again, until they be brought to the fairer game; which rises with fear, yet still strives by flight, until he is wearied and breathless. The nobles call the heast a wise hart, who, to avoid all his enemies, runs into the greatest herds, and so brings a cloud of error on the dogs, to obstruct their farther pursuit; sometimes also bearing some of the herd into his footings, that so he may the more easily escape by amusing the dogs. Afterwards he betakes himself to his heels again, still running with the wind, not only for the sake of refreshment, but also because he can thus more easily hear the voice of his pursuers, whether they be

far off or near. But being again discovered by ine hunters, and the sagacious scent of the dogs, he flies into herds of cattle, as cows, sheep, &c., leaping on a cow or ox, laying the fore-parts of his body thereon, so that touching the earth only with his hinder feet, he may leave very little or no scent behind. But their usual manner is, when they see themselves hard beset, and every way intercepted, to make force with their horns at the enemy who first comes upon them, unless they be prevented by spear or sword. When the beast is slain, the huntsman winds the fall of the beast; and then the whole company come up, blowing their horns in triumph for such a conquest; among whom, the skilfullest opens the beast, and rewards the hounds with what properly belongs to them, for their future encouragement, for which purpose the huntsmen dip bread in the blood of the beast to give to the hounds. It is very dangerous to go in to a hart at bay; of which there are two sorts, one on land and the other in water. If the hart be in deep water, where you can not well come at him, couple up your dogs; for, should they continue long in the water, it would endanger their surbating or foundering. In this case get a boat and swim to him, with drawn dagger, or else with a rope that has a noose, and throw it over his horns: for, if the water be so deep that the hart swims, there is no danger in approaching him; otherwise you must be very cautious. As to the land bay, if a hart be burnished, consider the place; for if it be in a plain and open place, where there is no wood or covert, it is dangerous and difficult to come in to him; but if he be on a hedge-side, or in a thicket, then, while the hart is staring on the hounds, you may come softly and covertly behind him, and cut his throat. If you miss your aim, and the hart turn head upon you, then take refuge at some tree; and, when the hart is at bay, couple up your hounds; and when you see the hart turn head to fly, gallop in roundly to him, and kill him with your sword. The first ceremony, when the huntsman comes in to the death of a deer, is to cry 'ware haunch,' that the hounds may not break in to the deer; which being done, the next is the cutting his throat, and blooding the youngest hounds, that they may the better love a deer, and learn to leap at his throat: then the mort having been blown, and all the company come in, the best person, who hath not taken say before, is to take up the knife that the keeper or huntsman is to lay across the belly of the deer, some holding by the fore legs, and the keeper or huntsman drawing down the pizzle, the person who takes say, is to draw the edge of the knife leisurely along the middle of the belly, beginning near the brisket, and drawing a little upon it, enough in the length and depth to discover how fat the deer is; then he that is to break up the deer, first slits the skin from the cutting of the throat downwards, making the arber, that so the ordure may not break forth, and then he paunches him, rewarding the hounds with it. In the next place, he is to present the same person who took say, with a drawn hanger, to cut off the head of the deer. Which being done, and the hounds rewarded, the concluding ceremony is, if it be a stag, to draw a

triple mort; and if a buck, a double one, and then all who have horns blow a recheat in concert, and immediately a general whoop.

HUNTING THE OTTER is performed with dogs, and also with otter spears; with which, when they find themselves wounded, they make to land, and fight with the dogs most furiously, as if they were sensible that cold water would annoy their green wounds. There is indeed craft to be used in hunting them, but they may be caught in snares under water, and by river sides : but great care must be taken, for they bite sorely; and, if they remain long in the snare, they will get themselves free by their teeth. In hunting them, one man must be on one side of the river, and another on the other, both beating the banks with dogs; and the beast not being able to endure the water long, you will soon discover if there be an otter or not in that quarter. If any of the hounds find out an otter, then view the soft grounds and moist places, to find out which way he bent his head : and then follow the hounds, and lodge him as a hart or deer. But if you do not find him quickly, you may suppose he is gone to couch somewhere farther off from the river; for sometimes they will go to feed a considerable way from the place of their rest, choosing rather to go up the river than down it. Those who hunt otters must carry their spears, to watch his vents, that being the chief advantage; and if they perceive him swimming under water, they must endeavour to strike him with their spears, and, if they miss, must pursue him with their hounds, which, if they be good, will go chanting and trailing along the river side, and will beat every root of a tree, osier-bed, and tuft of bulrushes : nay, they will sometimes take water and bait the beast like a spaniel, by which means he will hardly escape.

We will now give a short definition of the principal terms used in hunting. 1. For beasts as they are in company :- Hunters say, a herd of harts, and all manner of deer; a bevy of roes; a sounder of swine; a rout of wolves; a richess of martens; a brace or leash of bucks, foxes, or hares; a couple of rabbits or coneys. 2. For their lodging :- A hart is said to harbour; a buck lodges; a roe beds; a hare seats or forms; a coney sits; a fox kennels; a marten trees; an otter watches; a badger earths; a boar couches. Hence, to express their dislodging, they say, unharbour the hart; rouse the buck; start the hare; bolt the coney; unkennel the fox; untree the marten; vent the otter; dig the badger; rear the boar. 3. For their noise at rutting time :---A hart belleth; a buck growns or troats; a roe bellows; a hare beats or taps; an otter whines; a boar freams; a fox barks; a badger shrieks; a wolf howls; a goat rattles. 4. For the footing and treading :- Of a hart, they say the slot; of a buck, and all fallow-deer, the view; of all deer, if on the grass, and scarce visible, the foiling; of a fox, the print; and of other vermin, the footing; of an otter, the marks; of a boar, the track; the hare, when in open field, is said to sore; when she winds about to deceive the hounds, she doubles; when she beats on the hard highway, and her footing comes to be perceived, she pricketh; in snow, it is called the trace of

the hare. 5. The tail of a hart, buck, or other deer, is called the single; that of a boar, the wreath; of a fox, the brush, or drag; and the tip at the end, the chape; of a wolf, the stern; of a hare and coney, the scut. 6. The ordure of a hart and all deer, is called fewmets or fewmishing; of a hare, crotiles or crotising; of a boar, lesses; of a fox, the billiting; and of other vermin, the fuants; of an otter, the spraints. 7. As the attire or parts of deer, those of a stag, if per-fect, are the bur, the pearls, the little knobs on it, the beam, the gutters, the antler, the surantler, royal, sur-royal, and all at top the croches; of the buck, the bur, beam, brow-antler, black-antler, advancer, palm, and spellers. If the croches grow in the form of a man's hand, it is called a palmed head. Heads bearing not above three or four, and the croches placed aloft. all of one height, are called crowned heads; heads having double croches, are called forked heads, because the croches are planted on the top of the beams like forks. 8. Of the young, they say, a litter of cubs, a nest of rabbits, a squirrel's dray. 9. The terms used in respect of the dogs, &c., are as follows :--Of greyhounds, two make a brace; of hounds, a couple; of greyhounds, three make a leash; of hounds, a couple and half. They say, let slip a greyhound; and, cast off a hound. The string wherein a greyhound is led, is called a leash; and that of a hound, a lyome. The greyhound has his collar, and the hound his couples. We say a kennel of hounds, and a pack of beagles. 10. The following terms and phrases are more im-mediately used in the progress of the sport itself :--- When the hounds, being cast off, and finding the scent of some game, begin to open and cry, they are said to challenge; when they are too busy ere the scent be good, they are said to babble; when too busy where the scent is good, to bawl ; when they run it endwise orderly, holding in together merrily, and making it good, they are said to be in full cry; when they run along without opening at all, it is called running mute; when spaniels open in the string, or a greyhound in the course, they are said to lapse; when beagles bark and cry at their prey, they are said to yearn; when the dogs hit the scent the contrary way, they are said to draw amiss; when they take fresh scent and quit the former chase for a new one, it is called hunting change; when they hunt the game by the heel or track, they are said to hunt counter; when the chase goes off, and returns again traversing the same ground, it is called hunting the foil; when the dogs run at a whole herd of deer, instead of a single one, it is called running riot; dogs set in readiness where the game is expected to come by, and cast off after the other hounds are passed, are called a relay. If they be cast off ere the other dogs come up, it is called vauntlay; when, finding where the chase has been, they make a proffer to enter, but return, it is called a blemish; a lesson on the horn to encourage the hounds, is named a call, or recheat; that blown at the death of a deer, is called the mort; the part belonging to the dogs of any chase they have killed is the reward. They say, take off a deer's skin; strip or case a hare, fox, and all sorts of vermin:

which is done by beginning at the snout, and turning the skin over the ears down to the tail.

HUNTINGDONSHIRE. Before the Roman invasion, this county, with the adjacent counties of Cambridge, Norfolk, and Suffolk, was inhabited by the Cenamini or Cenemagni. The Romans included it in the province of Flavia Cæsariensis. The Saxons made it part of the kingdom of East Anglia, at which time it was called Huntendunescyre and Hantandunscyre. It was subsequently subjugated by the Mercian kings. Huntendunscyre signifies hunters'-down shire, this district being at the time it was so first named well adapted for the sport of hunting, as it was almost one continued forest.

Huntingdonshire, sometimes called Hunts, is an inland county, bounded by Northamptonshire on the north, north-west, and west; by Bedfordshire on the south and south-west; and by Cambridgeshire on the east, south-east, and north-It extends in length about twenty-six east. miles, in breadth twenty, and in circumference about seventy-six miles, containing about 194,950 acres of land. It lies in the Norfolk circuit, and its ecclesiastical government is in the province of Canterbury, and the diocese of Lincoln. The fenny part of it is in the Bedford Level. It is divided into four hundreds, one borough, six market-towns, and seventy-nine parishes. It is remarkable that this county and Cambridgeshire are joined together under one civil government, there being but one high sheriff for both, who is alternately chosen one year out of Cambridge-shire, the second out of the Isle of Ely in the same county, and the third out of this county.

The climate of Huntingdonshire on the whole is tolerably healthy, considering that all the east or north-east part of the county is skirted by fens, and that but a small part of it is well supplied with spring-water. Mr. Maxwell remarks, that this county possesses several distinct sorts of soil: viz. first, fens or moors; second, skirty land; third, meadow land; fourth, strong deep stapled soil, either consisting of clay or of gravel with a mixture of loam; and, fifth, thin stapled light clay. It appears, from an invaluable list in Mr. Parkinson's View of the Agriculture of this county, that the greater part is watered by ponds. The Ouse and the Nen are the only rivers which communicate with the county, the former falling into it at St. Neots, whence it winds through several parishes into Cambridgeshire, which it enters at or near Erith. The latter divides the northern part from the county of Northampton, in which county it rises, and, flowing through a delightful vale, reaches Huntingdonshire near Elton. It is here that it forms the boundary between the two counties, and, meandering to the north, passes Yarwell and Wansford ; soon after, winding to the east, through a more level country, it pursues a devious course to Peterborough, below which it sinks into the Fens, and slowly winds through Wisbech to the sea. Some smaller streams water the north-east side of this county, together with large meres, or pools of water; namely, Whittlesea-mere, Ramsey-mere, Ugg-mere, &c. Most of the meres are visited by abundance of wild fowl. The river Ouse is navigable along

its whole line across this county. Inland navigation is neglected in Huntingdonshire: there is, however, a canal, navigable from Ramsay to Lynn in Norfolk; also from Warboys to the same place.

The chief produce of this county is corn and cattle, with fowl and sheep. The cheese of Hunts is deemed of an excellent quality. The sheep are a mixed race, and have been much improved by crosses of the Lincolnshire and Leicestershire breeds. They are without horns, and of imperfect shape, but are found profitable from the quantity of wool they produce; their fleeces weighing from seven to eight pounds each. Those of the native sheep still found, seldom exceed four pounds in weight. The cows are bred with little attention, and are also a mixture of many races. A principal object of pursuit is the suckling of calves to supply veal to London. Many horses are bred in the lower part of the county.

Two medicinal springs are mentioned by Camden, and after him by Fuller, as found at Hailweston, near St. Neots. From one of these issued fresh water, and from the other water somewhat saline. Judging of the productive quality of the ground in this county by the test laid down by Fuller, we may infer that few counties are more fertile and rich. 'The goodness of the ground,' he says, ' may certainly be collected from the plenty of convents erected therein, at St. Neots, Hinchingbrook, Huntingdon, Sautrie, St. Ives, Ramsey, &c.; so that the fourth foot at least in this shire was abbeyland, belonging to monks and friars; and such weeds we know would not grow but in rich ground. If any man say that monks might not choose their own habitations, being confined therein to the pleasure of their founders; know, there were few founders that did not first consult some religious person in the erection of convents; and such would be sure to choose the best for men of their own profession. Sure I am, it would set all England hard to show, in so short a distance, so pleasant a park as Waybridge, so fair a meadow as Portsholme, and so fruitful a tillage as Godmanchester, all three within so many miles in this county."

The county of Hunts returns four members to parliament; viz. two for the county, and two for the county town, Huntingdon. The family of viscount Hinchingbrook, as well as the ducal branch of Manchester, has always possessed a considerable influence over this county. The Probys and Ludlows have also been frequently returned. Mr. Montague, the husband of the celebrated Mrs. Montague of Portman-square, sat for the county town in 1734, 1741, 1747, 1754, and 1762. The duke of Manchester and the earl of Sandwich are deemed proprietors or patrons of both the shire and the town.

Sawtrey Beaumes, in this county, is thought to have been the birth-place of Beaumais, bishop of London in the time of Henry I., and surnamed Rufus to distinguish him from his nephew, who was afterwards bishop of the same see. He was appointed the first warden of the marshes of Wales, and afterwards governor of the whole of Salop. He died in January 1127-8,

-Richard Broughton, author of the Monasticum Britannicum, was born at Stukely, on the high-road from Huntingdon towards Stilton. -Sir Robert Bruce Cotton, the celebrated antiquary, whose inestimable MSS and library are now in the British Museum, was born at Denton in 1570. Died 1621 .- Huntingdon gave birth to Oliver Cromwell .- Richard Cromwell (Oliver's brother) was also a native of this town. Died 1712 .- Stephen Marshall, the parliamentary divine, and head of the Smectymnians, and whom Dugdale calls ' the bell-wether of that blessed flock,' ' Presbyterianorum anti-signanus,' was born at Godmanchester. ---- Roger, de St. Ives, an Augustine friar, who wrote against the Lollards about 1390, was born at St. Ives, and appears to have been living in 1420.

There is scarcely any manufacture in this county. A little wool-stapling and spinning of yarn are carried on in some places; also a lace manufactory at Kimbolton. Stilton is famous for its cheese : and there is a vinegar manufactory of some extent at the foot of Huntingdon bridge. The remains of antiquity in this county are principally Roman; among them are the vestiges of three roads, which were constructed by that people. The remains of Ramsey Abbey and Castle, the seat of the family of Oliver Cromwell, are of venerable date; and the churches of St. Ives, Bluntisham, and St. Neots, and the castle of Kimbolton are ancient.

HUNTINGDON, the chief town of the above county, is pleasantly situated on the north bank of the Ouse, over which there is here a bridge of six arches. It at present consists of but four parishes, having two churches, and two dissenting chapels; but is said to have been formerly a place of more importance, and to have numbered fifteen churches. Near the church of St. Mary was anciently a priory of black canons, and on an eminence near it stood a castle, erected by Edward the Elder, and enlarged by David I. of Scotland, earl of Huntingdon. Towards the eastern side of the town, where the principal part of it formerly stood, the lanes which divide the enclosures from each other still retain their ancient names; and in a piece of ground, called the Priory-Close, two stone coffins were dug up several years ago. The county assizes, in March and July, contribute greatly to the support of the town. The town-hall is a good modern building, with a piazza and shambles. The lower part contains the civil and criminal courts; and above is a spacious assembly room. The market place is commodious, and the market well supplied. The principal street is very respectable in appearance, and the whole place is well paved and lighted. Here is a free grammar-school, and a charitable green-coat-school. The county gaol is a small structure in the High-street. Huntingdon is famous for being the native place of Olivei Cromwell, whose baptism is entered in the register for 1599. It is a borough by prescription, and sends two members to parliament, chosen by about 200 freemen and inhabitant householders. It is governed by a mayor, twelve aldermen, and a common council of burgesses. The Ouse being navigable from Lynn, through this town up to Bedford, it derives its

supply of coals, wood, &c., from Lynn by barges. It has a market on Saturday, noted for corn. Fifteen miles north-west of Cambridge, and fiftyeight and a half north of London.

HUN

HUNTINGDON, an extensive mountainous county of Pennsylvania, bounded north and north-west by Lycoming county, east and north-east by Mifflin, south-east by Franklin, south and southwest by Bedford and Somerset, and west by Westmoreland. It is about seventy-five miles long, and thirty-nine broad. Limestone, iron ore, and lead, are found here. It contains eighteen townships. Huntingdon, the chief town, is situated at the north-east side of the Juniatta river, fifty miles from its mouth. It contains a court-house and a jail. Twenty-three miles south-west of Lewistown, and 184 W.N.W. from Philadelphia.

HUNTINGDON (Selina), countess of, was the second daughter of Washington, earl Ferrers, and born in 1707. She married, June 3d 1728, Theophilus, earl of Huntingdon, by whom she had a family of four sons and three daughters; but, becoming a widow, she embraced the principles of the Calvinistic methodists, and patronised the Rev. George Whitefield, whom she afterwards made her chaplain. She was long considered as the head of the sect of Calvinistic methodists, who were designated as the people of lady Huntingdon. She founded schools and colleges for their preachers, supported them with her purse, and expended annually large sums. She died June 17th, 1791, much respected for her virtues.

HUNTINGTON, or HUNT (William), who styled himself S.S., was born near Cranbrook in the weald of Kent, in 1774. He does not spare his mother's reputation in endeavouring to sustain his own; he was ' the offspring,' he tells us, of ' a double adultery.' At first he was a farmer's servant of the lowest description; then, for a while, a gun-maker; then, again, a farmer's servant; then a gardener; then a gunpowder-manufacturer; then a coal-heaver (at which period he first began to preach); then a shoe-maker; and, finally, a dissenting teacher. He added to his original name Hunt, the syllables 'ington' to escape the demand of the parish of Frittenden in Kent upon him for an illegitimate child; and S.S. to proclaim that he was, in his own estimation, a sinner saved.

' You know,' he says, 'we clergy are very fond of titles of honor; some are called lords spiritual, though we have no such lords but in the persons of the ever-blessed Trinity; others are named doctors of divinity, and prebends, though God gives no such titles; therefore I cannot conscientiously add D. D. to my function, though some hundreds have been spiritually healed under my ministry; nor have I £14 to spare to buy the dissenting title of D. D. Being thus circumstanced, I cannot call myself a lord spiritual, because Peter, the pope's enemy, con-demns it; nor can I call myself lord high primate, because supremacy, in the Scriptures, is applied only to kings, and never to ministers of the gospel. As I cannot get at D. D. for the want of cash, neither can I get at M.A. for the want of learning ; therefore I am compelled to fly for refuge to S. S., by which I mean Sinner Saved.

His own fanatical story of his conversion, and ' call' to preach, has been adverted to by the Quarterly Review (No. 48.), and other writers, to bring into contempt all modern ' experience' in religion, and conversions as different from this man's as that of St. Paul the apostle. We entirely doubt Hunt's pretensions to having ever been a real lover of good morals, and therefore dismiss his whole profession of Christianity as a mixture of knavery and fanaticism. No man of right fielding would have thought it needful to confess his mother's sins; no man, as we think, that ever hated his own, would have related them in the manner he has done.

It will be sufficient, therefore, to add, that he removed from Thames Ditton, where he commenced preacher, to London about the year 1796; that he first officiated in a chapel of lady Huntingdon's in Margaret-street, but soon obtained one of his own; and finally built the handsome meeting-house in Gray's-Inn Lane, called Providence Chapel; published largely; married the widow of Sir James Saunderson, a late lord mayor; and died rich, in 1813.

HURD (Richard), D. D., bishop of Worcester, a distinguished divine and elegant classical scholar, was born, as he himself informs us, at Congreve, in Staffordshire, in 1720. There being a good grammar school at Brewood, he was educated there under the Rev. Mr. Hillman, and, upon his death, under his successor, the Rev. Mr. Budworth, and continued under his care till he went to the university, when he was admitted to Emanuel College, Cambridge. He took his B. A.'s degree in 1738-39; his M. A.'s degree, and was elected fellow, in 1742. In 1749 he took his degree of B. D. He published the same year Remarks on Mr. Weston's Book on the Rejection of Heathen Miracles, and his Commentary on Horace's Ars Poetica, which last book introduced him to the acquaintance of Dr. Warburton, by whose recommendation to Dr. Sherlock, bishop of London, he was appointed Whitehall preacher in May 1750. He published the Commentary on the Epistle to Augustus in 1751; the new edition of both Comments, with dedication to Mr. Warburton, in 1753; and the Dissertation on the Delicacy of Friendship in 1755. His Remarks on Hume's Natural History of Religion appeared in 1757; and he was instituted this year (February 16th), to the rectory of Thurcaston, in the county of Leicester, on the presentation of Emanuel Colrege. He published Moral and Pol tical Dialogues in 1759. In 1762 he published the Letters on Chivalry and Romance; and Dialogues on Foreign Travel in 1763; and Letter to Dr. Leland of Dublin in 1764. He was made preacher of Lincoln's Inn, on the recommendation of Mr. Charles Yorke, &c., November 6th, 1765; was collated to the archdeaconry of Gloucester, on the death of Dr. Geekie, August 27th, 1767; and was appointed to open the Lecture of bishop Warburton on Prophecy in 1768. He took the degree of D. D. at Cambridge, in the commencement of this year. He published the Sermons on Prophecy in 1772; was consecrated bishop of Litchfield and Coventry, the 12th of February, 1775; and published the first volume of Ser-

mons preached at Lincoln's Inn, 1776; Dr. Hurd was now made preceptor to the prince of Wales and his brother prince Frederick. He lost his old and best friend, bishop Warburton, June 7th, 1779. He was elected member of the Royal Society of Gottingen, January 11th, 1781; and on the death of the bishop of Winchester was translated to the see of Worcester, and made a clerk of the closet. In 1783 archbishop Cornwallis died, and Hurd had it is said the offer of the archbishopric from his majesty; but he begged leave to decline it, as a charge not suited to his temper and talents, and much too heavy for him to sustain, especially in these times. It was also offered to the bishop of London, Dr. Lowth, and refused by him, as was foreseen, on account of his ill health. It was then given to Dr. Moore, bishop of Bangor. Declining all offers of preferment, bishop Hurd continued to fulfil the duties of his station for more than twenty years; during which period he enjoyed the countenance and respect of the royal family, from several members of which he even received repeated visits. The king presented to him two fine full length pictures of his Majesty and the Queen, which the bishop put up in his drawing-room with a suitable inscription. After a few days' confinement to his bed, he expired in his sleep, on Saturday morning, May 28th, 1808; having completed four months beyond his eighty-eighth year. He was buried in Hartlebury church-yard, according to his own directions. He had been bishop of Worcester for almost twenty-seven years; a longer period than any bishop of that see since the Reformation.

HUNYAD, a palatinate of Transylvania on the frontier of Hungary. It has an area of 2250 square miles, and a population of above 100,000, chiefly Walachians, with a few Germans and Hungarians.

HURA, in botany, a genus of the monadelphia order, and monœcia class of plants, natural order fifty-eighth, tricoccæ. The amentum of the male is imbricated, perianth truncated: cor. none, the filaments cylindrical, peltated on top, and surrounded with numerous or double antheræ. Female: cAL. none: cor. none: STYLE is funnel-shaped, the stigma cleft in twelve parts: cAPS. twelve-celled, with a single seed in each cell. There is but one species, viz.

H. crepitans, a native of the West Indies. It rises with a soft ligneous stem to the height of twenty-four feet, dividing into many branches, which abound with a milky juice, and have scars on their bark where the leaves have fallen off. The male flowers come out from between the leaves upon foot-stalks three inches long; and are formed into a close spike or column, lying over each other like the scales of fish. The female flowers are situated at a distance from them; and have a long funnel-shaped tube spreading at the top, where it is cut into twelve reflected parts. After the flower, the germen swells, and becomes a round compressed ligneous capsule, having twelve deep furrows, each being a distinct cell, containing one large round compressed seed. When the pods are ripe, they burst with violence, and throw out their seeds to a considerable distance. It is propagated by seeds raised on a hot-bed; and the plants must be constantly kept in a stove. The kernels are said to be purgative, and sometimes emetic.

HUR'DLE, n. s. Sax. pypeel; Goth. hurd. A texture of sticks woven together; a crate. Grate on which criminals are dragged to execution.

Settle your fine joints 'gainst Thursday next,

Or I will drag thee on a hurdle thither. Shakspeare.

The blacksmith was hanged, drawn, and quartered at Tyburn; taking pleasure upon the *hurdle*, to think that he should be famous in after-times. Bacon.

The sled, the tumbril, hurdles and the flail,

These all must be prepared. Dryden's Georgicks.

HURDLES, in fortification, are made of twigs of willows or osiers interwoven close together, sustained by long stakes, in the figure of a long square, the length being five or six feet, and the breadth three and a half. The closer they are wattled together, the better. They serve to render the batteries firm, or to consolidate the passage over muddy ditches; or to cover traverses and lodgments for the defence of the workmen against fireworks or stones. The Romans had a kind of military execution for mutineers, called putting to death under the hurdle. The criminal was laid at his length in a shallow water, under an hurdle, upon which was heaped stones, and so pressed down till he was drowned.

HURDLES, in husbandry, certain frames made either of split timber, or of hazel rods wattled together, to serve for gates in enclosures, or to make sheep-folds, &c.

HURDÍS (James), D. D., a poet of the last century, was the son of a gentleman of small fortune, and born at Bishopstone, in Sussex, in 1763. He was educated at Chichester, and in 1780 entered a commoner of St. Mary Hall, Oxford. In 1782 was chosen a demy of St. Mary Magdalen. Two years after Mr. Hurdis became tutor to the youngest son of lord Chichester, the honorable George Pelham, since bishop of Exeter. In 1788 first appeared his Village Curate, which was followed by Adriano, Panthea, Elmer and Ophelia, and the Orphan Twins. In 1791 he was presented to the living of Bishopstone; and in 1793 elected professor of poetry at Oxford, where in 1794 he took the degree of B.D. and in 1797 that of D. D. He died December 23d, 1801. In addition to the above works Dr. Hurdis was author of A Disquisition on Genesis 1 and 21; Select Remarks on the First Ten Chapters of Genesis; Sir Thomas More, a Tragedy; Cursory Remarks on the Arrangement of the Plays of Shakspeare; A Vindication of the University of Oxford from the aspersions of Mr. Gibbon; The Favorite Village, a poem, and Twelve Dissertations on the Nature and Occasions of Prophecy. His poems were published after his death in three volumes by subscription, with a life by his sister.

HURDWAR, or HAREDWARA, a town of the province of Delhi, Hindostan, on the western bank of the Ganges, near to the issuing of that river from the mountains. It is one of the most famous places of Hindoo purification; and

pilgrims from every part of India resort hither, in the month of April; on which occasion a number of merchants also attend, and form one of the largest fairs held in Hindostan. Since it came into possession of the British the heavy taxes have been abolished, and every encouragement is held out to the merchants; in consequence of which, at the great fair held every twelfth year, 1,000,000 of persons have attended. A British magistrate, supported by police officers and a corps of native infantry, always attends. Long. 78° 2' E., lat. 29° 57' N.

HURE (Charles), a French divine, the son of a laborer at Champigny sur Yonne, born in 1639. He studied theology and the eastern languages with such success that he became principal of the college at Bencourt. He wrote, 1. A Dictionary of the Bible, in 2 vols. folio. 2. A sacred Grammar. 3. A translation of the New Testament into French He was a Jansenist; and died in 1717.

HURL, v. a. & n. s.
HURL-BAT, n. s.
HUR'LER, n. s.
HURL'WIND, n. s.
HUR'LY,
Hup'ry pupty

From hurolt, to throw down, Islandic; or, according to Skinner, from whirl. Fr. harlubrelu, inconsiderately : hurl, to throw with

HUE'LY-BURLY. J hurl, to throw with violence; to utter with vehemence, but this sense is not in use; to play at a kind of game: hurl, tumult; commotion: hurl-wind for whirlwind, a violent gust: hurl-bat for whirl-bat, a weapon whirled rapidly round: hurly-burly, from the French word, as above, tumult or hustle. To hurl 'implies an unusual vehemence on the part of the agent, and an excessive provocation on the part of the sufferer.'

If he thrust him of hatred, or hurl at him by laying of wait. Numbers xxxv. 20.

They use both the right hand and the left in hurling stones. Chronicles xii. 2.

Like seattered down by howling Eurus blown, By rapid *hurlwinds* from his mansion thrown.

Sandys.

The glad merchant that does view

His ship far come from watry wilderness,

He hurls out vows. Spenser. All places were filled with turnult and hurly-burly, every man measured the danger by his own fear ; and such a pitiful cry was in every place, and in cities presently to be besicged. Knolles.

He in the same *hurl* murdering such as he thought would withstand his desire, was chosen king. *Id.*

If heav'ns have any grievous plague in store, O, let them keep it 'till thy sins be ripe,

And then hurl down their indignation

And then hurt down their indignation

On thee ! Shakspeare. Richard III. He holds vengeance in his hand,

To hurl upon their heads that break his law.

Shakspears. I with my nails digged stones out of the ground, To hurl at the beholders of my shame.

- To hurl at the beholders of my shame. Id. Winds take the ruffian billows by the top, That with the hurly death itself awake. Id. Poor discontents,
 - Which gape and rub the elbow at the news Of hurly-burly innovation. Id.
 - Methinks, I see this hurly all on foot. 1d. Hurl ink and wit,
 - As madmen stones. Ben J.mam.

478

Carew's Survey of Cornwall. Hurling taketh its denomination from throwing of the ball, and is of two sorts; to goals, and to the country: for hurling to goals there are fifteen or thirty players, more or less, chosen out on each side, who strip themselves, and then join hands in ranks, one against another: out of those ranks they match themselves by pairs, one embracing another, and so pass away; every of which couple are to watch one another during this play. Carew.

When balls against the stones are hardest throwne, Then highest up into the aire they fly;

So, when men hurle us (with most fury) downe, Wee hopefull are to be advanced thereby.

G. Withers.

Corrupted light of knowledge hurled Sin, death, and ignorance o'er all the world. Denham.

His darling sons,

Hurled headlong to partake with us, shall curse Their frail original and faded bliss. Milton.

Highly they rag'd against the Highest,

Hurling defiance towards the vaults of heaven. Id.

Thus the rash Phaeton with fury hurled And rapid rage, consumes our British world. Marvell.

She strikes the lute; but if it sound, Threatens to *hurl* it on the ground. Waller.

Young Phaeton,

From East to North irregularly hurled, First set himself on fire, and then the world.

Dryden.

Conjure him far to drive the Grecian train, And hurl them headlong to the fleet and main. Pope.

To hurl the dart, to ride the car, To stem the deluges of war, An's natch from fate a sinking land; Trample the invader's lofty crest And from his grasp the dagger wrest And desolating brand. Beattie.

The captive usurper, Hurled down from his throne, Lay buried in torper, Forgotten and lone. I broke through his slumbers, I shivered his chain, I leagued him with numbers, He's tyrant again. Byron's Manfred.

HURON, a large lake of North America, one of the five principal ones which lie partly in the British territories, and partly in those of the United States. Its form is nearly triangular, and its circumference above 1000 miles, being upwards of 240 miles long from east to west, and 180 broad from north to south. It has many bays and islands, and communicates with lake Michigan on the west by the straits of Michillimackinac, with Lake Superior on the north-east by those of St. Mary, and with lake Erie on the south by those of Detroit. It abounds with fish, particularly trout and sturgeons, and its banks with sand cherries. The Chippeway, Ottoway, and Huron Indians reside on its banks. It lies between 80° 10' and 84° 30' W. long., and between 43° 30' and 46° 10' N. lat.

On the western side of lake Huron an extensive series of islands, called the Manatoulin Islands, stretches in an easterly direction for 160 uniles;

on some of which the land rises into elevations of great height. On this lake, also, the navigator is often assailed by violent storms, attended with thunder and lightning, more terrific than in any other part of North America. Lake Michigan, at the western angle, although distinguished by a separate name, can only be considered as a part of Lake Huron, deepening into a bay of 262 miles in length, by fifty-five in breadth, and whose entire circumference is 731 miles. Between it and Lake Huron there is a peninsula, that at the widest part is 150 miles; along which, and round the bottom of Michigan, runs part of the chain forming the Land's Height to the sonthward; whence descend many large and numerous streams that run into it. On the north side of Lake Huron many rivers of considerable size run down from the Land's Height. One of them, called French River, communicates with Lake Nipissing, whence a succession of smaller ones, connected by short portages, opens an intercourse with the Ottawa River, that joins the St. Lawrence near Montreal. On the eastern extremity of the lake is the Matchedash River, which through another succession of lakes, separated only by one short portage, establishes a communication by Lake Simcoe, Holland River, and Yonge Street, with the town of York, the capital of Upper Canada. The land bordering on the western shore of the lake is greatly inferior in quality to that on Lake Erie. It is mixed with sand and small stones, and is principally covered with pines, birch, and some oaks.

HURON, a county of the United States, in Ohio, bounded south by Richland, or the parallel of lat. 41° N. and Indian Lands; east by Medina and Cayahoga counties; north by Lake Erie; and west by Indian Lands. It is watered by Black, Vermillion, and Huron rivers, Pipe and Cold creeks, and Sandusky and Portage rivers. The chief place is Aveny.

HURON, a river of the United States, in the North Western Territory, which rises near the Sciota, and running north-east falls into Lake Erie.

HURONS, a nation of North American Indians, who reside on the banks of the above lake, and whose language is spoken over a great extent of country.

IIUR'RICANE, n. s. Fr. ouragan; Span. IIURRICA'NO, n. s. Shraacan. A violent storm, such as is often experienced in the western hemisphere.

Blow winds, and crack your cheeks !

You cataracts, and hurricanoes, spout ! Shakspeare.

A poet who had a great genius for tragedy, made every man and woman too in his plays stark raging mad: all was tempestuous and blustering; heaven and earth were coming together at every word; a mere *hurricane* from the beginning to the end.

Dryden.

The ministers of state, who gave us law, In corners with selected friends withdraw; There in deaf murmurs, solemnly are wise, Whisp'ring like winds, ere *hurricanes* arise. Id.

A storm or *hurricano*, though but the force of air, makes a strange havock where it comes. Burnet.

So, where our wide Numidian wastes extend, Sudden th' impetuous hurricanes descend, Wheel through the air, in circling eddies play, Tear up the sands, and sweep whole plains away. Addison.

HURRICANES, in the warm climates, greatly exceed the most violent storms known in this country. ' The ruin and desolation accompanying a hurricane,' says Dr. Mosely in his Treatise on Tropical Diseases, ' cannot be described. Like fire, its resistless force consumes every thing in its track, in the most terrible and rapid manner. It is generally preceded by an awful stillness of the elements, and a closeness and mistiness in the atmosphere, which makes the sun appear red, and the stars larger. But a dreadful reverse succeeding-the sky is suddenly overcast and wild-the sea rises at once from a profound calm into mountains-the wind rages and roars like the noise of cannon-the rain descends in deluges-a dismal obscurity envelopes the earth with darkness-the superior regions appear rent with lightning and thunderthe earth often does, and always seems to tremble-terror and consternation distract all naturebirds are carried from the woods into the ocean: and those whose element is the sea seek for refuge on land-the frightened animals in the field assemble together, and are almost suffocated by the impetuos ty of the wind in searching for shelter, which, when found, serves only for destruction-the roofs of houses are carried to vast distances from their walls, which are beaten to the ground, burying their inhabitants under them-large trees are torn up by the roots, and huge branches shivered off, and driven through the air in every direction, with immense velocity-every tree and shrub that withstands the shock, is stripped of its boughs and foliageplants and grass are laid flat on the earth --luxuriant spring is changed in a moment to dreary winter. This dreadful tragedy ended, when it happens in a town, the devastation is surveyed with accumulated horror : the harbour is covered with wrecks of boats and vessels; and the shore has not a vestige of its former state remaining. Mounds of rubbish and rafters in one place, heaps of earth and trunks of trees in another, deep gullies from torrents of water, and the dead and dying bodies of men, women, and children, half buried, and scattered about, where streets but a few hours before were, present the miserable survivors with a shocking conclusion of a spectacle to be followed by famine, and, when accompanied by an earthquake, by mor-tal diseases.' These destructive phenomena are now thought to arise from electricity, though the manner in which it acts in such cases is unknown. See WIND.

HUR'RY, v.n. & n. s.) Sax. pengian, to HUR'RIER, n. s. Splunder : hurs was likewise a word used by the old Germans in urging their horses to speed, and seems the imperative of the verb .- Johnson. To hasten; to put into precipitation or confusion; to drive confusedly; to move on with precipitation: hurry, tumult; commotion: hurrier, a disturber.

Your nobles will not hear you; but are gone To offer service to your enemy ;

And wild amazement hurries up and down

479

The little number of your doubtful friends.

Shakspeare.

Among all the horrible hurries in England, Ireland was then almost quiet. Hayward.

Mars, that horrid hurrier of men. Chapman. For whom all this haste

Of midnight march, and hurry'd meeting here? Milton.

That hurrycd o'er

Such swarms of English to the neighb'ring shore. Dryden.

Did you but know what joys your way attend, Id. You would not hurry to your journey's end. Impetuous lust hurries him on to satisfy it. South.

It might have pleased him in the present heat and hurry of his rage; but must have displeased him infinitely in the sedate reflection. Id.

Stay these sudden gusts of passion,

That hurry you away. Rowe's Royal Convert. An bition raises a tumult in the soul, it inflames the mind, and puts into a violent hurry of thought.

Addison.

A long train of coaches and six ran through the heart, one after another in a very great hurry. Id.

I do not include the life of those who are in a perpetual hurry of affairs, but of those who are not always engaged. Id.

A man has not time to subdue his passions, establish his soul in virtue, and come up to the perfection of his nature, before he is hurried off the stage. Id.

After the violence of the hurry and commotion was over, the water came to a state somewhat more calm. Woodward.

The pavement sounds with trampling feet,

And the mixt hurry barricades the street.

If a council be called, or a battle fought, you are not coldly informed, the reader is hurried out of himself by the poet's imagination.

Pope's Preface to the Iliad.

Time hurries on

With a resistless unremitting stream,

Yet treads more soft, than e'er did midnight thief, That slides his hand under the miser's pillow, And carries off his prize. Blair.

Ah! then and there was hurrying to and fro, And gathering tears, and tremblings of distress, And cheeks all pale, which, but an hour ago, Blushed at the praise of their own loveliness.

Byron. Childe Harold.

HURST CASTLE, a fortress in Hampshire on a remarkable tongue of the county, projecting two miles into the sea toward the Isle of Wight, though scarcely 200 yards over at high water. The castle was built by Henry VIII., and consists of a round tower, fortified by bastions. Here Charles I. remained for several days pre-vious to his trial. It is two miles west of Yarmouth.

HURT, v.a. & n.s. HURT'ER, n. s. HURT'FUL, adj. HURT'FULLY, adv. HURT'FULNESS, n.S. HURT'LESS, adj. HURT'LESSLY, adv.

Imperf. I hurt; preterper. I have hurt. Sax. pynz; Teut. hurtew; Fr. heurler, to strike. Hurt implies corporeal injury, as mischief; wound; blow; bruise; HURT'LESSNESS, n. s.) mental pain, or wound-

ed feelings; sorrow; displeasure; personal loss by injustice or wrong ; hurtful, mischievous;

Gay's Trivia.

pernicious: hurtless, innocent; harmless; incapable of doing injury.

I have slain a man to my hurt.

Why should damage grow to the hurt of the king ? Ezra.

See thou hurt not the oil and wine. Revelation. For there n'as lady ne creture,

Save on the wals old portraiture

Of horsmen, haukes, and hounds,

And hurt dere all full of woundes,

Some like bitten, some hurt with shot.

Chaucer's Dreame.

Spiritual theft is sacriledge, that is to say, Hurting of holy thinges. Id. The Persones Tale. The hurt thereby is greater than the good.

Spenser.

Genesis.

She joyed to make proof of her cruchty On gentle dame, so hurtless and so true.

Id. Faerie Queene.

Secret neglect of our duty is but only our own hurt : one man's contempt of the common prayer of the church of God may be most hurtful unto many. Hooker.

Where is he wounded ?

-There will be large cicatrices to shew the people : he received seven hurts i' the' body.

Shakspeare. Coriolanus.

My heart is turned to stone: I strike it, and it hurts my hand. Id. Othello.

Carter adventured bravely, and received two great hurts in his body. Hayward.

Virtue may be assailed, but never hurt Surprized by unjust force, but not enthralled.

Milton.

The Adonis of the sea, is so called, because it is a soving and innocent fish, that hurts nothing that has life. Walton.

Unto her home he oft would go,

Where bold and hurtless many a play he tries,

Her parents liking well it should be so; For simple goodness shined in his eyes. Sidney.

Your neighbours have found you so hurtlessly strong, that they thought it better to rest in your friendship than make new trial of your enmity. Id.

It breeds contempt

For herds to listen, or presume to pry, When the hurt lion groans within his den.

Dryden. The hurtful hazle in the vineyard shun, Nor plant it to receive the setting sun.

Id. Georgicks.

Shorter every gasp he takes,

And vain efforts and hurtless blows he makes

Id. Æneid.

The pains of sickness and hurts, hunger, thirst, and cold, all men feel. Locke.

In arms and science tis the same,

Our rivals' hurts create our fame. Prior.

HURTERS, in fortification, pieces of timber about six inches square, placed at the lower end of the platform, next the parapet, to prevent the wheels of the gun carriage from hurting the parapet, whence the name.

HURTLE, v. n. & v. a. Prabably from hurt. Fr. heurter; Ital. urtare. To clash; to skirmish; to run against any thing; to jostle; to meet in shock and encounter ; to move with violence or impetuosity, but this meaning is obsolete.

He foineth on his foo with a tronchoun ;

An he him hurtleth with his hors, adoun.

Chaucer. The Knightes Tale.

HUS

And hertily thei hurtlen al at ones

And fro the top, doune cometh the grete stones. Id. Legende of Good Women. His harmful club he gan to hurtle high,

And threaten battle to the fairy knight.

Faerie Queene.

The noise of battle hurtled in the air. Shakspeare. Kindness

Made him give battle to the lioness,

Who quickly fell before him ; in which hurtling,

From miserable slumber I awaked.

Shakspeare. As You Like It.

HUS'BAND, n.s. & v. a.	Dan. and Swed.
	hus bonde, master,
HUS'BANDLY, adj.	from house and
	Run. bonda; or
HUS'BANDRY, n. s.	Dan. and Swed.

bonde, a conductor, a male guide. A man married to a woman; the male of animals: an economist; a man that knows and practises the methods of frugality and profit : a tiller of the ground, or farmer : the verb signifies to manage with frugality; to till or cultivate: husbandless, without a husband : husbandly, thrifty; frugal : husbandman, an agriculturist : husbandry, tillage of land by manual labor; thrift; frugality; parsimony.

And after dinner, gonnen they to dance

And sing also, sauf Dorigene alone,

Which made alway hire complaint and hire mone, For she ne saw him on the dance go,

That was hire husband and hir love also.

Chaucer. The Frankeleines Tale.

This widewe, which I tell you of my tale,

Sin thilke day that she was last a wif,

In patience led a full simple lif.

For litel was hir catel and hir rente;

By husbondry of swiche as God hir sente

She found herself, and eke her doughtien two. Id. The Nonnes Priestes Tale.

Husbandry supplieth all things necessary for food. Spenser.

Husband's work is laborious and hard.

Hubberd's Tale.

Asked if in husbandry he ought did know, To plough, to plant, to reap, to sow. Id.

Bare plots full of galls, if ye plow overthwart; And compass it then, is a husbandly part. Tusser.

Think you I am no stronger than my sex, Being so fathered and so husbanded ? Shakspeare. If you shall prove

This ring was ever her's you shall as easy Prove that I husbanded her bed in Florence,

Id. Where yet she never was.

- Lorenzo, I commit into your hands
- Id. The husbandry and manage of my house. It will be pastime passing excellent,
 - If it be husbanded with modesty. Id. A widow husbandless, subject to tears ;
 - Id. A woman, naturally born to fears.

This Davy serves you for good uses; he is your serving-man, and your husbandman. Id.

Why, woman, your husband is in his old lunes again : he so takes on yonder with my husband, and so rails against all married mankind. Id.

By me invested, he compeers the best.

-That were the most, if he should husband you.

Peace hath from France too long been chased ; And all her husbandry doth lie on heaps, Corrupting in its own fertility. Id. Henry V

Id.

In my right,

There's husbandry in heaven;

Id. Macbeth. The candles are all out. Thy husband is thy lord, thy life, thy keeper,

Thy head, thy sovereign. Id. Taming of the Shrew. The seeds of virtue may, by the husbandry of Chris-

tian counsel, produce better fruit than the strength of Raleigh. self-nature.

Husbandry the Spaniards wanting in the valleys of Mexico, could not toake our wheat bear seed. Id.

I heard a great husband say, that it was a common error to think that chalk helpeth arable grounds. Bacon.

A farmer cannot husband his ground, if he sits at a great rent. Id.

The French, wisely husbanding the possession of a victory, kept themselves within their trenches.

Id. Henry VII. Many men love the sea, others husbandry; hriefly, they cannot agree in their own trades and professions, much less in their lives and actions.

Burton. Anat. Mcl.

481

s

t

If thou be master-gunner, spend not all That thou canst speak at once ; but husband it,

And give men turns of speech. Herbert. In those fields

The painful husband ploughing up his ground, Shall find all fret with rust, both pikes, and shields Hakewill.

He was a father to the fatherless, To widows he supplyed a husband's care.

Fletcher's Purple Island. Thus with Sapphira and her husband's fate

(A fault which I like them am taught too late), For all that I gave up I nothing gain, And perish for the past that I retain. Cowley.

Such, as good husbands covet or good wives (The dere companions of most happy lives)

Wrong courses take to gaine them; yet contemne Their honest love, who rightly counsel them. G. Withers.

He began with a wild method to run over all the art of husbandry, especially employing his tongue about well dunging of a field. Sidney.

A family governed with order will fall naturally to the several trades of husbandry, tillage, and pasturage. Temple.

Even though a snowy ram thou shalt hehold, Prefer him not in haste, for husband to thy fold.

Dryden.

This careful husband had been long away, Whom his chaste wife and little children mourn. Id.

If continued rain

The lab'ring husband in his house restrain, Let him forecast his work.

Id. Georgicks. Let any one consider the difference between an acre of land sown with wheat, and an acre of the same land lying without any husbandry upon it, and he will find that the improvement of labour makes the Locke.

The contract and ceremony of marriage is the occasion of the denomination of relation of husband. Id.

The greatest schemes which human wit can forge, Or bold ambition dares to put in practice,

Depend upon our husbanding a moment,

And the light lasting of a woman's will.

Rowe's Ludy Jane Grey. You have already saved several millions to the publick, and that what we ask is too inconsiderable to break into any rules of the strictest good husbandry. Swift.

The mule being more swift in his labour than the ox, more ground was allowed to the mule by the husbundenan. Broome.

VOL. XI.

HUS

And if in the mean time her husband died,

But heaven forbid that such a thought should cross Her brain though In a dream! (and then she sighed),

Nover could she survive that common loss. Byron. Don Juan.

	0		
HUSH, interj., adj., & v. n. HUSH-UP, v. a.	Danish, hys;		
HUSH-UP, v. a.	Goth. thus. The		
	interjection is		
xpressive of silence! be still	l no noise! the		
djective signifies silent; quiet: the verbs, to be			
till, or cause to be still; to appease: to hush-			
ip, to suppress in silence; to forbid to be men-			
ioned : hush-money, a bribe to	o secure silence.		
• •			

' Husht! pees," quod the miller, ' seist thon not the Frere

llow he lowreth under his hood with a doggish eye. Chaucer. The Pardonere and Tapsterc.

When they were set, and husht was al the place, And Theseus abiden bath a space,

Or any word came from his wise brest,

His eyen set he ther, as was his lest.

Id. The Knightes Tale. This frowned, that fawned, the third for shame did blush:

Another seemed envious or coy;

Another in her teeth did gnaw a rush ;

But at these strangers' presence every one did hush. Spenser.

Yet can I not of such tame patience boast,

As to be husht, and nought at all to say. Shakspearc. It was my breath that blew this tempest up,

Upon your stubborn usage of the pope;

But, since you are a gentle convertite,

My tongue shall hush again this storm of war,

And make fair weather in our blust'ring land. Id. Speak softly;

All's husht as midnight yet. Id. Tempest. My love would speak ; my duty hushes me. Shakspeare.

As we often see, against some storm,

A silence in the heav'ns, the rack stands still,

The bold winds speechless, and the orb below

Id. Hamlet. As hush as death.

The king hath done you wrong; but hush! 'tis so. Shakspearc.

There's something else to do ; hush and be mute, Or else our spell is marred. Id. Tempest.

When in a bed of straw we shrink together, And the bleak winds shall whistle round our heads, Wilt thou then talk thus to me ? Wilt thou then Hush my cares thus, and shelter me with love?

Otway.

Hushed as midnight silence go; He will not have your acclamations now.

Dryden.

Her sire at length is kind,

Calms every storm, and hushes ev'ry wind ; Prepares his empire for his daughter's ease, And for his hatching nephews smooths the scas. Id.

The court was hushed, and a whisper ran.

Addison.

This matter is hushed up, and the servants are forbid to talk of it. Pope.

A dext'rous steward, when his tricks are found, Hushmoney seuds to all the neighbours round; His master, unsuspicious of his pranks,

Pays all the cost, and gives the villain thanks.

Swift. Alas! thou art pale, and on thy brow the drops Gather like night dew. My beloved, hush -Calm thee. Byron.

24

For I have called on thee in the still night,

Startled the slumbering birds from the hushed boughs,

And woke the mountain wolves, and made the caves Acquainted with thy vainly echocd name.

Id. Manfred.

482

HUSK, n. s. & v. a. HUSK, n. s. & v. a. HUSK, p. adj. Hulsa. The outmost integument of fruits : husk, to strip off the integument : husked, covered with a husk : husky, abounding in husks.

Do but behold yon poor and starved band, And your fair souls shall suck away their souls, Leaving them but the shales and *husks* of men. Shakspeare.

Thy food shall be

The fresh brook muscles, withered roots, and husks Wherein the acorn cradled. Id. Tempest. Most seeds, in their growing, leave their husks or

rind about the root. Bacon's Natural History. Art thou returned here to repent too late,

And gather husks of learning up at last,

Now the rich harvest time of life is past,

And winter marches on so fast. Cowley. Yea, some have lived on huskes, whilst others fed

On that which was their labour's due reward, And, where pursued, (till they almost were dead) Without the world's compassion or regard. G. Withers.

Fruits of all kinds, in coat

Rough or smooth rind, or bearded *husks*, or shell She gathers; tribute large! and on the board Heaps with unsparing hand. Milton.

Some steep their seeds, and some in cauldrons boil

O'er gentle fires; the exuberant juice to drain, And swell the flatt'ring husks with fruitful grain. Dryden.

Most have found

A husky harvest from the grudging ground. Id. Virgil.

With timely care

Shave the goat's shaggy beard, lest thou too late In vain should'st seek a strainer, to dispart The *husky* terrene dregs from purer must.

Phillips.

Some, when the press

Has drained the pulpous mass, regale their swine With the dry refuse : thou, more wise, shalt steep The *hushs* in water, and again employ The pond'rous engine. Id.

Barley for ptisan was first steeped in water till it swelled; afterwards dried in the sun, then beat till the *hush* was taken off, and ground.

Arbuthnot on Coins.

Do not content yourselves with mere words, lest you feed upon husks instead of kernels. Watts.

HUSS (John), an eminent reformer and martyr, born at Huss, in Bohemia. He lived at Prague, where he was distinguished by his uncommon erudition and eloquence, and performed the functions of professor of divinity in the university, and pastor in the church of that city. He adopted the sentiments of Wickliffe, and the Waldenses; and in 1407 began openly to oppose and preach against divers errors in doctrine, as well as corruptions in point of discipline, then reigning in the church. He also endeavoured to withdraw the university of Prague from the jurisdiction of Gregory XII. whom the kingdom of Bohemia had hitherto acknowledged

as the lawful head of the church. This occasioned a violent altercation between the archbishop of Prague and our reformer, which the latter daily augmented by his exclamations against the court of Rome, and the corruptions that prevailed among the sacerdotal order. Several other circumstances contributed to inflame the resentment of the clergy against him. He adopted the philosophical opinions of the Realists, and strongly opposed, and persecuted, as some say, the Nominalists, whose number and influence were considerable in the university of Prague. He also multiplied the number of his enemies in 1403, by procuring a sentence in favor of the Bohemians, who disputed with the Germans concerning the number of suffrages which their respective nations were entitled to, in all matters decided by election, in this university. In consequence of a decree obtained in favor of the former, which restored them to their constitutional right of three suffrages, usurped by the latter, the Germans withdrew from Prague, and, in 1409, founded a new academy at Leipsic. This event no sooner happened than Huss began to inveigh with greater freedom than he had before done against the vices and corruptions of the clergy, and to recommend, in a public manner, the writings and opinions of Wickliffe, as far as they related to the papal hierarchy, the despotism of the court of Rome, and the corruption of the clergy. Hence an accusation was brought against him, in 1410, before the tribunal of John XXIII., by whom he was solemnly expelled from the communion of the church. Notwithstanding this sentence of excommunication, he proceeded to expose the Romish church with a fortitude and zeal that were almost universally applauded. He was now, therefore, summoned to appear before the council of Constance. Secured, as he apprehended, from the rage of his enemies, by the safe conduct granted him by the emperor Sigismund for his journey to Constance, his residence in that place, and his return to his own country, he obeyed the order of the council, and appeared before it to demonstrate his innocence. But, by the most scandalous breach of public faith, he was cast into prison, declared a heretic, and burnt alive in 1415; a punishment which he endured with unparalleled magna-nimity and resolution. The same unhappy fate attended Jerome of Prague, his intimate companion, who attended the council to support his persecuted friend. See JEROME. John Huss's writings, which were numerous and learned, were burnt along with him ; but copies of most, if not all of them, were preserved, and published after the invention of printing.

HUSSITES, in ecclesiastical history, a party of reformers, the followers of John Huss. They adhered to their master's doctrine after his death with a zeal which broke out into an open war, that was carried on with the most savage and unparalleled barbarity. John Ziska, a Bohemian knight, in 1420, put himself at the head of the Hussites, who were now become a very considerable party, and threw off the despotic yoke of Sigismund, who had treated their brethren in the most barbarous manner. Ziska was succeeded by Procopius, in the year 1424. The acts of Larbarity that were committed on both sides were horrible beyond expression : for, notwithstanding the irreconcileable opposition between the religious sentiments of the contending parties, they both agreed in this one horrible principle, that it was lawful to persecute and extirpate with fire and sword the enemies of the true religion; and such they reciprocally held each other. These commotions in a great measure subsided, by the interference of the council of Basil, in 1433. The Hussites, who were divided into two parties, the Calixtines and Taborites, spread over all Bohemia and Hungary, and even Silesia and Poland; and there are remains of them still subsisting in all these parts.

HUSTINGS, n.s. Sax, purzing. A council; a court held; the place where it is held.

HUSTINGS is a court held in Guildhall before the lord-mayor and aldermen of London, and reckoned the supreme court of the city. Here deeds may be enrolled, outlawries sued out, and replevins and writs of error determined. In this court also is the election of the lord-mayor and sheriffs, of the four members of parliament for the city, &c. This court is very ancient, as appears from the laws of Edward the Confessor. Some other cities have likewise had a court bearing the same name, as Winchester, York, &c.

HUS'TLE, v. a. Perhaps corrupted from hurtle. To shake together in confusion.

HUSTNAPOOR, or HASTINANAGARA, a once famous and ancient city, founded by Rajah Hasti, fifty miles north-east from the city of Delhi, much celebrated in the Hindoo Mythological Poems. It is about twenty miles southwest from Daranagur, standing on a branch of the Ganges, formerly the bed of that river. There remains only a small place of worship, the ex-tensive site of the ancient city being entirely covered with large ant-hills.

HUSUM, a town of Denmark, in the duchy of Sleswick, and capital of the bailiwic of IInsum, with a strong citadel and a very handsome church. It is seated on the river Ow, on the German Ocean, and is subject to the duke of Holstein Gottorp. Long. 9° 8' E., lat. 54°. 32' N.

HUS'WIFE, n. s. & v. a. From housewife. Hus'sy, n. s. Juse housewife in HUS'WIFERY, n. s. a good, and huswife in a bad sense. A bad

manager; also a thrifty woman; an economist : huswifery, good or bad management, es-pecially in rural business. Ilussy (corrupted from housewife, taken in an ill sense), a sorry or a bad woman; a worthless wench. It is often used ludicrously in slight disapprobation. See Housewife.

	Good huswifery trieth	
	To rise with the cock;	
	Ill huswifery lyeth	
		Tusser.
f	cheeses in dairie have Argus his eyes	
	At.1. 11 C 1.1 1 1 1 10 11	·

Tell Cisley the fault in her huswifery lies. Why should you want? Id.

The hounteous huswife, Nature on each hush Lays her fulness before you. Shakspearc. Bianca,

A huswife, that, by selling her desires,

ĩ.

Buys herself bread and cloth. Id. Othello.

483

But huswifing the little Heaven had lent, She duly paid a goat for quarter-rent ;

And pinched her belly, with her daughters' too,

To bring the year about with much ado. Dryden.

Get you in, hussy, go : now will I personate this Southern's Innocent Adul. hopeful young jade.

HUT. n.s. Sax. purce; Fr. hute. A poor cottage.

Our wand'ring saints, in woful state,

To a small cottage came at last, Where dwelt a good old honest ycoman,

Who kindly did these saints invite

In his poor hut to pass the night.

Swift. Sore pierced by wintry winds

How many shrink into the sordid hut

Of cheerless poverty. Thomson. HUTCH, n. s. Sax. ppæcca; Fr. huche. A corn chest.

The best way to keep them after they are threshed, is to dry them well, and keep them in hutches, or Mortimer. close casks.

HUTCHESON (Dr. Francis), an elegant writer of the eighteenth century, the son of a dissenting minister in the north of Ireland. He was born in 1694, and, having gone through the usual school education, was removed to the University of Glasgow. He afterwards returned to Ireland, and was about to be settled as minister to a small congregation of dissenters, in the north of that country, when some gentlemen of Dublin invited him to commence a private academy there. He had been fixed but a short time in Dublin, when his merits made him generally known; and his acquaintance was sought by men of all ranks, who had a taste for literature. Lord viscount Molesworth, and Dr. Synge, bishop of Elphin, lived in friendship with him, and assisted him with their observations upon his Enquiry into the Ideas of Beauty and Virtue, before it came abroad. The first edition was published without the author's name; but such was the reputation of the work, that lord Gran-ville, then lord lieutenant of Ireland, enquired out the author, and treated him with distinguished marks of his esteem. From this time his ac-quaintance began to be still more courted by men of distinction in Ireland. A few years after his Enquiry, his Treatise on the Passions was published. Both these works have been often reprinted, and much admired, even by those who have not assented to his philosophy. After conducting a private academy in Dublin for seven or eight years, with great reputation and success, he was called, in 1729, to Scotland, to be professor of philosophy in the University of Glasgow. Several young gentlemen came with him from the academy, and his high reputation drew many more thither from England and Ireland. He died in 1747, aged fifty-three, leaving behind him one son, Francis Hutcheson, M. D., who published, from his father's original MS., A system of Moral Philosophy, in three books; at

Glasgow, 1755, in 2 vols. 4to. HUTCHINS (John), an English topographer, born at Bradford Peverell, where his father was curate, in 1698. He was educated at Baliol College, Oxford ; and, having entered into orders, obtained several benefices, and at last the rectory of Wareham, in 1743, where he died in 1773. He wrote the llistory and Antiquities of the

county of Dorset, which was published by subscription in 2 vols. folio, with a number of beautiful plates.

HUTCHINSON (John), a well known philosophical writer, born in 1674. He at first served the duke of Somerset as steward, and in the course of his travels employed himself in colecting fossils. The duke afterwards made him his riding surveyor, a sinceure place of £200 a-year, with a good house in the Meuse. In 1724he published the first part of his Moses's Principia, in which he ridiculed Dr. Woodward's Natural History of the Earth, and attacked the doctrine of gravitation established in Newton's Principia; in 1727 he published the second part of his Moses's Principia, containing the principles of the Scripture philosophy. From this time to his death, he published a volume every year or two; which, with the MSS. he left behind him, were published in 1748, in 12 vols. 8vo. An abstract of the whole has been published in 1 vol. 12mo. However fanciful or extravagant his views of Scripture, his writings are the result of intense study and application. He died August 28th, 1737.

HUTCHINSONIANS, a name given to those who adopt the religious and philosophical opinions of Mr. J. Hutchinson. The reader may find a distinct and comprehensive summary of the Hutchinsonian system in a book, entitled Thoughts concerning Religion, &c., printed in Edinburgh in 1743; and in a letter to a bishop, annexed to it, first printed in 1732, and written by president Forbes. Bishop Horne, the Rev. Julius Bates, and the Rev. W. Jones, as well as the respectable lexicographer Mr. Parkhurst, have been considered as his disciples.

HUTTANY, a large trading town in the Mahratta territories, in the province of Bejapoor, twenty miles east from Mirjee. It has an extensive commerce with Bombay, Surat, Rachore, &c., in its manufactures of silk and cotton sarees, piece goods, &c., but its staple article is grain. The town is enclosed by a wall and ditcl, and there is a stone fort of no great strength. But here is an excellent durrumsalla, or place of accommodation for travellers. It is capable of lodging 500 persons, the horses and camels being picketed round the building. Huttany was, in 1679, a considerable place when it was taken from Serajee, who had reduced it, by the confederates from Bejapoor; and the English factory at Carwar, about the middle of the seventeenth century, had considerable traffickings here; but, on account of its frequent revolutions, the intercourse was discontinued.

HUTTEN (Ulric De), one of the early reformers, was born at Seckenburg, the seat of his family, in 1488. He studied at Fulda in 1506, and took the degree of M. A. at Frankfort on the Oder; after which he went into the imperial army, and was at the siege of Padua in 1509. Having published several poetical pieces, which were much admired, the emperor Maximilian 1., upon his return to Germany in 1516, bestowed on him the poetical crown. His cousin John de Hutten, court-marshal to Ulric, duke of Wirtemberg, being murdered by the duke, our author gave vent to his vengeance, not only by his pen, in satirising the duke in various poems, letters,

484

orations, and dialogues (collected and printed at Steckleburg in 1519, 4to), but also by his sword ; for the duke being impeached before the diet of Augsburgh, for this and other crimes, and a league being formed against him, Hutten engaged in the war. About 1520, having become a convert to the doctrines of Luther, Hutten employed his pen in defence of that great reformer, and published Leo the Xth's bull against him with comments, which so exasperated the Pope that he wrote to Albert elector of Mentz, in whose military service Hutten had engaged, to send him bound hand and foot to Rome. Hutten, however, withdrew to Brahant, and was for some time at the court of the emperor Charles V. He afterwards went to Ebernburg, where he was protected by Francis de Sickengen, a friend of Luther. He died, in August 1523, in an island in the lake of Zurich. His Latin poems were published at Frankfort in 12mo, in 1538.

HUTTON (Charles), LL. D. and F. R. S., a celebrated mathematician, was born at Newcastleupon-Tyne, August 14th, 1737. At an early age, and during the laborious accumulation of most of his own elementary knowledge, he undertook the profession of a teacher, at a village called Jesmond, from whence he removed to his native place, where he conducted a respectable seminary from 1760 to 1773. At this period he had lord Eldon, the late chancellor, for a pupil. In 1771, the bridge of Newcastle being nearly destroyed by a flood, Mr. Hutton drew up suggestions for the future security of the fabric. In 1773 he offered himself as a candidate for the professorship of the Royal Military Academy at Woolwich, and, after a rigid examination, was elected. Soon after he was chosen a fellow of the Royal Society, whose transactions he enriched with so many valuable papers, that he was fixed upon, in 1775, to conduct the observations on the Mean Density of the Earth. He was also appointed the foreign secretary to the society, which office he held till the accession of Sir Joseph Banks to the presidency, who rather illiherally displaced him, on the plea that the situation ought to be filled by a resident of the metropolis. Upon this the doctor resigned. In 1785 Dr. Hutton published his Mathematical Tables; and, the year following, Tracts on Mathematical and Philosophical Subjects, 3 vols. 8vo. In 1787 appeared the Compendious Measurer, which was followed by his Elements of Conic Sections. In 1795 came out his Mathematical and Philosophical Dictionary, in 2 vols. 4to. In 1803 he undertook, with Drs. Pearson and Shaw, an abridgment of the Philosophical Transactions. While this great undertaking was in progress, he produced a translation of Montucla's Recreations in Mathematics and Natural Philosophy, and a Course of Mathematics, in two octavo volumes. In 1806 he resigned the mastership of the Academy at Woolwich, on a pension of £500 a-year. Ile died at his house in Bedfordrow, January 27th, 1823. Dr. Hutton was twice married, and left one son, a general in the army, and two daughters.

HUTTON (William), an ingenious miscellaneous writer, was born at Derby in 1723. From the age of seven to fourteen he worked at a silk-mill, and was afterwards apprenticed to a stocking-weaver at which trade he laboured as a journeyman, until he taught himself bookbinding, by which he added to his humble income. In 1750 he opened a book-shop in Birmingham, to which he added a circulating library, and succeeded so well as to be enabled to embark in the paper business, in which, by industry and frugality, he arrived gradually at opulence. In 1791 his house in Birmingham, and villa near that town, were burnt by the rioters, for which he obtained but He died Sepan inadequate remuneration. tember 20th, 1815, at the advanced age of ninetytwo. The works of this acute and self-taught man arc, The History of Birmingham, 8vo; Journey to London; History of the Court of Requests, and of the Hundred Court of Birmingham, a lively and ingenious work ; History of Blackport; History of the Battle of Bosworth Field; History of Derby; Description of the Roman Wall; Remarks upon North Wales; Tour to Scarborough ; Poems ; Trip to Coatham, &c.

HUTTON (James), M. D., was born in Edinburgh in 1726. He was sent first to the high school of Edinburgh, and afterwards to the university, where he entered as a student of humanity. in November 1740. His friends wishing him, however, to follow business rather than science, he was placed as an apprentice to a writer to the signet; but he was afterwards allowed to exchange the profession of a writer for that of a physician. After attending the classes in the university of his native town, from 1744 to 1747, he repaired to Paris, where he pursued, with great ardor, the study of anatomy and chemistry. Having resided in that metropolis nearly two years, he returned by the way of the Low Countries, and took the degree of M.D. in September 1749. His thesis is entitled, De Sanguine et Circulatione in Microcosmo. Dr. Hutton did not, however, enter upon the practice of medicine. He cultivated his farm in Berwickshire till it ceased to have any attractions for him; and, in 1768, he took up his abode in Edinburgh, and from that time devoted his undivided attention to scientific pursuits. A good deal of his leisure, says Mr. Playfair, was now employed in the prosecution of chemical experiments. In one of these he first discovered an alkali in zeolite, or in a stony body. About this time he visited the salt-mines in Cheshire, and made those observations on the concentric circles marked on the roof of these mines, to which he has referred in his Theory of the Earth as affording a proof that the salt rock was not formed from mere aqueous deposition. While at Edinburgh he read several papers to the Philosophical Society of that city, but which, from that society being soon after in-corporated with the Royal Society, were never published, with the exception of a treatise On certain Natural Appearances of the Ground on the Hill of Arthur's Seat. The institution of the Royal Society of Edinburgh had the good effect of calling forth from Dr. Hutton the first sketch of a theory of the earth, the formation of which had been the great object of his life. Another paper from his pen, a Theory of Rain, appeared also in the first volume of the Edinburgh Transactions. He had long studied meteorology with

great attention; and this communication contains one of the few speculations in that branch of knowledge entitled to the name of theory. A more voluminous work from Dr. Hutton's pen made its appearance soon after, viz. An Investigation of the Principles of Knowledge, and of the Progress of Reason, from Sense to Science and Philosophy, in 3 vols. 4to. Ilis activity was now called into exertion by an attack on his Theory of the Earth, made by Mr. Kirwan in the Memoirs of the Irish Academy. Before this period, though Dr. Hutton had been often urged by his friends to publish his entire work on the Theory of the Earth, he had continually put off the publication; but he now began the revisal of his MS., and resolved immediately to send it to the press. The work was accordingly published, in 2 vols. 8vo., in 1795; and contained, besides the treatise formerly given in the Edinburgh Transactions, a more detailed application of his principles to the explanation of appearances. He next began a work on the Elements of Agriculture, in the progress of which, however, he was seized with a violent fever; and, though he recovered from the immediate danger, it left him to emaciated and feeble, that he died about three months after, March, 1797.

HUXING, among fishermen, a particular method of catching pikes. For this purpose they take as large bladders as can be got; blow them up, and tie them close and strong; and at the mouth of each tie a line, longer or shorter according to the depth of the water. At the end of the line is fastened an armed hook, artfully baited; and thus they are put into the water with the advantage of the wind, that they may gently move up and down the pond. When a large pike has struck himself, it affords great entertainment to see him bounce about in the water with a bladder fastened to him; at last, when they perceive him almost spent, they take him up.

HUYGENS (Christian), one of the greatest mathematicians and astronomers of the seventeenth century, was the son of Constantine Huygens, lord of Zuylichem, who had served three successive princes of Orange in the quality of secretary. He was born at the Hague in 1629, and discovered from his infancy an extraordinary partiality for the mathematics; in which he soon made great progress, and perfected himself under the famous professor Schooten, at Leyden. In 1649 he went to Holstein and Denmark, in the retinue of Henry count of Nassau. He travelled into France and England; was, in 1663, chosen F. R. S; and, upon his return to France, M. Colbert settled a considerable pension upon him to engage him to fix at Paris; to which M. Huygens consented, and staid there from 1666 to 1681, where he was admitted a member of the Academy of Sciences; and daily added to the reputation of that society. He was the discoverer of Saturn's ring, and a third satellite belonging to that planet. He discovered the means of rendering clocks exact, by applying the pendulum, and rendering all its vibrations equal by the cycloid. He died at the Hague in 1695. He was the author of several excellent works. The principal of these are contained in two collections; the first printed at Leyden in 1682; in 4to, entitled Opera Varia; and the second at Amsterdam in 1728, in 2 vols. 4to., entitled Opera Reliqua.

HUYNEN, or HUYNGEN, a town of Germany, in the late archbishopric of Cologne, now annexed to Prussia. It is twenty-five miles south of Cologne, and is included in the grand duchy of the Lower Rhine.

HUYSUM (Justus Van), an eminent painter, born at Amsterdam in 1659. He studied under Nicholas Berchem, and painted flowers, landscapes, and battles.

Iluysum (John), a celebrated Dutch painter, whose subjects were flowers, fruit, and landscapes. He was born at Amsterdam in 1682, and was a disciple of Justus Van Huysum his father. He began at first to paint, not so much for the acquisition of money as of fame, and therefore did not aim at expedition, but at delicacy. Having first attentively studied the pictures of Mignon and other artists of distinction in his own style, he painted every thing after nature; and, was so exact, as to watch even the hour of the day in which his model appeared in its greatest perfection. Ilis reputation finally rose to such a height, that he fixed immoderate prices on his works; so that none but princes, or those of princely fortunes, could become purchasers. Six of his paintings were sold at a public sale in Holland for prices almost incredible. One of them, a flower-piece, for 1450 guilders, a fruit piece for 1500, and the smaller pictures for 900. The vast sums which he thus received caused him to redouble his endeavours to excel; no person was admitted into his room while he was painting; and his method of mixing the tints, and preserving the lustre of his colors, was an impenetrable secret. From the same principle, he would never take any scholars, except one lady, named Haverman; and he grew envious and jealous even of her merit. It is universally agreed that he has excelled all who ever painted fruit and flowers before him, both in the delicacy of his pencil and his manner of finishing. The greatest truth, united with the greatest brilliancy, and a velvet softness on the s irface of his objects, are visible on every part of his compositions; and his touch looks like the pencil of nature. Those pictures which he painted on a clear ground are preferred as having greater lustre; yet there are some on a dark ground, in which appear rather more force and harmony. In grouping his flowers, he generally designed those which were brightest in the centre, and gradually decreased the force of color from the centre to the extremities. He also painted landscapes with great applause. He died in 1749, aged sixty-seven.

HUZZ, v.n.

Etymology from HUZZA', interj. & v. n. S the sound. To buzz; to murmur : huzza, a cry of acclamation or joy ; to utter acclamation; to receive with shouts of pleasure.

The huzzes of the rabble are the same to a bear that they are to a prince. L'Estrange.

He was huzzaed into the court by several thousands of weavers and elothiers. Addison.

A caldron of fat beef, and stoop of ale, On the huzzaing mob shall still prevail.

486

King's Cookery.

You keep a parcel of roaring bullies about me day and night; huzzas and hunting-horns never let me Arbuthnot. cool.

All fame is foreign, but of true desert ; Plays round the head, but comes not to the heart : One self-appoving hour whole years outweighs Of stupid starers and of loud huzzas. Pope.

Huzza boys !- By the Royal George, I swear, Tom Coxen and the crew shall straight be there: Garrick.

HY'ACINTH, n. s.) Fr. hyacinthe; Lat. HYACIN'THINE, adj. 5 hyacinthus; Gr. varivooc. A flower; the same with the lapis lyncurius of the ancients : hyacinthine, having the color of the hyacinth.

The Spartan mirtle, whence sweet gumb does flowe,

The purple hyacinthe, and fresh costmarie.

Spenser. Facrie Queenc. And hyacinthin locks

Round from his parted forelock manly hung Clustering. Milton's Paradice Lost.

Beds of hyacinth and roses, Where young Adonis oft reposes. Id. Comus.

Let these hyacinth boughs

Be his long, flowing hair,

And wave o'er his brows

As thou wavest in air.

Byron. The Deformed Transformed. Her hair in hyacinshine flow

When left to roll its folds below;

As midst her handmaids in the hall

She stood superior to them all,

Hath swept the marble where her feet

Gleamed whiter than the mountain sleet.

Id. The Giuour.

HYACINTH, in botany. See CRINUM, HYA-CINTHUS, and SCILLA.

HYACINTHIA, in antiquity, feasts held at Sparta, in honor of Apollo, and in commemoration of his favorite Hyacinthus. They lasted three days; the first and third of which were employed in bewailing the death of Hyacinthus, and the second in feasting and rejoicing.

HYACINTHUS, hyacinth, in botany, a genus of the monogynia order, and hexandria class of plants; natural order tenth, coronariæ: con. campanulated, and there are three melliferous pores at the top of the germen. There are thirteen species; of which the most remarkable is H. orientalis, the eastern hyacinth. Of this there are a great number of varieties, amounting to some hundreds. It has a large, purplish, bulbous root, sending up several narrow erect leaves, eight or ten inches long; the flower-stalk is upright, robust, and succulent, from ten to fifteen inches in height; adorned upward with many large funnel or bell-shaped flowers, swelling at the base, and cut half way into six parts; collected into a large pyramidal spike of different colors in the varieties; flowering in April or May. They are hardy, and will prosper any where, though the finer kinds require a little shelter during the winter, and may be propagated either by seeds or off-sets from the roots. The properties of a good oriental hyacinth are, a stem, perfectly upright, of moderate length, and so strong and well-proportioned that it will sustain the weight of the florets without bending; the florets should be large, swelling below, expanded above, and numerous, ten or fifteen at least, but are often twenty or thirty in number; and should be placed equally round the stem, the pedicles, on which they grow longer below than above, diminishing gradually in length upward, in such a manner as to represent a pyramid, and each pedicle sufficiently strong to support the florets without drooping. The curious in these plants take care never to plant the fine sorts two years together in the same bed of earth; for, by planting them every year in a fresh bed, the beauty of the flowers is greatly improved.

HYACINTHUS, the son of Amyclas king of Sparta, was beloved both by Apollo and Zephyrus. The youth showing most affection for the former, his rival grew jealous; and, to be revenged, one day, as Apollo was playing at the discus with Hyacinthus, Zephyrus turned the direction of a quoit, which Apollo had pitched, full upon the head of Hyacinthus, who fell down dead. Apollo then transformed him into a flower of the same name; and, as a farther token of respect, instituted the feasts of Hyacinthia.

HY'ADES, n. s.) Gr. ὑάδες. A watery con-Hy'ADS, n. s.) stellation.

Then sailors quartered heaven, and found a name For every fixed and every wandering star;

The pleiads, hyads. Dryden's Georgicks.

HYADES, in astronomy, are seven stars in the bull's head, famous among the poets for the bringing of rain. Whence their name $Ya\delta\eta c$, from the Greek veiv, 'to rain.' The principal of them is in the left eye, by the Arabs called Aldebaran.

HYADES, in the mythology, the daughters of Atlas and Pleione. Their brother Hyas being torn to pieces by a lioness, they wept for his death with such vehemence, that the gods, in compassion, translated them into heaven, and placed them in the bull's forehead, where they continue to weep; this constellation being supposed to presage rain. Others represent the Hyades as the nurses of Bacchus; and the same with the Dodonides, who fearing the resentment of Juno, and flying from the crucity of king Lycurgus, were translated by Jupiter into heaven.

IIY/ENA, in natural history, a species of the canis, with the tail straight and annulated; the hairs of the neck long and crect: ears naked: toes, four on each foot. It has six incisores, and two canine teeth in each jaw: and between the tail and the anus a transverse orifice. This quadruped is almost as large as a wolf, excepting that its legs are not so long; the hair of it is rough, and its skin spotted with divers colors. Hyænas were formerly produced at Rome in the public games, and they have been represented on some medals on account of their rarity. It inhabits Asiatic Turkey, Syria, Persia, Barbary, and the Cape of Good Hope. It has no neck, but its head is fastened to the vertebra of the back, so that it is forced to turn itself quite round, whenever it would look behind. It is very cruel and voracious; it drags dead bodies out of their graves, and carries them to its den. It also preys on herds and flocks, and has been

known to run off with live children. It is a solitary unsociable animal, living in caves. Several fossil remains of these animals have been lately found in Kirkdale, Yorkshire. See our article ENGLAND.

HYÆNIUS LAPIS, in natural history, a stone said to be found in the eyes of the hyæna. Pliny informs us, that those creatures were in old times hunted and destroyed for the sake of these stones, and that it was supposed they gave a man the gift of prophecy by being put under his tongue.

HY'ALINE, adj. Gr. νάλινος. Glassy; crystalline; made glass; resembling glass.

From heaven-gate not far, founded in view On the clear hyaline, the glassy sea. Milton.

HYBLA, in ancient geography, a town on the east coast of Sicily, called also Hybla Parva, Galeotis, and Megara ; which last name it took from the Megareans, who led thither a colony. In Strabo's time Megara was extinct, but the name Hybla remained on account of its excellent boney named from it. It was situated between Syracuse and the Leontines. Galeotæ and Megarenses were the names of the people, who were of a prophetic spirit, being the descendants of Galeus, the son of Apollo.

HYBLA MAJOR, in ancient geography, a town of Italy, in the tract lying between Mount Ætna and the river Simæthus. In Pausanias's time it was desolate.

HYBLA MINOR, or HERE, an inland town ot Sicily, situated between the rivers Oanus and Herminius; now called Ragusa.

HYBLÆI COLLES, small eminences at the springs of the Albus, near Hybla, famous for their variety of flowers, especially thyme; the honey gathered from which was by the ancients reckoned the best in the world, excepting that of Hymettus in Attica.

HYB'RIDOUS, *adj.* Gr. $i\beta\rho\mu\varsigma$; Lat. *hybrida*. Begotten between animals of different species.

Why such different species should not only mingle together, but also generate an animal, and yet that that hybridous production should not again generate, is to me a mystery. Ray.

HYBRISTICA, of Gr. $\nu\beta\rho\mu$, injury, in antiquity, a solemn feast held among the Greeks, with sacrifices and other ceremonies; at which the men attended in the apparel of women, and the women in that of men, to do honor to Venus in quality either of a god or goddess, or both. According to others, the hybristica was a feast celebrated at Argos, wherein the women, being dressed like men, insulted their husbands, and treated them with all marks of superiority, in memory of the Argian dames having auciently defended their country with singular courage against Cleomenes and Demaratus.

HYDARTHRUS, from Gr. $v\delta\omega\rho$, water, and $a\rho\theta\rho\rho\nu$, a joint, in medicine, is more usually known by the name of white swelling, and is in this country but too common. Systematic writers have generally distinguished this disease into two kinds, viz. scrofulous and rheumatic. The scrofulous is, however, much more important and dangerous than the other kind, and is perhaps the most serious disorder of the bones to

which man is subject. It commonly commences with a violent pain in one part of the joint, generally the knee, and there appears from the beginning a uniform swelling of the whole surrounding integuments. Great tension generally prevails; but at first there is seldom any external change of color. From the commencement of the disease the motion of the joint is attended with exquisite pain, and the patient keeps it constantly in a relaxed posture, finding that the easiest. Hence, the tendons become extremely stiff and rigid, till at last the joints have the appearance of complete and real anchyloses. The swelling now begins to augment, till the joint has acquired three or four times its natural size; the cuticular veins become turgid and varicose; at the same time that the muscular substance of the limb below decays, though it frequently acquires an equality in size by becoming ædematous; the pain becomes intolerable, especially when the person is warm in bed, or otherwise heated; abscesses form in different parts, which, either breaking of themselves, or, by being laid open, discharge considerable quantities of matter, but without any remarkable effect in reducing the size of the swellings. The bones are found to be carious, and pieces of them are frequently discharged. In the mean time, the health of the patient gradually declines, from the violence of the pain, and the absorption of matter into the system, which takes place in some degree from its first formation in the different abscesses; but which never appears so evidently till the different abscesses have been laid open; after which, a quick pulse, night sweats, and a weakening diarrhœa, are sure to occur, which generally carry off the patient, if the member is not either amputated, or the disease cured some other way. See MEDICINE. HYDAT'IDES, n. s. From θέωρ. Little

TYDATIDES, n. s. From $\vartheta \delta \omega \rho$. Little transparent bladders of water in any part; most common in dropsical persons, from a distension or rupture of the lympheducts.

All the water is contained in little bladders, adhering to the liver and peritoneum, known by the name of hydatides. Wiseman.

HYDE (Edward), earl of Clarendon, and lord high chancellor of England, was descended from an ancient family in Cheshire, and born at Dinton near Hindon, in Wiltshire, in 1608. He was entered of Magdalen Hall, Oxford, where in 1625 he took the degree of A.B., and afterwards studied the law in the Middle Temple. In the parliament which began at Westminster, April 10th, 1640, he served for Wotton Basset m-Wiltshire. But, that parliament being soon after dissolved, he was chosen for Saltash in · Cornwall, in the long parliament. His abilities were taken notice of, and he was employed in several committees to examine into grievances; but at last, being dissatisfied with the proceedings of the parliament, he retired to the king, and was made chancellor of the exchequer, a privy counsellor, and knight. Upon the decline of the king's cause he went to France, where, after the death of king Charles 1., he was sworn of the privy council to Charles H. In 1649 he and bord Cottington were sent ambassadors extraordinary into Spain, and in 1657 he was consti-

tuted lord high chancellor of England. In 1659 the duke of York became enamoured of Anne Hyde, the chancellor's eldest daughter, but carefully concealed the amour both from the king and chancellor. After the Restoration, however, he fulfilled his promise of marriage, and her father was chosen chanceller of the university of Oxford; soon after created baron Hindon, viscount Cornbury, and earl of Clarendon; and, on the death of Henry lord Falkland, was made lord lieutenant of Oxfordshire. In these important stations his principal aim was neither to abridge the king's prerogative, nor encroach upon the liberties of the people; he therefore refused to set aside the petition of right, nor would he endeavour again to raise the star-chamber or highcommission courts: and when he might have obtained for the king £2,000,000, for a standing revenue, he asked only £1,200,000, which he thought would still keep the king dependent upon his parliament. In this just conduct he is said to have been influenced by his father's dying advice. In 1662 he opposed a proposal for the king's marriage with the infanta of Portugal, and the sale of Dunkirk; and in the following year articles of impeachment for high treason were exhibited against him by the earl of Bristol; but they were rejected by the house of lords. In 1664 he opposed the war with Holland. In August, 1667, he was removed from his post of lord chancellor, and in November following impeached of high treason, and other crimes and misdemeanors, by the house of commons; upon which he retired into France, when a bill was passed for banishing him from the king's dominions. He now resided at Rouen in Normandy; and dying there, in 1674, his body was brought to England, and interred in Westminster Abbey. He wrote, 1. A History of the Rebellion, 3 vols. folio. 2. A Letter to the Duke of York, and another to the Duchess, upon their embracing the Romish religion. 3. An Answer to Hobbes's Leviathan. 4. A History of the Rebellion and Civil Wars in Ireland, 8vo., and some other works. His character is thus panegyrised by Horace Walpole:-- Sir Edward Hyde, who opposed an arbitrary court and embraced the party of an afflicted one, must be allowed to have acted conscientiously. A better proof was his behaviour on the Restoration, when the torrent of an infatuated nation entreated the king and his minister to be absolute. Had Clarendon sought nothing but power, his power had never ceased. A corrupted court, and a blinded populace, were less the causes of the chancellor's fall, than an ungrateful king, who could not pardon his lordship's having refused to accept for him the slavery of his country. Like justice herself, he held the balance between the necessary power of the supreme magistrate and the interests of the people. This never-dying obligation his contemporaries were taught to overlook and clamor against, till they removed the only man, who, if he could, would have corrected his master's evil government. Almost every virtue of a minister made his character venerable. As an historian, he seems more exceptionable. His majesty and cloquence, his power of painting characters, his knowledge of his subject, rank

489

him in the first class of writers; yet he has both great and little faults. Of the latter, his stories of ghosts and omens are not to be defended. His capital fault is his whole work being a labored justification of king Charles. If he relates faults, some palliating epithet always slides in; and he has the art of breaking his darkest shades with gleams of light, that take off all impression of horror. One may pronounce on my lord Clarendon, in his double capacity of statesman and historian, that he acted for liberty, but wrote for prerogative.'

HYDE (Thomas), D. D., professor of Arabic at Oxford, and one of the most learned writers of the seventeenth century, was born in 1636, and studied first at Cambridge, and afterwards at Oxford. Before he was eighteen years of age he was sent from Cambridge to London to assist Walton in the great work of the Polyglot Bible; and about that period undertook to transcribe the Persian Pentateuch out of the Hebrew characters, which archbishop Usher, who well knew the difficulty of the undertaking, pronounced to be an impossible task to a native Persian. He, however, succeeded in his task, and was made archdeacon of Gloucester, canon of Christ Church, head keeper of the Bodleian library, and professor of Hebrew and Arabic, in the university of Oxford. He was interpreter and secretary of the Oriental languages, during the reigns of Charles II., James II., and William III. Of all his learned works (the very catalogue of which, as observed by Anthony Wood, is a curiosity), his Religio Veterum Persarum is the most celebrated. Dr. Gregory Sharpe collected several of his pieces formerly printed, and republished them, with some additional dissertations, and his life prefixed, in 2 elegant vols. 4to. He died on the 18th of February, 1702. Among his other works is, A Latin Translation of Ulug Beig's Observations on the Longitude and Latitude of the fixed Stars.

HYDER ALY, or ALI, a celebrated Indian usurper, and for some time a formidable opponent of the British interest in the East Indies. lle was the son of a killader, or governor of a fort, to the king of Mysore, and acquired his skill in military tactics in the French army. In 1753 he distinguished himself as their auxiliary at Trichinopoly. In 1763, being commander of the Mysore army, he dethroned his sovereign, and governed the kingdom under the title of regent. In the wars with the British, between 1767 and 1770, he displayed great spirit and abilities; but in 1771 he was totally defeated by the Mahrattas. During the peace that followed he greatly improved his army and revenues. In 1780 he made an irruption into the Carnatic, and cut to pieces a British detachment under colonel Baillie; but his victorious career was soon stopped by Sir Eyre Coote, who, with a force scarcely exceeding 7000 men, gained a complete victory over Hyder Ali at the head of 150,000, and defeated him six times successively afterwards, the last of which victories was obtained on the 7th of June 1782. Hyder died in December 1782.

HYDERABAD, Telingana, or Golconda, an extensive province of Hindostan, situated chiefly

between the sixteenth and nineteenth degrees of northern latitude, and between the rivers Godavery and Kistna; but the name is now also applied to all the territories of the Nizam. It may be stated therefore to be bounded on the northeast by the territories of the Berar rajah, and on the north-west by those of the Poonah Mahrattas. on the west by the same power, and on the south and east by the British possessions; being about 350 miles in extreme length, and about 300 in breadth. It thus comprises the ancient provinces of Beder and Nandere, part of Dowlet or Aurungabad, part of Bejapore, and part of Berar; and is principally governed by zemindars, or granted in jagiers (fiefs) to the officers of government. The former are nearly independent. The whole of the land, except some portions set aside for charitable purposes and the estates of the nizam and his family, is thus in the hands of a few individuals; but it is fertile, and, if well managed, it would yield much more abundantly. Its commerce is very confined, the diamond mines hardly paying the expense of working; and the only other article being cotton, which is bartered for salt and European commodities. The chief towns are Hyderabad, Golconda, Warangole. Aurungabad, Beder, and Ellichpore. A considerable portion of the inhabitants are Mahommedans: the majority, however, are Hindoos; but the population is thin.

Hyderabad was once subject to the rajahs of Telingana and Bijanagur, but was conquered by the Mahommedans in the fifteenth century, and in the year 1512 was formed into a separate kingdom under the name of Golconda. Abdoolah Kuttub Shah, of the original dynasty, died in 1674, and was succeeded by his son in law Aboul Hussen, who, in the year 1687, was taken prisoner by Aurungzebe, and Golconda converted into one of the provinces of the Mogul empire, and, with the other five southern provinces, was formed into a viceroyalty, called the Soubadar of the Deccan. In 1719 a Mogul officer, named Cheen Khilij Khan, appointed to this government, had a very large army placed under his command to keep freebooters in awe; and this inspired him with the ambition of founding an independent kingdom. He for several years employed himself in getting possession of the strong holds; and, when summoned to Delhi, proceeded thither with so large a force as to overawe his master.

He is also accused of having encouraged the Persian Nadir Shah to invade Hindostan in 1739 ; and having, after that event, been appointed vizier or prime minister, he left to Mohammed the emperor nothing but the name. For two years he governed at Delhi with absolute sway, during which period he appointed his son Ghazy ad Deen, his deputy ; but, the Mahrattas having invaded the Deccan, he marched in 1741 to meet them with a numerous army. On his arrival at Arcot he found that country in total confusion; and not fewer than twenty petty chiefs assuming the title of rajah : the measures that he pursued, however, tranquillised the country; and he disposed of its different offices to his friends, with out consulting the court of Delhi. He now made Anrungahad his capital, but died at Boor

hanpore in the year 1748, aged 104 years. His eldest son, Ghazy ad Deen, was, at this period, one of the ministers at Delhi; and the second son, Nasir Jung, having obtained possession of the treasure and the army, was too powerful to be dispossessed: he was therefore confirmed by the emperor Ahmed as soubadar of the Deccan. Assassinated in 1750, this prince was succeeded by his nephew Muzuffer Jung, who was put to death the following year, and succeeded by his consin Salabut Jung, who held the government for ten years. He was then confined by his brother Nizam Aly, who for nearly twenty years was engaged in wars with Hyder Aly, the British, and the Mahrattas; and had it not been for his alliance with the British, in 1800, his kingdom would have been annihilated. Nizam Aly transferred the seat of government from Aurungabad to Hyderabad, and died in 1803, being succeeded by his son Mirza Sekunder Jah; and the family is supported in its authority by a British force of 10,000 men, and by treaties of alliance offensive and defensive. There is also a British ambassador constantly residing at this court.

HYDERABAD, the capital of the above kingdom, is situated on the south bank of the Musa, about six miles from the fortress of Golconda. It is said to have been founded about the year 1586, by Mohammed Kootub Shah, who named it Hyderabad, in compliment to the caliph Aly, one of whose titles was Hyder Allah (the Lion of God). It continued to be the residence of the Kootub Shahy dynasty till 1687, when it was taken by Aurungzebe. The late Nizam Aly was the first of the nizams that made it his residence, and expended considerable sums of money in improving Hyderabad. It is now a fine and flourishing city, of about seven miles in circumference, surrounded by a stone wall, with towers at the angles and gates. It contains two palaces and some handsome mosques; and between it and Golcouda are various splendid tombs.

HYDERABAD is also the name of a city, the capital of the province of Sinde, Hindostan. A fortress of this name stands on a rock the foot of which is washed by the Fulalee, a branch of the river Indus. Its shape is an irregular pentagon, defended at the angles by round towers. The fortifications are of such a nature as to be very formidable to the native troops. Inside the fort is a good bazaar and several handsome mosques. It is the residence of the princes, who form the aristocracy by which this province is governed, and contains about 15,000 inhabitants. A considerable trade is carried on, by means of the river, with Moultan Tattah, and other towns at the mouths of the Indus.

IIYDNUM, in botany, a genus of the natural order of fungi, cryptogamia class of plants. The fungus is echinated or prickly on the under side. One of the species, viz.

II. imbricatum, is a native of Britain, and is found in woods. It has a convex hat, tiled, standing on a smooth pillar, of a pale flesh color, with white prickles. It is eaten in Italy, and is said to be of a very delicate taste.

HY'DRA, n. s. Lat. hydra. A monster with many heads slain by Hercules: whence any multiplicity of evils is termed a hydra. Or like the hell-borne hydra, which they faine That great Alcides whilome overthrew, After that he had laboured long in vaine To crop his thousand heads, the which still new Forth budded, and in greater number grew.

Spenser. Faerie Queene. New rebellions raise

Their hydra heads, and the false North displays Her broken league to imp her serpent wings.

Milton.

More formidable hydra stands within, Whose jaws with iron teeth severely grin. Dryden. Subdue

The hydra of the many-headed hissing crew. Id.

HYDRA, in fabulous history, was a serpent in the marsh of Lerna, in Peloponnesus, with many heads, one of which being cut off, another, or two others, immediately succeeded in its place, unless the wound was instantly cauterised. Hercules attacked this monster; and, having caused Iolaus to hew down wood for flaming brands, as he cut off the heads he applied the brands to the wounds, by which means he destroyed the hydra. This hydra is supposed to have been a multitude of serpents which infested the marshes of Lerna, near Mycene, and seemed to multiply as they were destroyed. Hercules, with the assistance of his companions, cleared the country of them, by burning the reeds in which they lodged.

HYDRA, in astronomy, a southern constellation, consisting of a number of stars, imagined to represent a water serpent. See ASTRONOMY.

HYDRA, in zoology, a genus of the order of zoophyta, belonging to the class of vermes. There are several species, known by the general name of polypes. See ANIMALCULE, and PO-LYPUS.

HYDRA, an island between the Archipelago, and the eastern side of the peninsula of the Morea, south of the gulf of Athens and east of that of Napoli, long. 20° 50' E. lat. 37° 20' N. It is about twenty-four miles long from north-east to south-west, and ten miles in breadth across the middle, where it is broadest, the extremities tapering almost to a point. If in other parts of Greece, as M. Castellan remarks, we see a people either miserable or diseased. in a rich country and under a balsamic climate, the rocks of Hydra present us with the agreeable spectacle of a vigorous population, which has found the means of creating for itself riches out of a territory naturally confined and barren, and has displayed a spirit of enterprise and speculation almost unique even in Greece. The Schypetars of Albania are found in Hydra as in some other districts of Greece; these colonists, to whom, after the expedition of the Russians into Greece, many refu-gees from the Peloponnesus united themselves, have improved the ancient race of inhabitants. This appears in the activity which they now discover, and sometimes also by the examples of harshness and cruelty which they afford, and the piracies which they commit.

Happily the greater part of the population of the island prefer enriching themselves by peaceable and honest means, and owe their prosperity solely to their industry. According to M. Pouqueville they have 120 vessels, forty of which are from 400 to 600 tons burden, which used to visit all the ports of the Mediterranean and of the

Atlantic as far as America. The productions and merchandise of France, of Italy, of the Barbary states, and of Egypt, furnish the Hydriots with objects of traffic to the ports of the Levant. The Peloponnesus, especially the canton of Olympia, supplies them with wood for the building of their ships, and many of the continental Greeks afford them funds, which these islanders use to the greatest advantage, though they are destitute of the sciences, and all their knowledge is practical. Even in navigation itself, they are mariners by necessity and by education. From their very childhood they undertake sea voyages, employ themselves in the management of ships, learn to know the latitudes they must constantly travel over, and share in the profits of the expedition. They are hard drinkers, it is true; and it is said, that they sometimes empty in one month the vessels destined for the supply of the whole voyage. Yet mariners, though often intoxicated are full of intelligence, and of wonderful probity: they carry no bills of lading; the money, which they are intrusted to convey, they put into ticketed bags, and for-ward with the utmost fidelity. Their vessels are well armed, and since the year 1821 they have boldly attacked and put to flight the Turkish squadrons. This island formerly used to furnish an important supply of sailors, and even officers for the Turkish navy.

The island of Hydra owes its embellishments to the people that inhabit it; nature is very sparing : it is from Attica that they fetch even those vegetables with which they used formerly to supply that country; so great is the change that has taken place in this province. The town of Hydra, where the senate is held, contains about 3000 houses, and 16,000 inhabitants, some of whom are rich. They are very fond of dress. The merchants speak three or four different languages. There is a small port for ships, and the quay is lined with houses neatly whitened, the fronts of which are furnished with covered galleries. A great number of warehouses, filled with grain and other provisions, bespeak the trade to which the inhabitants are devoted. The women, who are brown, but well made and of an agreeable figure, appear in the streets, having their veils thrown over only the lower parts of the body, while the children, entirely naked, run about on the shore, or swim near the coast. A female, convicted of an intrigue, would be imprisoned for life, and the seducer punished with the bastinado and banished, if private vengeance did not direct against him the poniards and pistols of the injured relatives.

There is a handsome church in the town, which attracts the attention of foreigners: its front is ornamented with pillars of white marble, and surmounted by a steeple of the same material; it has also a cloister surrounding it, formed with arches. The images painted in water colors, the sculptures in wood, and the gilded adornings of the choir, the pilasters of marble which separate the latter from the nave, every thing announces, that the inhabitants spared nothing to embellish the place of their worship, which they practise with all the fervor common to the Greeks. Their Papas know how to make themselves useful and

even necessary to their countrymen; they bless their ships with great pomp. Without this ceremony, they think, the captain and his crew would have no prosperity; and they never fail to burn little wax-lights before the image of the Madonna or Panagia, which is placed at the stern.

This island has not even a single spring. From their commerce, however, they derive good bread, and wine of no inferior quality. On their return from their voyages, the Hydriots love to indulge in good cheer. What Tyre was on a large scale Hydra is in miniature. If the island were larger, this rock would have great influence over the affairs of Greece.

HYDRABAD, the capital of Golconda and of the Deccan, a large city, seated in a plain, on the banks of a river that runs into the Kistna. It is surrounded with walls, and defended with towers; and contains above 100,000 inhabitants It is 690 miles south of Delhi, and 270 E. N.W. of Madras, according to Mr. Crutwell; but Dr Brookes and J. Walker make it 352 miles north by east of that city. Long. 78° 52' E., lat. 17° 17' N.

HYDRABAD, a fort of Hindostan Proper, in the province of Sindy, the residence of a Mahommedan prince, who is tributary to the king of Candahar. It is situate on the Indus, near Nusserpour. Long. 69° 30' E., lat. 25° 29. N.

HY DRAGOGUES, n. s. Gr. $\vartheta \delta \omega \rho$ and $\dot{\alpha} \gamma \omega$; Fr. hydragogue. Such medicines as occasion the discharge of watery humors, which is generally the case of the stronger cachartics, because they shake most forcibly the bowels and their appendages.

HYDRAGOGUES, from $v\delta\omega\rho$, water, and $a\gamma\epsilon\nu$, to draw, are used in dropsies; but the original use of the term proceeded upon a mistaken supposition, that every purgative had some particular humor which it would evacuate, and which could not be evacuated by any other. It is now, however discovered, that all strong purgatives will prove hydragogues, if given in large quantity or in weak constitutions. The principal medicines recommended as hydragogues are—the juice of elder, the roots of iris, soldanella, mechoacan, jalan, &c.

jalap, &c. HYDRANGEA, in botany, a genus of the digynia order, and decandria class of plants; natural order thirteenth, succulentæ : CAPS. bilocular, birostrated, and cut round or parting horizontally. There are four species; the chief, H. arborescens, is a native of North America, whence it has been brought to Europe, and is preserved in gardens, more for the sake of variety than beauty. It rises about three feet high ; and has many soft pithy stalks, garnished with two oblong heart-shaped leaves, placed opposite. The flowers are produced at the top of the stalks in a corymbus. They are white, composed of five petals with ten stamina surrounding the style. These plants are easily propagated by parting the roots, in the end of October. They thrive best in a moist soil, but must be sheltered from frost.

HYDRARGYRUM, mercury, or quicksilver; so called from $v \tilde{c} \omega \rho$, water, and $a \rho \gamma v \rho \sigma g$, silver; q. d. water of silver, on account of its resembling liquid or melted silver. See PHARMACY.

HYDRASTIS, in botany, a genus of the polygamia order, and polyandria class of plants. There is neither calyx nor nectarium; there are three petals; and the berry is composed of a monospermous acini.

HYDRAU'LICS, n. s. Gr. vowp, the addi. science of convey-

HYDRAU'LIC, adj. ing water through pipes or conduits : hydraulical, hydraulic, from the substantive, relating to the conveyance of water through pipes.

Among the engines in which the air is useful, pumps may be accounted, and other hydraulical engines. Derham.

We have employed a virtuoso to make an hydraulick engine, in which a chymical liquor, resembling blood, is driven through elastick channels.

Arbuthnot and Pope.

HYDRAULICS comprehend the science of the motion of fluids and the construction of all kinds of instruments and machines relating thereto. See HYDROSTATICS

HYDRIODIC Acid, in chemistry, is, like the muriatic acid, a gaseous substance when in an insulated state. If four parts of iodine be mixed with one of phosphorus, in a small glass retort, applying a gentle heat, and adding a few drops of water from time to time, a gas comes over, which must be received in the mercurial bath. Its specific gravity is 4.4. It is elastic and invisible, but has a smell somewhat similar to that of muriatic acid. Mercury after some time decomposes it, seizing its iodine, and leaving its hydrogen, equal to one-half the original bulk, at liberty. Chlorine, on the other hand, unites to its hydrogen, and precipitates the iodine. From these experiments, it evidently consists of vapor of iodine and hydrogen, which combine in equal volumes, without change of their primitive bulk. Hydriodic acid is partly decomposed at a red heat, and the decomposition is complete if it be mixed with oxygen. Water is then formed and iodine separated.

We can easily obtain an aqueous hydriodic acid very economically, by passing sulphureted hydrogen gas through a mixture of water and iodine in a Woolfe's bottle. On heating the liquid obtained, the excess of sulphur flies off, and leaves watery hydriodic acid. When exposed to the air, it is speedily decomposed, and iodine is evolved. Concentrated sulphuric and nitric acids also decompose it. When poured into a saline solution of lead, it throws down a fine orange precipitate. With solution of peroxide of mercury, it gives a red precipitate ; and, with that of silver, a white precipitate insoluble in ammonia.

The compounds of hydriodic acid with the salifiable bases may be easily formed, either by direct combination, or by acting on the basis in water with iodine. Upon a determinate quantity of iodine, pour solution of potassa or soda, till the liquid ceases to be colored. Evaporate to dryness, and digest the dry salt in alcohol, which will retain the hydriodate. Then distil off the alcohol, and complete the neutralisation of the potassa, by means of a little hydriodic acid separately obtained. Sulphurous and muriatic acids, as well as sulphureted hydrogen, produce

no change on the hydriodates, at the usual temperarute of the air. Chlorine, nitric acid, and concentrated sulphuric, instantly decompose them, and separate the iodine. With solution of silver, they give a white precipitate insoluble in animonia; with the pernitrate of mercury, a greenish-yellow precipitate; with corrosive sublimate, a precipitate of a fine orange-red, very soluble in an excess of hydriodate ; and, with nitrate of lead, a precipitate of an orange-ycllow color. They dissolve iodine, and acquire a deep reddish-brown color.

Hydriodate of ammonia results from the combination of equal volumes of ammoniacal and hydriodic gases; though it is usually prepared by saturating the liquid acid with ammonia. It is nearly as volatile as sal ammoniac; but it is more soluble and more deliquescent. It crystallises in cubes.

Hydriodate of zinc is easily obtained, by putting iodine into water with an excess of zinc, and favoring their action by heat. When dried it becomes an iodide.

HYDROCELE, in medicine, from vowp, water, and $\kappa\eta\lambda\eta$, a tumor, would literally signify any swelling or tumor produced by water; bu: it is confined by surgeons of the present time to those which possess either the membranes of the scrotum, or the coats of the testicle and its vessels. Of this disease there are only three different kinds, one the anasarcous hydrocele, in which the fluid is lodged in the cellular texture of the scrotum; a second in which it is contained in the tunica vaginalis; and a third in which it it is collected in the spermatic cord.

The anasarcous hydrocele is generally a symptom of dropsy throughout the whole body; but some instances have occurred of a local cause producing a mere local dropsy of the scrotum. Thus, it has been known to happen from swellings in the groin and in the abdomen obstructing the passage of the lymphatics. When this is the case, if tumors producing such obstructions can be extirpated, no other means will afford such effectual relief: but, when they are so deeply seated as to render any attempt for removing them improper, the practice of making punctures in the most depending part of the tumor to drain off the fluid must be employed, with a view to palliate such symptoms as occur.

The hydrocele of the tunica vaginalis, is a preternatural collection of the aqueous fluid, employed by nature for lubricating the surface of the testicle. The symptoms are, a fulness at first observed about the inferior parts of the testicle, and most remarkable when the patient is erect, becoming gradually more tense as the disease advances; the tumor by degrees changing from the globular to the pyramidical form; no degree of pressure making the swelling disappear at any period of the disease. In the early part of the disease, therefore, if it be not combined with hernia, or with a hydrocele of the cord, the spermatic process may be distinctly felt, because the swelling does not extend beyond the scrotum. In its more advanced state, it cannot be distinguished; the weight of the tumor now drags the skin of the neighbouring parts so much as to cause the penis almost to disappear ; and in this state of the disease the testicle cannot be felt without much difficulty. On a minute examination, a hardness is always to be felt along that part of the scrotum where the testicle is situated; and at this point pressure excites some uneasiness. Fluctuation of fluid may in general be distinguished through the whole course of the disease. In late stages, however, the appearance of a fluid is not very evident.

-

....

The transparency of the tumor has been generally supposed to be the principal criterion of this species of the disorder: but this must depend upon the nature of the contents, or thickness of the sac; so that, though the transparency of the tumor is a certain sign of the existence of water, its opacity cannot upon any account be considered as an indication of its absence. Through the whole course of the disease, the cumor is not attended with pain, but some uneasiness is commonly felt in the back by the weight of the swelling of the spermatic cord. This is more particularly the case when a suspensory bandage is not used. In the radical cure of hydrocele, in whatever way it is attemptcd, some degree of inflammation will take place.

The cure of the hydrocele of the tunica was formerly effected by one of three methods; either by caustic, by the seton, or by incision. Although in most cases any one of these methods will induce a cure, yet that of simple incision is less liable to produce violent inflammation, the danger of which from the proximity of the intestings is too evident to require discussion.

But the surgeons of the present day do not generally make use of any of these systems. The cure is now generally attempted by the injection of some irritating fluid which will cause inflammation throughout the whole extent of the tunica. The preference is usually given to wine, and commonly that is somewhat diluted; but, where no pain is excited by the injection, the liquor should be discharged, and a stronger one used. For where no pain takes place a cure is not to be expected.

The hydrocele of the spermatic cord is either anasarcous or encysted. The anasarcous kind is attended with a colorless tumor in the course of the spermatic cord, soft and inelastic to the touch, and unaccompanied with fluctuation. In an erect position of the body it is of an oblong figure; but, when the body is recumbent, it is flatter. . Generally it is no longer than that part of the cord which lies in the groin, though it sometimes extends as far as the testicle, and even stretches the scrotum to an uncommon size; an instance of which is related by Mr. Pott, who from a swelling of this kind discharged eleven pints at once. By pressure a great part of the swelling can always be made to recede into the abdomen; but it instantly returns to its former situation on the pressure being withdrawn.

When the tumor is connected with general anasarca of the system, it can only be cured with the rest of the disease; but, when the swelling is local, the remedy is also to be locally applied. An incision is to be made of such a size as may be sufficient for discharging the whole of the water; in the performance of which, attention is necessary to guard against hurting the spermatic vessels. The contents of the tumor being discharged, the sore is to be treated like any other simple wound.

Encysted hydrocele of the spermatic cord sometimes begins in the upper, but generally in the lower part of the spermatic cord. On its first appearance it is so small as to give little or no trouble; hence it is seldom particularly attended to till it has acquired a considerable size. By degrees it extends as far as the abdominal muscles, and sometimes reaches to the bottom of the scrotum; and, to a person unacquainted with the appearance of the disorder, may be mistaken for a hydrocele of the tunica vaginalis. But here the tumor is always above the testicle, which is distinctly felt below; whereas, in the advanced stages of hydrocele in the vaginal coat the testicle cannot be distinctly felt. In the encysted hydrocele of the cord, the figure and size of the penis is little altered; whereas, in cases of common hydrocele, the penis frequently disappears almost entirely. In adults, the cyst, in every variety of incysted hydrocele, becomes so firm as not to be affected by external applications; so that, when the tumor becomes large, it is necessary to use means for producing either a palliative or radical cnre, in the same manner as is done for a hydrocele in the tunica vaginalis. See SURGERY and MEDICINE.

HYDROCEPHALUS, in medicine, (fron: $v\delta\omega\rho$ water, and $\kappa\epsilon\phi\alpha\lambda\eta$ the head), is as the name imports a dropsy of the head, and is commonly called water on the brain. It is a disease almost peculiar to children, being seldom observed in persons above the age of twelve or fourteen, and it seems to be most prevalent in scrofulous families. With respect to the proximate cause of hydrocephalus very opposite opinions are entertained by different medical writers. It appears generally to begin with slight inflammation, but whether as a cause or only as a symptom is a matter of dispute. The disease appears to be constitutional. Patients usually complain first of a pain in some part below the head, commonly about the nape of the neck and shoulders; often in the legs; and sometimes, but rarely, in the arms. The pain is not uniformly acute, nor always fixed to one place; and some-times does not affect the limbs. Some have violent sickness and head-aches alternately. From being perfectly well and sportive, some are in a few hours seized with those pains in the limbs, or with sickness, or head-ach, in a slight degree; whilst others are observed to droop a few days before they complain of any local indisposition. In this manner they continue three, four, or five days. They then complain of an acute deepseated pain in the head, extending across the forehead from temple to temple; of which, and a sickness, they alternately complain in short and affecting exclamations; dosing a little in the intervals, breathing irregularly, and sighing much while awake. Sometimes their sighs, for a few minutes, are incessant. As the disease advances, the pulse becomes slower and irregular, till within a day or two of the fatal termination, when it becomes exceedingly quick; the breathing being deep, irregular, and laborious. After the first access, which is often attended with

feverish heats, the heat of the body is for the most part temperate, till at last it keeps pace with the increasing quickness of the pulse. The head and præcordia are always hot from the first attack. The sleeps are short and disturbed, sometimes interrupted by watchfulness and startings. In the first stage there is a peculiar sensibility of the eyes, and intolerance of light. But in the progress of the disease a very opposite state occurs. The pupil is remarkably dilated, and cannot be made to contract by the action even of strong light. Various methods of cure have been attempted, but the disease almost always terminates fatally. See MEDICINE.

HYDROCYANIC Acid. See Prussic Acid.

HYDROCHARIS, the little water lily, a genus of the enneandria order, and diœcia class of plants; natural order first, palmæ. Male spatha diphyllous: CAL trifid: con. tripetalous; the three inferior filaments styliferous. Female CAL trifid: con. tripetalous; the styles six: CAPS. six celled and polyspermous inferior. There is only one species, a native of Britain, growing in slow streams and wet ditches. It has kidney-shaped leaves, thick, smooth, and of a brownish-green color, with white blossoms. There is a variety with double flowers of a very sweet smell.

HYDROCOTYLE, water navelwort, a genus of the digynia order, and pentandria class of plants; natural order forty-fifth, umbellatæ. The umbel is simple; the involucrum tetraphyllous; the petals entire; the seeds are half round and compressed. There are several species, none of which are ever cultivated in gardens. One of them, a native of Britain, growing in marshy grounds, is supposed by some farmers to occasion the rot in sheep. The leaves have central leaf-stalks, with about five flowers in a rundle; the petals are of a reddish white.

HYDROGEN GAS, in chemistry (from υδωρ, water and yEvvaw to produce), is the lightest species of ponderable matter hitherto discovered. The following is the best method of obtaining it :--Into a phial furnished with a bent tube fitted to its cork, or into a retort, put some pieces of pure redistilled zine, or harpsichord iron wire, and pour on them sulphuric acid diluted with five times its bulk of water. An effervescence will ensue, occasioned by the decomposition of the water, and disengagement of hydrogen, which may be collected in the pneumatic apparatus. For very accurate researches, it must be received in jars over mercury, and exposed to the joint action of dry muriate of lime, and a low temperature. It derived its name from the property it posssesses of forming water when mixed with oxygen, and exposed to the electric shock. If a bottle, containing the effervescing mixture of iron and dilute sulphuric acid, be shut with a cork, having a straight tube of narrow bore fixed upright in it, then the hydrogen will issue in a jet, which, being kindled, forms the philosophical candle of Dr. Priestley. If a long glass tube be held over the flame, moisture will speedily bedew its sides, and harmonic tones will soon begin to sound. Mr. Faraday, in an ingenious paper inserted in the tenth number of

the Journal of Science, states, that carbonne oxide produces, by the action of its flame, similar sounds, and that therefore the effect is not due to the affections of aqueous vapor, as had formerly been supposed. He shows, that the sound is nothing more than the report of a continued explosion, agreeably to Sir H. Davy's theory of the constitution of flame. Vapor of ether, made to burn from a small aperture, produces the same sonorous effect as the jet of hydrogen, of coal gas, or olefiant gas, on glass and other tubes. Globes from seven to two inches in diameter, with short necks, give very low tones; bottles, Florence flasks, and phials, always succeeded; air jars, from four inches diameter to a very small size, may be used. Some angular tubes were constructed of long narrow slips of glass and wood, placing three or four together, so as to form a triangular or square tube, tying them round with pack-thread. These, held over the hydrogen jet, gave distinct tones.

Professor Dobereiner has discovered that, by throwing a jet of hydrogen gas on a small pellet of spongy platinum, the platinum instantly becomes red hot and the jet of hydrogen inflamed. Mr. Gordon of Oxford Street has formed a lamp on this principle, which is actually a new apparatus for procuring instantaneous fire. See our articles CHEMISTRY in which the nature properties and combination of hydrogen are fully treated of, and GAS in which its application to lighting of roads, shops, &c., is detailed. One of the principal objections to its use as a light is the strong disagreeable smell. But if hydrogen gas, obtained by the solution of iron in sulphuric acid, be made to pass into pure alcohol, it almost entirely loses its smell. Water added to the alcohol renders it milky; and, on resting some hours, a volatile oil separates, which is the cause of the well-known smell of hydrogen gas. This gas is obtained perfectly free of smell, by putting into pure water an amalgam of potassium; but, if there be added to the water an acid or sal-ammoniae to accelerate the development of the gas, the latter will have the smell, which is observed during the solution of zinc in weak sulphuric acid. Ann. de Chim. et de Phys., October 1824.

HYDROG'RAPHER, n. s. Fr. hydro-HYDROGRAPHY, n. s. Sgraphe; Greek, $v \mathcal{E} \omega \rho$ and $\gamma \rho \alpha \phi \omega$. One who draws maps of the sea. Description of the watery parts of the globe.

It may be drawn from the writings of our hydrographers. Boyle.

HYDROGRAPHY is the art of measuring and describing the sea, rivers, canals, lakes, &c. With regard to the sea, it gives an account of its tides, counter-tides, soundings, bays, gulfs, creeks, &c.; also the rocks, shelves, sands, shallows, promontories, harbours; the distance and bearing of one port from another; with every thing that is remarkable, whether out at sea or on the coast.

HYDROLEA, in botany, a genus of the digynia order, pentandria class of plants: CAL. pentaphyllous: con. rotaceous; the filaments at the base cordate: CAPS. bilocular and bivalved. There are four species, two of which are natives of South America, two of the East Indies.

HY'DROMANCY, n. s. Fr. hydromantie; Gr. ΰδωρ and μαντία. Prediction by water.

Divination was invented by the Persians : there are four kinds of divination; hydromancy, pyromancy, aeromancy, and geomancy. Ayliffe.

HY'DROMEL, n. s. Fr. hydromel; Gr. ΰδωρ and μέλι. Honey and water.

Hydromel is a drink prepared of honey, being one of the most pleasant and universal drinks the northern part of Europe affords, as well as one of the most ancient. Mortimer.

In fevers the aliments prescribed by Hippocrates were ptisans and cream of barley : hydromel, that is, honey and water, when there was no tendency to a delirium. Arbuthnot.

HYDROM'ETER, n.s. Greek, $v\delta\omega\rho$ and Hydrom'etrry, n.s. $\mu\epsilon\tau\rho\sigma\nu$. An instrument to measure the extent or depth of water: the act of measuring it.

HYDROPHO'BIA, n. s. Fr. hydrophobie; Gr. ύδροφοβία. Dread of water.

Hydrophobia is a kind of madness, well known in every village, which comes by the biting of a mad dog; or scratching [saith Aurelianus), touching, or smelling alone, sometimes (as Sckenkius proves), and is incident to many other creatures as well as man; so called because the parties so affected cannot endure the sight of water, or any liquor, supposing still they see a mad dog in it. Burton. Anat. Mel.

HYDROPHOBIA in medicine, is a disease generally communicated to man by the bite of a rabid dog, and is so called because one of its principal symptoms is the inability of the patient to swallow water or any other liquid. It is called by some writers canine madness, and seldom makes its appearance till a considerable time after the bite of the rabid animal. In some few instances it has commenced in seven or eight days from the accident; but generally the patient continues in health for twenty, thirty, or forty days, or even much longer. The bite will in general be healed long before that time, frequently with the greatest ease; though sometimes it resists all kinds of healing applications, and forms a running ulcer, which discharges a quantity of matter for many days. The approach of the disease is known by the cicatrix of the wound becoming high, hard, and elevated, and by a peculiar sense of prickling at the part; pains shoot from it towards the throat; sometimes it is surrounded with livid or red streaks, and seems to be in a state of inflammation; though often there is nothing remarkable to be observed. The patient becomes melancholy, loves solitude, and feels sickness at the stomach. Sometimes the peculiar symptom, the dread of water, comes on all at once. Sometimes the disease begins like a common sore throat; and, the soreness daily increasing, the hydrophobic symptoms appear like a convulsive spasm of the muscles of the In others, the mind is first affected, and fauces. a real dread of water arises before the patient tries whether he can swallow it. But, in whatever manner this symptom comes on, the most painful sensations accompany every attempt to swallow liquids. Nay, the bare sight of water, or any thing clear, will give the utmost uneasi-

ness, or even throw the patient into convulsions. The patient, however, is not as yet deprived of reason. Some have, merely by the dint of resolution, conquered the dread of water, though they never could overcome the convulsive motions which the contact of liquids occasioned, and yet this has been of no avail; for the convulsions and other symptoms increasing, have always overpowered the individual at last; and a great flow of viscid saliva into the mouth now takes place ; as it has the same effect upon their fauces that other liquids have. This therefore is blown off with violence, which in a patient of Dr. Fothergill's occasioned a noise like the barking of a dog. Patients then have an insatiable thirst, but are unable to get down any drink without the utmost difficulty; though sometimes they can swallow bread soaked in liquids, slices of oranges, or other fruits. There is a pain under the scrobiculus cordis, as in the tetanus. But the symptoms are so various, that they cannot be enumerated; for we seldom read two cases of hydrophobia which do not differ very remarkably. Sometimes every member is convulsed by fits, but most violently from the navel up to the breast and esophagus. The fit comes on perhaps every quarter of an hour, the fauces are not red, nor the tongue dry. The pulse is not at all feverish; and, when the fit is over, nearly like a sound pulse. The face grows pale, then brown, and during the fit almost black, the lips livid, the head is drowsy, and the ears tingling; the urine limpid. At last the patient is weary, the fits are less violent, the pulse becomes weak, intermittent, and not very quick; and at last the whole body becomes cold. If the patient can get sleep, so he will expire. The blood drawn a few hours before death appears good in every respect. The hydrophobia seems to be a symptom peculiar to the human race; for the mad animals which communicate the infection do not seem to have any dread of water.

With regard to the symptoms of madness in dogs, they are very equivocal; and those particularly enumerated by some authors are only such as might be expected in dogs much heated or agitated by being violently pursued and struck. The most certain symptom, indeed, is that all other dogs avoid and run away from one that is mad; and even large dogs will not attack one of the smallest size who is infected with this disease. You may discover whether a dog who has been killed was really mad or not, by rubbing a piece of meat along the inside of his mouth, and then offering it to a sound dog. If the latter eats it, it is a sign the dog was not mad; but, if the other rejects it with a kind of a howling noise, it is certain that he was. Dr. James tells us, that among dogs the disease is infectious by staying in the same place; and, that after a kennel has been once infected, the dogs put into it will be for a considerable time afterwards in danger of going mad. He rejects as false the opinion, that dogs, when going mad, will not bark: though he owns that there is a very considerable change in their bark which becomes hoarse and hollow.

It is said, that the causes commonly assigned for this disease among animals viz. heat, feeding upon putrid flesh, want of water, &c., are not sufficient to produce the distemper. It does not appear that madness is more frequent among dogs in the warm than in the cold climates; nay, in the island of Antigua, where the climate is very hot, and the water very scarce, this distemper has never, it is said, been observed. As to putrid aliment, it seems natural for dogs to prefer this to any other, and they have been known to subsist upon it for a long time without detriment. With regard to the imme-diate cause among mankind, there is not the least doubt that the hydrophobia is occasioned by the saliva of the mad animal being mixed with the blood. It does not appear that this can operate through the cuticula; but, when that is rubbed off, the smallest quantity is sufficient to communicate the disease, and a slight scratch with the teeth of a mad animal has been found as pernicious as a large wound. It is certain, also, that the infection has been communicated by the bites of dogs, cats, wolves, foxes, weasels, swine, and even cocks and hens, when in a state of madness.

If the disease once exhibits its symptoms in a human patient the chances for recovery are small indeed : there having never been one well authenticated case of the recovery of a really hydrophobous person .- Prevention is the only chance, and removal of the contagious matter the only fair hope, of preserving life. Of all the means of removal, the cutting out the part to which the tooth has been applied, is unquestionably the most effectual. This therefore should not be delayed; one-quarter of an hour's hesitation will sometimes prove fatal. But, besides cutting away the part, careful washing may be used. Cold water should be poured upon the wound from a considerable height, that the matter may be washed away with some force. Even after removal by the knife careful washing is still proper. And after both these, to prevent, as far as can be, the possibility of any contagious matter lurking about the wounded part, it should not be allowed to heal, but a discharge of matter should be supported for several weeks, by ointment with cantharides, or similar applications. By these means there is the best chance of removing the matter at a sufficiently early period. Prevention may also be obtained by the destruction of the contagious matter at the part; and, where there is the least reason to think that a complete removal has not been obtained, these should always be had recourse to. With this intention the actual cautery, and burning with gun-powder, have been employed. And fire is, doubtless, one of the most powerful agents that can be used for this purpose. Recourse has also been had to washing, both with acids and alkalies. Of the former, vinegar has been chiefly used; but more may be expected from the latter, particularly from the caustic alkali, so far diluted that it can be applied with safety; for, from its influence as a solvent of animal mucus, it gives a better chance of a complete removal of the poison. See MEDICINE, Index.

HYDROPHYLUM, water leaf: a genus of the monogynia order, and pentandria class of plants: con. campanulated, with five melliferous longitudinal stria on the inside; the stigma is bifd: cars. globose and bivalved. There are three species, the chief is—II. Virginianum, the water leaf of Morinus. It grows naturally in Canada and many other parts of America on moist spongy ground. The root is composed of many strong fleshy fibres, from which arise many leaves with foot-stalks five or six inches long, jagged into three, five, or seven lobes, almost the mid-rib, indented on their edges. The flowers are produced in loose clusters hanging downwards, are bell-shaped, and of a dirty white color. It may be propagated by parting the roots; which ought to be done in autumn, that the plants may be well rooted before spring, otherwise they will require a great deal of water.

otherwise they win require a given a stream of the stream

Cantharides heat the watery parts of the body; as urine, and hydropical water.

Bacon's Natural History.

The world's whole sap is sunk :

The general halm the hydropick earth hath drunk. Donne.

Every lust is a kind of hydropick distemper, and the more we drink the more we shall thirst. *Tillotson*.

Hydropick wretches by degrees decay,

Growing the more, the more they waste away; By their own ruins they augmented lye,

With thirst and heat amidst a deluge fry.

Blackmore.

Hydropical swollings, if they be pure, are pellucid. Wiseman.

One sort of remedy he uses in dropsies, the water of the hydropicks. Arbuthnot.

IIYDROSELENIC ACID. The best process which we can employ for procuring this acid, according to M. Berzelius, consists in treating the seleniurct of iron with the liquid muriatic acid. The acid gas evolved must be collected over mercury. As in this case a little of another gas, condensable neither by water nor alkaline solutions, appears, the best 'substance for obtaining absolutely pure hydroselenic acid would be seleniuret of potassium.

Seleniureted hydrogen gas is colorless. It reddens litmus. Its density has not been determined by experiment. Its smell resembles, at first, that of sulphureted hydrogen gas; but the sensation soon changes, and another succeeds, which is at once pungent, astringent, and painful. The eyes become almost instantly red and inflamed, and the sense of smelling entirely disappears. A bubble of the size of a little pea is sufficient to produce these effects. Of all the bodies derived from the inorganic kingdom, seleniureted hydrogen is that which exercises the strongest action on the animal economy. Water dissolves this gas; but in what proportions is not known. This solution disturbs almost all the metallic solutions, producing black or brown precipitates, which assume, on rubbing with Zinc, polished hæmatites, a metallic lustre, manganese, and cerium, form exceptions. They yield flesh-colored precipitates, which appear to be hydro-seleniurets of the oxides, whilst the others, for the most part, are merely metallic seleniurets.

HYDROSTATICAL, adj. HYDROSTATICALLY, adv. HYDROSTATICS, n. s. Gr. υδωρ and σσικη. The science of weighing fluids, and bodies in fluids.

A human body forming in such a fluid, will never be reconciled to this *hydrostatical* law; there will be always something lighter beneath, and something heavier above; because bone, the heaviest in specie, will be ever in the midst. Bentley.

The weight of all bodies around the earth is ever proportional to the quantity of their matter: for instance, a pound weight, examined hydrostatically, doth always contain an equal quantity of solid mass. Id.

HYDROSTATICS and HYDRAULICS; from ὑδωρ, water, and satury, the art of weighing : and ύδωp and anλos, a pipe or flute, (the doctrine of machines worked by water, because organs when first invented were thus first sounded, or filled with wind). In the arrangement of our more important treatises we endeavour to unite the consideration of scientific propriety with the convenience of alphabetical order. Looking only to the latter of these, in regard to the above sciences. HYDRAULICS would claim a prior place, but as this arrangement would, of necessity, tend to render the subject obscure and unconnected, it will be advisable to connect these important subjects and to treat of them in their natural order; beginning with the weight and pressure of water, and then showing the application of hydrostatic equilibrium in the construction of hydraulic machines.

We had better in the first instance explain the nature of fluidity. A perfect freedom of motion is essential to this state, and fluid bodies are usually divided into elastic, and non-elastic. Air is an example of the first, as its bulk may be lessened by augmenting the pressure, and enlarged by diminishing the compressive force. Water, on the contrary, is said to be non-elastic, or incompressible, not because it is absolutely so, but because its compressibility is so very small, as te make no sensible difference in our calculations, relative to its weight or motion.

The compressibility of water was a subject which engaged the attention of philosophers at a very early period. The Florentine academi-cians, from the following experiment, inferred that it could not be diminished in bulk : they took a globe of gold, which was the least porcus of any body at that time known; and, having filled it with water, they closed it up. They then subjected the globe to a great compressive force, which squeezed the water through its pores, before any indentation could be made in it. As a hollow sphere has a greater capacity than any other form, under the same surface, the academicians supposed that the compressive power, which was applied to the globe, must either force the particles of the fluid closer together, or drive them through the metal, before the globe yielded in the slightest degree to compression. With respect to its precise object, therefore, this celebrated experiment is not entirely conclusive, because they had no means of determining whether the diminution of the internal capacity of the globe by pressure, was exactly equal to the quantity of water forced through its pores; but they certainly proved the extreme minuteness of the particles that could be forced through so dense a metal as gold. The inference, drawn by the Florentines, remained uncontradicted till about 1762, when Canton published some experiments on the subject. With the barometer at $29\frac{1}{2}^{\circ}$, and the thermometer at 50° , he states the following to be the results obtained :—

Compression of spirits

of wine	÷	66 parts in	1,000,000
Oil of olives		48 Ditto	
Rain-water		46 Ditto	
Sea-water		40 Ditto	
Mercury		3 Ditto	

These results he obtained in the following manner: he took a glass tube, about two feet long, with a ball at one end, of an inch and a quarter in diameter; he filled the ball end part of the tube with water, which had previously been deprived of air as much as possible; he then placed it under the receiver of an airpump, and removed the pressure of the atmosphere: under this treatment, he observed that the water rose a little in the tube. On the contrary, when he placed the apparatus upon a condensing engine, and by condensing the air in the receiver, increased the pressure upon the water, he observed that the water descended in the tube. In this manner he proved that water expanded one part in 21,740, when the pressure of the atmosphere was removed; and submitted to a compression of one part in 10,870, under the weight of a double atmosphere. He also observed, that water possessed the remarkable property of being more compressible in winter than in summer; contrary to the effect on spirit of wine and oil of olives. Lest it might be supposed the compressibility, thus discovered, might be owing to air lodged within the fluids employed, a quantity of water was caused to imbibe more air than it contained in a preceding trial, but its incompressibility was not increased. These experiments, although, upon the whole, so apparently decisive of the questions they were instituted to determine, are not yet to be received without some caution; and, in particular, the remark that the addition of a portion of so compressible a fluid as air did not render water more compressible than before, is rather staggering; and is calculated to throw a veil of doubt over all the rest. It remained, therefore, for future investigators to determine the data for this branch of the science; but, even granting all the compressibility that has been contended for, the quantity of it is too small to be noticed in practice.

The piezometer employed by Mr. Perkins, in his experiments on the compressibility of water, 2 K

is represented in plate I. fig. 1. HYDROSTATICS and liyDRAULICS. The end I, of a cylinder S, three inches wide and eighteen long, being made water-tight by a plate firmly soldered to it : a cap, also water-tight, was screwed on the extremity. The rod a, $\frac{5}{10}$ ths of an inch in diameter, and carrying a flexible ring C, was made to pass through a tight stuffing-box F. The compression was effected in a cannon, the top of which was capable of containing the piezometer. It was fixed vertically in the earth, the touch-hole being plugged tight, and the muzzle about eighteen inches above ground. A strong cap was firmly screwed on at the mouth, and in the centre of it a small forcing pump, with a piston sths of an inch in diameter, was tightly screwed, and a valve introduced to ascertain the degree of pressure, one pound of pressure on that valve indicating an atmosphere. In performing experiments with this apparatus, the piczometer was introduced into the cannon, the water being forced in till the cap showed signs of leakage: the valve at the same time indicating a pressure of 100 atmospheres; when the piezometer was taken out of the cannon, the flexible ring, C, was eight inches upon the rod a, which proved that the rod had been forced that length into the cylinder, and that the compression was about one per cent.; in order to produce this compression, three per cent. must be pumped into the gun; an effect arising from the expansion of the gun, or the entrance of the water into the pores of the cast iron.

On his voyage to England, Mr. Perkins repeated this experiment frequently, and with the same result; by sinking the piezometer with fifty-four pounds of lead, to the depth of 500 fathoms, which gives nearly a pressure of 100 atmospheres. Being satisfied that the above piezometer would not show all the compression, he made another, consisting of a small tube, closed at the lower end, and water-tight; at the upper end, the water entered through a small aperture, closed by a delicate valve opening inwards; it was then perfectly filled with water (the weight of which was accurately known), and subjected in a common hydraulic press to a pressure of about 326 atmospheres. When taken out, and weighed, there was found an increase of water, amounting to about 31 per cent. This water had been previously boiled and cooled down to 48°, and kept at that temperature during the experiment.

Fluids have weight, and gravitate towards the earth according to their density in the same way that solids do; but from the want of cohesion among their particles they are, however, incapable of assuming and retaining any particular form or figure without support and assistance, and consequently they always take the form of the vessel which contains them, and they also exert a certain force against the sides of that vessel from their tendency to fall, which constitutes their lateral pressure ; for fluids not only press downwards with their whole weight, in obedience to gravitation, but they press sideways or laterally in all directions at the same time and from the same cause, and consequently no fluid can remain in a state of quiet equilibrium, unless every

part of its surface is equidistant from the centre of the carth, or in what is generally called a level plane, although that apparent plane is, in fact, not a plane, but partakes of the convexity of the earth. And it is for the purpose of establishing such an equilibrium that fluids always run from a higher to a lower situation.

For the purpose of explaining the manner m which the surfaces of fluids become level, it may be very fairly supposed that the particles of which they are composed are placed one upon another so as to form what may be termed pillars or columns of particles as represented in plate I. fig. 2, and supposing all the particles to be of the same size and weight, then the six which are on one side will be an exact balance to the six which are on the other (both columns being supported by the bottom of the vessel which contains them), and their two tops will be level; but, if the two upper particles t and v are supposed to be taken away, a balance can no longer exist, for now there will be six particles in one column, while there are but four in the opposite one to press against and resist them, the consequence of which will be that the tallest column will descend, and the particle u will fall into the situation of w, while that marked x will, with its column, ascend into the situation v, and thus x and u will come to the same level, and a balance or equilibrium will be again restored. Every vessel is supposed to be filled by an infinite number of such columns, although two only are represented in the figure to prevent confusion. The cause of bodies floating upon fluids, or sinking in them, may be explained by the same reasoning, for whenever a solid is immersed in a fluid, it displaces a quantity of water, and consequently renders the columns of particles underneath it shorter, and therefore lighter, than those which surround it. It will only then be to conceive that the two particles t and v, in the last figure represent a body which is partly immersed in the water, and is floating near its surface; the columns under that body will be shorter than those which surround it, but the weight of the body becomes a counterpoise to the greater length of the surrounding columus, and must in every case be precisely equal to the quantity of water which it displaces, otherwise it cannot float, for all bodies which are incapable of so becoming this counterpoise, or, in other words, are so heavy that their small bulk will not permit them to displace as much water as is equal to their own weight, must inevitably sink ; consequently all things which are lighter than their bulks of water will swim, and all that are heavier must sink, unless when they are placed in a boat or hollow vessel, which by its bulk enables them to displace more water than is equal to their weight, and then they will float. A ship therefore of 500 tons burthen must displace 500 tons of water from the bed or hollow which it makes itself up to its water-line, and in this way the tonnage of vessels is estimated.

The truth of this position is very satisfactorily proved by putting the model of a ship or any other body capable of floating into a scale, and exactly balancing it with water in the other scale. The floating body is then to be removed and placed in a small cistern, previously filled quite full of water, when a quantity of it will flow over, and on again removing the floating body a vacuity of water will be found, which will be exactly reinstated by the quantity in the scale, being the weight of the floating body.

The balance which has been stated to take place among the columns of water may be pleasingly illustrated by the simple expedient of tying a bladder in a flaceid way over the end of a large patent lamp glass, or other cylinder which is open at both ends; when, upon filling the same to a little above the bladder, it will be borne down by the weight of the water, and will continue in the same situation even when the apparatus is immersed in water, until such immersion causes the water, both within and without the glass, to stand at the same level; and, whenever this is the case, a balance occurs between the pressures of the internal and external water, and the bladder will become quite flaceid, thus indicating that it is under no pressure either from above or below; on pressing the glass a little deeper into the water the external columns will become the longest, and consequently the most powerful, and the bladder will therefore in this case be as forcibly protruded upwards into the glass as it was at first pressed downwards,

The ancient method of supplying towns with water was by means of aqueducts, or bridges built over the valleys, and supporting either pipes or an open conduit or channel. These stupendous and eostly erections, the remains of which still adorn the ruins of some ancient cities, and which exist in a more perfect state in the neighbourhoods of Paris and Lisbon, could not have been constructed for want of a knowledge of fluids rising to their common level, but probably from the practical difficulty of uniting a long range of pipes, in such a manner as to remain perfectly water-tight against the pressure of a heavy column of water, a circumstance which is by no means easy, even in our present state of improvement, and with all the advantage of east iron and the most durable materials, instead of stone or earthenware, which appears to have been chiefly resorted to for pipes in the formation of the older water-works.

The New River water-works, which are of such vast importance to the comfort and health of the great metropolis of England, are in themselves a species of aqueduct, and unite all the varieties in the construction of water-works. The spring that supplies them rises at Ware, in Hertfordshire, and its waters are conducted in an artificial channel or eut, formed for their conveyance alone, which is sometimes raised by arches and embankments very considerably above the natural surface of the ground, and at others sinks deeply into it, for upwards of thirty-eight miles. At length it ends in the open basin or reservoir, called the New River Head, at Islington, which is sufficiently high to supply the lower parts of the town by its natural descent into the pipes. To accomplish the rest, a powerful steam-engine is placed near this reservoir, for the purpose of working pumps which force a part of the water into still more elevated reservoirs on Pentonville Hil, and in the Hampstead read, and what these

cannot command is effected by an air vessel attached to the pumps of the steam engine, so that the greater part of London is supplied, without the expense of any other power than the water's natural gravitation, and the remainder by the well appropriated power of a steam engine.

There is a very singular paradoxical experiment illustrative of this part of our subject. It is this, that any quantity of water, or any other fluid, however small, may be made to balance and support any quantity, or any weight, how great soever. Thus, the water in a pipe, or canal, open at both ends, always rises to the same height at both ends, whether those ends be wide or narrow, equal or unequal. And since the pressure of fluids is directly as their perpendicular heights, without any regard to their quantities, it follows, that whatever the figure or size of the vessels may be, provided their heights be equal, and the areas of their bottoms equal, the pressures of equal heights of water are equal upon the bottoms of those vessels, even though the one should contain 1000, or 10,000 times as much as the other. Mr. Ferguson has illustrated this matter by the following apparatus :- Let two vessels, plate 1, figs. 3 and 4, such as C and O, be of equal heights, but very unequal capacity; let each vessel be open at both ends, and their bottoms E and F of equal widths; let the brass bottoms be exactly fitted to each vessel, not so as to go into them, but for each vessel to rest upon respectively; and let a piece of wet leather be put between each vessel and its brass bottom, for the sake of keeping them close. Join each bottom to its vessel by a hinge, A F, so that it may open like the lid of a box; and let each bottom be kept up to its vessel by equal weights, BI, hung to lines which pass over the pulley as at I, the blocks being fixed to the sides of the vessel, and the lines tied to hooks at DB, fixed in the brass bottoms opposite to the hinges. Things being thus prepared, hold one vessel upright in the hand over a basin on a table, and cause water to be poured slowly into it, till the pressure of the water bears down its bottom at the side, and raises the weight, and then part of the water will run out beneath. Mark the height at which the surface of the water stood in the vessel when the bottom began to give way; and then, holding up the other vessel in the same manner, eause water to be poured into it, and it will be seen that, when the water rises in this vessel just as high as it did in the former, its bottom will also give way at the same height, and it will lose part of the water.

The cause of this apparently surprising phenomenon is, that, since all the parts of a fluid at equal depths below the surface are equally pressed in all directions, the water immediately below the fixed part will be pressed as much upward, against its lower surface within the vessel, by the action of the column in the centre, as it would be by a column of the same height, and of any diameter whatever; and therefore, since action and re-action are equal, and contrary to each other, the water immediately below the surface, B, will be pressed as much downwards by it as if it were immediately touched, and pressed by a column of the whole height, and of the diameter AB; and therefore the water in the cavity beneath will be pressed as much downwards upon its bottom, F, as the bottom of the other vessel is pressed by all the water above it.

When a machine is constructed expressly for the purpose of showing, in the most striking manner, that the pressure of fluids is as their perpendicular heights, and that a quantity, however small, may be made to support a weight, or another quantity, however large, it may be most advantageously made in the form of what is called the hydrostatical bellows. This apparatus may now be examined. It consists of two circular boards I, plate I. fig. 5, about sixteen inches in diameter; these boards are connected by means of a strong leather, which entirely surrounds them, and permits them to open and close like a pair of common bellows, with this difference, that they open equally all round, and therefore the boards always remain parallel to one another. The leather, at its junctures, is well secured, and the whole machine is watertight. In the upper board is fixed a pipe, AC, communicating with the interior, and reaching above to a considerable height, suppose five feet. Through this pipe let some water be poured into the bellows, and the upper board will be observed to rise a little; place a weight, B, upon it, pour in more water, and it will rise, though we increase the weight very considerably. Indeed, we may add water till the leathers are at their utmost extension; the water will then fill in the tube, and the upper board cannot be depressed, nor the water forced out of the small tube, until the pressure upon it is more than that of a column of water whose diameter is equal to that of the interior of the bellows, and its height equal to that in the tube; by increasing, therefore, the length of the tube, a most enormous weight might be raised by the pressure of a few ounces of water.

To illustrate this singular experiment, we may suppose a hole to be made in any part of the upper board, and another tube to be inserted there; the water would certainly rise to the same level in them both; and, supposing the board to be filled with tubes, the water would obtain the same level in them all, because a series of pipes would, in fact, form a solid cylinder of water. If we suppose the hole to be of the same diameter as the interior of the tube, and fitted with a piston, then, if the tube contained two ounces of water, the piston would sustain a weight of two ounces without being depressed. If the area of the whole were twice that of the bore of the tube, two ounces in the tube would sustain four ounces on the piston. In this manner, every part equal to the bore of the tube is pressed upwards with a force equal to the weight of fluid in the tube. Hence, if the proportion subsisting between the area of the tube and that of the bellows be multiplied by the weight of water in the tube, the product will express the force with which the boards are separated.

In lice of the bellows part of the apparatus, the leather of which would be incapable of resisting any very considerable pressure, Mr. Bramah suggested the use of a very strong metal cylinder, in which a piston was so packed as to move water-tight; and, as a substitute for the high column of water, he employed a small forcing pump, to which any power can be applied; and thus the pressing column becomes iadefinitely long, although the whole apparatus is of itself comparatively small.

In plate I., fig. 6, we have a section of one of these presses, in which b is the piston of the large cylinder, formed of a solid piece of metal turned truly cylindrical, and carrying the lower board v of the press upon it : r is the piston of the small forcing pump, being also a cylinder of solid metal, moved up and down by a handle or lever. The whole lower part of the press is sometimes made to stand in a case, S a, containing more than a sufficient quantity of water, as at C, to fill both the cylinders; and the suction pipe of the forcing-pump dipping into this water will be constantly supplied. Whenever, therefore, the handle is moved upwards, the water will rise through the conical metal valve, opening upwards into the bottom of the pump t; and, when the handle is depressed, that water will be forced through another similar valve g, opening in an opposite direction in the pipe of a communication between the pump and the great cylinder d, which will now receive the water by which the piston rod b will be elevated at each stroke of the pump t. Another small conical value, f, is applied by means of a screw to an orifice in the lower part of the large cylinder, the use of which is to release the pressure whenever it may be necessary; for, on opening this valve, any water which was previously contained in the large cylinder d will run off into the reservoir by the passage c, and the piston bwill descend; so that the same water may be used over and over again. The power of such a machine is enormously great; for supposing the hand to be applied at the end of the handle with a force of only ten pounds, and that this handle, or lever, be so constructed as to multiply that force but five times, then the force with which the piston r descends will be equal to fifty pounds : let us next suppose that the magnitude of the piston b is such, that the area of its horizontal section shall contain a similar area of the smaller piston r fifty times; then fifty times multiplied by fifty gives 2500 pounds, for the force with which the piston b and the presser v will rise. A man can, however, exert ten times this force for a short time, and could therefore raise 25,000 pounds; and would do more if a greater disproportion existed between the two pistons b and r, and the lever or handle of the pump were made more favorable to the exertion of his strength.

Mr. Hawkins has contrived an hydrostatic weighing machine, which may be easily understood by reference to plate I. fig. 7: a is a cylinder made of tin, and japanned, which is partly filled with water; b is another cylinder, rather less in diameter, resting upon and floating in the water contained in the external vessel. A graduated scale and glass tube, c, are seen to run parallel to the vessel a, with which they are con-

nected at bottom; so that the water always stands at the same height in both. The central cylinder is furnished with a dish or scale for holding the goods to be weighed, the pressure of which causes it to sink. The water being thus displaced in the larger vessel is raised in the small tube in an equal proportion, and the exact weight of the goods will be indicated by the scale attached to the tube. This ingenious contrivance is well adapted for small weights; and, if mercury be substituted for the water recommended by Mr. Hawkins, the range of the instrument may be extended, without its accuracy being affected by its evaporation.

If a hole be made in the side of a vessel, the water will spout forth in a curvilinear path because fluids press equally in all directions.

The velocity with which water spouts out, at a hole in the side or bottom of a vessel, is as the square root of the depth or distance of the hole below the surface of the water: for, in order to make double the quantity of a fluid run through one hole as through another of the same size, it will require four times the pressure of the other, and therefore the aperture must be four times the depth of the other below the surface of the water; and, for the same reason, three times the quantity, running in an equal time through the same sort of hole, must run with three times the velocity, which will require nine times the pressure, and consequently the hole must be nine times as deep below the surface of the fluid, and so on.

To prove this by experiment, let two pipes of equal sized bores be fixed into the side of a vessel, one pipe being four times as deep below the surface of the water in the vessel as the other is : and, whilst the pipes run, let water be poured constantly into the vessel, so as to keep it always full. Then if a cup that holds a pint be so placed as to receive the water that spouts from the upper pipe, and at the same moment a cup that holds a quart be placed to receive the water from the lower pipe, both cups will be filled at the same time by their respective pipes.

The horizontal distance to which a fluid will spont from a horizontal pipe in any part of the side of an upright vessel, below the surface of the fluid, is equal to twice the length of a perpendicular to the side of the vessel, drawn from the mouth of the pipe to a semicircle described upon the altitude of the fluid : and therefore the spout will be to the greatest distance possible from a pipe whose mouth is at the centre of the semicircle; because a perpendicular to its diameter (supposed parallel to the side of the vessel), drawn from that point, is the longest that can possibly be drawn from any part of the diameter to the circumference of the semicircle.

Thus if the vessel A B, plate I. fig. 8, be full the depth, will counter-balance the weight of the of water, the horizontal pipe D be in the middle body, and there will be no pressure from above, of its side, and the semi-circle NE C be described except the weight of the body. Thus, lead is upon D, as a centre, with the radius, or semidiameter D C, or D N, the perpendicular D E If a cube of lead be placed so as to press closely to the diameter C D N is the longest that can be against the bottom of a wooden pipe one foot drawn from any part of the diameter to the cir-square, closed at the top, and plunged twelve cumference: and, if the vessel be kept full, the feet deep, and held upright, it will there swim ; greater M N, which is double the length of the greater than its weight, and there being no pres-

perpendicular D E. If two other pipes, as F and G, be fixed into the side of the vessel, at equal distances above and below the pipe D, the perpendiculars F H and G I, from these pipes to the semi-circle, will be equal; and the jets spouting from them will each go to the horizontal distance N K, which is double the length of either of the perpendiculars F H or G I.

The reader will easily perceive that the curve described by the spouting fluid, in all the different situations, will be that of a parabola; being acted upon by the combined forces of the lateral pressure of the fluid in the vessel, and the force of gravity.

When a solid body is plunged in any liquid, it must displace a quantity of that liquid exactly equal to its own bulk. Hence, by measuring the bulk of the liquid so displaced, we can ascertain precisely the bulk of the body; for the liquid can be put into any shape, as that of cubical feet or inches, by being poured into a vessel of that shape, divided into equal parts, or the vessel in which the body is plunged may be of that shape, and so divided. If the width of the vessel is four inches by three, or twelve square inches, and divided on the upright side into twelfths of an inch, when a body of any irregular shape, as a bit of rough gold or silver, is plunged in it, every division that the water rises will show that one-twelfth of twelve cubic inches, or one cubic inch of water, has been displaced; so that, if it rises two divisions, the body contains exactly two solid inches of metal. And this is by far the easiest way of measuring the solid contents of irregular bodies.

When a body is so plunged it will remain in whatever part of the fluid it is put in, if it be of the same weight with the fluid; that is, if the bulk of the body weighs as much as the same bulk of the fluid; for in this case it will be the same thing as if the fluid were not displaced, and as an equal quantity of the fluid would have remained at rest there, being equally pressed on all sides, so will the solid body: it will be pressed from below with the same weight of fluid as from above. But if the body be heavier than the fluid, bulk for bulk, this balance will be destroyed, and the weight of the fluid pressing from above will be greater than that pressing from below, by the weight of the solid body, which will therefore sink to the bottom. So, if it be lighter than an equal bulk of the fluid, it will rise through the fluid to the surface. But if a solid heavier than the fluid be plunged to a depth as many times greater than its thickness, as the solid is heavier than the fluid, and there protected by any means from the pressure of the fluid above, it will float notwithstanding its weight, because the pressure from below, being in proportion to the depth, will counter-balance the weight of the body, and there will be no pressure from above, except the weight of the body. Thus, lead is somewhat above eleven times heavier than water. If a cube of lead be placed so as to press closely against the bottom of a wooden pipe one foot square, closed at the top, and plunged twelve feet deep, and held upright, it will there swim ;

sure fron. the water downwards. So if a body lighter than water, as cork, be placed at the bottom of a vessel, and so smoothly cut that no water gets between its lower surface and the surface of the bottom, it will not rise but remain fixed there, because it is pressed downwards by the water from above, and there is no pressure from below to counter-balance that from above.

It follows from these principles, that if any body be weighed in the air, and then weighed in any liquid, it will seem to lose as much as an equal bulk of the liquid weighs. Not that the body really loses its weight, but that it is pressed upwards by a force equal to the weight of the liquid, the place of which it fills. Thus, if a piece of lead weigh an ounce before being plunged in water, that is, require an ounce weight on the opposite scale to balance it; if you hang it by a thread from its own scale, and let it be plunged so that the water in a full jar covers it, a quantity of water equal to the bulk of the lead will run over the sides of the jar, and a number of grains equal to the weight of this quantity of water must be taken out of the opposite scale to restore the balance: for the lead is now pressed downwards in the water with a force not equal to its own weight, but to the difference between its own weight and that of an equal bulk of the water. And in this manner we can determine the relative weights of all bodies, or the proportion which they bear to each other in weight; which is called their specific gravity; that is, their weight in kind, and sometimes their relative gravity, that is, their weight compared with the weight of other bodies. By weighing a known bulk, as a cubic foot or a cubic inch of any two substances, we can find their specific gravity; or their gravity as compared with each other : if, for instance, we found a cubic inch of iron weighed 1948 grains, and a cubic inch of lead 2858, we should say, that the specific gravities of the two substances were in the proportion of 3 to $4\frac{1}{3}$ nearly; and so we might find the specific gravity of a solid substance, as compared with that of a liquid, by weighing an equal bulk of each. But this operation is extremely difficult, because it requires the substances compared to be formed accurately into the same shape and size; and, when we are not allowed to change their figure, the comparison cannot be made at all. Thus we could not ascertain the specific gravity of precious stones, crystals, metallic ores, or animal and vegetable substances, without in effect destroying them. But the hydrostatic balance, upon the principles now explained, affords a perfectly easy and most accurate method of comparing all substances solid and fluid. We have only to weigh any substance first in air, and then in water; the difference of the weights is the weight of a hulk of water equal to the bulk of the substance; and by comparing any other substance with water, in like manner, we ascertain its specific gravity, as compared with that of the first substance.

Let us now take an example of the use of the hydrostatic balance. If a guinea suspended in air be counterbalanced by 129 grains in the opposite scale, and upon being immersed in water re-

quires 71 grains to be put in the scale over it, in order to restore the equilibrium; we thus find that a quantity of water, of equal bulk with the guinea weighs 74 grains, or 7.25; by which divide 129, the weight of the guinea in air, and the quotient, or 17.793, shows that the guinea is so many times heavier than its bulk of water. Whence if any piece of gold be tried, by weighing it first in air, then in water, and if upon dividing the weight in air by the loss in water, the quotient is 17.793, the gold is good; if the quotient is 18, or between 18 and 19, the gold is very fine; but, if it be less than $17\frac{1}{2}$, the gold is too much alloyed with other metal. If silver be tried in this manner, and found to be eleven times heavier than water, it is very fine : if it be 101 times heavier, it is standard : but, if it be any less weight compared with water, it is mixed with some lighter metal, such as tin.

When substances are lighter than water, a different mode of treatment to that which has been described must be adopted for obtaining their specific gravities; for now some force is necessary for producing their submersion :- To effect this a small pulley moving with little friction may be attached to the bottom of the water jar, or to a weight sufficiently heavy to cause it to remain steadily there; and the hair attached to the substance, must in this case pass downwards under the pulley, and rise again so that its opposite end may fix to the hook of one of the scale pans. The substance is first to be weighed in the scale in the ordinary manner, and afterwards placed in the jar; water must then be added, until the substance, by floating, draws the scale beam into an horizontal position; after which weights must be placed in the opposite scale until the substance is drawn under the water.

Mr. Ritchie's hydrostatic halance is cheap and delicate; it is constructed as follows :- Let a slender beam of wood be procured, about eighteen or twenty-four inches long, and tapering a little from the middle to each end. Let a fulcrum of tempered steel, resembling the blade of a pen-knife, be made to pass through the middle of the beam, a little above the centre of gravity. Similar steel blades are also made to pass through the ends of the beam for suspending the scales. The fulcrum rests on two small portions of thermometer tubes, fixed horizontally on the upright support E F, fig. 9, plate I. The support has a slit passing along the middle, to allow the needle at EF to play between the sides. A small scale made of card, and divided into any number of equal parts, is placed at F, for the purpose of ascertaining the point at which the needle remains stationary. This balance posneedle remains stationary. This barance pro-needle remains stationary. It may even be made more sensible than that belonging to the Royal Society of London.

To ascertain the weight of any body, place it in one of the scales, and bring the needle to any point by means of small shot placed in the other scale; observe the point opposite to which the needle rests, or the middle between its extreme point of oscillation; remove the body, and put into the scale as many known weights as will bring the needle to the same division as before. These weights will evidently be equal to the weight of the body, whether the arms of the balance be equal or not. This method of weighing is due to Borda.

In the use of the hydrostatical balance generally, it will be proper to observe the following general precautions. The water in which the solid is to be weighed, besides its being either distilled or rain water, must be quite clean. Its temperature, as well as that of the solid, must be as near as possible to 62° of Fahrenheit's thermometer; for which purpose the ball of the thermometer must be placed in the water, and the temperature is adjusted by the addition of hot or cold water. If the solid body be soluble in water, or if it be perous enough to absorb any water, then it must be varnished, or coated with some oily or greasy substance; but in that case some allowance is to be made on ac-count of the varnish, &c. When the solid is weighed in water, its upper part ought to be a little way below the surface of the water; for instance, about an inch; and it must by no means be suffered to touch the sides or bottom of the jar. Care must be taken that no bubbles of air adhere to the solid under water; for they would partly buoy it up. These may be easily removed by means of a feather. The solid must be of a compact form, and free from accidental

or artificial vacuities, so as not to harbour any air; for otherwise its specific gravity cannot be ascertained by weighing in water, &c. Thus a piece of silver, which is much heavier than water, may be formed into a hollow sphere, which will appear to be much lighter than water; for, if this sphere were immersed in water, it would displace a quantity of water which is equal not only to the silver, but also to the space which is contained in the sphere. It is for this reason that a ship might be made of iron, or of copper, or, in short, of any substance whose specific gravity far exceeds that of water, and yet it would float as well as a ship which is made of wood in the usual way.

In order to determine the specific gravity of liv.ng men, Mr. Robertson prepared a cistern seventy-eight inches long, thirty inches wide, and thirty inches deep; and, having procured ter men for his purpose, the height of each was taken, and his weight, and afterwards they plunged successively into the cistern. A ruler, graduated to inches and decimal parts of an inch, was fixed to one end of the cistern, and the height of the water noted before each man went in, and to what height it rose when he immersed himself under its surface.

The following Table contains the several results of his experiments:----

No. of. Men.	Height.		Height.		Height,		Height,		Height.		Height.		Height.		Height.		Height,		Height,		Weight.	Height of water before immersed.	Height of water when im- mersed.	Water raised.	Solidíty.	Weight of water.
	Ft.	In.	lbs.	In.	In.	In.		lbs.																		
1	6	2	161	19.30	21.20	1.90	2.573	160.8																		
2	5	10용	147	19.25	21.16	1.91	2.586	161.6																		
3	5	$0\frac{1}{2}$	156	19.21	21.06	1.85	2.505	156.6																		
4	5	$6\frac{3}{4}$	140	19.17	21.21	2.04	2.763	172.6																		
5	5	57	158	19.13	21.21	2.08	2.817	176.0																		
6	5	$5\frac{1}{2}$	158	19.09	21.26	2.17	2.939	183.7																		
7	5	48	140	19.05	21.06	2.01	2.722	170.1																		
8	5	31	132	19.01	20.86	1.85	2.505	156.6																		
9	5	41	121	18.97	20.76	1.79	2.424	151.5																		
10	5	34	148	18.93	20.66	1.73	2.343	146.4																		
10		34	140	10.93	20.00	1.1.3	2.340	1404																		

One of the reasons, Mr. Robertson says, that induced him to make these experiments, was a desire to know what quantity of fir or oak timber would be sufficient to keep a man afloat in river or sea water, thinking that most men were specifically heavier than river or common fresh water; but the contrary appears from the trials before recited; for, except the first and last, every man was lighter than his equal bulk of fresh water, and much more so than his equal bulk of sea water: consequently, if persons who fall into the water could preserve their presence of mind, many might be preserved from drowning, and a piece of wood, not larger than an oar, would buoy a man partly above water as long as he could adhere to it.

It is evident also that a reference to the same general principle will enable us to ascertain the specific gravities of different fluids. For, if the same substance be weighed in two fluids, the weight which it loses in each is as the specific gravity of that fluid. Thus a cubic inch of lead

loses 253 grains when weighed in water, and only 209 grains when weighed in rectified spirits; therefore a cubic inch of rectified spirit weighs 209 grains, an equal bulk of water weighing 253; and so the specific gravity of the water is about a fourth greater than that of the spirit.

Upon this principle the hydrometer is constructed. There are various kinds of hydrometers. One is a glass or copper ball with a stem, on which is marked a scale of equal parts or degrees. The point to which the stem sinks in any liquid being ascertained, and marked on this scale, we can tell how many degrees any other liquid is heavier or lighter, by observing the point to which the stem sinks in it. Another and a very simple hydrometer is formed by preparing a number of hollow glass beads of different weights, but the proportions of which are known, and the beads marked accordingly; they are then successively dropped in the fluid to be examined, until one is found which neither sinks nor comes up to the surface, but remains at rest,

wherever it is placed in the liquid. You thus ascertain that the liquid is of the same specific gravity with this bead. If the same bead be dropped into another liquid, and sink, that liquid must be lighter than the first; if the bead come to the top, the second liquid is heavier than the first; and by trying the liquid with the other beads, until one is found which neither sinks nor floats, you ascertain the relative weight of the liquid by the number of the bead.

A hydrometer of great delicacy and peculiarly useful for measuring the specific gravity of different waters, and thereby ascertaining their degrees of purity, consists of a ball of glass three inches diameter, with another joining it, and opening into it, of one inch diameter, B and C, plate I. fig. 10, and a brass neck d, into which is screwed a wire *a* o, about ten inches long, and one-fortieth of an inch diameter, divided into inches, and tenths of an inch. The whole weight of this instrument is 4000 grs. when loaded with shot in the lower ball. It is found that, when plunged into water in the jar, a grain laid upon the top a makes it sink one inch; therefore a tenth of a grain sinks it a tenth of an inch. Now it will stand in one kind of water a tenth of an inch lower than in another, which shows that a bulk of one kind of water equal to the bulk of the instrument weighs one-tenth of a grain less than an equal bulk of the other kind of water; so that a difference in specific gravity of one part in 40,000 is thus detected. This weight of 4000 grs. is convenient for comparing water; but the quantity of shot in the lower ball may be varied, so as to make it lighter or heavier, and so adapt it to measure the specific gravities of lighter or heavier liquids. It will always be an accurate and very delicate measure for liquids of nearly the same weight. Indeed its delicacy is sogreat, that an impurity too slight to be detected by the taste, will be discovered by this instrument.

The areometer invented by M. De Parcieux, of Paris, is more simple, and affords a very accurate comparison of different liquids. It is only a different form of the instrument just described. A glass phial, about two inches or two inches and a half in diameter, and seven or eight long, with a plane or round bottom, is corked tight, and into the cork is fixed a perfectly straight wire of about one-twelfth of an inch diameter, and thirty inches long. The phial is loaded with shot, so as to make it sink in the heaviest liquid to be examined, leaving the wire just below the surface. There is a cylinder of glass, about three or three and a half inches diameter, and three or four feet long, with a scale of equal parts on the side. The liquor to be tried is put into this; and the scale marks the point to which the top of the wire This instrument is so sensible, that if it sinks. stands at any point in water of the common temperature, and the sun's rays fall upon the water, the wire will sink several inches, from the slight increase of heat causing an increase of bulk, and consequently a diminution of relative weight in the water; and it will rise again when carried into the shade. A pinch of salt or sugar thrown in makes it rise some inches, and a little spirits poured in make it sink. With one of these instruments, weighing somewhat less than twenty-

four ounces, and plunged in water, there is a fall or rise of above half an inch for every $\frac{1}{11}$ th part of the water displaced; so that the difference of $\frac{1}{10000}$ th part is easily perceived. Fahrenheit's hydrometer, like the common one,

Fahrenheit's hydrometer, like the common one, consists of a hollow ball, with a counterpoise c, fig. 11, but the stem B is very slender, and terminates in a small dish A. Round the middle of the stem is drawn a fine line; and there are no divisions on the stem, which is always immersed in the fluid to be tried, up to the mark, by placing as much weight as may be required in the small dish A. Hence, as the part immersed is constantly of the same magnitude, and the whole weight of the hydrometer is known, this last weight, added to the weight in the dish, will be equal to the weight of fluid displaced by the instrument.

Mr. Clarke's hydrometer is made of copper, because ivory imbibes spirituous liquors, and glass is apt to break. It consists of a brass wire about one-fourth of an inch thick, passing through and soldered into the copper ball Bb, fig 12, plate 1. The upper part of the wire is filed flat on one side of the stem of the hydrometer, and marked at m, to which division it exactly sinks in proof spirits. There are two other marks, A and B; the one showing that the liquor is one-tenth above proof, when this instrument sinks to A, and the other indicating one-tenth under proof when it emerges to B; a brass weight, as C, having been previously screwed on to the Lottom at c. There is a great variety of weights of different sizes, as K, &c., adapted to liquors that differ more than one-tenth from proof, and for determining the specific gravities of all such liquors as occur in trade, as well as for showing the specific gravities of all fluids down to common water. The round part of the wire above the ball may be marked across, so that with the weight C, which fits the instrument for the trial of river water, in which it sinks to R W, it may serve for wines or other waters: thus in spring water it will sink to SP; in mineral water to MI; in sea-water to SE; and in the water of salt springs to SA: and the marks br, ra, po, me, denote the divisions to which the instrument descends in Bristol water, rain water, port wine, and mountain wine, respectively.

This hydrometer is inferior to Fahrenheit's in two respects. In the first place, either a bubble of air, or a portion of the fluid, will be hid in that part of the cavity of the ballast weight which is not filled by the screw; and it is of very different consequence which of the two is there. And secondly, the weights acting on the instrument, by their residual gravity, will not be constant; or, in other words, an additional weight will be accompanied by an addition to the bulk of the immersed part of the instrument; and in the case where the specific gravity of the liquid is not given, but required, it will not be easy to determine how much the operation of the one is counteracted by the other. However, though this last consideration evinces that the instrument is not fit for general use, yet it is accurate for the trial of ardent spirits, or any other particular liquid, when the weights are adjusted by experiment to the intended use.

Sikes's hydrometer is now generally employed, especially since its adoption by the commissioners of his majesty's customs. This instrument has but nine shifting weights, applicable upon the upper part of the stem, and is used with a set of tables, or a sliding rule sold with it, for computing compensation for different temperatures. The scale is divided into ten principal divisions, each of which is subdivided into five parts, and by the separate application of the weights in succession completes the range of strength from pure alcohol to water, each weight being equivalent to ten principal divisions. This hydrometer, with the weight marked 60, screwed on to the lower stem, is so adjusted as to sink to the line mark P on the scale of the instrument when placed in proof spirit, of the temperature of 51° Fahrenheit, and, by the addition of the square weight on the top of the stem, it sinks to the same point in distilled water of the same temperature. This weight being just one-twelfth part of the entire weight of the whole hydrometer, together with its bottom weight No. 60, causes the scale to show the difference between water and proof spirit, which, the act states, shall weigh exactly twelve-thirteenth parts of an equal bulk of distilled water.

Mr. Meikle's hydrometer consists of a glass tube, open at both ends, and bent into a kind of double syphon, having four parallel legs; so that the open ends are pointed in the same direction or upwards, as shown in fig. 13, plate I. The manner of using it is very simple. Let one of the ends be stopped with a finger or cork, and water be poured into the other. This fluid will only rise a small way into the second leg, because of the included air. Next stop the other orifice, and open the one first closed; and, having poured into the latter the liquid whose specific gravity is to be tried, open the top of the water tube; then, the instrument being held upright, the two liquids will arrange themselves so as to press equally on the included air. This pressure will be measured by the difference in the heights of the two columns of either liquid, multiplied by its specific gravity, so that, by dividing the difference of the two columns of water by the difference of those of the other liquid, we obtain the specific gravity of the latter; that of water being unity. The difference between the columns may be measured by applying any scale of small equal parts, or the glass may be attached to a graduated plate furnished with verniers, &c. The longer the columns of liquids employed, the more accurate the process. The expansion of the glass, or its capillary action, cannot affect the result, nor is it influenced by the expansion of the scale; the only correction required will be to reduce the observations to one temperature.

There are other methods of judging of the strength of spirituous liquors, which though useful are not accurate, such as the taste, the size and appearance of the bubbles when shaken, the sinking or floating of olive oil in it, and the appearances that it exhibits when burned; if it burns away perfectly to dryness, and inflames gunpowder, or a piece of cotton inmersed in it, it is considered as alcohol; the different spirituous

liquors leave variable proportions of water, when thus burned in a graduated vessel.

There is the greatest difficulty in ascertaining what is meant by the terms proof spirit. Dr. Thomson, quoting the act of parliament of 1762, states, that at the temperature of 60°, the specific gravity of proof spirit should be 0°916; and he also observes, that proof spirit usually means a mixture of equal bulks of alcohol and water; but the specific gravity of such a mixture will, of course, depend upon that of the standard alcohol, which is not specified. It appears from Gilpin's Tables that spirit of the specific gravity °16, at 60°, consists, by weight, of 100 parts of alcohol, specific gravity °825, at 60°, and 75 of water; and, by measure, of 100 parts of the same alcohol, and 61°87 of water.

One of the most accurate and convenient methods of obtaining the specific gravity of fluids is by what is called a thousand grain bottle. This is sold by most of the philosophical instrument makers, together with a weight, which is an exact counterpoise for the bottle when filled with distilled water; its magnitude being adjusted by grinding down the length of its neck, until it holds exactly 1000 grains of water at 60° of Fahrenheit. This instrument consequently requires no computation, but: is simply to be filled with fluid, and placed in one scale of a balance, while its counterpoise is placed in the other. If the fluid put into it is lighter than water, it will appear deficient in weight, and as many grains must be added to the scale that contains it as will restore the balance. This at once shows that the specific gravity of the fluid under examination is negative, or less than the standard, and consequently must be a fractional number; but, should the fluid be heavier than water, the bottle will preponderate, and weights must be put into the opposite scale, when their amount will be positive, and must be added to the amount of the standard. For example: if the bottle were filled with sulphurie ether, it would require 739 grains to be placed in the same scale to restore the balance, consequently its specific gravity would be thus expressed 0.739. Had it been filled with seawater, which is rather denser than that which is distilled, twenty-six-hundredths, or rather better than one-fourth of a grain must have been added in the opposite seale, and these, as already explained, must be added to the standard 1.000 to express the specific gravity of such water, which would be thus written 1.026. Sulphuric acid again, being still heavier, would, in like manner require 875 grains, and would accordingly be expressed 1.875.

A bottle, however, holding 1000 grains is often inconveniently large, and a small and thin globular phial, with a piece of thermometer tube ground into it by way of stopper, will be found more useful · such a phial should not weigh more than from fifty to sixty grains, and may contain between 400 and 500 grains of water. To use it it should be accurately counterbalanced in a delicate pair of seales, and then filled with distilled water, and the stopper thrust in, the capillary opening in which allows a little to coze out, and prevents the likelihood of bursting the

phial; it is then to be wiped clean and dry, and again carefully weighed, by which the quantity of water it contains is ascertained; the water being poured out it is next filled with the liquid whose specific gravity is required, taking care that it is of the same temperature as the water; we then weigh as before, and divide the weight by the former weight of water, the product gives the specific gravity required. Thus, suppose the phial to contain 425 grains of water at the temperature of 45°, it will be found to hold 5737.5 grains of pure mercury of the same temperature; and $5737.5 \div 425 \pm 13.5$ the specific gravity of mercury. Or, supposing the liquid lighter than water, such as alcohol, of which we may assume the phial to contain 350.5; then $350.5 \div 425 \equiv 0.824$, the specific gravity of the alcohol under trial.

The following table is given by Mr. Gilpin, in the eighty-fourth volume of the Philosophical Transactions, and is of essential use for taking the specific gravities both of solids and fluids, by enabling the operator to reduce the weight or bulk of the distilled water, employed in any case, to that which it would have at any other common temperature, and particularly to 60°, which is the usual standard.

Thus, for example, since the specific gravity of water at 47° is 1.0008 grains, and at 60° is 1.00000, (and consequently 1.0008 grains, at 47°, are equal in bulk to 1.00000 grains at 60°), it follows that it would require 252.708 grains at 47°, to equal the space of a cubic inch; for 1.00000; 1.0008; 252.506 (the weight of a cubic inch at 60°), 252.708.

TABLE of the SPECIFIC GRAVITY of WATER, at every Degree of Temperature, from 30° to 80° Fahrenheit.

TABLE OF SPECIFIC GRAVITIES .- Continuea

1

	BLE OF SPECIFIC GRAVITIES.— C	ontinuea
Cornelian speckled . 2.6	13 Sulphureted do. 1 · 11 Sulphurous acid 2·2: Glass, crown 2·5: 57 green 2·6: 60 flint from 2·760 to 3·00 plate 2·9: 62 Granite . 2·9: 63 Granite . 1:4	301 or not 7+799
Chalcodony common from	Sulphurous acid 2.20	30 or not 7.788
Charcedony, common, nom	Glass grown 9:50	Lead . 11.38 20 Manganese . 8000
	5 Olass, clowit 2.52	Manganese . 8.000
Chalk . from 2.252 to 2.6	green . 2.6-	12 Mercury, solid, 3°
Chrysolite 3.4	10 fint from 2.760 to 3.00	below 0 of Fahr. 15.61
Chrystalline lens of the eye 1.1	00 plate 2.94	2 Do. at 32° of Fahr, 13.61
Cinnabar, from Almaden 6.9)2 Granite . from 2.613 to 2.95	6 Do. at 60° of Fahr. 13.58
Coals . from 1.020 to 1.30	00 Gum arabic 1.45	2 Do. at 212° of Fahr. 13-37
Const 1.0	100 Gum arabic	1 Nolyhdonum 9.000
Copal	Cuppowder losso	1 Molybdenum 8.600
Corai, red, from 2.030 to 2.83	Grunpowder, loose . 0.83	6 Nickel, cast . 8.279
white, from 2.540 to 2.57	snaken . 0.93	2 forged . 3.666
Corundum 3.71	0 solid 1.74	5 Osmium and Rhodi-
Cyder 1.01	8 Gypsum, compact, from	um, alloy of . 19.50
Diamond, oriental, color-	1.872 to 2.28	8 Palladium . 11.80
less 3:59	1 crystallised, from	Platinum 21.47
Do colored variation from	2:311 to 3:00	Potassium at 59°
Do. colored varieties, from	Unitedante en blandeten e	1 otassium at 59
004010000	Unitenotiope, or biologione	1 raut 0.865
Do. Brasilian 3.44	4 from 2.629 to 2.700 Honey 1.450	Rhodium $.10.65$
Do. colored varieties, from	Honey 1.450	Selenium . 4.300
3.518 to 3.55	Honeystone, or mellite, from	Silver 10.47
Dolomite from 2:540 to 2:83	1:560 to 1:666	hammered 10.51
Dragon's blood (a resin) 1:20	1·560 to 1·666 Hornblende, common, from	Sodium at 59° Fahr. 0.972
Ether Acetic		Starling Fair. 0.972
Ether, Acetic . 0.86 Muriatic . 0.72 Nitric . 0.90	3.250 to 3.830	Steel, soft . 7-833
Muriatic 0.72	basaltic, from	tempered 7.816 Steel, hardened 7.840
Nitric 0.90	3·160 to 3·333	Steel, hardened 7.840
Subburie from	Hornstone from 2:533 to 2:810	fempered and
0 632 to 0.77	5 Hyacinth from 4.000 to 4.780 Jasper . from 2.358 to 2.816	hardened 7.818
Emerald from 2:600 to 2:77	Jasper from 2.358 to 2.816	Tellurium, from
Euclass from 0:000 to 2:00	Lot 1.200	
Euclase from 2.900 to 5.30		5.700 to 6.115
Fat of Beet · 0.92	Jet 1.300 3 Indigo 1009	Tin, Cornish . 7.291
Hogs 0.93	5 Ironstone from Carron . 3.281	Do. hardened 7.299
Mutton 0.92	B Do. Lancashire 3.573	Tungsten . 17.40
Veal 0.934	Isinglass 1.111	Uranium 9.000
Felsnar from 2.438 to 2.700	Ivory 1.825	Zinc from 6:000 to 7:101
Flint block	Lanis Nonhritiana 9.904	Mice from 0.650 to 7 191
Flint, black 2:58	Lapis Nephriticus . 2.894	Mica from 2.650 to 2.934
Flint, black . 2:58 Gamboge . 1:22	Lapis Nephriticus . 2.894 Lard 0.947	Mica from 2.650 to 2.934 Milk 1.032
Flint, black 2.585 Gamboge 1.225 Garnet, precious, from	Lapis Nephriticus . 2894 Lard 0947 Lead, glance or galena from	Mica from 2.650 to 2.934 Milk . 1.032 Mineral pitch, or asphal- . .
Flint, black 2·58 Gamboge 1·22 Garnet, precious, from 4·000 to 4·230	Lapis Nephriticus 2894 Lard 0947 Lead, glance or galena from Derbyshire, from 6565	Mica from 2.650 to 2.934 Milk 1.032 Mineral pitch, or asphal- tum, from 0.905 to 1.650
		Inf, Cornish 7'291 Do. hardened 7'299 Tungsten 17'40 Uranium 9'000 Zinc from 6'900 to 7'191 Mica from 2'650 to 2'934 Milk 1'032 Mineral pitch, or asphal- tum, from 0'905 to 1'650 Mineral tallow 0'770

	Mr. O. T. T	

* It may be proper to add, that Mr. S. L. Kent, to whom we are indebted for much valuable information on this subject, has nearly completed the most extensive and accurate series of observations on the specific gravity of mineral bodies that has ever been attempted.

Having in the preceding portion of our article examined the nature of hydrostatic pressure, we may now proceed to treat of fluids in motion, and the structure of hydraulic machines.

One of the most simple instruments for raising water is the syphon; a bent tube which owes its operation to the pressure of the atmosphere. The ordinary syphon is represented at fig. 1, plate II., HYDEOSTATICS and HYDEAU-LICS; and consists of a erooked tube A B C, of such a length, and with such an angle, or so bent at the vertex, as that, when the orifice A is placed on a horizontal plane, the height of A B may not exceed thirty-two or thirty-three feet. For common uses a foot or half a foot high suffices. If now the less arm A B be immersed in water, or any other liquid, and the air be sucked out of it by the herture C till the liquor

follow, it will continue to flow out of the vessel. through the tube B C, as long as the aperture A is under the surface of the liquor. Or if the syphon be at first filled with the fluid, and the aperture C stopped with the finger until the aperture A is immersed, the event will be precisely the same. During the process of sucking, the air in the tube is rarefied, and the equilibrium destroyed; consequently the water must be raised into the less leg AB, by the preponderating pressure of the atmosphere. The syphon being thus filled, the atmosphere presses equally on each extremity, so as to sustain any equal quantity of water in each leg; but the air not being able to sustain all the water in the longer leg, and being more than able to sustain that in the shorter leg, with the excess of force, therefore, it will raise new water into the shorter leg; and this new water cannot make its way

but by protruding the first before it : by this means the water is continually driven out at the longer leg, as fast as it is raised by the shorter.

The syphon will raise a stream of water to a considerable altitude in every situation where a little descent can be procured, but, while the operation continues, no water can directly be taken out of the stream above the lowest part of the tube. When, however, the two open ends of a syphon are closed, a quantity of water may be let out of the highest part, and its place supplied by introducing a like quantity of no use: all the avenues for the purpose being then closed, and the stream suffered to flow through the tube, the useless water will be displaced, and a fresh quantity may be soon after drawn off. This mode of exchanging fluids may be useful in furnishing a supply for domestic purposes; but there are some cases in which the water drawn off by this arrangement would not be thought sufficiently pure. To effect the same end the following apparatus has been suggested. In the upper part of the syphon E E, fig. 2, plate II., are inserted two small pipes, and their apertures in the inside of the tube should be divided by a projecting piece a quarter of an inch thick ; wherever the pipes are inserted, the piece must be placed in such a position that the current will strike against one of its flat sides. The pipe which opens on that side of the obstacle, or dam, struck by the stream, may be called the water-pipe, and that on the other side the air-pipe. Insert their other ends into a circular vessel, the air-pipe opposite to c must rise to near the top of this vessel, but the waterpipe o need not rise above the place of its insertion; a cock perfectly air-tight must be fixed in each pipe between the vessel and syphon; the vessel must also have a tube in its lower part for letting out water. This tube must have a cock fixed in it, or a valve, covered with leather, to close its lower end. To hasten the delivery of the water in this vessel, the external air may be admitted in such a manner as is most convenient.

The communication between the vessel and syphon being intercepted by turning the cocks in the pipes c o, and the branches closed at their lower ends, the tube may be filled with water through an aperture in the top. After this aperture is closed, and a stream of water let into the cistern o for supplying the syphon, the ends of the branches may be opened, and a continued stream will flow through the tube.

When it is required to fill the vessel c o with water, exclude the external air, and open the pipes between it and the syphon. The vessel will soon be filled, and the water may be let out by opening the tube for that purpose; after which the small pipes are again closed by turning the cocks.

In estimating the discharge by a syphon, the head of water must be reckoned equal to the difference between the levels of the surface of the water, and of the lower orifice. The reason of this will be obvious, when it is recollected that the length of the shorter leg is only measured to the surface of the water, however far it may reach below; and that, he the action of the

instrument is dependent on the discharging leg being the longer of two, the greater the difference in favor of this leg, the greater will be the force employed in promoting the discharge.

The improved syphon of M. Buten is shown at fig. 3, where A B is the long branch, with a bulb at A, and D C the short branch. This syphon requires neither to be blown into, nor any suction. It is sufficient to fill the long branch A B, and the ball A with the liquid, and to plunge the short branch C D into the liquid to be decanted. The bulb A, in emptying itself, draws off the liquid in contact with the short branch, and, though the bulb itself is partly empty, the flow is unremitting.

Another improved syphon by M. Hempel, is shown at fig. 4. It has the same advantages as that of M. Buten, and is more easily constructed on a large scale. A part of the liquid to be decanted is poured into the funnel A, at the top of the tube A B, which is fitted into the short branch of the syphon. As soon as the flow commences, through the long branch D C, the tube A B is withdrawn, and the flow of water continues.

The syphon is also occasionally disguised to form a philosophical toy, called Tantalus's cup, from the well known fable. This eup has a hollow stem, as at y, fig. 5, into which a small glass syphon z is cemented in such a manner that the upper bend of the syphon may be a little helow the top of the cup, and the shortest leg a may very nearly touch it. On pouring water into the cup it will rise to its proper level in the tube a, but still the cup will hold water, but, on attempting to fill it, the water will still rise up the tube a until it reaches the bend, which it will flow over and thus fill the whole of the longer leg z b; and the instant this is effected the water will flow continuously from buntil the cup is quite emptied. The upper part of the syphon z a may be concealed by placing a hollow image of a man over it, with the chin on a level with the bend of the syphon, when the cup will hold water until filled to the chin of the figure, but the water will begin to flow away as soon as it reaches that point.

The strange appearance of intermitting springs, or springs which run for a time and then stop altogether, and after a time run again, and then stop, is entirely occasioned by the channels in which the water flows being formed like syphons. Thus if A B C fig. 6, plate 11., represents a hill or mountain, in which there is a hollow E F G, and a channel bent like a syphon F H B leading out of it. The water collected from the rills d will fill the hollow, and, as soon as it rises to the line O P, of the same height with H, it will rise to H in the channel, and then flow out through B, till the whole runs off to the level of F. It will then cease to flow until the hollow is again filled to the level O P, when it will flow again, and so on. Some springs called variable or reciprocating, do not cease to flow, but only discharge a much smaller quantity of water for a certain time, and then give out a greater quantity. This is owing to the hollow being supplied from another hollow, which is situated higher up, and has a common runner going to join the stream below the bend H: for this

runner keeps the stream always supplied to a certain degree, and when the lower hollow, which feeds the syphon runner F II, is filled up to O H, both the common runner and the syphon runner feed the stream together, until the lower hollow is drained.

In some places the most absurd tales are told and believed by ignorant people respecting such springs; their flowing and ceasing are ascribed to witchcraft; and designing men have sometimes taken advantage of the credulity of others, and gained credit for themselves, by fortelling the return of the spring after it had ceased, or pretending to stop it when it was running. Some notions connected with superstitions of this kind are adverted to in the account given of an intermitting, or rather a variable spring, at Laywell, near Torbay, in Devonshire, by Dr. Atwell, the first person who distinctly explained these appearances by a reference to the nature of the syphon. 'It is a long mile,' says he, ' distant from the sea, upon the north side of a ridge of hills lying between it and the sea, and making a turn or angle near this spring. It is situated in the side of those hills, near the bottom, and seems to have its course from the south-west towards the north-east. There is a constantly running stream which discharges itself near one corner into a basin, about eight feet in length, and four feet and a half in breadth, the outlet of which is at the farthest end from the entrance of the stream, about three feet wide and of a sufficient height. This I mention that a better judgment may be made of the perpendicular rise of the water in the basin at the time of the flux or increase of the stream. Upon the outside of the basin are three other springs which always run, but with streams subject to a like regular increase and decrease with the former: they seem indeed only branches of the former, or rather channels discharging some parts of the constantly running water, which could not empty itself all into the basin; and, therefore, when by means of the season or weather the springs are large and high, upon the flux or increase of this fountain, several other little springs are said to break forth, both at the bottom of the basin and without it, which disappear again upon the ebb or decrease of the fountain. All the constant running streams put together at the time I saw them, were, I believe, more than sufficient to drive an overshot mill, and the stream running into the basin might be one-half of the whole. I had made a journey, purposely to see it, in company with a friend; when we came to the fountain we were informed by a man working just by the basin, that the spring had flowed and ebbed about twenty times that morning, but had ceased doing so about half an hour before we came. I observed the stream running into the basin for more than an hour by my watch, without perceiving the least variation in it, or the least alteration in the height of the surface of the water in the basin; which we could observe with great niccty by means of a broad stone laid in a shelving position in the water. Thus disappointed, we were obliged to go and take some little refreshment at our inn; after which, we intended to come back and spend the rest of our time by the fountain,

before we returned home. They told us in the house that many had been disappointed in this manner, and the common people superstitiously imputed it to I know not what influence which the presence of some people had over the fountain; for which reason they advised, that, in case it did not flow and ebb when we were both present, one of us should absent himself, to try whether it would do so in the presence of the other. Upon our return to it, the man, who was still at work, told us that it had begun to flow and ebb about half an hour after we went away, and had done so ten or twelve times in less than a minute. We saw the stream coming into the basin, and likewise the others on the outside of the basin began to increase, and to flow with great violence, upon which the surface of the water in the basin rose an inch and a quarter perpendicularly, in nearly the space of two minutes; immediately after which the stream began to abate again to its ordinary course, and in nearly two minutes time the surface was sunk down to its usual height, where it remained two minutes more; then it began to flow again as before, and, in the space of twenty-six minutes, flowed and ebbed five times; so that an increase, decrease, and pause, taken together, were made in about five minutes, or a little more. I could observe by the mark upon the stones, that the surface of the water in the basin had risen, before we came, at least three quarters of an inch perpendicularly higher than we saw it; and I thought that I could perceive some very little abatement each turn, both in the height, and in the time of its sinking; but the time of the pause, or standing on the surface at its usual height, or equable running of the stream, was lengthened, yet so as to leave some abatement in the time of the rising, sinking, and pause al together.'

It should seem, that, in the hill from which this stream comes, there are three hollows, or reservoirs, of different sizes, and connected by syphons of different widths. The times of the increase and decrease lengthening, arises from the water sinking in one of the reservoirs, which makes it flow more slowly than when it is full.

Having already briefly adverted to the principle upon which the syphon acts, it will now be necessary for us to show in what manner this instrument may be employed as a prime mover. The apparatus to which we allude was contrived by Mr. C. A. Busby, the son of Dr. Busby, and termed the hydraulic orrery. The original apparatus, as described by Mr. Busby, in the for-tieth volume of the Transactions of the Society of Arts, is exceedingly complicated ; but the following arrangement, as constructed by Mr. Partington, and employed by him in his public lectures, will be found to possess much greater simplicity, and its construction will be easily understood. A, fig. 7, plate II., represents a tin water-tight vessel, placed in a circular trough C. The upper vessel of water is furnished with an upright stem of wire, supporting a ball S, which is intended to represent the sun. The smaller balls, E and m, revolve round the larger sphere in the same time that the earth and moon revolve round the sun, and as such, serve to convey a

tolerably accurate idea of the movements of those bodies. The syphon B may be considered as the prime mover; as the lateral apertures at D, by allowing the escape of a small portion of water from the lower extremity of the instrument, destroy the equilibrium within the tube, and give a preponderance of power to the side which is opposed to the jet, and by this simple process an equable rotatory motion is produced : the whole apparatus floating round the central wire that supports the sun.

The mode of constructing pumps must next be examined. The common sucking-pump consists of a pipe, open at both ends, in which is a moveable piston, bucket, or sucker, in which is situated the valve. The piston is leathered round, so as to move freely, but not to admit any air between it and the pump-barrel. When the pump is worked, the piston is raised, and causes a vacuum between itself and the valve below; the external pressure of the air upon the surface of the water in the well then forces it up through the lower valve to supply the vacuum, when the whole space between the valves is filled with water. At the next stroke of the pump, the piston is forced down, and the water rises through the upper valve; when the piston, on being again raised, in addition to its former operation, lifts up the water which had before passed through the upper valve, and discharges it from the spout of the pump; and this it con-tinues to do as long as the pump is worked. Thus, every time the piston is raised, the lower valve rises, and the upper one falls; and every time it is depressed the upper valve opens, while the lower one shuts.

As it is the pressure of the atmosphere which causes the water to rise and follow the piston or bucket as it is drawn up; and since a column of water, about thirty-two feet high, is of the same weight as a column of air of equal area, from the earth to the utmost height of the atmosphere, therefore, the perpendicular height of the piston or bucket, from the surface of the water in the well, must always be less than thirty-two feet. For, independently of the inconvenience in most cases of having so long a stroke, if it were ever so much increased, the water would never rise higher than thirty-two feet (nor indeed so high, as it would have the weight of the valve to lift), and there would be an empty space between the surface of the water in the pumpbarrel and the sucker, and consequently a considerable loss of time and labor. But, when the water has once passed through the upper valve, it may be lifted by it to any height, if the pistonrod be made long enough, and a sufficient degree of strength employed, without ever lengthening the stroke.

The construction of pumps is usually explained to the student by glass models, in which the action both of the pistons and valves may be seen. In order to understand the arrangement of the common pump, we may refer to fig. 8, plate II. A is a vessel intended to contain water, which must be deep enough to rise at least as high as from B to C. The valve a on the moveable bucket D, and the valve b on the fixed box E (which box quite fills the bore of the pipe or barrel at E), will

each lie close, by its own weight, upon the hole in the bucket and box, until the engine begins to work. The valves are made of brass, and covered underneath with leather for closing the holes more exactly; and the bucket D is raised and depressed alternately by the handle F and rod G c, the bucket being supposed at II before the working begins.

Take hold of the handle F, and thereby draw up the bucket from H to I, which will make room for the air in the pump to dilate itself, by which its spring is weakened, and then its force is not equivalent to the weight or pressure of the outward air upon the water A : and, therefore, at the first stroke, the outward air will press up the water through the notched foot B, into the lower pipe, about as far as d: this will condense the rarefied air in the pipe between d and I to the same state it was in before; and then, as its spring within the pipe is equal to the force or pressure of the outward air, the water will rise no higher by the first stroke; and the value b_{\bullet} which was raised a little by the dilatation of the air in the pipe, will fall, and stop the hole in the box E; and the surface of the water will stand at d. Then depress the piston or bucket from I to H, and, as the air in the part II cannot get back again through the value b, it will (as the bucket descends), raise the valve a, and so make its way through the upper part of the barrel c, into the open air. But, upon raising the bucket D a second time, the air between it and the water in the lower pipe at d, will be again left at liberty to fill a larger space; and so, its spring being again weakened, the pressure of the outward air on the water A, will force more water up into the lower pipe from d to e; and when the bucket is at its greatest height I, the lower valve b, will fall, and stop the hole in the box E, as before. At the next stroke of the bucket or piston, the water will rise through the box E towards H, and then the valve b, which was raised by it, will fall when the bucket D is at its greatest height. Upon depressing the bucket again, the water cannot be pushed back through the value b, which keeps close upon the hole whilst the piston descends. And, upon raising the piston again, the outward pressure of the air will force the water up through E, where it will raise the valve, and follow the bucket to I. Upon the next depression of the bucket D it will go down into the water in the barrel II; and, as the water cannot be driven back through the now close valve b, it will raise the valve a as the bucket descends, and will be lifted up by the bucket when it is next raised. And now, the whole space below the bucket being full, the water above it cannot sink when it is next depressed; but, upon its depression, the valve a will rise to let the bucket go down; and when it is quite down the valve a will fall by its weight, and stop the hole in the bucket. When the bucket is next raised, all the water above it will be lifted up and begin to run off by the pipe K. And thus, by raising and depressing the bucket alternately, there is still more water raised by it; which, getting above the pipe K, into the wide top L, will supply the pipe, and make it run with a continued stream.

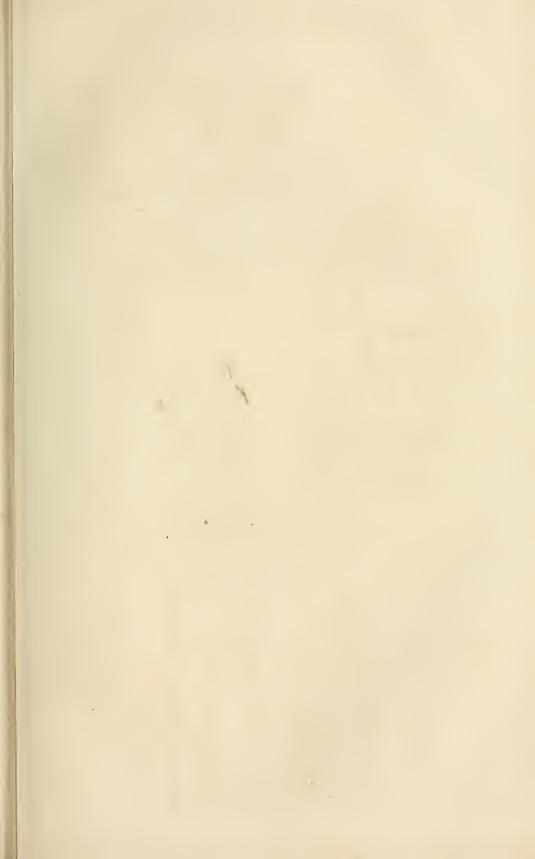

The common sucking-pump may, by a small addition, be converted into a lifting-pump, fitted for propelling the water to any distance, and with any velocity. Fig. 9 is a sucking-pump whose working-barrel A B has a lateral pipe, C, connected with it close to the top. This terminates in a main, or rising-pipe, furnished, or not, with a valve. The top of the working-barrel A B is shut by a strong plate, having a hollow neck terminating in a small flanch. The pistonrod passes through this neck, and is accurately turned and polished. A number of rings of leather are put over the rod, and strongly compressed round it by another flanch and several screwed bolts. By this contrivance, the rod is closely grasped by the leathers, but may be easily drawn up and down, while all passage of air and water is effectually prevented. The piston is perforated, and furnished with a valve open ing upwards. There is also a valve T on the top of the suction-pipe; and it will be of advantage, though not absolutely necessary, to put a valve L at the bottom of the rising-pipe. Now, suppose the piston at the bottom of the workingbarrel; when it is drawn up, it tends to compress the air above it, because the valve in the piston remains shut by its own weight. The air, therefore, is drawn through the valve L into the rising-pipe, and escapes. In the mean time, the air, which occupied the small space between the piston and the valve T, expands into the upper part of the working-barrel; and its elasticity is so much diminished thereby, that the atmosphere presses the water of the cistern into the suction-pipe, where it rises until an equilibrium is again produced. The next stroke of the piston, downwards, allows the air which had come from the suction-pipe into the barrel during the ascent of the piston, to get through its valve. Upon drawing up the piston, the air is also drawn off through the rising pipe. Repeating this process brings the water at last into the working-barrel, and it is then driven along the rising-pipe by the piston.

This is one of the best forms of a pump. The rarefaction may be very perfect, because the piston can be brought so near to the bottom of the working barrel; and, for forcing water in opposition to great pressures, it appears preferable to the common forcing-pump; because in that, the piston-rod is compressed and exposed to bending, which greatly hurts the pump, by This wearing the piston and barrel on one side. soon renders it less tight; and much water squirts out by the sides of the piston. But in this pump the piston-rod is always drawn, or pulled, which keeps it straight, and rods exert a much greater force in opposition to a pull than to compression. The collar of leather round the pistonrod is found by experience to be very impervious to water; and, though it needs but little repair, yet the whole is very accessible; and, in this respect much preferable to the common pump in deep mines, where every fault of the piston obliges us to draw up some hundred feet of pistori-rods. By this addition, too, any common pump, for the service of a house, may be converted into an engine for extinguishing fire; or may be made to convey the water to every

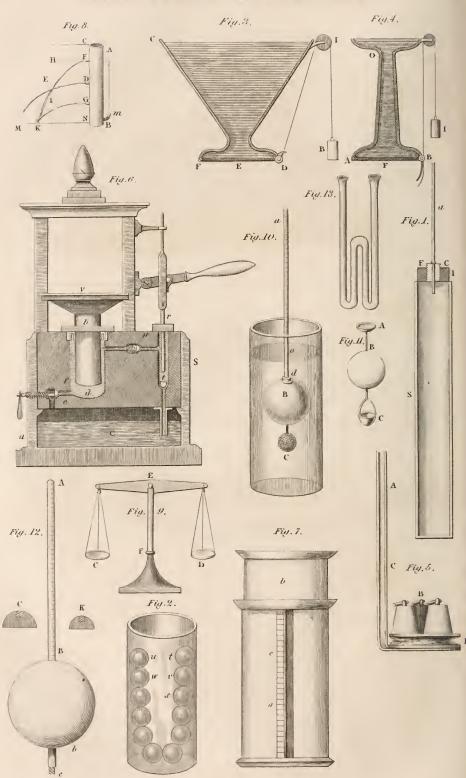

part of the house; and this without hurting or obstructing its common ases. All that is necessary is, to have a large cock on the upper part of the working-barrel, opposite to the lateral pipe in this figure. This cock serves for a spout, when the pump is used for common purposes; and the merely shutting this cock converts the whole into an engine for extinguishing fire, or for supplying distant places with water. It is scarcely necessary to add, that, for these services, it will be requisite to connect an air-vessel with some convenient part of the rising-pipe, in order that the current of water may be continual.

It is of considerable importance that as equable motion as possible be produced in the main pipe, which diminishes those strains to which it is otherwise liable. The application of an air vessel, at the beginning of the pipe, answers this purpose. In great works it is usual to effect this by the alternate action of two pumps. It will be rendered still more uniform if four pumps be employed, succeeding each other at the interval of one quarter of the time of a complete stroke.

But ingenious men have attempted the same thing with a single pump; and many different constructions for this purpose have been proposed and executed. Fig. 10 represents one of the best. It consists of a working-barrel a b, closed at both ends; the piston c is solid, and the pistonrod passes through a collar of leathers at the top of the barrel. This barrel communicates laterally with two pipes n and k, the communications being as near to the top and bottom of the barrel as possible. At each of the communications are two valves, opening upwards. The two pipes unite in a larger rising-pipe at b, which bends a little back, to give room for the pistonrod. Suppose the piston down close to the entry of the lateral pipe h; when it is drawn up, it compresses the air above it, and drives it through the value in the pipe k, whence it escapes through the rising-pipe; at the same time it rarefies the air below it. Therefore the weight of the atmosphere shuts the value m, and causes the water in the cistern to rise through the valve n, and fill the lower part of the pump. When the piston is pushed down again this water is fresh driven through the value m, because n immediately shuts; and then most of the air which was in this part of the pump at the beginning goes up through it, some of the water coming back in its stead. In the mean time the air which remained in the upper part of the pump after the ascent of the piston, is rarefied by its descent; because the valve o shuts as soon as the piston begins to descend, the valve p opens, the air in the suction-pipe h, expands into the barrel, and the water rises into the pipes by the pressure of the atmosphere. The next rise of the piston must bring more water into the lower part of the barrel, and must drive a little more air through the valve o, namely, part of that which had come out of the suction-pipe h; and the next descent of the piston must drive more water into the rising-pipe k, and along with it most, if not all, of the air which remained below the piston, and must rarefy still more the air remaining above the piston; and more water

will come in through the pipe h, and get into the barrel. It is evident, that a few repetitions will at last fill the barrel on both sides of the piston with water. When this is accomplished, there is no difficulty in perceiving how, at every rise of the piston, the water of the cistern will come in by the valve n, and the water in the upper part of the barrel will be driven through the valve σ ; and, in every descent of the piston, the water of the cistern will come into the barrel by the valve p, and the water below the piston will be driven through the value m; and thus there will be a continual influx into the barrel through the values n and p, and a continual discharge along the rising-pipe l, through the values mand o.

This machine is certainly equivalent to two forcing-pnmps, although it has but one barrel and one piston; but it has no sort of superiority. It is not even more economical, in most cases; because, probably, the expense of the additional workmanship will equal that of the barrel and piston, which is saved. There is, indeed, a saving in the rest of the machinery, because one lever produces both motions. It therefore cannot be called inferior to two pumps; and there is undoubtedly some ingenuity in the contrivance.

The forcing-pump represented at fig. 1, plate III., consists of a barrel A B, and a piston or forcer C. It is also provided with an airvessel v.

When the forcer is first moved upwards in the barrel, the air between that and the water below, having room to dilate, by its natural spring, will of course be rarefied; the pressure of the atmosphere being intercepted by the force of the barrel A B on one hand, and by the upper valve at S in the branching-pipe, on the other, the water will rise from the spring into A B, for the reason already given; and repeated strokes of the piston will fetch up the fluid to the forcer, and fill the cavity of the pipes between the fixed valves D and S. The water in this manner raised, being hindered from going down again by the lower valve, will be pressed by the forcer every time it descends, and be thereby obliged to make its way where there is least resistance, viz. through the upper valve at S. And whenever, on the rising of the forcer, this pressure intermits, the valve at S will immediately close under the weight of the upper water, and prevent its return that way, while the piston is rising with a fresh supply; and this is repeated at every stroke of the forcer.

It is evident that the operation of a pump is by starts, and that the water in the main remains at rest, pressing on the valve during the time that the piston is withdrawn from the bottom of the working-barrel. It is in most cases desirable to have this motion equable, and in some cases it is absolutely necessary. Thus, in the engine for extinguishing fires, the spout of water, going by jerks, could never be directed with a certain aim, and half of the water would be lost by the way; because a body at rest cannot in an instant be put in rapid motion; and the first portion of every jerk of water would have nut a small velocity. A very ingenious contrivance has been fallen upon for obviating this in-

VOL. XI.

convenience, and procuring a stream nearly equable. At any convenient part of the rising pipe, beyond the valve S, there is annexed a strong and capacious vessel V, closed at top by a small pipe T fixed into it, which reaches nearly to the bottom of the vessel. When the water is forced along the rising-pipe, S, it gets into this vessel, and rises above the lower part of the pipe Τ. The air, which is above the water in the vessel, being now confined, and being condensed into a smaller space by the admission of more water at each action of the piston, presses by its elasticity upon the surface of the water, which cannot return by the valve S, and forces it up the pipe T in a continued stream. This air-vessel must be so large, that the change of bulk of the compressed air, during the inaction of the piston, may be inconsiderable, otherwise the stream will not continue until the next stroke. We must not imagine, that because the stream produced by the assistance of an air-vessel is almost perfectly equable, and because as much water runs out during the returning of the piston as during its active stroke, that it therefore doubles the quantity of water. No more water can run out than what is sent forward by the piston during its effective stroke. The continued stream is produced only by preventing the whole of this water from being discharged during this time, and by providing a propelling force to act during the piston's return. It is, however, a matter of fact, that a pump, furnished with an air-vessel, delivers a little more water than it would do without it.

In forcing-pumps it is of the utmost consequence to avoid all contractions in the pipes. The main, which leads from the forcing-pumps, should be equal to the working barrel. If it be only half the diameter, it has but onefourth of the area; the velocity in the main is four times greater than that of the piston; and the force necessary for discharging the same quantity of water is sixteen times greater. It is not, however, possible to avoid these contractions altogether, without making the main wider than the barrel; for if only so wide, with an entry of the same size, the valve makes a considerable obstruction. Unskilful engineers endeavour to obviate this, by making an enlargement in that part of the main which contains the valve. If this be not done with great judgment, it will increase the obstruction; for, if this enlargement be full of water, the water must move in the direction of its axis with a diminished velocity; and, when it comes to the main, it must again be accelerated. In short, any abrupt enlargement, which is to be afterwards contracted, does as much harm as a contraction, unless it be so short that the water in the axis keeps its velocity until it reach the contraction. All angular enlargements, all boxes into which the pipes, from different working-barrels, unite their water before it goes into a main, must therefore be avoided by an artist who would execute a good machine; and the different contractions, which are unavoidable at the scats of valves, and the perforations of pistons, &c., should be diminished, by giving the parts a trumpet shape. In the airvessel, for producing a constant stream, this is of

2 L

very great consequence. The throat, or the end of the tube through which the water is forced by the expansion of the confined air, should be always formed in this manner. A neglect of this seemingly trifling circumstance will diminish the performance at least one-fifth.

The requisites of a valve are, that it be tight, and of sufficient strength to resist the pressure to which it is exposed ; that it afford a free passage to the water; and that it do not allow much to go back whilst it is shutting. The clack-valve is of all others the most obvious and common. It consists merely of a leather flap, covering the aperture, and having a piece of metal on the upper side, both to strengthen and to make it heavier, that it may shut of itself. Sometimes the hinge is of metal. The hinge being liable to be worn by such incessant motion, and as it is troublesome, especially in deep mines and under water, to undo the joint of the pump, in order to put in a new valve, it is frequently annexed to a box like a piston, made a little conical on the outside, and dropt into a conical seat made for it in the pipe, where it sticks fast; and, to draw it up again, there is a handle, like that of a basket, fixed to it, which can be laid hold of by a long grappling-iron. The only defect of this valve is, that, by opening very wide, when pushed up by the stream of water, it allows a good deal to go back during its shutting again.

The butterfly-valve is free from most of these inconveniences, and seems to be the most perfect of the clack-valves. It consists of two semicircular flaps revolving round their diameters, which are fixed to a bar placed across the opening through the cistern. Some engineers make their great valves of a pyramidal form, consisting of four clacks, whose hinges are in the circumference of the water-way, and which meet with their points in the middle, and are supported by four ribs, which rise up from the sides, and unite in the middle. This is a most excellent form, affording a more spacious water-way, and shutting very readily.

There is another form of a valve, called the button, or tail-valve. It consists of a plate of metal turned conical on the edge, so as exactly to fit the conical cavity of its box. A tail projects from the under side, which passes through a cross bar in the bottom of the box, and has a little knob at the end, to hinder the valve from rising too high. This valve, when nicely made, is unexceptionable. It has great strength, and is therefore proper for all severe strains; and it may be made perfectly tight by grinding. Accordingly, it is used in all cases where tightness is of indispensable consequence. It is most durable, and the only kind that will do for passages where steam or hot water is to pass through.

Mr. Perkins has contrived an ingenious and valuable ship's pump, which may be constructed by sea-faring people while at sea, from materials that are always found on board; viz. deal boards or planks, leather, nails, canvas, and tar.

This pump is constructed as follows: take four strips of deal bords, of suitable width and length, nail them firmly together, so as to form a square trunk: this trunk is next covered entirely with tarpawling; then another layer of boards is

laid over the trunk, observing to break the joints. A third layer of boards, nailed firmly to the first and second layer, will complete the body of the pump, if of a common size (say five inches); but, if the pump is larger, it may be strengthened by adding more layers of boards. The substitute for the upper hox of the common pump consists of two isosceles triangular valves, the sides of which are double the length of the base, jointed with leather to two square pieces of wood (hard wood, if convenient). These two pieces of board, to which the valves are jointed, play diagonally in the pump. Between these two pieces of board is fastened, with nails, the pump rod, which is also made of deal board : the leather which forms the joint should be extended over the sides of the valves, so as to form the stuffing, as the valves lie obliquely in the angles of the pump. The inside of the valves may be loaded with sheet lead, if convenient; at any rate, they should be filled with as many nails as the valves will hold without weakening them. The upper valves are furnished with a check string, to prevent the friction of the valves on the sides of the pump; this check, which may be made of small line, is very important to the ease of working the pump. It should be so adjusted as to prevent the valves from resting on the sides of the pump; the leather only should touch the pump. The lower valves, which are fixed to the bottom of the pump, are made similar to the upper valves, with the exception of the rod and check. Between the lower valves a piece of hard wood, for hooking up the valves, if no sheet iron or copper is at hand, should be fastened.

This pump works very easily, owing to the water-way by the valves being much greater than the water-way through common boxes. It is not liable to choke, in consequence of the water not being wire-drawn below the boxes or valves; for the water-way below the valves may be so contracted as to draw up even iron; but, by enlarging the bottom of the pump, this will be remedied.

Plate III., HYDROSTATICS and HYDRAULICS, fig. 2, is a side section of the pump; and fig. 4 the upper end of the trunk. AA, body of the pump: C C, pump rods: D D, upper valves: E E, lower valves.

We may now notice the ingenious pump contrived by Mr. Aust, for which he was rewarded by the Society of Arts. The advantages which it possesses over pumps of the ordinary construction depend on the curvilinear form of the barrel, which allows, and indeed obliges, the rod, the handle, and the lever, on which it works, to be all in one piece. Hence results, not only a much greater simplicity in the workmanship, and consequent cheapness, but a greater steadiness and precision of action, whereby more water is discharged, and the leathering of the valve will last a much longer time without wanting repair.

Plate III., fig. 3, is a view of the pump, *aa*, the barrel, forming a curve of a quarter of a circle, fixed at the upper end to the head f_i , and at its lower to the pipe *b*: *b b*, the pipe that conducts the water into the barrel; it is made curvilinear, in order that as little obstacle as possible may be opposed to the ascending water: c, c, c, the piston, the handle, and the lever, on which it works, all in one piece; the piston part is curved, to correspond with the curvature of the barrel: d, the pivot on which the lever of the handle works: e, a flat plate to which the whole apparatus is fastened, and which may itself be screwed to a block of wood fixed against the wall.

Mr. Eve's patent pump is probably one of the most ingenious and valuable inventions of its kind that has appeared of late years; there are no valves to open and close, the moving parts being rotatory; their speed may therefore be increased at pleasure, and to an almost unlimited degree. The water pumped up is in proportion to the speed of the revolving parts, and to the force applied. Figs. 5, 6, will, however, best illustrate its construction. A shows a front view; and B an interior view; after the end of the case with the cog-wheels is removed.

The principle is this: two cylinders of equal diameter (three inches and a half) and equal length (six inches), move in close contact on axes or pivots, and revolve in opposite directions, in an outer case or box. These cylinders have each two wings, of three-fourths of an inch area, and two grooves; and, as they revolve, the wing of one cylinder falls regularly into the groove of the other, alternately, and so in rotation; and in order that the groove may present itself regularly to the wings of the opposite cylinder, and let them pass, cog-wheels, placed outside the case, are fixed to the axes or pivots, which project: these cog-wheels insure not only an even revolution of the two moving parts, but they communicate the power, which is applied by means of a handle, to the axis of a large toothed wheel gearing into one of the two cog-wheels.

The pump-case is placed upon a common pipe, descending down to the well twenty-one feet below. Two men, turning the handle, raise half a ton of water in three minutes with this small pump; which is allowed to be a most satisfactory result, considering that, as the first pump constructed on this principle, it has of course many imperfections.

By substituting an air-vessel, with a hose and pipe, the machine becomes the most simple, strong, and effectual fire-engine. It may be converted into a water-wheel, where a small stream with a high fall of water exists, or be acted upon by steam as a rotatory steam-engine.

The advantages which it possesses over common pumps are manifold and self-evident. The most conspicuous are, a saving of power, on account of the friction being much less than in ordinary pumps. It requires no leathering, being made entirely of metal; it does not wear, as no parts touch or rub, except the axes or pivots on their bearings. Its simplicity, strength, and elegance, and the ease with which it is turned into a fire-engine, the saving of room, and weight in pump work, if applied to deep wells or shafts in mines, the advantages as a ship's pump, are peculiar, and too numerous here to enumerate.

[^] Mr. William Brunton, of Butterly iron works in Derbyshire, has presented to the Society of Arts an improved pump for mining, which ob-

viates many difficulties connected with the ordinary arrangements. To prevent the pump drawing air, he has introduced a side pipe, connecting the parts of the working barrel which are above and below the bucket, which pipe has a stop valve, that the miners can regulate with the greatest ease, so as to keep the engine to its full stroke, without drawing air, by letting down the water from the upper part of the barrel into the lower, so that it is working again in its own water. Instead of having the whole weight of the lower lift of pumps standing on the bottom, it is fixed in the pit by cross beams, and the miner has only to fit and move an additional pipe or wind-bore, which slides upon the lower length of the pump like a telescope, to lengthen down, and this additional wind-bore is besides crooked, and turned aside like a short crank, which, by the facility with which it turns round in the leathered collar above the nose of it, can easily be removed into every fresh hole which is made in the bottom by the miners. The pumps are supported in the pit by beams placed across at proper distances, so as to suit the lengths of the pipes, or lengths of the pump, which are nine feet. Short picces are laid across these, with half circular holes in them: which being put round the pump, first beneath the flanches, firmly sustain its weight, but may quickly be removed when it is required to lower the pumps in the pit; and, as they are not fastened by any bolt, they do not prevent the pumps being drawn upwards, if it becomes necessary to take out the pumps when the pit is full of water. The pumps by these means remain stationary, and the suction-pipe lengthens as the pit is sunk, until it is drawn out to its full extent; the whole column is then lowered to the next flanches, and another pipe is added to the top. The pumps being thus kept stationary till nine feet are sunk, the pipe at the top will of course deliver the water at the same level at all times, and, instead of being obliged to lengthen the column every yard sunk, it will only be necessary every nine feet. Plate III., fig. 7, ex-plains the construction of Mr. Brunton's pump, being a section through the centre of the working barrel and suction-piece. A is the door which unscrews to get at the clack of the pump; B is the working barrel, with the bucket D working in it; E is the clack, also shown enlarged in figs. 8 and 9; F is the suction-pipe, and GG a moveable lengthening piece : this slides over, and includes the other when the pump is first fixed ; but, as the pit is sunk, it slides down over the pipe F, to reach the bottom. The outside of the inner pipe F is turned truly cylindrical and smooth, and the inside of the outer pipe G, at the upper end, for about six inches down, is made to fit it. The junction is made perfect, by leathers being placed in the bottom of the cup a a, which holds water and wet clay over them, to keep them wet and pliable, and consequently air-tight. The lower extremity of the suction-pipe G, terminates in a nose R, pierced with a number of small holes, that it may not take up dirt. This nose is not placed in a line with the pipe, but curved to one side of it, like a crank, so as to describe a circle when turned round. By this means the miners, by turning it round upon the 2 L 2

pipe F, can always place the nose R in the deepest part of the pit; and, when they dig or blast a deeper part, they turn the nose about into it, the sliding tube lengthening down to reach the bottom of the hole, as shown in the figure. By this means there is never a necessity to set a shot for blasting so near the pump-foot as to put it in any danger of being injured by the explosion, as is the case in the common pump, in which this danger can only be avoided by moving the pump-foot to one side of the pit, which necessarily throws the whole column of pumps out of the perpendicular.

The construction of the clack is explained by the preceding figs., the former being a section, and the latter a plan. LL is a cast-iron ring, fitting into a conical seat in the bottom of the chamber of the pump, as shown in fig. 10; it has two stems rising from it, to support a second iron ring 1,1, M M; just beneath this, a bar m extends across from one stem to another, and has two screws tapped through it; these press down a second cross-bar n, which holds the leather of the values down upon the cross-bar of the ring L, and this makes it fast, forming the hinge on which the double valves open, without the necessity of making any holes through the leather, as is common; but the chief advantage is, that by this means the clack can be repaired, and a new leather put in, with far less loss of time than at present, an object of the greatest importance; for in many situations the water gathers so fast in the pit, that if the clack fails, and cannot be quickly repaired, the water rises above the clack door, so as to prevent any access to it, and there is no remedy in the common pump but drawing up the whole pile of pumps, which is a most tedious and expensive operation. In Mr. Brunton's pump, the clack can at any time be drawn out of it, by first drawing out the bucket, and letting down an iron prong Z, which has hooks on the outside of its two points : this, when dropped down, will fall into the ring M, and its prongs springing out will catch the under side, and hold it fast enough to draw it up. Another part of Mr. Brunton's improvement consists in the addition of a pipe H, which is cast at the same time with the barrel, and communicates with it at the top and bottom, just above the clack : at the upper end the pipe is covered by a flat sliding plate, which can be moved by a small rod b, passing through a collar of leather; the rod has a communication by a lever, so that the valve can be opened or shut by the men in the bottom of the pit. The object of this side pipe is to let down such a proportion of the water which the pump draws, as will prevent its drawing air; though, of course, the motion of the engine will be so adapted as not to require a great proportion of the water to be thus returned through the side pipe, yet it will not be possible to work the engine so correctly as not to draw some without this contrivance, and, if it does, it draws up much dirt and pieces of stone into the pump, besides causing the engine to work very irregularly, in consequence of partially losing its load every time the air enters the pump. Another use of the side pipe is to let down water into the chamber of the clack to fill it, when the engine is first

set to work, after the pumps have been standing still, and the lower part of the barrel and chamber empty.

When a spiral pipe, consisting of many convolutions, arranged either in a single plane, or in a cylindrical or conical surface, and revolving round a horizontal axis, is connected at one end by a water-tight joint with an ascending pipe, while the other end receives, during each revolution, nearly equal quantities of air and water, the machine is called a spiral pump. It was invented about 1746, by Andrew Wirtz, a pewterer at Zurich. The end of this pipe is furnished with a spoon, containing as much water as will fill half a coil, which enters the pipe a little before the spoon has arrived at its highest situation; the other half remaining full of air, which communicates the pressure of the column of water to the preceding portion, and in this manner the effect of nearly all the water in the wheel is united, and becomes equivalent to that of the column of water, or of water mixed with air, in the ascending pipe. The air nearest the joint is compressed into a space much smaller than that which it occupied at its entrance; so that, where the height is considerable, it becomes advisable to admit a larger portion of air than would naturally fill half the coil, and this lessens the quantity of water raised, but it lessens also the force required to turn the machine. The joint ought to be conical, in order that it may be tightened when it becomes loose, and the pressure ought to be removed from it as much as possible. The loss of power, supposing the ma-chine well constructed, arises only from the friction of the water in the pipe, and the friction of the wheel on its axis; and, where a large quantity of water is to be raised to a moderate height, both of these resistances may be rendered inconsiderable. But, when the height is very great, the length of the spiral must be much increased, so that the weight of the pipe becomes extremely cumbersome, and causes a great friction on the axis, as well as a strain on the machinery: thus, for a height of forty feet, Dr. Young found that the wheel required above 100 feet of a pipe which was three-quarters of an inch in diameter; and, more than one-half of the pipe being always full of water, we have to overcome the friction of about eighty feet of such a pipe, which will require twenty-four times as much excess of pressure to produce a given ve-locity, as if there were no friction. The centrifugal force of the water in the wheel would, also, materially impede its ascent if the velocity were considerable, since it would be always possible to turn it so rapidly as to throw the whole water back into the spoon. The machine which Dr. Young had erected being out of repair, he thought it more eligible to substitute for it a common forcing-pump, than to attempt to make any further improvement in it, under circumstances so unfavorable. But if the wheel, with its pipes, were entirely made of wood, it might in many cases succeed better; or the pipes may be made of tinned copper, or even of earthenware, which might be cheaper and lighter than lead.

The chain-pump consists of two square or cy-

lindrical barrels, through which a chain passes, having a great number of flat pistons, or valves, fixed upon it at proper distances. The chain passes round a wheel, fixed at one end of the machine. The teeth of this are so contrived as to receive one-half of the flat pistons, which go free of the sides of the barrel by nearly a quarter of an inch, and let them fold in, and they take hold of the links as they rise. A whole row of the pistons, which go free of the sides of the barrel by nearly a quarter of an inch, are always lifting when the pump is at work, and, as this machine is generally worked with rapidity, they bring up a full bore of water in the pump. It is worked either by one 'or two handles, according to the labor required.

The many fatal accidents which happen to ships, from the choking of their pumps, makes it an important object in naval affairs to find some machine for freeing ships from water, not liable to so dangerous a defect. The chain-pump, being found least exceptionable in this respect, was adopted in the British navy ; but the chainpump itself is not free from imperfections. If the valves are not well fitted to the cylinders, through which they move, much water will fall back ; if they are well fitted the friction of many valves must be considerable, besides the friction of the chain round the sprocket-wheels, and that of the wheels themselves. To which may be added the great wear of leathers, and the disadvantage which attends the surging and breaking of the chain. The preference, therefore, which has been given to chain-pumps over those which work by the pressure of the atmosphere, must have arisen from one circumstance, that they have been found less liable to choke.

In point of friction, of coolness, and of cheapness, the sucking pump has so evidently the advantage over the chain-pump, that it will not fail to gain the preference, whenever it shall be no longer liable to be choked with gravel and with chips.

Buchanan's pump, which, like the common pump, acts by the pressure of the atmosphere, is not liable to the defects incident to other pumps upon that principle, being essentially different from any in general use.

The principal object of its invention was to remove the imperfection of choking, and, in attaining this important end, a variety of collateral advantages nave also been produced, which enhance its utility.

The points in which it differs essentially from the common pump, and by which it excels, are, that it discharges the water below the piston, and has its valves lying near each other.

The advantages of this arrangement are—that the sand or other matter, which may be in the water, is discharged without injuring the barrel or the piston-leathers; so that, besides avoiding unnecessary wear and tear, the power of the pump is preserved, and not apt to be diminished or destroyed in moments of danger, as is often the case with the common and chain-pumps that the valves are not confined to any particular dimensions, but may be made capable of discharging every thing that can rise in the suctionpiece, without danger of being choked—that, if

there should happen upon any occasion to be an obstruction in the valves, they are both within the reach of a person's hand, and may be cleared at once, without the disjunction of any part of the pump—and that the pump is rendered capable of being instantaneously converted into an engine for extinguishing fire. Besides, it occupies very little space in the hold, and thus saves room for stowage.

But this pump is not confined to nautical uses alone; its adaptation extends to the raising of water in all situations, and with peculiar advantage where it happens to be mixed with sand or substances which destroy other pumps, as, for instance, in alum-works, in mines, in quarries, in the clearing of foundations; and in its double capacity it will be very convenient in gardens, bleaching-grounds, in stable, and farm yards, and in all manufactories, or other places, where there is a necessity for raising water and the risk of fire.

With all these advantages, it is a simple and durable pump, and may be made either of metal or wood, at a moderate expense.

Fig. 1, plate IV. HYDROSTATICS and HYDRAULICS, is a vertical section of the pump, as made of metal, in which A is the suction-piece, B the inner valve, C the outer valve.

The valves are of the kind called clack-valves. Their hinges are generally made of metal, as being more durable than leather.

D the working-barrel, E the piston, G the spout.

The following parts are necessary only when the pump is intended to act as a fire-engine.

H an air-vessel, which is screwed like a hosepipe, that it may, at pleasure, the more readily be fixed or unfixed.

There is a perforated stopple for the spout, made for receiving such pipes as are common to fire-engines. It is oval and tapered, and, being introduced transversely, upon being pulled back, becomes immediately tight.

These parts being provided, all that is necessary to make the pump act as a fire-engine, after having been used as a sucking-pump, is to plug up the spout with the stopple.

No particular mode being essential in the working of this pump, it may, according to choice, or circumstances, be wrought by all tho methods practised with the common pump. In many cases, however, it may be advantageous to have two of them so connected as to have an alternate motion, in which case one air-vessel, and even one suction-piece, might serve both.

The usual method of working pumps, either in distilleries, &c., or on board ships, is to force the water to the top of the barrel, and allow it to run off to a lower level.

It is quite clear that, if the water in this case descends from the top of the pump to a place of delivery much below the top of the pump-barrel, the fall of the water through this height is a mechanical force which is entirely wasted, and which may be actually employed in raising the water through a part of the pump-barrel. Mr. Witty avails himself of this power in a very iugenious manner. 'Instead of letting the water or liquid escape from a common pump, at the usual place of delivery, I caused it to descend again in a syphon-pipe to the lowest level at which it can conveniently be delivered; and as this descent is considerable in ships, brewhouses, &c., a considerable saving of labor is effected in working pumps by a descending column of water or liquor, counterbalancing as much in length of the rising column in the pump, as the height which it descends in the syphon-pipe, to the place where it can be delivered.' We have no doubt that this invention will be found to be of great practical value, as it relieves the men at the pump of a very great part of their labor. In cases of danger, at sea, it may prove the means of saving both the ship and the crew.

If we consider the water, which in ordinary pumps falls from the top of the barrel to the place of its reception, as a mechanical force which is lost, we may avail ourselves of it, by various contrivances, for assisting in the work to be performed. In Mr. Witty's contrivance, the men at the pump raise the water to the bottom of the short leg of the syphon, and it is then drawn through the syphon by the action of the longer branch. There are many cases, however, when we may allow the men to raise the water to the top of the barrel, and employ the direct force of the descending fluid to work another pump, or perform any other piece of work that may be required.

Mr. Robert Clarke, of Sunderland, has proposed an improvement in the mode of applying men's force to pumping, which is worthy the consideration of seamen. It is to change the posture of standing to sitting, and making the action the same as that of rowing, which, besides that it is by philosophers considered as the most efficacious application of a man's force, is to seamen most particularly so from their habitual practice of it. He objects to the ordinary action of pumping with a brake, as the posture is weak, and requires much force to preserve it. It oppresses the man by over-stretching his loins on one side, and incommodes respiration by the flexure of the body on the other side. Too much motion of the shoulder-joint is required, as the muscles which act on the arm-bone at this joint, are disproportionate to the effort they must make, when the arm vibrates on the shoulder-joints as a centre, for the force to be communicated by the hand. Besides this, the arms themselves are at one instant enfeebled, by being thrown above the head and requiring a pull, and the next instant requiring a pushing effort; which changes of direction, in the exertion and sustaining force, are too continual and rapid for long continuance; in standing, too, the body is a continued dead weight upon the legs.

The action of rowing is powerful to a surprising degree, and so well adapted to a man's ease, that he can continue it a greater length of time without fatigue, than any other mode of exertion; for, though the motion is large, it is made up of easy motions in several joints; the velocity and resistance of which, suit the muscles employed. Very little sustaining force is required; for the body is supported, and returns unloaded to its charge: the breathing also is free. The manner of carrying this into effect is very simple: the lever or brake being bent at right angles at a centre pin, so that it hangs straight down when it is at rest, instead of being horizontal; then to the lower extremity a rod is jointed, which is carried rather in an inclined direction upwards to the seaman, who is seated before the pump with a rest for his feet. The rod has a cross handle, to hold by both hands, and in some cases it may be made long enough for two men to sit side by side upon the same seat; and by drawing and pushing it, in the same manner as rowing, the perpendicular lever is caused to vibrate, and the horizontal arm, or bended part which suspends the pump spear, partakes of the motion sufficiently for pumping.

The latest improvements in ship-pumps are by captain Jekyl. This gentleman has invented an addition to the pump of an air vessel, and a stuffing-box for the rod to pass through, by which it will raise the water to a greater height than the head of the pump, and a hose being attached to the pump spout, by very simple means, the water is conveyed to any desired part of the ship, and thrown in a jet through a nose-pipe with great force, to extinguish fire, if such a calamity should befal a ship, and thus the pump is rendered of two-fold service. The idea of converting the pump to a fire-engine is not new, having been attempted in many different ways by forcing-pumps; but these having pipes proceeding from the lower part of the barrels and valves, which are not very accessible, are always liable to choke up by obstructions, and have not succeeded in general use. The air-vessel has always been in the way, if made of a sufficient size to answer the purpose of equalizing the stream. Captain Jekyl has obviated these objections, and, without altering the material parts of the handpump, has rendered it as complete a fire-engine as can be wished. This is explained by fig. 2, plate IV., which is a section of the pump through its whole length. A BC is the iron brake or lever to work it. It is branched at the same extreme end, and has a wooden pole, C, fixed in it, for several men to hold at once : D is the iron stanchion or fulcrum of the brake; it is fixed to the pump-head by means of strong iron hoops at E E and F F, which at the same time strengthen the work of the pump. The centre-pin is to be at a height of two feet six inches above the ship's deck. If are the slings of the pump, united by a firlock or pin to the end of the brake, and suspending the pump-spear I, by means of the joint-piece g. IK is the pump-spear, made of copper in the upper part I, and the lower length K of iron: the latter has the bucket M attached to it. The valve of the bucket is made in a very simple and effective manner; the valve being merely a round plate of brass, with a hole through the centre to receive the rod, upon which it rises and falls, and covers the aperture in the bucket. The bucket is a ring of brass, with a cross bar to fix the rod in : it is made in two thicknesses, one above the other, and a cup of leather is held in between them, projecting all round the upper part of the bucket, and turning up, to make a tight fitting in the barrel. The two rings of the bucket are held together by the piston-rod passing through both, and a cross-wedge beneath.

L is the brass chamber in which the bucket works: it is well fitted into the wood of the pumptree, so that the water cannot leak by it, and is bored smooth withinside. N is the lower box, fitted into the lower part of the pump-tree, beneath the chamber : it has a groove round it into which oakum is placed, and when it is put down makes a tight joint : its valve is of the same construction as that of the bucket, with the addition of a ring or eye on the top of the pin, on which the valve rises and falls. By this eye the box can be drawn up when it needs repair, by first drawing up the bucket of the pump, and putting an iron hook down into this eye. OOP is the air-vessel : this is a cylinder of sheet copper, soldered to a cover of brass; within the centre of it is a tube, likewise soldered to the cover, through which the copper pump-spear passes, and is fitted round at top with a collar of leather and stuffing. To prevent the escape of the water, it is packed with hemp and two rings of leather. R shows the place of two iron bars, fitted through the head of the pump, and confining the cover, O O, of the air-vessel; they are fastened by the wedges d: it is by these only that the air-vessel is held down: a circle of leather is first put round the air-vessel, just beneath its lid, and this, being pressed upon the recess in the wood, makes the joint tight. I is the pump nozzle, which delivers the water. When it is used as a fire-engine, a hose is fixed on by its link-joints, and keys or wedges: the nozzle is fixed to the pump by four screw-bolts going through the thickness of the pump, and is fixed in such a direction as will most conveniently lead to a receiver which unites the hoses from all three of the ship's pumps.

.

7

22

Fig. 3 is the link-joint of the hose, T representing the pump-spout, made of cast iron, and screwed to the pump-tree; ee is the collar or socket, made of brass, with the hose X bound upon it. This has two trunnions, on which a link, f, is fitted, one on each side; these links pass through grooves in the cast-iron piece T, and a key g, put down through the link behind it, draws the joint tight, without any screwing or farther trouble. The socket e e is fitted into the nozzle, and has a leather ring to make it tight. The outside of the pump is to be hooped at every three feet, to prevent it from bursting by the pressure of the water. The disposition of the three hand-pumps in a ship's well renders their connexion with a common receiver very convenient to bring all the water into one stream, which will then be very powerful, and more capable of extinguishing a fire than any moveable engine. Two hand-pumps are always placed on the starboard side of the main-mast, in the well, and one of them being the cistern pump, used for washing decks, its foot stands upon a small cistern fixed upon the step of the main-mast, and supplied with water by a pipe through the ship's side, with a cock to admit it at pleasure; there is one pump on the larboard side of the mast, three separate hoses being united with each of the pumps by a link-joint at one end, and, with three necks attached by similar joints at the other, bringing all the water into one; and a hose being joined by a link-joint, l, to the opposite end of

the receiver, conveys the whole water to any part of the ship. The receiver has the three nozzles k k k at one end made in a divergent direction, agreeably to the directions in which the hoses come from the three different pumps, and a valve is placed withinside, before each hose, to open inwards, in order that the receiver may be used for one or two pumps, whilst the others are repairing or getting ready, or that, if any of the hoses burst, the water may not escape from the receiver at that nozzle. There are two handles fixed to the receiver, to lift and carry it, as it is to be moveable, and when in use is proposed to be laid on the grating of the main hatchway, as the most central situation, from which the hose may be carried in any direction. Z is a branch pipe, or jet, screwed at the end of the great hose X; and it also unscrews at the extreme end, to fit on jets of different bores, in the same manner as all other fire-engines. In working, the pressure of the water condenses the air contained in the receiver, OOP, into a small space, and its reaction to resume its former bulk equalizes the efflux of water from the nozzle of the pump.

In some experiments it performed as well as could be desired, a single pump forming a very effective engine; but, when the three were combined, it was superior in force to any ever seen, and would throw a stream of an inch in diameter over the main top-mast head of a seventy-four gun ship. Besides, the length of the handle C admitting several men to work at once, an accession of force is gained by a rope n, made fast to the brake AB, and conducted through a single block, hooked to the deck at m, and thence along the ship's deck. At this any number of men may be applied very advantageously to produce the stroke, leaving those at the handle only to return it by lifting the handle. If the ship proves leaky, and the stuffing-box is thought to be an obstruction to the working of the pump, the airvessel may be taken out, by drawing the wedges d, and taking out the bars R, which confine it; then after taking out the key which connects the joint-piece g with the copper rod, also removing the brake, lift out the air-vessel by the two screws of the stuffing-box, and fix on the joint-piece again; but fix the guide-eye H in the lowest pair of holes, so that it will receive the top of the copper rod, and prevent the pump-spear having any play in the slings. In this state it acts as a common hand-pump, but the air-vessel can be restored to its place and be ready for work in two To prevent any of the work being minutes. neglected from carelessness, the inventer proposes that one of the pumps shall be always used to wash the ship by the hose and jet in the morning, which it would do much more effectively than by the present mode of raising the water into buckets; and the force with which the jet of water is thrown would very completely wash into every recess of the gun-carriages, and other places where a brush cannot reach; while, by this constant exercise, the pumps would always be ready, at a moment's notice, on an alarm of fire.

The following simple and ingenious method of working a ship's pump, when the crew are either too few in number, or too much exhausted

to attend to that duty, when the performance is most necessary, namely, in a heavy gale, was put in practice with great success by captain Leslie, of the ship George and Susan, on a late voyage from Stockholm to North America. He fixed a spar aloft, one end of which was ten or twelve feet above the top of his pumps, and the other projected over the stern; to each end he affixed a block, or pulley; he then fastened a rope to the spears of the pump, and, after passing it through both pulleys along the spar, dropped it into the sea astern. To the rope he fastened a cask, 110 gallons measurement, and containing sixty or seventy gallons of water. This cask answered as a balance-weight, and every motion of the ship from the roll of the sea made the machinery work. When the stern descended, or when a sea or any agitation of water raised the cask, the pump-spears descended ; and the contrary motion of the ship raised the spears, when the water flowed out. The ship was cleared out in a few hours, and the crew were of course greatly relieved.

In the Persian wheel, water may be raised by means of a stream d, plate IV. fig. 4, turning a series of floats, and furnished with buckets a b, suspended by strong pins fixed in the side of the rim; but the wheel must be made as high as the water is intended to be raised above the level of that part of the stream in which the wheel is placed. As the wheel turns, the buckets on the one side descend into the water, and then go up full on the other; when they arrive at C they strike against the end of the fixed trough and are overset, and empty the water into the trough ; from which it may be conveyed in pipes to the place where it is designed for; and, as each bucket gets over the trough, it falls into a perpendicular position again, and goes down empty, until it comes to the water at d, where it is filled as before. On each bucket is a spring, which, going over the top or crown of the bar, raises the bottom of the bucket above the level of its mouth, and so causes it to empty all its water into the trough.

Sometimes this wheel is made to raise water no higher than its axis; and then, instead of buckets hung upon it, its spokes are made of a bent form, and hollow within; these hollows opening into holes on the outside of the wheel, and also into those in the box upon the axis. So that, as the holes dip into the water, it runs into them; and, as the wheel turns, the water rises in the hollow spokes, and runs out in a stream from a series of holes, thus falling into the trough, whence it is conveyed by pipes to its destination.

Nearly allied to the Persian wheel, but much more elegant in its contrivance, is the screw of Archimedes, a unachine invented and used by this philosopher, for raising water and draining land in Egypt, about 200 years before the Christian era. The cochlion consists of a succession of buckets or recesses to be filled with the water to be raised; but instead of their being separate and detached, as in the Persian wheel, they are formed by the lower parts of the hollow thread of a screw, and their motion and succession are brought about by turning that screw.

This will be better understood by referring to fig. 5, which is a representation of this machine. and in which v u w x shows a flexible tube or pipe, wound in a screw-like form round a solid cylinder y y, the two extreme ends of which are equipped with pivots, so that the cylinder, with its encircling screw-formed tube, may be made to revolve on its axis by the force of running water, or any other power applied to its upper or lower end. Lastly, this machine must be supported by its two pivots, so as to make an angle with the horizon, as shown in the figure. If now the lower end v of the tube be supposed to be covered with water, that water will flow to its own level within the tube, and will occupy the lowest bend v; and if now the cylinder, yy, be turned round by its handle, in a direction from left to right, the lower end of the spiral tube will become elevated above the surface of the water in the reservoir, and that water which had entered into the tube will have no opportunity of escaping, but, by the motion of the screw-tube, will flow within it, until, at the end of the first revolution, it will be found in the second lower bend u. In the mean time the lowest extreme end of the tube will have made a second dip into the water of the reservoir, and will receive a second charge, which, in like manner, will be transferred to u, at the next revolution, while the water lately at u will be elevated to w; until at length, when the cylinder has made as many revolutions as there are turns of the tube round it, each lower bend will become filled with water, whatever may be the length of the cylinder y y; and as the extreme upper end a of the tube becomes depressed, in each revolution, into the situation of a lower bend, it will there discharge its water into an elevated cistern b, placed to receive it. The quantity of water raised by this machine will depend upon the capacity of the screw-pipe, and the angle above the horizon at which it is placed to work; but it will be seen by the figure, that there is room to dispose several pipes, parallel to each other, round the same cylinder, when they will all work simultaneously; or the whole cylinder itself may be made into a hollow screw, by merely placing a thin screw-formed diaphragm or partition round its central axis, which is the most usual form of the machine in practice. On a small scale, it may be constructed by wrapping one or more flexible lead pipes round a solid cylinder of wood, which forms a useful machine for raising water to small heights. It was formerly much used, but owing to its liability t become choked by mud, weeds, and other impediments, and the great difficulty of cleaning it out, it is seldom met with. It has, from its specious appearance of seeming to throw the entire weight of water that it is raising upon its axles, and the little friction with which these may be made to move by frictionrollers, had astonishing powers ascribed to it; but, if investigated, it will be found that the water is merely made to flow up an inclined plane; and whether water or any other weight be drawn up a fixed inclined plane, or it be stationary until moved by an inclined plane being forced under it, as is the case with the

quantities of water contained in the several bends v, u, w, x, &c., the mechanical effort will be the same; consequently, this machine possesses no other mechanical advantage over other constructions of pumps, except that its motions are attended by less friction than belongs to most of them.

The rope-pump of Vera, described in most books on hydraulics, consists of an upper and lower pulley, formed in the ordinary manner, hut with several grooves in each, in which endless ropes of very loosely spun horse-hair or wool are made to move with great rapidity by a nultiplying wheel connected with the upper pulley. The lower pulley, together with a great part of the rope, moves in the water, which is merely brought up by adhering to the ropes, and the rapidity of their motion. This, therefore, is but a very imperfect and rude kind of bueketpump, and is by no means deserving the place it has so long held in the catalogue of hydraulic machines.

Sarjeant's pump may be considered as a cheap and useful prime mover. It was originally applied to the raising of water at Irton Hall; and a small stream in the neighbourhood was brought by a wooden trough, into which was inserted a piece of two-inch leaden pipe, a part of which is seen at A, plate 4, fig. 6.

The stream of the pipe is so directed as to run into the bucket B, when the bucket is elevated; but so soon as it begins to descend, the stream flows over it, and goes to supply the wooden trough, or well, in which the foot of the forcingpump C stands, of three inches bore.

D is an iron cylinder, attached to the pumprod, which passes through it. It is filled with lead, and weighs about 240 lbs. This is the power which works the pump, and forces the water through 420 feet of inch pipe, from the pump up to the house.

At E is fixed a cord, which, when the bucket comes to within four or five inches of its lowest projection, becomes stretched, and opens a valve in the bottom of it, through which the water empties itself.

There is another machine for the purpose of procuring motion and power by water, which was invented by Dr. Barker towards the close of the last century, and which is generally known by the name of Barker's Centrifugal Mill. Its general construction is shown at fig. 7, plate IV., in which v u is a metal pipe of considerable height, its top v being widened or extended into a funnel shape. The pipe is maintained in its vertical position, as shown in the figure, by resting on a pointed steel pivot turning into a brass box w at the lower extremity, while the upper part has a cylindrical steel axis passing through the top y y of a frame which supports it: the pipe v u is consequently free to move round upon its own axis, which it does with very little friction. Towards the lower extremity of the pipe v u, and at right angles to its axis, two or more smaller pipes or arms with closed external ends are inserted as at z a, and an adjustable orifice is made at the side of each of these small pipes as near as possible to its end, and placed on opposite sides of such pipes,

so that water issuing from them may spout horizontally and in opposite directions, as shown at the letters z and a. One end of a pipe B communicates with a supply of water which it delivers into the funnel head v without touching it in any part, and the supply of this pipe must be so regulated by a cock or otherwise, that it may constantly keep the pipe u v filled with water without running over, at the same time that the discharge is going on from the orifices z a, which will deliver their water with a force proportionate to the perpendicular height of the column of water contained in uv; and, since the holes zaare in opposite directions, the water in passing from them will meet with such a resistance from the surrounding air as to throw the pipe *u v*, with its arms and axis x, into rapid roratory motion, and this axis may communicate its motion and power to wheel-work or machinery, or even to a mill-stone connected with its upper end. This machine is described and highly spoken of in almost all the books that teach of hydraulic machinery, but it does not appear to have been carried into practical effect in England.

The centrifugal pump may be considered as bearing some resemblance to Barker's Mill inverted, as the water in this case rises up the tube A A fig. 8, plate IV., from the reservoir E, and is thrown off by the centrifugal force at the ends of the lateral branch B C. This branch is furnished with valves at the extremities; and, a quantity of water having been poured into the lower vessel E, the cylinder and the lateral branch are also filled with water. The apparatus is then put into motion by turning the handle at G, and the centrifugal force driving out the valves at the extremities of the branch, the water rushes rapidly into the trough D, from which it returns into the reservoir through a hole at f. The water at the same time rises through a valve, at the bottom of the tube A A, opening upwards.

The Water Ram, or Belier Hydraulique, as it was called by its inventor, M. Montgolfier, of Paris, is a highly useful and simple machine, for the purpose of raising water without the expenditure or aid of any other force than that which is produced by the momentum or moving force of a part of the water that is to be raised; and is one of the most simple and truly philosophical machines that hydraulics can boast. The action of this machine depends entirely upon the momentum that is generated whenever a body is put into motion, and its effect is so great as to give the apparatus the appearance of aeting in defiance of the established laws of hydrostatic equilibrium; for a moving column of water of small height is made to overcome and move another column much higher than itself.

The form and construction of the water-ram is shown at fig. 9. Suppose o to represent a cistern or reservoir, or the source of a spring which is constantly overflowing and running to waste, by means of a channel a few feet lower than itself, as at the level line p p. Instead of permitting the water to run over the sides of o, let it be conducted to the level line p p, by means of iron or other pipes q q connected with the side of the reservoir, and terminating by an

orifice r, in which a conical or other value s is placed so as to be capable of effectually closing the pipe when such valve is drawn upwards; t is an adjustable weight fixed on to the spindle of the valve s, by means of which the valve is kept down and open; any water therefore that is in the cistern o will flow down the pipe q q, and escape at the orifice r, so long as the value remains down, but, the instant it is raised and shut, all motion of the water is suspended. Thus situated, the adjustment of the weight tmust take place, and, by adding to or subtracting from it, it must be made just so heavy as to be capable of sinking or forcing its way downwards, against the upward pressure of the water, the force of which will depend upon the perpendicular distance from the surface of the water in o, to its point of discharge at r (represented by the dotted line ov). But the water by moving acquires momentum and new force, and consequently is no longer equal to the column o v, to which the valve has been adjusted, but is superior to it, by which it is enabled to overpower the resistance of the weight t, and it carries the value up with it, and closes the orifice r. This is no sooner done than the water is constrained to become stationary again, by which the momentum is lost, and the valve and weight once more become superior, and fall, thus reopening the orifice and permitting the water to move again; and, as the pressure of the water and the weight of the valve each become alternately superior, the valve is kept in a constant state of vibration, or of opening and shutting without any external aid, whatever. Such is the principle upon which the motion of the water in the pipe \hat{q} \hat{q} is produced : but the momentum generated cannot be instantly annihilated; and it is not only of sufficient power to raise the valve s, but likewise to burst open the lower end of the pipe q q, unless a sufficient vent be provided by which this accumulated force can escape. Accordingly a second valve *u* is placed near the lower end of the pipe q q, and is made to open upwards into an air-vessel, having a discharging pipe x; and consequently, whenever the valve s is closed, the water, which otherwise would have flowed from the orifice r, now opens the value u and enters the air-vessel, until the spring of the contained air overcomes the gradually decreasing force of the momentum, when the value u closes, and that at s opens to permit the water to make a second blow or pulsation, and in this way the action of the machine continues unceasingly without any external aid so long as it is supplied with water, and remains in repair. A small running stream is necessary for this machine, as the water at o should be kept at one constant elevation to ensure the perfection of its action. A much greater quantity of water likewise escapes at the orifice r, between the pulsations, than can be raised in the delivering pipe x, particularly if it extends to any considerable height; for the comparative quantity of water discharged through x, and permitted to run to waste at r, must always depend upon the respective perpendicular heights of the pressing column o v, and the delivered or resisting column u x, and the rapidity of the pulsations will like-

wise depend on the same circumstances. A very insignificant pressing column o v is capable of raising a very high ascending column u x, so that a sufficient fall of water may be obtained in almost every running brook, by damming up its upper end to produce the reservoir o, and carrying the pipes q q down the natural channel of the stream until a sufficient fall be obtained; for a considerable length of descending pipes from o to r is necessary to insure the certain effect of the machine, since, if the column q qis not of sufficient length, its water will be thrown back into the reservoir, instead of entering the air-vessel, which requires to be replenished with air, and this is admitted into it by the self-acting shifting value, shown at b in the shaded part of it, which is an enlarged view of the air-vessel in an improved form; its valve is made by a ball at a, having a metal bridle over it to prevent its rising too high.

In taking the height to which water is to be raised by a pump, perpendicular height alone is to be regarded, and not lateral extension, because fluids press according to their perpendicular height. Thus, if a pipe 100 feet long is six feet higher at one end than at the other, the six feet only are to be regarded as the height to which the water must be raised, and the 100 feet may be disregarded, except so far as it produces friction detrimental to the motion of the water. The height of a lift of water must be taken from the surface of the water which is to be lifted to the surface of the cistern, or reservoir, or end of the pipe that is to receive or deliver it, and not from the bottom of the suction-pipe, because that pipe may descend any distance below the surface of the water to be raised without affecting the measurement, since the water will always rise to its own level within that pipe, without the aid of any exertion of force by the pump. Be careful, likewise, to introduce no right-angled or short turns into pipes, if they can be avoided; but let every such turn be a regular curved sweep, and the larger and more regular that sweep is made, the less impediment it will offer to the passage of the water.

In order to determine the force or power necessary to work a pump of any description, the height to which the water is to be raised must always be taken into account; for this height multiplied into the area of the piston, and reduced to any of the usual denominations of weight, will give the amount of resistance to be overcome (friction of the pump only excepted). The size of the pipe containing the water is quite immaterial, provided it be large enough to prevent friction and unnatural velocity in the water; and the entire perpendicular height from the surface of the water raised to the point where it is delivered, whether occupied by suction or feeding-pipe, or delivering pipe from a forcing pump must be added together, and considered as the height of the lift : so that if a lift and force-pump of four inches in diameter, in the working-barrel, has ten feet of three-inch suction-pipe below its piston, and twenty feet of two-inch delivering-pipe (including the length of the working-barrel) above it, the column to be lifted will be equal to thirty feet of four-inch

523

pipe filled with water. The contents in gallons of thirty feet of four-inch pipe must therefore be found, and, as each imperial gallon of water weighs 10 lbs. avoirdupois, the weight or load upon the pump will be immediately found, to which must be added from one-tenth to onesixth, according to the construction of the pump, for friction. The load upon an eccentric or any other pump may be found by the same rule, if the effective horizontal area of the piston, or its substitute, be found; and this be in like manner multiplied into the height of the lift. It therefore becomes important to know the weight and quantity of water which a certain length of pipe of any given diameter will contain, and a tolerably close approximation to this may be obtained by squaring the diameter of any pipe in inches, and cutting off the last figure of the product by a decimal point, which will nearly give the contents in ale-gallons of one yard in length of such pipe. Thus, for example, if a pipe is six inches in diameter, 6 times 6 make 36, and introducing the decimal point would reduce this number to 3.6, so that one yard of such pipe would contain three gallons and six-If a three-inch pipe had been taken, tenths. then $3 \times 3 \equiv 9$; consequently there remains but one figure to cut off. The gallons' place must therefore be supplied by a cypher, thus, 0.9, and the yard of such pipe would contain but nine-tenths of a gallon.

For greater certainty, however, the following table and rules are introduced. They are extracted from Brunton's Compendium of Mechanics; a recent little work, published at Glasgow, and which is replete with useful information :--

TABLE of the Contents of a Pipe one inch diameter for any required Height.

Feet high.	Quantity in Cub. In.	Weight in Avoir. Oz.	
1	9.42	5.46	0.0407
2	18.85	10.92	•0816
3	28.27	16.38	.1224
4	37.70	21.85	.1632
5	47.12	27.31	·2040
6	56.55	32 77	·2423
7	65.97	38.53	·2448
8	75.40	43.69	·3264
9	84.82	49.16	•3671
10	94.25	54.62	•4080
20	188.49	109.24	·8160
30	282.7-1	163.86	1.2240
40	376.99	218.47	1.6300
50	471.24	273.09	2.0400
60	565.49	327.71	2.4480
70	659.73	382.33	2.8560
80	753.98	436.95	3.2640
90	848.23	491.57	3.6700
100	942.48	546.19	-4.0800
200	1884.96	1092-38	8•1600

Although the above table only gives the contents of a pipe one inch in diameter, it will serve as a standard for pipes of any other size, by observing the following

Rule.—Multiply the numbers found in the table against any height by the square of the diameter of the pipe, and the product will be the number of cubic inches, avoirdupois ounces, and wine gallons of water, that the given pipe will contain.

Example.—How many wine gallons of water are contained in a pipe six inches diameter, and sixty feet long :—

 $2.4480 \times 36 \pm 88.1280$ wine gallons.

The wine gallon contains 231 cubic inches, and the new imperial gallon $277 \cdot 274$ cubic inches; therefore, to reduce the wine to the imperial gallon, divide by $1 \cdot 20032$; and for a like reduction of the ale gallon, which contains 282 cubic inches, divide by $0 \cdot 98324$.

HYDROSULPHURETS. Compounds of sulphureted hydrogen with the salifiable bases.

HYDROTHIONIC Acid. Sulphureted hydrogen, the hydrosulphuric acid of M. Gay Lussac.

HYDRO'TIC, n. s. Fr. hydrotique; Gr. ΰδωρ. Purger of water or phlegm.

He seems to have been the first who divided purges into hydroticks and purgers of bile. Arbutknot.

HYDRUNTUM, in ancient geography, a noble and commodious port of Calabria, from which there was a short passage to Apollonia. (Pliny) famous for its antiquity, and for the fidelity and bravery of its inhabitants; now called Otranto. Long. $19^{\circ} 15' E$, lat. $40^{\circ} 12' N$.

HYEMANTES, in the primitive church, offenders who were not allowed to enter the porch of the churches with other penitents, but were obliged to stand without, exposed to the inclemency of the weather, even in winter..

HYEN, u. s. Fr. hyene; Lat. hyæna. An HYE'NA, n. s. Sanimal like a wolf; said fabulously to imitate human voices.

I will weep when you are disposed to be merry; I will laugh like a hyen, when you are inclined to sleep. Shakspeare.

Out, out, hyena ; these are thy wonted arts,

And arts of every woman false like thee.

Milton. Samson Agonistes.

The hyena was indeed well joined with the beaver, as having also a bag in those parts, if thereby we understand the hyena odorata, or civet cat.

Browne's Vulgar Errours.

Oh the bewitching tongues of faithless men !

'Tis thus the false *hyena* makes her moan To draw the pitving traveller to her den. Otway.

To draw the pitying traveller to her den. Ot A wonder more amazing would we find;

The hyena shews it of a double kind ;

Varying the sexes in alternate years,

In one begets, and in another bears.

Dryden's Fables.

The keen hypena, fellest of the fell. Thomson. Tearing, and grinning, howling, screeching, swearing,

And with hyena laughter, died despairing.

Byron, Don Juan.

HYGEIA, or HYGIEA, Greek, YYIIIA, in mythology, the daughter o *Esculapius*, and the goddess of health, among the ancient Greeks, called by the Romans Salus. See SALUS.

HYGINUS (Caius Julius), a grammarian, the freedman of Augustus, and the friend of Ovid,

was born in Spain, or, according to others, in Alexandria. He wrote many works, all of which are lost, except his Fabularum Liber, and Astronomicon Poeticon, lib. iv., and even these are come down to us very imperfect. The best edition is that of Munker, in the Mythographi Latini; 2 vols. 8vo. 1681.

HYGROM'ETER, n. s. Fr. hygrometre; Gr. ψγρός and μετρεω. An instrument to measure the degrees of moisture,

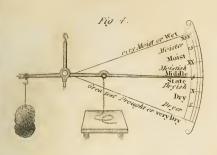

A sponge, perhaps, might be a better hygrometer than the earth of the river. Arbuthnot on Air.

The HYGROMETER, HYGROSCOPE, OF NOTIO-METER, is used for measuring the degrees of dryness and moisture of the atmosphere, as the barometer and thermometer measure its different degrees of gravity and warmth, although this instrument is far from being yet so perfect as these. There are three general principles on which hygrometers have been constructed: 1. The lengthening and shortening, or twisting and untwisting, of strings by dryness and moisture; 2. The swelling and shrinking of solid substances by moisture or dryness; and, 3, By the increase or decrease of the weight of particular bodies, which absorb the humidity of the atmosphere.

There are various kinds of hygrometers; for whatever body either swells by moisture, or shrinks by dryness, is capable of being formed into a hygrometer. Such are woods of most kinds, particularly deal, ash, poplar, &c. Such also is catgut, the heard of a wild oat, and twisted cord, &c. The best and most usual contrivances for this purpose are as follows: 1. Stretch a common cord or a fiddle-string along a wall, passing it over a pulley; fixing it at one end, and to the other end hanging a weight, carrying a style or index. Against the same wall fit a plate of metal, graduated, or divided into any number of equal parts; and the hygrometer is complete. For it is constantly observed, that moisture sensibly shortens cords and strings; and that, as the moisture evaporates, they return to their former length again. The same is observed of a fiddle-string; and hence such strings are apt to break in damp weather, when not slackened by the screws of the violin. Hence it follows, that the weight will ascend when the air is more moist, and descend again when it becomes drier; by which means the index will be carried up and down, and, by pointing to the several divisions on the scale, will show the degrees of moisture or dryness. 2. For a more accurate hygrometer, strain a whipcord or catgut over several pulleys and proceed as before for the rest of the construction. Nor does it matter whether the several parts of the cord be parallel to the horizon, or perpendicular to it, or in any other position; the advantage of this over the former method being merely the having a greater length of cord in the same compass: for the longer the cord, the greater is the contraction and dilatation, and consequently the degrees of variation of the index over the scale, for any given change of moisture in the air. 3. Fasten a twisted cord or harpstring to a hock at A, plate HYGROMETER, fig. 1, and suspend by it a weight B carrying an index C nearly touching

the horizontal board or table on which is described the circular scale D E. Upon an increase or decrease of the humidity of the air, the index will show the quantity by twisting, and consequently the increase or decrease of mois-ture or dryness. Those Dutch toys called weather-houses, where a small image of a man, and one of a woman, are fixed upon the ends of an index, are constructed upon this principle. For the index, being sustained by a cord or twisted catgut, turns backwards and forwards, bringing out the man in wet weather, and the woman in dry. 4. Fasten one end of a cord or catgut A B, fig. 2, to a hook at A; and to the other end a ball D of about 1 lb. weight; upon which draw two concentric circles, and divide them into any number of equal parts, for a scale; then fit a style or index E C into a proper support at E, so as the extremity C may almost touch the divisions of the ball. Here the cord twisting or untwisting will indicate the change of moisture, by the successive application of the divisions of the circular scale, as the ball turns round to the index C. An hygrometer may be made of the thin boards of ash or fir, by their swelling or contracting. But these, and all the other kinds of this instrument above described, become in time sensibly less and less accurate; till, at last, they lose their effect entirely, and suffer no alteration from the weather. But the following sort is much more durable, serving for many years with tolerable accuracy. To the extremity of the balance, fig. 3, fix at E a sponge, or other body, that easily imbibes moisture. To prepare the sponge, it may be proper first to wash it in water very clean ; and, when dry again, in water or vinegar in which there has been dissolved sal ammoniac, or salt of tartar; after which let it dry again. Now, if the air become moist, the sponge will imbibe it and grow heavier, and consequently will preponderate, and turn the index towards C; on the contrary, when the air becomes drier, the sponge becomes lighter, and the index turns towards A; thus showing the state of the air. Mr. Gould, in the Philosophical Transactions, instead of a sponge, recommends oil of vitriol, which grows sensibly lighter or heavier from the degrees of moisture in the air; so that, being saturated in the moistest weather, it afterwards retains or loses its acquired weight, as the air proves more or less moist. The alteration in this liquor is so great, that in fifty-seven days it has been known to change its weight from three drachms to nine; and has shifted the tongue or index of a balance thirty degrees. So that in this way a pair of scales may afford a very nice hygrometer. Oil of sulphur or campanum, or oil of tartar per deliquium, or the liquor of fixed nitre, may be used instead of the oil of vitriol. This balance may be contrived in two ways; by either having the pin in the middle of the beam, with a slender tongue a foot and a half long, pointing to the divisions on an arched plate, as in fig. 3; or the scale with the liquor may be hung to the point of the beam near the pin, and the other extremity made so long as to describe a large arch on a board placed for that purpose, as in fig. 4. It may be observed, with regard to hygrometers of wood,

HYGROMETERS.

Londen Published by Themas Tego. 73. Cheapside. November 1. 1827.

CG

that the wood shrinks most in summer, and swells most in winter, but is most liable to change in the spring and fall; that this motion happens chiefly in the day-time, there being scarcely any variation in the night; and that there is a motion even in dry weather, the wood swelling in the morning, and shrinking in the afternoon: also that the wood by night as well as by day, usually shrinks when the wind is in the north, north-east, and east, both in summer and winter; that by constant observation of the motion and rest of the wood, with the help of a thermometer, the direction of the wind may be told nearly without a weather-cock.

Drs. Hales and Desaguliers contrived another form of sponge hygrometer. They made an horizontal axis, having a small part of its length cy-lindrical, and the remainder tapering conically with a spiral thread cut in it, after the manner of the fuzee of a watch. See fig. 5. The sponge is suspended by a fine silk thread to the cylindrical part of the axis, upon which it winds. This is balanced by a small weight, W, suspended also by a thread, which winds upon the spiral fuzee. When the sponge grows heavier, in moist weather, it descends and turns the axis, and so draws up the weight; which, coming to a thicker part of the axis, becomes a balance to the sponge, and its motion is shown by an attached scale; and vice versa, when the air becomes drier. Salt of tartar, or any other salt, or pot ashes, may be put into the scale of a balance, and used instead of the sponge.

De Luc's contrivances for an hygrometer are very ingenious. Finding that even ivory swells with moisture, and contracts with dryness, he made a small and very thin hollow cylinder of ivory, open only at the upper end, into which is fitted the under or open end of a very fine long glass tube, like that of a thermometer. Into these is introduced some quicksilver, filling the ivory cylinder, and a small part of the length up the glass tube. The consequence is this: When moisture swells the ivory cylinder, its bore or capacity grows larger, and consequently the mercury sinks in the fine glass tube; and, vice versa, when the air is drier, the ivory contracts, and forces the mercury higher up the tube of glass. An instrument thus constructed is in fact also a thermometer, and must necessarily be affected by the vicissitudes of heat and cold, as well as by those of dryness and moisture. It is a known fact, that a hair will stretch when moistened, and contract when dried ; and M. de Saussure found, by repeated experiments, that the difference between the greatest extension and contraction, when the hair is properly prepared, and has a weight of about three grains suspended by it, is nearly one-fortieth of its whole length, or one inch in forty. This circumstance suggested the idea of a new hygrometer. To render these small variations of the length of the hair perceptible, an apparatus was contrived, in which one of the extremities of the hair is fixed, and the other, bearing the counterpoise above-mentioned, surrounds the circumference of a cylinder, which turns upon an axis to which a hand is adapted, marking upon a dial, in large divisions, the almost insensible motion of this axis. About

twelve inches high is recommended as the most convenient and useful: and, to render them portable, a contrivance is added, by which the hand and the counterpoise can be occasionally fixed. But M. de Luc, in his Idées sur la Meteorologie, vol. i., opposed M. de Saussure's plan, on the ground that all hairs, if immersed in water, first lengthen and then shorten. He was answered by Saussure, who, at the same time, published a detailed account of his instrument.

In plate HYGROMETER, fig. 6, there is a representation of his whole original instrument, with the hair and other appendages complete. The lower extremity of the hair, a b, is held by the screw pincers b, more distinctly represented at B; and, by a screw at the end of these, the hair is fastened to the bottom plate C. The upper extremity, a, of the hair is held by the under chaps of the double pincers a. These pincers below hold the hair, and above fasten a very fine narrow slip of silver, carefully annealed, which rolls round the arbor or cylinder d, a separate figure of which is shown, DF, fig. 7. This arbor, which carries the needle or index E in the separate figure, is cut in the shape of a screw; and the intervals of the threads of this screw have their bases flat, and are cut square so as to receive the slip of silver that is fastened to the pincers a, and joined in this manner with the hair. M. de Sausure observes that hair alone, fixed immediately to the arbor, would not do; for it curled upon it, and acquired a stiffness that the counterpoise was not able to surmount. The arbor was cut in a screw form, in order that the slip of silver in winding upon it should not increase the diameter of the arbor, nor ever take a situation too oblique and variable. The slip is fixed to the arbor by a small pin F. The other extremity of the arbor, D, is shaped like a pulley, flat at the bottom, so as to receive a fine supple silken string, to which is suspended the counterpoise g in the large figure, and G in the side one. This counterpoise is applied to distend the hair; and acts in a contrary direction to that of the hair, and the moveable pincers to which the hair is fixed. If, then, the hair should be loaded with the weight of four grains, the counterpoise must weigh four grains more than the pincers. The arbor at one end passes through the centre of the dial, and turns therein, in a very fine hole, on a pivot made very cylindrical, and well polished : at the other end is also a similar pivot, which turns in a hole made in the end of the arm of the cock. M. de Saussure had hygrometers made with hairs fourteen inches long; but he found one foot sufficient. The arbor is three-fourths of a line in diameter at the base between the threads of the screw, or the part on which the slip winds. The variations, when a hair properly prepared is applied to it, are more than an entire circumference, the index describing about 400° in moving from extreme dryness to extreme humidity.

M. Saussure has even made smaller instruments to be carried in the pocket, and to make experiments with under small receivers; they were only seven inches high by two inches broad; which, notwithstanding their variations, were very sensible. In the preparation of the hair, it is necessary to free it of its natural unctuosity, which in a great measure deprives it of its hygrometrical sensibility. A number of hairs are boiled in a lie of vegetable alkalı; and among these are to be chosen for use such as are most transparent, bright, and soft: particular precautions are necessary for preventing the straining of the hair, which renders it unfit for the intended purpose. The two fixed points of the hygrometer are the extremes both of moisture and dryness. The former is obtained by exposing it to air completely saturated with water, by placing it in a glass receiver standing in water, the sides of which are kept continually moistened. The point on the dial, at which the hand after a certain interval remains stationary, is marked 100. The point of extreme dryness, not absolute dryness, for that does not exist, but the greatest degree of it that can be obtained, is produced by introducing repeatedly into the same receiver containing the instrument, and standing now upon quicksilver, certain quantities of deliquescent alkaline salts, which absorb the moisture of the air. This hygrometer is considered by M. Saussure as possessed of every property requisite for such an instrument : as, it points out the smallest variation of moisture in the air : its indications are quick : it is always consistent : several of them agree : it is affected only by aqueous vapors : and its variations are in proportion to those of the air.

The best hygrometer upon the third principle, viz. that of the alteration of the weight of substances, by attracting the moisture of the air, and for ascertaining the quantity as well as the degree of moisture in the variation of the hygrometer, is that of Mr. Coventry of London. The account he gives of it is as follows :--- ' Take two sheets of fine tissue paper, such as is used by hatters; dry them carefully at about two feet distance from a tolerably good fire, till after repeatedly weighing them in a good pair of scales no moisture remains. When the sheets are in this perfectly dry state, reduce them to exactly fifty grains; the hygrometer is then fit for use. The sheets must be kept free from dust, and exposed a few minutes in the open air; after which may be always known, by weighing them, the exact quantity of moisture they have imbibed. For many years, adds he, the hygrometer has engrossed a considerable share of my attention; and every advantage proposed by others, either as it respected the substances of which the instrument was composed, or the manner in which its operations were to be discerned, has been impartially examined. But I have never seen an hygrometer so simple in itself, or that would act with such certainty or so equally alike, as the one I have now described. The materials of one I have now described. The materials of which it is composed, being thin, are easily deprived wholly of their moisture; which is a circumstance essentially necessary in fixing a datum from which to reckon, and which, I think, cannot be said of any substance hitherto employed in the construction of hygrometers : with equal facility they imbibe or impart the humidity of the atmosphere, and show with the greatest exactness when the least alteration takes place.' For

easier weighing the paper, take a piece of round tin or brass the size of a crown piece, through the centre of which drill a hole, and also three others round it at equal distances : then cut about 100 papers; and, after putting them under the tin or brass, drive through each hole a strong pin into a board, in order to round them to the shape of the plate : the papers must then be separated and exposed to the air a few hours with that already weighed, and so many of them taken as are equal to the weight already specified. This done, thread them together through these holes made by the pins, putting between every paper on each thread a small bead, to prevent the papers from touching each other, and also that the air may be more readily admitted. The top of the hygrometer is covered with a card cut to the same size; and which, by its stiffness, supports all the papers, and keeps them in proper shape. Before the papers are threaded, the beads, silk, card, and a thin piece of brass about the size of a sixpence, which must be placed at the bottom, and through which the centre string passes, must be weighed with the greatest exactness, to bring them to a certain weight, suppose fifty grains; now the paper in its driest state, being of equal weight, they will weigh together 100 grains; consequently, what they weigh more at any time is moisture. To obviate the difficulty of trying experiments with weights and scales, Mr. Coventry contrived a machine or scale by which to determine at one view the humidity or dryness of the atmosphere. This, with its case, is represented by fig. 8. The front and back of the case are glass; the sides fine gauze, which excludes the dust and admits the air; the case is about ten inches high, eight inches broad, and four inches deep. A, a brass bracket in front, behind which, at about three inches and a half distance, is another; these support the axis of the index E, also of the beam D, and another which supports the stem B, to which the ivory scale of divisions C is fixed. G, a brass scale suspended in the usual manner to the end of a beam D, and weighing exactly 100 grains. This scale is an exact counterpoise to the papers I, and the different apparatus. The manner of suspension is as follows :- The axis g, of the beam, which is made of brass, instead of hanging on pivots as in common scales, turns with two steel edges k k, fixed in the extremities of the brass axis: these edges are shaped like the edge of a knife, and act on two steel concave edges l, l, in order to render the friction as small as possible. D is a fine scale beam fixed at right angles with the axis g. E, the steel index fixed to the under side of the same axis. F, a brass sliding weight : h is the axis that holds the stem B to which the scale of divisions C is fixed. A, A, the brass brackets which support the whole by four screws, two of which are seen at i, i, that screw the brackets to the top of the case. The axis of the scale of divisions is hung on pivots, one of which is seen at m, that, should the case not stand level, the stem B may always be in a perpendicular situation. The hygrometer, before use, should be thus adjusted :- To the end of the beam where the hygrometer is suspended, hang a weight of 100 grains, which is equal to the weight of

527

the scale; then move the sliding-weight F up or down the index E, till one grain will cause the index to traverse neither more nor less than the whole scale of divisions; then add half a grain to the scale, in order to bring the index to 0; and the instrument, after taking off the 100 grain weight and hanging on the papers, is fit for use; then put grain weights in the scale till the index is brought within compass of the scale of divisions. Example: If is three grains on the brass scale, and the index points at 10; consequently there are three grains and $\frac{1}{123}$ is of a grain of moisture in the papers. If four grain weights are kept, viz. 1, 2, 4, and 5, they will make any number from one to nine, which are as many as will be wanted. Sometimes the index will continue traversing within the scale of divisions for many days without shifting the weights; but, if otherwise, they must be changed as occasion may require. 'One great advantage (says Mr. Coventry) of this hygrometer, above all others that have attracted my notice, is that it acts from a certain datum, namely, the dry extreme; from which all the variations towards moist are calculated with certainty: and, if constructed with that precision represented by the drawing, it will afford pleasure to the curious in observing the almost perpetual alteration of the atmosphere, even in the most settled weather. In winter it will be constantly traversing from about 8 A. M. till 4 or 5 P. M. towards dry; and in summer, from about 4 A.M. till 6 or 7 P.M. when the weather is hot and gloomy, the hygrometer discovers a very great change towards moisture; and, when clear and frosty, that it contains a much greater quantity of moisture than is generally imagined'

HYGROMETRY, the art or science of measuring the moisture of the atmosphere. See HYGROMETER.

HY'GROSCOPE, n. s. Fr. hygroscope; Gr. $"ypoc and \sigma \kappa o \pi \acute{e} \omega$. An instrument to show the moisture and dryness of the air, and to measure and estimate the quantity of either extreme.— Quincy.

Moisture in the air is discovered by hygroscopes. Arbuthnot.

HYGROSCOPE is commonly used in the same sense with hygrometer, but Wolfius makes a difference from the etymology of the words. The hygroscope (he says) only shows the changes of humidity or dryness in the air, but the hygrometer measures them.

HYLA, in ancient geography, a river of Mysia Minor, famous for the death of Hylas. It runs by Prusa, whence it seems to be the same with the Ryndacus, which runs north-west into the Propontis.

HYLAS, in fabulous history, son of Theodamus, and favorite of Hercules. He was ravished by the nymphs of a fountain as he was taking out water; and afterwards drowned in the Hyla.

HYLOZOISTS, $v\lambda\eta$, matter, and $\zeta\omega\eta$, life, a sect of atheists among the ancient Greek philosophers, who maintained that matter had some natural perception, without animal sensation, or reflection in itself considered; but that this imperfect life occasioned that organisation whence

sensation and reflection afterwards arose. Of these, some held only one life, which they called a plastic nature, presiding regularly and invariably over the whole corporeal universe, which they represented as a kind of large plant or vegetable : these were called the cosmoplastic and stoical atheists, because the stoics held such a nature, though many of them supposed it to be the instrument of the deity. Others thought that every particle of matter was endued with life, and made the mundane system to depend upon a certain mixture of chance and p astic or orderly nature united together. These were called Stratonici from Strato Lampsacenus, a disciple of Theophrastus, called also Physicus, who was first a celebrated Peripatetic, and afterwards formed this new system of atheism for himself.

HYM, n.s. A species of dog (unless it is by mistake for lym.—Johnson.)

Avaunt, you curs Mastiff, greyhound, mungril grim, Hound er spaniel, branch or hym; Or bobtail tike, or trundle tail, Tom will make him weep and wail.

Shakspeare.

HY'MEN, n. s. HYMENE'AL, n. s. & adj. HYMENE'AL, n. s. & adj. god of marriage: the virginal membrane: a marriage song: any thing pertaining to marriage.

And wedded had he with full blissful chere, King Pandiones fairè doughter dere, That hight Progne, the floure of hire countie, Though Juno liste not at the fest to be, Ne Hymen, that the god of weddyng is.

Chaucer. Legende of Good Women.

Run now you shepherd swains; ah¹ run you thither, Where this fair bridegroom leads the blessed way: And haste you lovely maids, haste you together With this sweet bride, while yet the sun-shine day Guides your blind steps; while yet loud summons call,

That every wood and hill resounds withal,

Come Hymen, Hymen, come, drest in thy golden pall. Fletcher's Purple Island.

And heavenly choirs the hymenean sung.

Milton.

For her the spouse prepares the bridal ring; For her white virgins hymeneals sing, Pope, The suitors heard, and deemed the mirthful voice A signal of her hymeneal choice. Id, Odyssey.

HYMEN, or HYMENEUS, in ancient mythology the son of Bacchus and Venus, and the god of marriage. He was invoked in epithalamiums, and other matrimonial ceremonies. The poets crown this deity with a chaplet of roses, and represent him enervated with pleasures, dressed in a yellow robe and yellow shoes, with a torch in his hand. The new married couple bore garlands of flowers on the wedding day; which custom also obtained among the Hebrews, and even among Christiaus during the first ages of the church, as appears from Tertullian.

HYMEN, 'Yµµy', in anatomy, is a thin membrane or skin, sometimes circular, of different breadths, more or less smooth, and sometimes semilunar, formed by the union of the internal membrane of the great canal with that on the inside of the alke, resembling a piece of fine parchment. This membrane is stretched in the

neck of the womb of virgins, below the nympha, leaving in some subjects a very small opening, in others a larger, and in all rendering the external orifice narrower than the rest of the eavity, and to be broken when they are deflowered; an effusion of blood following the breach. See ANATOMY. The hymen is considered as the test of virginity, an opinion which is very ancient. See Deuteronomy 22, 13. In infants it is a fine thin membrane, not very conspicuous, because of the natural straitness of the passage itself, which does not admit of any great expansion in so little room. This membrane grows more distinct, as well as firm, by age, and it is sometimes very strong and even impervious, when incision becomes necessary.

HYMEN/EA, the bastard locust tree; a genus of the monogynia order, and decandria class of plants: natural order thirty-third, lomentacex. CAL. quinquepartite : there are five petals, nearly equal; the style is intorted; the legumen full of meally pulp. There is but one species, viz.

H. courbarilla, or the courbaril, a large tree which grows naturally in the Spanish West In-The trunk is covered with a ligh ash-codies. lored bark; is often more than sixty feet high, and three in diameter. The branches are furnished with dark green leaves, which stand by pairs on one common foot-stalk, diverging from their base in manner of a pair of shears when opened. The flowers come out in loose spikes at the ends of the branches, and are yellow, striped with purple. Each consists of five petals placed in a double calyx, the outer leaf of which is divided into five parts, and the inner one is cut into five teeth at its brim. In the centre are ten declining stamina, longer than the petals, surrounding an oblong germen, which becomes a thick, fleshy, brown pod, four or five inches long and one broad, with a suture on both cdges, and includes three or four purplish seeds, somewhat of the shape of Windsor beans, but smaller. The seeds are covered with a light brown sugary substance, which the Indians scrape off and eat with great avidity, and which is very pleasant and agreeable. At the principal roots, under ground, is found collected in large lumps a yellowish-red transparent gum, which, when dissolved in rectified spirit of wine, affords a most excellent varnish, and is the gum anime of the shops.

HYMENOPTERA, from $\nu\mu\eta\nu$, membrane, and $\pi \tau \epsilon \rho o \nu$, a wing, in the Linnwan system of zoology, an order of insects, having four membranaceous wings; the tails of the females are furnished with stings, which in some are used for instilling poison, and in others for merely piercing the bark and leaves of trees, and the bodies of other animals, in which they deposit their eggs. See ENTOMOLOGY.

HYMETHUS, or HYMETTUS, in ancient geography, a mountain of Attica near Athens, famous for its marble quarries, and for its excellent honey. See GREECE. Pliny says that Crassus first fetched marble columns from it.

st fetched marble control of the state of th A song of praise or adoration; an encomiastic song to some superior being; to praise, or wor-

ship, or sing songs of thanksgiving : hymnic. relating to hymns, or spiritual songs.

Doe thou youchsafe with thy love-kindling light

To' illuminate my dim and dulled eyne,

528

And beautifie this sacred hymne of thyne.

Spenser's Hymnes.

As I erst in the praise of mine own dame,

So now in honour of thy mother dear,

An honourable hymn I eke should frame. Spenser.

Our solemn hymns to sullen dirges change ;

Our bridal flowers serve for a buried corse. Shaksp. When steel grows

Soft as a parasites silk, let hymns be made

Id. Coriolanus. An overture for the wars. There is an hymn sung; but, the subject of it is always the praises of Adam, and Noah, and Abraham, concluding ever with a thanksgiving for the nativity of our Saviour. Bacon.

He rounds the air, and breaks the hymnick notes In birds', heaven's choristers, organick throats; Which, if they did not die, might seem to be

A tenth rank in the heavenly hierarchy.

Donne. They tonched their golden harps, and hymning praised

God and his works. Milton.

Whose easier business were to serve their lord High up in Heaven, with songs to hymn his throne, And practised distance, to cringe, not fight. Id.

Farewell, you happy shades, Where angels first should practise hymns, and string Their tuneful harps, when they to heaven would sing. Dryden.

He had not left alive this patient saint,

This anvil of affronts, but sent him hence.

To hold a peaceful branch of palm above,

And hymn it in the quire. Id. Spanish Friar.

How the soldier's rough strain seems

Softened by distance to a hymn-like cadence !

Byron. Deformed Transformed.

A llymn, Isidore remarks, is properly a song of joy, full of the praises of God, and is distinguished from threna, which is a mourning song, full of lamentation. St. Hilary, bishop of Poictiers, is said to have been the first that composed hymns to be sung in churches, and was followed by St. Ambrose. In the Greek Liturgy there are four kinds of hymns; but the word is not taken in the sense of a praise offered in verse, but simply of a laud or praise. The angelic hymn, or gloria in excelsis, makes the first kind ; the trisagion, the second; the cherubic hymn, the third; and the hymn of victory and triumph, called enevirios, the last. The hymns of the ancients generally consisted of three sorts of stanzas; one of which, called strophe, was sung by the band as they walked from east to west; another, called antistrophe, was performed as they returned from west to east; the third part or epode, was sung before the altar. The Jewish hymns were accompanied with trumpets, drums, and cymbals.

IIYOIDES, in anatomy, the bone at the root of the tongue. See ANATOMY.

HYOSCYAMUS, henbane: a genus of the monogynia order, and pentandria class of plants : natural order twenty-eighth, luridæ. con. funncl-shaped and obtuse : stamina inclining to one side : CAPS. covered and bilocular. There are several species, one of which, viz.

II. niger, or common henbane, is a native of Britain. It grows on road-sides, and among

rubbish. It is a biennial plant, with long fleshy roots which strike deep into the ground, sending out several large soft leaves, deeply flashed on their edges; the following spring the stalks come up, about two feet high, garnished with flowers standing on one side in a double row, sitting close to the stalks alternately. They are of a dark purplish color, with a black bottom; and are succeeded by roundish capsules, which open with a lid at the top, and have two cells filled with small irregular seeds. The seeds, leaves, and roots of this plant, as well as of all other species of this genus, are poisonous: and many well attested instances of their bad effects are recorded; madness, convulsions, and death, being the common consequence. In a smaller being the common consequence. dose, they occasion giddiness and stupor. It is said that the leaves scattered about a house will drive away mice .--- The juice of the plant, evapo-rated to an extract, is prescribed in some cases as a narcotic; in which respect it may be a pow-erful medicine if properly managed. The dose is from half a scruple to half a drachm. Goats are not fond of the plant; horses, cows, sheep, and swine, refuse it.

To HYP, v. a. Barbarously contracted from hypochondriack. To make melancholy; to dispirit.

I have been to the last degree hypped since I saw you. Spectator.

HYP'ALLAGE, n. s. Gr. ύπαλλαγή. Α figure by which words change their cases with each other.

HYPANTE, or HYPERPANTE, a name given by the Greeks to the feast of the presentation of Jesus in the temple .--- This word, which signifies lowly or humble meeting, was given to this feast from the meeting of old Simeon and Anna the prophetess in the temple, when Jesus was brought thither.

HYPATIA, a learned and beautiful lady of antiquity, the daughter of Theon, a celebrated philosopher and mathematician, and president of the famous Alexandrian school, was born at Alexandria about the end of the fourth century. She made such progress in philosophy, geometry, astronomy, and the mathematics, that she was esteemed the most learned person of her time. At length she was thought worthy to succeed her father in that distinguished and important employment, the government of the school of Alexandria; and to teach from the chair of Ammonius and Hierocles. Her fame was so extensive, and her worth so universally acknowledged, that she had a very crowded auditory. One of her pupils was the celebrated Synesius, afterwards bishop of Ptolemais, who every where bears the strongest and most grateful testimony to her abilities and virtues. When Nicephorus intended to pass the highest compliment on the princess Eudocia, he thought he could not do it better than by calling her another Hypatia. But while Hypatia shone the brightest ornament of Alexandria, a kind of civil war which broke out between Orestes the governor, and St. Cyril the patriarch, proved fatal to the lady. In 415 about 500 monks attacked the governor, and would have killed him had he not been rescued by the townsmen; but, the respect which Orestes had for Hypatia caus-

ing her to be traduced among the mob, who dragged her from her chair, tore her to pieces, and burned her limbs. Cyril has been suspected of fomenting this tragedy, and Dr. Cave endeavours to remove the imputation of such a horrible action from the patriarch; calling the Alexandrian mob, levissimum hominum genus, 'a very trifling inconstant people.' But though Cyril should neither have been the perpetrator, nor the contriver of Hypatia's death, yet he did not discountenance it; for he received the dead body of Ammonius, one of the most forward in the riot, and pronounced a panegyric upon the ruffian, as having died a martyr for the truth. This transaction. so disgraceful to the church of Alexandria, took place A. D. 415 in the reign of Theodosius II. Hypatia published Commentaries on Apollonius's Conics, Diophantus's Arithmetic, and other works.

HYPECOUM, wild cumin : a genus of the digynia order, and tetandria class of plants ; natural order twenty-fourth, corydales: CAL. diphyllous: the petals four: the exterior two larger and trifid : the fruit a pod. There are seven species, all low herbaceous plants with yellow flowers, and easily propagated by seeds. The juice is of a yellow color, resembling that of celandine, and is affirmed by some eminent physicians to be as narcotic as opium. From the nectarium the bees collect great quantities of honey.

HY'PER, n. s. A word barbarously curtailed by Prior from hypercritic .-- Johnson. A hyrequires. Prior did not know the meaning of the word. The force of the Greek preposition, however, which is the etymon of this word, is to increase the force or meaning of those words with which it is found in composition, as may be seen by the examples :-

Criticks I read on other men,

Prior.

And hypers upon them again. HYPERBATON, in grammar, a figurative construction, inverting the natural and proper order of words and sentences. The several species of the hyperbaton are, the anastrophe, the hysteron-proteron, the hypallage, synchysis, tmesis, parenthesis, and the hyperbaton strictly so called. See ANASTROPHE.

HYPERBATON, strictly so called, is a long retention of the verb which completes the sentence. Instances occur in Virgil, wherein the verb is placed at the distance of nine lines from the nominative.

HYPER'BOLA, n. s.
HYPER BOLE, n. s.
HYPERBOL'ICAL, adj.
HYPERBOL'IC, adj.
HYPERBOL'ICALLY, adv.

Fr. hyperbole; Gr. $\upsilon \pi \epsilon \rho$ and $\beta \dot{\alpha} \lambda \lambda \omega$. In geometry, a section of a cone made by a

HYPERBOL'ICALLY, adv. plane, so that the HYPERBOL'IFORM, adv. axis of the section inclines to the parallel leg of the cone, which in the parabola is opposite to it, and in the ellipsis intersects it. The axis of the hyperbolical section will meet also with the opposite side of the cone, when produced above the vertex .- Harris. Hyperbole a figure in rhetoric by which any thing is increased or diminished beyond the exact truth; as, he runs faster than lightning. His possessions are fallen to dust. He was so gaunt,

VOL. XI.

2 M

the case of a flagelet was a mansion for him .---Shakspeare. Hyperbolic, hyperbolical, having the nature of an hyperbole, exaggerated, or extenuated, beyond the truth: hyperboliform, having the form of an hyperbola.

Tera. unsquared

Which, from the tongue of roaring Typhon dropt, Would seem hyperbolss.

Shak.peare. Troilus and Cressida.

Taffata phrases, silken terms precise, Three-piled hyperboles, spruce affectation,

Figures pedantical, these Summer flies,

Have blown me full of maggot ostentation.

Shakspeare.

Yet may all be solved, if we take it hyperbolically.

530

Browne.

They were above the hyperboles, that fond poetry bestows upon its admired objects. Glanville. It is parabolical, and probably hyperbolical, and

therefore not to be taken in a strict sense. Boyle. The horny or pellucid coat of the eye risctli up,

as a hillock, above the convexity of the white of the eye, and is of an hyperbolical or a parabolical figure. Ray on the Creation.

Cancellated in the middle with squares, with triangles before, and behind with hyperbolic lines.

Grew's Musæum.

Hyperboles, so daring and so bold, Disdaining bounds, are yet by rules controlled ; Above the clouds, but yet within our sight, They mount with truth, and make a tow'ring flight.

Granville.

Had the velocities of the several planets been greater or less than they are, or had their distances from the sun, or the quantity of the sun's matter, and consequently his attractive power, being greater or less than they are now, with the same velocities, they would not have revolved in concentrick circles, but have moved in hyperbolas very eccentrick.

Bentley.

The common people understand raillery, or at least rhetorick, and will not take hyperboles in too literal a sense. Swift.

Scylla is seated upon a narrow mountain, which thrusts into the sea a steep high rock, and hyperbolically described by Homer as inaccessible.

Broome's Notes on the Odyssey.

HYPERBOLA. See CONIC SECTIONS.

HYPERBOLE, in rhetoric. See ORATORY. Lord Kames, in his Elements of Criticism, observes, that 'an object uncommon with respect to size, either very great of its kind or very little, strikes us with surprise; and this emotion forces upon the mind a momentary conviction that the object is greater or less than it is in reality: the same effect, precisely, attends figurative grandeur or littleness, and hence the hyperhole, which expresses this momentary conviction. A writer is generally more successful in magnifying by a hyperbole than in diminishing. The reason is, that a minute object contracts the mind, and fetters its power of imagination; but that the mind, dilated and inflamed with a grand object, moulds objects for its gratification with great facility. Longinus cites ine following ludicrous instance of a diminishing hyperbole from a comic poet ;-- ' he was owner of a plot of ground not larger than a Lacedemonian letter.' But, for the reason now given, the hyperbole has by far the greater force in magnifying objects. It is unnecessary to quote examples. Homer, Virgil, Shakspeare, and all our best poets abound with them, and many are to be found in Scripture. See Gen. xiii. 15, 16; and John xxi. 25. The nicest point of all is to ascertain the natural limits of the hyperbole, beyond which, being overstrained, it has a bad effect. Longinus with great propriety compares this kind of hyperbole to a bow-string, which relaxes by overstraining, and produces an effect directly opposite to what is intended.

HYPERBOLIC CONOID, a solid formed by the revolution of a cone about its axis. HYPERBOLICUM ACUTUM, a solid made

by the revolution of the infinite area contained between the curve of the hyperbola and its asymptote. This produces a solid, which, though infinitely long, and generated by an infinite area, is demonstrated by Torricelli to be equal to a finite solid body.

HYPERBO'REAN, n. s. Fr. hyperboréen; Lat. hyperboreus. Northern.

HYPERBOREAN, in ancient geography, was applied to those people and places which were situated to the north of the Scythians. The ancients had very little acquaintance with these Hyperborean regions; all they tell us of them is very dubious, much of it false. Diodorus Sicu-Ius says, the Hyperboreans were thus called, because they dwelt beyond the wind Boreas; $v\pi\epsilon\rho$ signifying beyond, and Bopeas, Boreas, the north-wind. This etymology is more natural than that of Rudbeck, who would have the word to be Gothic, and to signify nobility. Herodotus doubts whether there were any such nations as the Hyperborean. Strabo, who believes there are, does not take Hyperborean to signify beyond Boreas or the north; the preposition $v\pi\epsilon\rho$, he supposes only to form a superlative, and to mean most northern. Most modern geographers, as Hoffman, Cellarius, &c., place the Hyperboreans in the north parts of Europe, among the Siberians and Samoieds; and think the Hyperboreans of the ancients were those who lived farthest to the north. The Hyperboreans of our days are those Russians who inhabit between the Volga and the White Sea. According to Cluvier, the name Celtes was synonymous with that of Hyperboreans.

HYPERCATALECTIC, adj. in Greek and Latin poetry, is applied to a verse that has one or two syllables too much, or beyond the regular and just measure; as,

Musæ sorores sunt Minervæ.

HYPERCRIT'IC, n. s. } Fr. appert. HYPERCRIT'IC, n. s. } tique; Gr. υπερ, κριτικος. A critic captious beyond use or reason.

Those hypercriticks in English poetry differ from the opinion of the Greek and Latin judges, from the Italians and French, and from the general taste of all ages. Dryden.

We are far from imposing those nice and hypercritical punctilios, which some astrologers oblige our Evelyn. gardeners to.

Such hypereritical readers will consider my business was to make a body of refined sayings, only taking care to produce them in the most natural man-Swift. ner.

HYPERDULIA, in the Romish theology (from $\upsilon \pi \varepsilon_0$, above, and $\delta s \lambda \iota a$, worship), the worship rendered to the holy virgin. The worship offered to the saints is called dulia; and that to the virgin hyperdulia, as being superior.

HYPERIA, in ancient geography, the seat of the Phæacians near the Cyclops. Some take it to be Camarina in Sicily; according to others it is supposed to be Melita, an adjoining island. This is confirmed by Apollonius Rhodius. The Phæacians afterwards removed to Corcyra, being expelled by the Phœnicians, who settled in Melita before the Trojan war, on account of the commodious harbours.

HYPERICUM, St. John's wort, a genus of the polyandria order, and polyadelphia class of plants; natural order twentieth, rotaceæ: CAL. quinquepartite; the petals five; the filaments many, and coalited at the base into five pencils : CAPS. is a pencil. Of this genus there are eighty-eight species, most of them hardy, deciduous shrubs, and under-shrubby plants, adorned with oblong and oval simple foliage, and pentapetalous yellow flowers in clusters. The most remarkable are,

1. H. androsæmum, tutsan or park leaves, which has an upright under-shrubby stalk, two feet high, branching by pairs opposite; and, at the ends of the stalks, clusters of small yellow flowers appear in July and August, and are suc-ceeded by roundish berry-like black capsules. This plant is hardy, and grows naturally in many parts of Britain. It has long held a place in the medicinal catalogues; but its virtues are not much valued at present. The leaves given in substance are said to destroy worms. Bv distillation they yield an essential oil. The flowers tinge spirits and oils of a fine purple color. Cows, goats, and sheep, eat the plant; horses and swine refuse it. The dried plant, boiled in water with alum, dyes yarn of a yellow color; and the Swedes give a fine purple tinge to their spirits with the flowers.

2. H. ascyron, or dwarf American St. John's wort, has spreading roots, sending up numerous slender, square stalks, a foot long; oval, spearshaped, close-sitting, smooth leaves, by pairs opposite; and, at the end of the stalks, large yellow flowers. It is a hardy plant.

3. H. Canariense, has shrubby stalks, dividing and branching six or seven feet high; oblong, close-sitting leaves by pairs; and, at the ends of the branches, clusters of yellow flowers appear-ing in June and July. This species and the hircinum propagate by suckers.

4. H. hircinum, or stinking St. John's wort. It rises three or four feet high, with several shrubby two-edged stalks from the root, branching by pairs opposite at every joint; oblong, oval, close-sitting, opposite leaves; and, at the ends of all the young shoots, clusters of yellow flowers. Of these there are three varieties; one with strong stalks, six or eight feet high, broad leaves, and large flowers; the other with strong stalks, broad leaves, and without any disagreeable odor; the third has variegated leaves. All these varieties are shrubby and hardy plants. They flower in June and July in such numerous clusters, that the shrubs appear covered with them; and produce abundance of seeds in autumn.

5. II. monogynum, the one-styled China hypericum, has a shrubby purplish stalk, about two feet high ; oblong, stiff, smooth, close-sitting leaves, of a shining green above, and white underneath; clusters of small yellow flowers, with colored cups, and only one style, flowering the greatest part of the year. This species is propagated by layers and cuttings, planted in pots, and plunged in a hot-bed.

HYPERIDES, an orator of Greece, and a disciple of Plato and Isocrates, who governed the republic of Athens. He defended with great zeal and courage the liberties of Greece; but was put to death by Antipater's order, A.A.C 322. He composed many orations, of which only one is extant. He was one of the ten celebrated orators of Greece; and, though the intimate friend of Demosthenes, accused him of taking bribes, and obtained his banishment.

HYPERIUS (Andrew Gerard), a learned divine of Ypres. He was educated in France; but, embracing Protestant principles, he came to England, and afterwards settled as professor of divinity at Marpurg, where he died in 1564. His works make seven vols. folio.

HYPER'METER, n. s. Greek, $\dot{v}\pi\varepsilon\rho$ and $\mu\epsilon\tau\rho\sigma\nu$. Any thing greater than the standard requires.

When a man rises beyond six foot, he is an hypermeter, and may be admitted into the tall club.

Addison.

HYPERMNESTRA, in fabulous history, one of the fifty daughters of Danaus, king of Argos, the only one who refused to obey her father's bloody order. See DANAIDES and DANAUS.

HYPERSARCO'SIS, n.s. Gr. υπερσάρκωσις, υπερ and σαρκος. The growth of fungous or proud flesh.

Where the hypersarcosis was great, I sprinkled it with precipitate, whereby I more speedily freed the ulcer of its putrefaction. Wiseman.

HYPERTHYRON, in architecture, a sort of table, usually placed over gates or doors of the Doric order, above the chambranle, in form of a frieze.

HY'PHEN, n. s. Gr. ὑφέν. A note of con-

junction; as, vir-tue, ever-living. HYPNOTIC, n. s. Gr. υπνος. Any medicine that induces sleep.

HYPNUM, feather-moss, in botany, a genus of the natural order of musci, and the cryptogamia class of plants. The antheræ are operculated, or covered with a lid; the calyptera smooth; the filament lateral, and rising out of a perichatium, or tuft of leaflets different from the other leaves of the plant. There are 156 species, many of them natives of Great Britain. The most remarkable are,

1. 11. parietinum, which has shoots nearly flat and winged, undivided for a considerable length, and the leaves shining; but the old shoots do not branch into new ones. It grows in woods and shady places, and is used for filling up the chinks in wooden houses, whence the trivial name.

2. II. proliferum is of a very singular structure, one shoot growing out from the centre of another; the veil is yellow and shining; the lid with a kind of long bill; the leaves not shining;

2 M 2

sometimes of a yellowish, and sometimes of a deep green. This moss covers the surface of the earth in the thickest shades, through which the sun never shines, and where no other plant can grow

HYPOBOLE, or subjection, from $\nu \pi o$, and $\beta \alpha \lambda \omega_{\mu}$ I cast, in rhetoric, a figure, when several things are mentioned, and each of them is refuted in order. When complete it consists of three parts; a proposition, an enumeration of particulars with their answers, and a conclusion. Thus Cicero, upon his return from banishment, vindicates his conduct in withdrawing so quietly, and not opposing the faction that ejected him. See ORATORY.

HYPOCAUSTUM, from $v\pi o$ and $\kappa a \omega$, to burn, among the ancient Greeks and Romans, a subterraneous place, where was a furnace to heat the baths. Hypocaustum was also a kind of kiln to heat their winter parlours. The remains of a Roman hypocaustum were discovered under ground at Lincoln in 1739. We have an account of these remains in the Philos. Trans. No. 461.

HYPOCHÆRIS, hawk's-eye, in botany, a genus of the polygamia æqualis order, and syngenesia class of plants; natural order forty-ninth, compositæ. The receptacle is paleaceous: cAL. a little imbricated; the pappus glumy. There are five species, of which the most remarkable is the

H. maculata, or spotted hawk's-eye, a native of Britain. It grows on high grounds. The leaves are oblong, egg-shaped, and toothed; the stem almost naked, generally with a single branch; the blossoms yellow, opening at 6 A. M. and closing at 4 P. M. The leaves are boiled and eaten like cabbage. Horses are fond of this plant when green, but not when dry. Cows, goats, and swine eat it; sheep are not fond of it.

IIYPOCHON'DRES, n.s. IYPOCHON'DRES, n.s. HYPOCHONDRI'ACAL, adj. HYPOCHONDRI'ACAL, adj. Iying on each side of the cartilago ensiformis, and those of the ribs, and the tip of the breast, which have in one the liver, and in the other the spleen.—Quincy. Hypochondriac, melancholy; because this disease was formerly supposed to be connected with the state of the liver, which is placed in the right hypochondrium.

Cold sweats are many times mortal, and always suspected; as in great fears, and hypochondriacal passions, being a relaxation or forsaking of the spirits. Bacon's Natural History.

The blood, moving too slowly through the celiack and mesenterick arteries, produces various complaints in the lower bowels and hypochondries; from whence such persons are called hypochondriack. Arbuthnot.

Socrates laid down his life in attestation of that most fundamental truth, the belief of one God : and yet he's not recorded either as fool or hypochondriack. Decay of Picty.

HYPOCHONDRIASIS, in medicine: See MEDICINE.

HYP'OCIST, n. s. Cr. ὑπόκιτις; Fr. hypociste.

Hypocist is an inspissated juice considerably hard and heavy, of a fine shining black colour, when broken. The stem of the plant is thick and fleshy; and much thicker at the top than towards the bottom. The fruits contain a tough glutinous liquor, gathered be-

532

fore they are ripe : the juice is expressed, then formed into cakes. *Hill.*

HYPOCIST, or HYPOCISTIS is obtained from the sessile asarum, and greatly resembles the true Egyptian acacia. The juice is evaporated over a very gentle fire, to the consistence of an extract, and, when formed into cakes, is exposed to the sun to dry. It is an astringent of considerable power; is good against diarrhœas and hæmorrhages of all kinds; and may be used in repellent gargarisms in the manner of true acacia; but it is rarely met with genuine, the German acacia being usually sold under its name. See ASARUM.

HYPOC'RISY, n. s. HYP'OCRITE, n. s. HYPOCRITICAL, adj. HYPOCRITICALLY, adv. gard to the moral or religious character; an insincere dissembling person: falsely; in a dissembling manner.

A wise man hateth not the law; but he that is an *hypocrite* therein, is as a ship in a storm.

Ecclus. xxxiii. 3.

Thou shalt not shrive thee for vaine glorie, ne for *ypocrisie*, ne for no cause, but only for the doute of Jesu Crist and the hele of thy soule.

Chaucer. The Persones Talc.

He heartily prays some occasion may detain us longer : I dare swear he is no hypocrite, but prays from his heart. Shakspearc.

Who can describe

Women's hypocrisies? their subtle wiles, Betraying smiles, feigned tears, inconstancies?

Otway's Orphan.

Next stood Hypocrisy with holy leer, Soft smiling and demurely looking down; But hid the dagger underneath the gown.

Dryden.

Fair hypocrite, you seek to cheat in vain; Your silence argues, you ask time to reign. Id.

Now you are confessing your enormities; I know it by that hypocritical, down-cast look. Id.

Kings and priests are in a manner bound For reverence sake to be close hypocrites. Id.

Beware, ye honest : the third circling glass

Suffices virtue; but may hypocrites, Who slily speak one thing, another think, Hateful as hell, still pleased unwarned drink on, And through intemp'rance grow awhile sincere. Phillips,

Whatever virtues may appear in him, they will be esteemed an hypocritical imposture on the world; and, in his retired pleasures, he will be presumed a libertine. Rogers.

The making religion necessary to interest might increase hyporisy; but if one in twenty should be brought to true piety, and nineteen be only hypocrites, the advantage would still be great. Swift.

Hypocrisy is much more trouble than open infidelity and vice; it wears the livery of religion, and is cautious of giving scandal: nay, continued disguises are too great a constraint: men would leave off their vices, rather than undergo the toil of practising them in private. Id.

Let others skrew their hypocritick face. Id. If I am nothing—

For nothing shall I be an hypocrite,

And seem well pleased with pain. Byron.

HYPOGAS'TRICK, adj. Fr. hypogastrique; Gr. $\forall \pi \sigma$ and $\gamma a \tau \eta \rho$. Seated in the lower part of the belly.

The swelling we supposed to rise from an effusion of serum through all the hypogastrick arteries.

Wiseman.

533

HYPAGASTRIC, an appellation given to the internal branch of the iliac artery.

HYPOGASTRIUM. See ANATOMY.

HYPOGE'UM, or Hypogæum, n. s. Gr. ΰπο and $\gamma\eta$. A name which the ancient architects gave to all the parts of a building that were under ground, as cellars and vaults. It was also used by the Greeks and Romans for subterraneous tombs in which they buried their dead.

HYPOGEUM, in astrology, a name given to the celestial houses below the horizon : especially the imum cœli, or bottom of heaven.

HYPOGLOSSI, externi, or majores, in anatomy, the ninth pair of nerves, called also linguales et gustatorii. See ANATOMY.

HYPOGLOSSIS, or Hypoglottis, of $v\pi o$, under, and $\gamma\lambda\omega\tau\tau\alpha$, tongue, in anatomy, a name given to two glands of the tongue, situated under it, near the venæ ranulares. There are other two, one on each side of it. They serve to fil-There are other trate a kind of serous matter, of the nature of saliva, which they discharge into the mouth by little ducts near the gums.

IIYPOLITE (St.), in France. See HIPPOLYTE. HYPOMOCHLION, the fulcrum or prop of a lever, or the point which sustains its pressure in raising or lowering bodies. It is also used for a roller set under a lever, or under stones, timber, &c., to assist in removing them.

HYPONITRIC Acid. See Nitric Acid.

HYPOPHOSPHORIC Acid. See Phospho-RIC ACID.

HYPOSCENIUM, in antiquity, a partition under the Logeum, or pulpit of the Greek theatre, appointed for the music.

HYPOS'TASIS, n. s. ? Fr. hypostase ; Gr. Hypostat'ICAL, adj. Sumosaoic. Distinct subsistence; personality, as applied to the holy Trinity: hypostatical, constituent as distinct ingredients; distinctly; personal.

Let our Carneades warn men not to subscribe to the grand doctrine of the chymists, touching their three hypostatical principles, till they have a little examined it. Boyle.

The oneness of our Lord Jesus Christ, referring to the several hypostases in the one eternal, indivisible, divine nature, and the eternity of the Son's generation and his co-eternity and consubstantiality with the Father, are assertions equivalent to those comprised in the ancient simple article. Hammond.

HYPOSTASIS literally signifies substance, or subsistence, but is used in theology for person. Thus we hold that there is but one nature or essence in God, but three hypostases or persons. This term is of a very ancient standing in the church. St. Cyril repeats it several times, as well as the phrase union according to hypostasis. The first time it occurs is in a letter from that father to Nestorius, where he uses it instead of $\pi \rho \circ \sigma \omega \pi \circ \nu$, the word we commonly render person, which did not seem expressive enough. This term occasioned great dissentions in the ancient church, both among the Greeks and the Latins. In the council of Nice hypostasis was

defined to denote the same with essence or substance; so that it was heresy to say that Jesus Christ was of a different hypostasis from the Father; but custom altered its meaning. In the necessity they were under of expressing themselves strongly against the Sabellians, the Greeks used the word hypostasis, and the Latins persona; which proved the occasion of endless disagreement. The phrase $\tau \rho \epsilon \iota \varsigma v \pi \sigma \tau a \sigma \epsilon \iota \varsigma$, used by the Greeks, offended the Latins, who trans-the Latin tongue in theological phrases allowed them but one word for the two Greek ones, goia and vnosaou; and thus disabled them from distinguishing essence from hypostasis. They therefore chose rather to use the term tres personæ and tres hypostases .- An end was put to these logomachies in a synod held at Alexandria about A. D. 362, at which St. Athanasius assisted : after which the Latins made no scruple of saying tres hypostases, nor the Greeks three persons.

HYPOSULPHURIC ACID. See SULPHURIC ACID.

HYPOTHEC, or Hypotheca, Gr. $\upsilon \pi o \theta \eta \kappa \eta$, a thing subject to obligation; in the civil law, an obligation, whereby the effects of a debtor are made over to his creditor to secure his debt. As the hypotheca is an engagement for the security of the creditor, various means have been made use of to secure to him the benefit of the convention. The use of the pawn or pledge is the most ancient, which is almost the same with the hypotheca; all the difference consisting in this, that the pledge is put into the creditor's hands; whereas, in a simple hypotheca, the thing remained in the possession of the debtor. It was found more easy to engage an estate by a civil covenant than by an actual delivery; accordingly it was first practised among the Greeks; and from them the Romans borrowed it; only the Greeks, the better to prevent frauds, used to fix some visible mark on the thing, that the public might know it was hypothecated or mortgaged by the proprietor; but the Romans, looking on such advertisements as injurious to the debtor, forbade the use of them. The Roman lawyers distinguished four kinds of hypothecas : the conventional, which was with the will and consent of both parties; the legal, which was appointed by law, and for that reason called tacitly the prætor's pledge, when, by the flight or non-appearing of the debtor, the creditor was put in possession of his effects; and the judiciary, when the creditor was put in possession by virtue of a sentence of the court.

HYPOTH'ENUSE, n. s. Fr. hypotenuse; Gr. ύποτένεσα. The line that subtends the right angle of a right-angled triangle ; the subtense.

The square of the hypothemuse, in a right-angled triangle, is equal to the squares of the two other sides. Locke.

HYPOTHENUSE. See GEOMETRY.

HYPOTH'ESIS, n. s. HYPOTH'ESIS, n. s. Gr. ήποθεσις. Α βίσι μαζί, βίσι μαζί, Α

Il yPOTHET'ICALLY, adv. Supposition ; a system formed upon some principle not proved ;

534

HYP hypothetical, including a supposition : conditionally.

The mind casts and turns itself restlessly from one thing to another, till at length it brings all the ends of a long and various hypothesis together ; sees how one part coheres with another, and so clears off all the appearing contrarieties that seemed to lie cross, and make the whole unintelligible. South.

With imagined sovereignty

Lord of his new hypothesis he reigns :

He reigns : how long ? till some usurper rise :

And he too, mighty thought, mighty wise,

Studies new lines, and other circles feigns.

Prior.

The only part liable to imputation is calling her a goddess: yet this is proposed with modesty and doubt, and hypothetically. Broome.

Conditional or hypothetical propositions are those whose parts are united by the conditional particle if ; as, if the sun be fixed, the earth must move.

Watts.

Il YPOTHESIS, in disputation. False hypotheses are often made, in order to draw the antagonist into absurdities; and even in geometry truths are often deducible from false hypotheses. Every hypothetical proposition may be distinguished into hypothesis and thesis; the first rehearses the conditions under which any thing is affirmed or denied ; and the latter is the thing itself affirmed or denied. Thus, in the proposition, a triangle is half a parallelogram, if the bases and altitudes of the two be equal; the latter part is the hypothesis, ' if the basis,' &c., and the former the thesis, ' a triangle is half a parallelogram.' In strict logic we are never to pass from the hypothesis to the thesis; that is, the principle supposed must be proved, before we require the consequence to be allowed.

HYPOTHESIS, in physics, &c., denotes a system formed to account for some phenomenon or appearance of nature; such as gravity, mag-netism, the deluge, the tides, &c. The real causes of natural things generally lie very deep; observation and experiment are in most cases extremely slow, and the human mind is very impatient : hence we often invent something that may seem like the cause, and which appears calculated to answer the several phenomena, so that it may possibly he the true cause.

HYPOTIPOSIS. See ORATORY.

HYPOXIS, in botany, a genus of the monogynia order, and hexandria class of plants; natural order tenth, coronariæ : con. is divided into six parts, and persisting, superior: CAPS. nar-rowing at the base: CAL. a bivalved glume. Species thirteen, natives of warm climates

HYPSICLES, an ancient mathematician of Alexandria, who flourished under Marcus Aurelins. He wrote a work entitled Anaphoricus, or A Book of Ascensions, printed in Greek and Latin at Paris in 1680.

HYPSICRATES, an ancient Phœnician nistorian, who wrote a history of Phœnicia in his native tongue, which was saved from the flames of Carthage when that city was destroyed, and translated into Greek.

HYPSIPYLE, in fabulous history, the daughter of Thoas, queen of Lemnos. All the women in the island having conspired to murder the men, in revenge for their husbands having preferred their female slaves to them, she saved her father's life. The Argonauts, soon after landing at Lemnos, rendered the women pregnant, and Hypsipyle had twins by Jason. Being afterwards banished by her subjects, she was taken by pirates, and sold to Lycurgus, king of Neinæa.

HYPSISTARII, from vyizog, highest, a sect of heretics in the fourth century; so called from the profession they made of worshipping the most high God. Their doctrine was a compound of Paganism, Judaism, and Christianity. They adored the most high God with the Christians; but they also revered fire and lamps with the Heathens, and observed the sabbath, and the distinction of clean and unclean things with the Jews. They bore a near resemblance to the Euchites, or Massalians.

HYRAX, the saphan, or ashkoko, in zoology, a genus of the mammalia class of animals, and of the order of glires. The generic characters are, two broad and distinct fore teeth above; four contiguous, broad, flat notched, fore teeth below; and four large grinders on each side in both jaws. The fore feet have four toes, the hind feet only three. There is no tail, and the clavicles are wanting. There are two species.

1. H. Capensis, the Cape ashkoko, has flat nails on all the toes, except one toe of each hind foot, which is armed with a sharp-pointed claw. It inhabits the Cape of Good Hope; is about the size of a rabbit, being about fifteen inches long; the head is short, with the back part very thick, and the snout very short and blunt; the eyes are small; the ears oval and open, brown, woolly, and half hid in the fur; the legs are very short, the upper joints of both being concealed beneath the skin; the hind legs are rather longer than the fore; the feet are large, black, and naked; the body is short, thick, and contracted, with a prominent belly, and is covered with a soft woolly fur, of a yellowish-brown or grayish color, hoary at the roots; the sides are of a dirty whitish gray, and along the back is a brownish stripe. This fur is interspersed with longer and coarser black hairs, and a few very coarse long bristles. The fore feet have four short, scarcely divided, thick toes, furnished with flat nails; the two outer toes of the hind feet are similar, but the inner toe is longer, and has a sharp claw. This animal has a sharp voice, and acute sense of hearing; its gait is very wavering and unsteady, owing to the shortness of its thighs, and unequal length of the hind and fore legs; notwithstanding which it is very active, and moves by leaps; it is very cleanly, lives entirely on vegetable food, drinks little, is fond of heat, and burrows in the ground. In manners and general appearance this animal resembles the marmot and cavy; in the conformation of its toes it has some analogy with the maucauco; but, from the circumstances of the teeth, it cannot be ranked with the last; and the peculiarity of the feet has caused Gmelin to separate it from both of the former.

2. H. Syriacus, the Syrian ashkoko, of Bruce and Schreber, has soft tender nails on all the toes. It inhabits Syria and Ethiopia. The body of this species is more lengthened than that of the former, and the snout more obloug. The

fur is of a reddish-gray color, like that of the wild rabbit; the throat, breast, and belly, being white; all over the body a number of long, strong, and polished hairs, are scattered among the fur. The body and head of the individual described by Mr. Bruce measured seventeen inches; the ears are broad, open, and rounded; each side of the mouth is garnished with long whiskers: in walking, which is performed creeping low with the belly almost touching the ground, the hind feet are used as far as the heel; all the toes have short, broad, weak, flat nails, except the inner toe of the hind foot, which is provided with a flat crooked nail somewhat longer than the rest; the soles of the feet are formed of fleshy naked protuberances divided by furrows. It lives mostly about the mouths of caves or clefts in rocks, is gregarious, feeds entirely on vegetables, is mild, feeble, timid, and easily tamed, and has no voice or cry. Mr. Bruce is of opinion, that this animal is the gannim, or daman Israel, of the Arabs, and the saphan of sacred Scripture, which has erroneously been translated the rabbit. Its flesh is very white, but is not eaten by the Abyssinians or Mahommedans. He is also of opinion, that it ruminates, or chews the eud.

¹ HYRCANIA, in ancient geography, a country of the Farther Asia, lying south-east of the Mare Hyrcanum; with Media on the east, Parthia on the south, and Margiana on the west, famous for its tigers, vines, figs, and olives.

HVRCANIA, the metropolis of the above country, thought to be the Tape of Strabo, the Syrinx of Polybius, the Zeudracarta of Arrian, and the Asaac of Isidorus Characenus.

HYRCANIA, an ancient town of Lydia, in the campus Hyrcanus, near Thyatira; destroyed by an earthquake in the reign of Tiberius; so called from colonists from Hyrcania. The people were called Hyrcani Macedones, because mixed with Macedonians.

HYRST, HURST, HERST, A wood or grove.

HYSSOP, n. s. Fr. hyssope; Lat. hyssopus. A verticillate plant.

The hyssop of Solomon cannot be well conceived to be our common hyssop; for that is not the least of vegetables observed to grow upon walls; but rather some kind of capillaries, which only grow upon walls and stony places. Browne.

It hath been a great dispute, whether the hyssop commonly known is the same which is mentioned in Scripture. Miller.

Hyssop. See Hyssopus.

HYSSOP, HEDGE. See GRATIOLA.

Hyssop, Mountain. See Thymbra.

IIYSSOPUS, hyssop; a genus of the gymnospermia order, didynamia class of plants. There are three species; but only one of them is cultivated for use: viz.

H. officinalis, the common hyssop: it has under shrubby, low, bushy stalks, growing a foot and a half high; small, spear-shaped, close-setting, opposite leaves, with several smaller ones rising from the same joint: and all the stalks and branches terminated by erect whorled spikes of flowers of different colors in the varieties. They are very hardy plants; and may be propagated either by slips or cuttings, or by seeds. The leaves have an aromatic smell, and a warm pungent taste. Besides the general virtues of aromatics, they are particularly recommended in humoral asthmas, coughs, and other disorders of the breast and lungs; and are said to promote expectoration greatly. Hyssop was generally used in purifications amongst the Jews by way of sprinkling. Sometimes they add a little wool to it of a scarlet color. They dipped a bunch of hyssop, some branches of cedar and red wool, in water mingled with the blood of a bird, in purifying lepers.

HYSTASPES, a noble Persian of the royal race of the Achæmenides, the father of king Darius I. He was the first who introduced the learning and sciences of the Indian Brahmins into Persia. Ctesias says he was killed by a fall from a mountain, whither he had gone to see a royal monument erected by Darius.

HYSTERIA, or the hysteric affection, from $v = \epsilon \rho a$, the womb, a disease in women, called also suffocation of the womb, and vulgarly fits of the mother. It is a spasmodico-convulsive affection of the nervous system, proceeding from the womb. See MEDICINE, Index.

HYSTER'ICAL, adj. HYSTER'IC, adj. HYSTER'IC, adj. HYSTER'IC, adj. Gr. $v_{\tau \epsilon \rho \mu \kappa \delta c}$. Fits of women, supposed to proceed from disorders in the womb: a state troubled with these disorders.

In hysterick women the rarity of symptoms doth oft strike an astonishment into spectators. Harvey.

Many hysterical women are sensible of wind passing from the womb. Floyer on the Humours.

Parent of vapours, and of female wit,

Who gave the hysterick or poetic fit. Pope. This terrible scene made too violent an impression upon a woman in her condition, and threw her into a strong hysterick fit. Arbuthnot and Pope.

A kind of wild and horrid glee, Half epileptical and half hysterical.

Byron. Don Juan.

HYSTERON PROTERON, in grammar and rhetoric, a species of hyperbaton, wherein the proper order of construction is so inverted, that the part of any sentence which should naturally come first is placed last: as in this of Terence, Valet et vivit, for vivit et valet: and in the following of Virgil, Moriamur, et in media arma ruamus, for In media arma ruamus, et moriamur.

HYSTRIX, in zoology, the porcupine, a genus of quadrupeds belonging to the order of glires. The characters are these: they have two fore teeth, obliquely divided both in the upper and under jaw, besides eight grinders; and the body is covered with quills or prickles. There are five species, viz.

1. H. cristata, the crested porcupine, has four toes on the fore feet, five on the hind feet, a crested head, a short tail, and the upper lip is divided like that of a hare. The length of the hody is about two feet, and the height about two and a half. The body is covered with prickles, some of them nine or ten inches long, and about one-fourth of an inch thick. Like the hedgehog, he rolls himself up in a globular form, in which position he is proof against the attacks of the most rapacious animals. The prickles are

exceedingly sharp, and each of them has five large black and as many white rings, which succeed one another alternately from the root to the point. These quills the animals can erect or let down at pleasure; when irritated he beats the ground with his hind feet, erects his quills, shakes his tail, and makes a considerably rattling noise with his quills. Most authors have asserted that the porcupine, when irritated, darts his quills to a considerable distance against the enemy. But count Buffon and some other late naturalists, after repeatedly irritating him without effect, assure us, that he possesses no such power. He says, indeed, that when the creature was much agitated with passion, some of the quills, which adhered but slightly to the skin, would fall off, particularly from the tail; and this circumstance, he imagines, has given rise to The porcupine, though originally the mistake. a native of Africa and the Indies, can live and multiply in the more temperate climates of Spain and Italy. Pliny, and every other natural historian since Aristotle, tell us, that the porcupine conceals itself during winter, and brings forth its young in eighty days. But these circumstances remain to this day uncertain. The porcupine, in a domestic state, is not a fierce or ill-natured animal; with his fore feet, which are strong and sharp, he can cut through a strong board; he eats bread, fruits, roots, &c.; he does considerable damage when he gets into a garden.

2. II. dorsata, or Canada porcupine, the urson of Buffon, has four toes on the fore feet, five on the hind feet; and has quills only on the back, which are short, and almost hid among the long hair. He is about two feet long. This species inhabits North America as high as Hudson's Bay; and makes its nest under the roots of great trees. It will also climb among the boughs, which the Indians cut down when one is in them, and kill the animal by striking it over the nose. They are very plentiful near Hudson's Bay; and many of the trading Indians depend on them for They feed on wild fruits and bark of food. trees, especially juniper; eat snow in winter, and drink water in summer, but avoid going into it. When they cannot avoid their pursuer, they will sidle towards him, in order to touch him with the quills, which seem but weak weapons of offence; for, on stroking the hair, they will come out of the skin sticking to the hand. The Indians stick them in their noses and ears, to make holes for the placing their ear-rings and other finery : they also trim the edges of their deer-skin habits with fringes made of the quills, or cover with them their bark boxes.

ii. II. dorsata alba, the white Canadian porcupine, is a variety mentioned by M. Pennant, of a uniform white color.

3. H. macroura has five toes both on the hind and fore feet; his tail is very long and the prickles are elevated. He inhabits the isles of the Indian Archipelago, and lives in the forests.

4. II. Mexicana, the Mexican porcupine, the hoitzlacuatzin, or the coendon of Buffon, is of a dusky color, with very long bristles intermixed with the down : the spines three inches long, slender, and varied with white and vellow;

scarcely apparent except on the tail, which Hernandez says is thicker and shorter than that of the prehensilis. He adds that the tail from the middle to the end is free from spines; and that he grows to the bulk of a middle-sized dog. His length is eighteen inches from the nose to the tail; the tail nine French measure, but taken from a mutilated skin. He inhabits the moun-tains of Mexico, lives on fruits, and may be easily tamed. The Indians pulverise the quills, and say they are very efficacious in gravelly cases; and applied whole to the forehead will relieve the most violent head-ache. They adhere till filled with blood, and then drop off. Count Buffon confounds this species with the prehensilis, of which he makes it a third variety; but Pennant, who had seen a specimen, ranks it as a distinct species, in which he is followed by Kerr.

5. H. prehensilis, or the Brasilian porcupine, has four toes on the fore feet, five on the hind, and a long tail. It is considerably less than the cristata, being only seventeen inches long from the point of the muzzle to the origin of the tail, which is nine inches long; and the legs and feet are covered with long brownish hair; the rest of the body covered with quills interspersed with long hair; the quills are about five inches long, and about one-twelfth of an inch in diameter. He feeds upon birds and small animals. He sleeps in the day like the hedge-hog, and searches for his food in the night. He climbs trees, and supports himself by twisting his tail round the branches. He is generally found in the high grounds of America from Brasil to Louisiana, and the southern parts of Canada. His flesh is esteemed very good food.

HYTHE, or HITHE, an old market town of Kent and one of the Cinque Ports, had formerly four churches, and was, according to Leland, 'a very great town in length.' At present it has neither port nor buildings of any moment; the beach being nearly a mile from the town.

Queen Élizabeth in the seventeenth year of her reign, granted a charter of incorporation to the mayor, twelve jurats, and twenty-four common-council men of the town and port of Hythe, who, with the freemen, making about 140 in number, choose the two barons or members of parliament, returned by the town.

The houses are chiefly situated in one long street, running parallel with the sea, but having smaller ones branching off at right angles. The court-hall and market-place are in the centre of the town; the latter was built by Philip viscount Strangford, who represented this port in parliament in the twelfth of Charles II. All the houses on the side of the hill have an uninterrupted view of the sea southward, Ronney Marsh, and the adjacent country. The old market, on Saturdays, has been long disused, though the farmers have for some time held a meeting on Thursdays, for selling their corn.

There are two hospitals, or alms-houses, in the parish of Hythe; one called St. Bartholomew's, and the other St. John's. The former was founded by Haimo, bishop of Rochester, about the year 1336, and is situated at a short distance south-westward from the church. There are teu poor persons, five men and five women, and 100

acres of land belonging to this foundation. It is under the management of three trustees, now called wardens, chosen by the mayor and corpo-The hospital of St. John is situated at ration. the east end of the town in High Street. Its revenues are at present derived from fifty-four acres of land. The number and qualifications of the poor relieved are at the discretion of the trustees, and there are six apartments for their accommodation. The church is a spacious old structure, consisting of a nave, chancel, two aisles, and north and south transepts, with a tower at the west en l. From the centre rises a low tower, of early English architecture. It occupies a very elevated situation on the acclivity of the hill above the town. The room over the I

porch is the Town Hall, where the mayor and other members of the corporation are chosen. In the crypt or vault, under the east of the chancel, is piled a vast quantity of human skulls and bones; the mass being twenty-eight feet in length, and eight feet in height and breadth. They are supposed to have been the remains of Britons, slain in a bloody battle fought on the shore between this place and Folkstone, with the retreattained their whiteness by lying for some time exposed to the sea spray. Several of the skulls have deep cuts in them. A military canal commences at this place, and proceeds to the neighbourhood of Appledore.

I & J.

I is the ninth letter in the alphabet, and considered both as a vowel and a consonant, though as the vowel and consonant differ in form as well as sound they may be more properly accounted two letters. It is called in the Hebrew, Jod; Chald. Jud; Arab. Jc; Assyr. Jothim; Egypt. Joquum, Jamin; Arm. Inni, Je, Jech; Gr. Iwra; Lat. I: it is a personal pronoun, answering to the Gr. eyw, and Lat. ego; Goth. ik; Sax. ic; Dut. ich; as I, accusative me, from Gr. µE; plural we; aceus. plu. us. Me is sometimes written for I, and I was often used in common conversation for yea, aye, yes : I is the first person as opposed to all others, as I myself, used emphatically. I, at the beginning of a word in the common edition and even the MS. of Chaucer, often represents a corruption of the Sax, prepositive expletive particle Le, which, in some editions of his works, is represented by y.

There is none greater in this house than I. Gen. xxxix. 9. Be of good cheer, it is I; be not afraid. Matt. xiv. 27. I have now ben a court-man all my lif; And God it wot, though I unworthy be, I have stonden in ful gret degree Abouten lordes of ful high estat : Yet had I never with non of hem debat ; I never hem contraned, trewely I wot wel, that my lord can more than I; What that he saith, I holde it firme and stable I say the same or elles semblable. Chaucer. The Merchantes Talc. I do not like these several councils, I. Shakspeare. Hath Romeo slain himself? Say thou but I, And that bare vowel, I, shall poison more Id. Than the death-darting eye of cockatrice. Did your letters pierce the queen ? -I, sir; she took 'em and read 'em in my presence And now and then an ample tear trilled down. Id. What shall I do to be for ever known, And make the age to come my own ? I shall like beasts or common people die, Cowley. Unless you write my elegy. Hence, and make room for mc.

When chance of business parts us two,

What do our souls, I wonder, do?

IJ.

Thus, having passed the night in fruitless pain, I to my longing friends return again.

Dryden's .Eneid.

Sweet contemplation elevates my sense, While I survey the works of providence. Gay.

Of night impatient, we demand the day, The day arrives and for the night we pray.

Blackmore.

There is but one man whom she can have, and that is me. Clarissa.

I vowel has a long sound, as fine, thine, which is usually marked with an e final; and a short sound, as sin, thin. Prefixed to e it makes a diphthong of the same sound with the soft i, or double e, ee: thus field, yield, are spoken as feeld, yeeld; except friend, which is spoken frend. Subjoined to a or e it makes them long, as fail, neigh: and to o makes a mingled sound, which approaches more nearly to the true notion of a dipthong, or sound composed of the sounds of two vowels, than any other combination of vowels in the English language, as oil, coin. The sound of i, before another i, and at the end of a word, is always expressed by y.

It is pronounced by throwing the breath suddeuly against the palate, as it comes out of the larynx, with a small hollowing of the tongue, and nearly the same opening of the lips as in pronouncing a or e. The ancients sometimes changed i into u; as decumus for decimus; maxumus for maximus, &c. I and J have long been considered as one letter by grammarians, with different sounds and powers, according to its position; and Mr. Bayle, in his Ilistorical and Critical Dictionary, also arranges Y along with them. As a numeral, I signifies one, and stands for so many units as it is times repeated : thus I, one; 11, two; 111, three, &c.; and when put before a higher numeral, it subtracts its value, as IV, four; IX, nine, &c. But, when set after it, so many are added to the higher numeral as there are I's added : thus V1 is 5 ± 1 , or six; VII, 5 + 2, or seven; VIII, 5 + 3, or eight. The ancient Romans likewise used 10, for 500, Cl₂ for 1000, 122 for 5000, CCl₂) for 10,000, 1223 for 50,000, and CCCl₂) for 100,000.

JAAR, a river of the kingdom of the Netherands, which rising in the province of Liege, near Tongres, falls into the Meuse at Maestricht.

JAB'BER, v. a. Scot. gabben; from gab, JAB'BERER, n. s. The mouth; Belg. gabberan. To talk inarticulately, indistinctly, or idly. See GABBER.

Out-cant the Babylonian labourers

At all their dialects of jabberers. Hudihras. We seorn, for want of talk, to jubber Of parties. Swift.

JABLONSKI (Daniel Ernest), a learned Polish Protestant divine, born at Dantzic in 1660. He became successively minister of Magdeburg, Lissa, Koningsberg, and Berlin; and was at length ecclesiastical counsellor, and president of the Academy of Sciences at the latter. He took great pains to effect a union between the Lutherans and Calvinists; and wrote some works which are esteemed, particularly Meditations on the Origin of the Scriptures, &c. He died in 1741.

JABLONSKI (Paul Ernest), the son of the above, was born at Berlin, and became professor of divinity at Frankfort on the Oder. He wrote, 1. Disquisitio de lingua Lycaonica; 2. De Memnone Græcorum ; 3. Institutiones Historiæ Ecclesiasticæ, 2 vols. 8vo.; 4. Pantheon Ægyp-ticorum, 3 vols. 8vo. He died in 1757.

JABLONSKI (Theodore), counsellor of the court of Prussia, and secretary of the Royal Academy of Sciences at Berlin, was also a man of distinguished merit. He published in 1711 a French and German Dictionary; a Course of Morality in 1713; a Dictionary of Arts and Sciences in 1721; and translated Tacitus de Moribus Germanorum into high Dutch in 1724.

JACATRA, a district and formerly a kingdom of Java, of which Batavia is the capital. The last of its sovereigns being subdued by the Dutch East India Company's troops, in the year 1619, they have ever since been possessed of it. The country comprised thirty districts, containing together 33,914 families, or 203,484 inhabitants, and is watered and fertilised by several rivers, most of which, however, are little better than rivulets in the dry season. Its productions are coffee, sugar, and rice, indigo, cotton-yarn, turmeric, and cadjang or lentiles, from which last the inhabitants express oil.

JA'CENT, adj. Lat. jacens. Lying at length. So laid, they are more apt in swagging down to pierce than in the jacent posture.

Wotton's Architecture.

JACHAL, a river of Chili, in the province of Cuyo, which runs east, and loses itself in a lake. It has a small town of the same name near it.

JACI, JACI D'AQUILA, or JACI REALE, a maritime town in the Val di Demona, on the coast of Sicily, situated near the foot of Mount Ætna. It is protected by a fort; and the river Acis, from which the town anciently took its name, forms a harbour here. The buildings are chiefly of indurated lava, in which the country abounds. The inhabitants manufacture considerable quantities of linen. The environs are fertile in fruit, silk, hemp, and flax. Population 11,000. Ten miles N. N. E. of Catania, and fifteen south by west of Taormind.

JA'CINTII, n. s. (For hyacinth.) The same with hyacinth. A gem of a deep reddish-yellow, approaching to a flame color, or the deepest amber.—Woodward.

The same properties I find ascribed to the jacinth, and topaze. They allay anger, grief; diminish madness; much delight and exhilarate the mind.

Burton. Anatomy of Melancholy.

JACK, n. s. Probably from the Fr. Jaques. James, says Dr. Johnson: but there was a Sax. zeoz and Goth. jog, jugg, from og, ug, young, meaning a young lad.

The diminutive of John. Used as a general term of contempt for saucy or paltry fellows

Sire Robert or sire Hue,

Or Jakke, or Rauf, or whose that it were.

Chaucer. The Reves Tale.

So hidous was the noise, a benedicite !

Certes he Jakke Straw and his meinie

Ne maden never shoutes half so shrille.

Whan that they wolden any Fleming kille,

As thilke day was made upon the fox.

Id. The Nonnes Preestes Tale. Go fro the window, Jacke fool ! she said.

Id. The Milleres Tale.

And many a Jacke of Dover hast thou sold That hath been twies hot and twies cold.

Id. Prologue to the Cokes Tale.

You will perceive that a Jack gardant cannot Office me from my son Coriolanus. Shakspeare.

Every Jack slave hath his belly-full of fighting, and I must go up and down like a cock that nobody can match. Id.

I have in my mind

A thousand raw tricks of these bragging jacks,

Which I will practise. Id. Merchant of Venice. The name of instruments which supply the

place of a boy, as an instrument to pull off boots.

Foot boys, who had frequently the common name of Jack given them, were kept to turn the spit, or to pull off their master's boots; but when instruments were invented for both those services, they were both Watts's Logick. called jucks.

An engine which turns the spit.

The ordinary jacks, used for roasting of meat, commonly consist but of three wheels. Wilkins.

The excellencies of a good jack are, that the jackframe be forged and filed square ; that the wheels be perpendicularly and stongly fixed on the squares of the spindles; that the teeth be evenly cut, and well smoothed; and that the teeth of the worm-wheel fall evenly into the groove of the worm. Moxon.

A cookmaid, by the fall of a juck weight upon her head, was beaten down. Wiseman's Surgery.

Some strain in rhyme ; the muses on their racks Scream, like the winding of ten thousand jacks.

Pope.

A young pike.

No fish will thrive in a pond where roach or gud-Mortimer's Husbandry. geons are, except jacks. Fr. Jacque. A coat of mail.

The residue were on foot, well furnished with jack and skull, pike, dagger, bucklers made of board, and slicing swords, broad, thin, and of an excellent temper. Hayward.

A cup of waxed leather.

Dead wine, that stinks of the borrachio, sup

From a feul juck, or greasy maple cup. Dryden. A small bowl thrown out for a mark to the bowlers.

'Tis as if one should say, that a bowl equally poised, and thrown upon a plain bowling-green, will run necessarily in a direct motion ; but, if it be made with

538

a byass, that may decline it a little from a straight line, it may acquire a liberty of will, and so run spontaneously to the jack. Bentley.

A part of the musical instrument called a virginal.

In a virginal, as soon as ever the jack falleth, and toucheth the string, the sound ceaseth. Bacon.

The male of animals.

A jack ass, for a stallion, was bought for three thousand two hundred and twenty-nine pounds three Arbuthnot on Coins. shillings and four pence.

A support to saw wood on .-- Ainsworth.

The color or ensigns of a ship .- Ainsworth. A cunning fellow who can turn to any thing, in the following phrase.

Jack of all trades, show and sound ;

An inverse burse, an exchange under ground. Cleaveland.

JACK BOOTS, n. s. From jack, a coat of mail. Boots which serve as armour to the legs.

A man on horseback, in his breeches and jack boots, dressed up in a commode and a night rail.

Spectator.

JACK BY THE HEDGE, n. s. Erysimum alliaria. Jack by the hedge is an herb that grows wild under hedges, is caten as other sallads are, and much used Mortimer. in broth.

JACK PUDDING, n. s. Jack and pudding. A zani; a merry Andrew.

Every Jack pudding will be ridiculing palpable weaknesses which they ought to cover. L'Estrange.

A buffoon is called by every nation by the name of the dish they like best: in French jean pottage, and in English jack pudding. Guardian.

Jack pudding, in his party-colored jacket, Tosses the glove, and jokes at eviry packet. Gay.

JACK WITH A LANTERN. An ignis fatuus.

JACKALE'NT, n.s. Jack in Lent, a poor starved fellow. A simple sheepish fellow.

You little jackalent, have you been true to us? -Ay, I'll be sworn.

Shakspeare. Merry Wives of Windsor.

JACK'ANAPES, n. s. Jack and ape.

Monkey; an ape.

A coxcomb; an impertinent.

Which is he

-That jackanapes with scarfs. Shakspeare. People wondered how such a young upstart jackanapes should grow so pert and saucy, and take so much upon him. Arbuthnot.

JACKDA'W, n. s. Jack and daw. A cock daw; a bird taught to imitate the human voice.

To impose on a child to get by heart a long scroll of phrases, without any ideas, is a practice fitter for a jackdaw than for any thing that wears the shape of man. Watts.

JACKA'L, n.s. Fr. chacal. A small animal supposed to start prey for the lion.

The Belgians tack upon our rear,

And racking chase-guns through our sterns they send ; Close by their fireships, like jackals appear,

Who on their lions, for the prey attend. Dryden. The mighty lion before whom stood the little jackal,

the faithful spy of the king of beasts. Arbuthnot and Pope.

JA'CKET, n. s. Fr. jacquet. A short coat; a close waistcoat.

In a blue jacket, with a cross of red.

Hubberd's Tales. She fell upon the jacket of the parson, who stood gaping at her L'Estrange.

And hens, and dogs, and hogs are feeding by ;

And here a sailor's jacket hangs to dry. Pope. The water rushed through in a way quite puzzling,

While they thrust shcets, shirts, jackets, bales of muslin, Into the opening.

Byron. Don Juan.

To beat one's. jacket, is to beat the man.

JACKSON, a county of the United States, in Indiana, west of Clark and Jefferson counties, north of Washington, east of Orange, and south of Indian county. It is watered by White River and its creeks, and was laid out in 1815.

JACKSON, a county of the United States, in

West Tennessee. Its chief town is Williamson. JACKSON, CAPE, or POINT JACKSON, a cape on the coast of New Holland. Long. 175° 10' E., lat. 40° 54' S.

JACOB, Heb. עקוב, i. e. a supplanter. The son of Isaac and Rebekah, was born A. M. 2168, and A.A.C. 1836. The history of this patriarch is recorded in Genesis xxv.-1. He died in Egypt in the 147th year of his age, and was honorably interred in Abraham's burying-place, near Hebron.

JACOB (Giles), an eminent lawyer, born at Romsey in Southamptonshire in 1686. He is principally known for his Law Dictionary in 1 vol. folio, which has been often printed. He also wrote two dramatic pieces; and a Poetical Register, containing the lives and characters of English dramatic poets. He died in 1744.

JACOB (Henry), celebrated as the founder of the first Independent, or Congregational church in England, was a native of Kent, and received his academical education at St. Mary's Hall, Oxford. Having entered into holy orders, he was made precentor of Corpus Christi College, and afterwards obtained the benefice of Cheriton in Kent. In the year 1604 he published Reasons taken out of God's Word, and the best of Human Testimonies, proving the Necessity of Reforming our Churches of England. The publication of this, and of another work, against what was falsely called 'learned preaching,' drew down upon him the persecution of bishop Bancroft, and to avoid this persecution he fled to Holland. At Leyden he met with Mr. Robinson, with whom he had frequent conferences, and became a convert to what were then called Brownist principles, since known by the name of Independency. In Holland he published several treatises, and upon his return he avowed a design of setting up a separate congregation upon the model of those in Holland. This, in a short time, he carried into effect, and thus laid the foundation of the first Independent Congregational church in England. He was elected pastor of the church, and continued with his people till the year 1624, when, being desirous of entering on a more enlarged sphere of usefulness, he went to Virginia, where he soon afterwards died. He was author of many publications, which were highly estcemed in his day.

JACOB'S LADDER, n. s. Polemonium; the same with Greek valerian.

JACOB'S STAFF, n.s. A pilgrim's staff. Staff concealing a dagger. A cross staff; a kind of astrolabe.

JACON BEN HAJIM, a rabbi famous for the

collection of the Masora in 1515, together with the text of the Bible, the Chaldaic paraphrase, and Rabbinical commentaries.

JACOB BEN NAPHTHALI, a famous rabbi of the fifth century: he was one of the principal Masorets, and bred at the school of Tiberias in Palestine with Ben Aser. The invention of the vowel points, and of accents to facilitate the reading of the Hebrew, are ascribed to these two rabbies: and said to have been begun in an assembly of the Jews held at Tiberias, A. D. 476.

JACOB EUS (Oliger), a celebrated professor of physic and philosophy at Copenhagen, born in 1651 at Aarhusen in Jutland, where his father was bishop. Christian V. intrusted him with the management of his grand cabinet of curiosities ; and Frederick IV., in 1698, made him counsellor of his court of justice. He wrote many medical works, and some excellent poems.

JAC'OBINE, n. s. A pigeon with a high tuft.—Ainsworth.

JACOBINS, in history, the name of one of the principal parties in the French revolution, so called from their meeting in the hall of the Jacobin Friars at Paris. Many of them were members of the constituent national assembly of France, and many more were deputies to the different conventions which succeeded it. They are represented as having been determined enemies to monarchy, aristocracy, and the Christian religion. The origin of this sect or party has been ascribed to M. Voltaire, 'who, being weary, as he said himself, 'of hearing people repeat, that twelve men were sufficient to establish Christianity, resolved to prove that one might be sufficient to overthrow it. Full of this project, he swore, before 1730, to dedicate his life to its accomplishment; and for some time he flattered himself that he should enjoy alone the glory of destroying the Christian religion. He found, however, that associates would be necessary; and, from the numerous tribe of his admirers and disciples, he chose D'Alembert and Diderot as the most proper persons to co-operate with him in his designs. He contrived to embark in the same cause with Frederick II. of Prussia, who wished to be thought a philosopher, and who of course deemed it expedient to talk and write against a religion he had never studied, and into the evidence of which he had probably never deigned to enquire. This royal adept was one of the most zealous of Voltaire's coadjutors, till he discovered that the philosophists were waging war with the throne as well as with the altar. The abbé Barruel says, that 'at its very first appearance, this sect counted 300,000 adepts; and it was supported by 2,000,000 of men, armed with torches and pikes, and all the firebrands of the revolution ; ' and, he adds, that it was ' the coalition of a triple sect, of a triple conspiracy, in which, long before the revolution, the overthrow of the altar, and the ruin of the throne, had been debated and determined.' See FRANCE.

JAC'OBITE, n. s. & adj. λ Lat. jacobus. A JAC'OBITISM, n. s. λ term applied to those who disseminated the doctrines of one Jacob, a Syrian, which taught the single nature of Christ in opposition to the received doctrine

of his two-fold character as human and divine: also a term of political import, applied to those who were attached to the cause of king James II. This word is also used for Jacobin, or White Friar.

Sometimes am I hore and olde, Now I am yong and stout and bolde, Now am I Robert now Robin, Now Frere Minor, now Jacobin.

Chaucer. Romaunt of the Rose.

He [James] made puritans in his time, as Jansenusts have been since made in France, and Jacobites in Britain by calling men so, and by treating them as such. Bolingbroke.

JACOBITES, a term of reproach bestowed on persons who, vindicating the doctrines of passive obedience and non-resistance to princes, disapproved of the revolution of 1688, and asserted the supposed rights of the Stuart family.

JACOBITES, in church history, a sect of Christians in Syria and Mesopotamia; so called either from Jacob, a Syrian, who lived in the reign of the emperor Mauritius, or from one Jacob, a monk who flourished in 550. They are of two sects, some following the rites of the Latin church, and others continuing separated from it. There is also a division among the latter, who have two rival patriarchs. They hold but one nature in Jesus Christ; with respect to purgatory, and prayers for the dead, they are of the same opinion with the Greeks and other eastern Christians : they consecrate unleavened bread at the eucharist, and are against confession, believing that it is not of divine institution.

JACOBS (Jurian), an eminent Swiss painter, born in 1610. He was the disciple of F. Snyders, and painted portraits, historical pieces, and animals, particularly the latter, in a masterly manner. Ile died in 1664.

JACOBUS, a gold coin, worth 25s. so called from king James VI. See Corx. There are two kinds of jacobus, the old and the new; the former valued at 25s. weighing six pennyweights ten grains; the latter called also carolus, valued at 23s., weighing five pennyweights twenty grains.

JACQUELOT (Isaac), a French protestant divine, born at Vassy, in 1647. On the revocation of the edict of Nantes, he retired to the Hague, and thence to Berlin, where he was made chaplain to the king of Prussia. While he lived at Berlin, he entered into a warm controversy with Mr. Bayle on the doctrine advanced in his dictionary favoring Manicheism, which continued until his death. In this dispute M. Jacquelot declared in favor of the Remonstrants. He wrote, 1. Dissertations sur l'Existence de Dieu; 2. Dissertations sur le Messie ; 3. Lettres à Messieurs les Prelates de l'Eglise Gallicane; 2 vols. of Sermons, &c. He was employed in finishing an important work on the divine authority of the holy Scriptures, when he died suddenly in 1708, aged sixty-one.

JACQUINIA, in botany, a genus of the monogynia order, and pentandria class of plants: cor, is decembid; the stamina inserted into the receptacle; the berry monospermous. Species five, natives of the West Indies.

JACTITATION, n.s. Lat. jactito. Tossing motion; restlessness; heaving. A term in the canon law for a false pretension to marriage.

JAC

541

Milton.

f the patient be surprised with jactitation, or great oppression about the stomach, expect no relief from Harrey. cordials.

JACULA'TION, n. s. Lat. jaculatio, jaculor. The act of throwing missive weapons.

So hills amid' the air encountered hills,

Hurled to and fro with jaculation.

JADDESSES, an inferior order of priests in Ceylon, who have the care of the chapels appropriated to the genii, a third order of gods among these idolaters. These priests are applied to by the people in times of disease or calamity, who offer a cock to appease the anger of the demons.

JA'DISH, adj.			(is do	ubtful : M	in-
JA'DED, adj.				derives	
JA'DRY, n. s.) from	the Hebr	ew

jaduh, rejicere; Skinner from gaad, a goad, or spur. A horse without spirit; a hired horse; a worthless nag; an ironical appellation of a young woman; a species of stone: to jade is to tire; harass; weary, applied originally to horses: to overbear, crush, or degrade: to sink. Jadish, vicious, when applied to a horse; unchaste; incontinent; frolicsome: jaded, wearied; exhausted : jadry, the properties of a bad or vicious horse, now obsolete.

Be blithe, although thou ride upon a jade. What though thin horse be bothe foule and lene, If he wol serve thee, recke thee not a bene : Loke that thyn herte be mery evermo.

Chaucer. Prologue to the Nonnes Preestes Tale. With his banners, and his well-paid ranks, The ne'er-yet-beaten horse of Parthia We've jaded out o' the field.

Shakspeare. Anthony and Cleopatra.

I do not now fool myself, to let imagination jade me; for every reason excites to this. Shakspeare.

When they should endure the bloody spur, They fall their crest, and, like deceitful jades,

Sink in the trial. Id. Julius Cæsar. The horsemen sit like fixed candlesticks,

With torchstaves in their hand ; and their poor jades Lob down their heads, dropping the head and hips. Shakspeare.

The honourable blood

Must not be shed by such a juded groom. Id. If we live thus tamely,

To be thus jaded by a piece of scarler,

Farewell nobility. Id. Henry VIII. It is good in diseourse to vary and intermingle

speech of the present occasion with arguments : for it is a dull thing to tire and jade any thing too far.

Bacon.

Shall these, these old jades, pass the flower Of youth, that you have, pass you. Chapman.

So have I seen with armed heel, A wight bestride a commonweal,

While still the more he kicked and spurred,

The less the sullen jade was stirred. Hudibras. That horsed us on their backs, to show us

A jadish trick at last, and throw us. Id. Alas, what wights are these that load my heart ! I am as dull as winter-starved sheep

Tired as a jude in overloaden cart. Sidney.

If fleet dragon's progeny at last

Proves jaded, and in frequent matches cast 1.0 favour for the stallion we retain,

And no respect for the degenerate strain.

Dryden.

The plain nag came upon the trial to prove those to be judes that made sport with him. L'Estrange.

'Tis to no boot to be jealous of a woman; for if the humour take her to be judish, not all the locks and spies in nature can keep her honest.

The mind once jaded, by an attempt beyond its power, is very hardly brought to exert its force again. Locke

Many offer at the effects of friendship, but they do not last : they are promising in the beginning, but they fail and jade and tire in the prosecution.

South.

You see now and then some handsome young judes among them : the sluts have very often white teetly and black eyes. Addison.

False steps but help them to renew their race, As, after stumbling, jades will mend their pace.

Pope. In diamonds, pearl, and rich brocades, She shines the first of battered jades,

And flutters in her pride. Swift.

But, she, the eunningest jade alive,

Says, 'tis the ready way to thrive. Stepney. There are seasons when the brain is overtired or jaded with study or thinking; and upon some other accounts animal nature may be languid or cloudy, and unfit to assist the spirit in meditation. Watts.

Sated with nature's boons, what thousands seek, With dishes tortured from their native taste, And mad variety to spur beyond Its wiser will the jaded appetite !

Armstrong.

JAEN, an extensive province of the eastern part of Andalusia, Spain, surrounded by the provinces of Granada, Murcia, Cordova, and La Mancha. Its territorial extent is 4730 square miles; and its population about 207,000. The north is occupied by the Sierra Morena, which separates it from La Mancha : another lofty chain divides it from Granada. These districts are in a great measure covered with wood: in the central part of the province the soil is in some places rich, in others barren and sandy; the climate in the plains is hot, and in certain situations unhealthy. With bad cultivation, this province produces wine, oil, silk, and corn, in considerable abundance, especially along the Guadalquivir. It was formerly famous for its horses. The minerals of common occurrence are salt, lead, and copper; the only manufactures woollen and silk. The chief towns are Jaen, Ubeda, Baeza, and Anduxa. The chief river is the Guadalquivir, but there are a number of smaller streams. Jaen was formerly the smallest of the Andalusian monarchies, and remained in the hauds of the Moors till 1243, when it was conquered by Ferdinand II. king of Castile. The king of Spain is still styled king of Jaen.

JAEN, a considerable city of Spain, the capital of the province of this name, is situated on the banks of the Guadalbulon, at the foot of a mountain composed almost entirely of marble. It is surrounded by walls and towers, is neatly built, and has several handsome churches and squares. It is a bishop's see, and the cathedral is a noble building. Water is distributed to all parts of the town by means of public fountains. Jacn was a well-known place in the time of the Romans: it was then called Oringi or Oningi; and its ancient ruins, among others an aqueduct, attest its importance. It flourished also under the Moors, when its manufactures of silk are said to have been of importance. Population about 28,000. It is about thirty-six miles north of Granada.

JAEN DE BRACAMOROS, a government of Colombia, in Quito, bounded on the north by Loja and Quixos y Macas; on the east by Maynas; on the west by Piura; and on the south by Caxamarca or Chacapoyasiu Peru. Its southern and western frontiers limit the territories of Peru.

The climate here is hot, though the rains are not so violent or lasting as in Quixos. The summer is the pleasantest season, as the heat, the rains, and the tempests, abate during that period.

The pongo de Manseriche, or strait by which the False Maranon passes the Andes, is partly in this district. The embarkation on the Lauricocha, the present name for a river which was, until very lately, supposed to be the Maranon, is usually at Chuchunga, a village of Bracamoros, in 5° 29' S. lat. four days' journey from Jaen, the river not being navigable nearer than this, on account of the rapids. All the rivers of Jaen flow into the Lauricocha, or descend into the descrts of the Maranon, to join that noble stream. The rivers of this government formerly produced a great deal of gold, but no exertions are made to procure it at present.

Those parts of this country which are under cultivation are very fertile, but nearly the whole government is covered with forests. The cacao flourishes very much. Tobacco is produced in great quantities : and the cigars of Jaen are universally sought after in Peru, Chili, and Quito. Cotton trees are also abundant, and their produce constitutes a great part of the trade of the inhabitants. Animals peculiar to the wilds of Jaen are the cougar or puma, the jaguar, and the great black bear of the Andes. They have also a very large animal called danta, as big as an ox; its skin is white, and it has a horn in the middle of its head bending backwards. The woods are well stocked with reptiles and birds.

Its commerce in cotton, tobacco, and mules, is brisk; and carried on chiefly with the provinces of Peru and Quito, in return for European articles.

The post communication is carried on down the rivers: the Indian who carries the letters wraps them in his dress, which he ties round his head, and travelling with a great knife in his hand with which he clears the underwood which may obstruct his road when obliged to land. He descends, swimming for two days, the river of Guacabamba, or Chamaya (full of rapids), and then the Amazons, to Tomependa, a village of Jaen. The postman passes the rapids by land, and generally carries with him a log of bombax or balsa, in order to rest himself on in the water.

Native Indians are found here in large hordes; and migrating from one hunting ground to another. Jaen the capital is in $5^{\circ} 25'$ S. lat. on the Chinchipe: its inhabitants are about 4000. Valladolid, Loyola, and Santiago de las Montanes are also chief towns.

JAFFA, the ancient JOPPA, is a town of Palestine on the Mediterranean. See JOPPA. It is now inhabited by Turks and Arabs with a mixed race of Armenians, Greeks and Maronites. The Christians sects have each small convents.

542

The town, standing on an eminence, is rather handsome; it contains about a thousand inhabitants, and is the usual landing place of the pilgrims, who come by sea to visit Jerusalem. It it surrounded by a stone wall, with several alternate squares and round towers, and in the centre is an old ruined citadel. Its ancient haven is choked up, and the road is rocky and uneven; a great surf also beats on the shore. The neighbourhood abounds in citrons, lemons, and oranges; and Dr. Clarke says he no where tasted equally fine water melons : the chief trade is in these fruits and the importation of rice from. Egypt. The customs are levied by the pacha of Gaza. Jaffa, being in 1799 taken by Buonaparte, became the scene of that massacre of prisoners of which Sir Robert Wilson first published the account. Four days after its surrender, he says, 3800 men were led to a field near the town, and publicly shot. Dr. Clarke saw here the fragments of bodies imperfectly buried ; but he did not hear of the massacre: but Buonaparte himself partially acknowledged it to lord Ebrington and Mr. Warden; and justified it on the ground that these were prisoners who, after being taken and dismissed on parole, had afterwards joined the garrison of Jaffa. But see our article NAPOLEON. Forty miles west of Jerusalem. Long. 34° 53' E., lat. 32° 2' N.

JAFFNAPATAM, a district, or rather a distinct island, at the northern extremity of the island of Ceylon, directly opposite to Negapatam in the southern Carnatic. It is of an oblong shape, and from its maritime situation it escapes the intensely hot winds which prevail on the continent. The climate is, therefore, on the whole healthy, the cultivation superior, and fruits, vegetables, and game, abundant. Sheep have been reared with considerable success. Dr. Davy supplies us with two analyses of the soils of this island. One of a soil of a tobacco field, which is manured by means of sheep, like turnipground in England; the other of rice-ground, which receives no manure, but is carefully irrigated. The tobacco soil, of a reddish-brown color, collected when perhaps partially exhausted, the crop not having been long taken off the ground, consisted of

95.5 siliceous sand, colored by iron, with a few particles of calcareous matter.

- 2.0 vegetable matter.
- 2.5 water.

The rice-soil, of a light gray color, containing a good deal of straw in a finely-divided state, consisted of

95.5 siliceous sand, with traces of iron, carbonate of lime and alumine.

2.5 vegetable matter.

2.0 water.

100.0

Cinnamon and pepper are produced also in sufficient quantity to be occasionally articles of foreign commerce. Dependent on Jaffna district, and at a small distance, are several islands of ne

^{100.0}

great size, which the Dutch have named Delft, Harlem, Leyden, and Amsterdam. In these islands are bred horses and cattle, as from their excellent pasture they are well adapted for this purpose. The woods towards Kandy are inhabited by an extraordinary race of savages, known by the name of Bedahs or Vaddahs, supposed to be the original inhabitants of the country.

JAFFNA, a fortified town of Ceylon, is the capital of the foregoing island or district, and possesses a good citadel. It was taken, after a short resistance, by the British troops, in 1795. Here is a flourishing manufacture of cotton The inhabitants are Mahommedans; goods. but since Ceylon was taken by the English many of the country-born Dutch families have settled in this place, as being cheaper and healthier than Columbo. It is garrisoned by the British troops, and is esteemed the second town of Ceylon.

JAGEPORE, or JEHAZPORE, a large town of the province of Orissa, Hindostan, capital of a district of the same name, situated on the south side of the Byturnee, which is here nearly half a mile broad. It is a straggling place, and has a manufacture of cotton cloths. The independent rajah of this place, in the year 1243, not only repelled the Afghauns from his own territory, but pursued them into Bengal, and laid siege to Gour. These princes retained their independence till 1568, when all Orissa was subdued by Callapahar, the general of Solyman Kerany, king of Bergal. During the Mahommedan governments it was also a place of consequence; and until they were expelled by the Mahrattas.

JAGG, v. a. & n. s. Weisn gagane, Jacke. To cut into indentures; to cut into JAG'GEDNESS, n. s. teeth, as a saw; to produce rough and irregular edges: jagg, a protuberance; a denticulation; the state produced in any thing which is hacked or mangled.

Some leaves are round, some long, some square, and many jagged on the sides.

Baeon's Natural History. The jagging of pinks and gilliflowers is like the inequality of oak leaves; but they never have any small plain purls. Baeon.

First draw rudely your leaves, making them plain, before you give them their veins by jaggedness.

Peacham on Drawing. The figure of the leaves is divided into so many jaggs or escallops, and curiously indented round the edges. Ray.

Take off all the staring straws, twigs, and jaggs in the hive, and make them as smooth as possible.

Mortimer's Husbandry.

His tow'ring crest was glorious to behold ; His shoulders and his sides were scaled with gold; Three tongues he brandished when he charged his foes ?

His teeth stood jaggy in three dreadful rows.

Addison. The banks of that sea must be jagged and torn by the impetuous assaults, or the silent underminings of waves; violent rains must wash down earth from the tops of mountains. Bentley.

An alder-tree is one among the lesser trees, whose younger branches are soft, and whose leaves are jagged. Watts.

Amid those angles, infinitely strained, They joyful 'eave their jaggy salts behind. Thomson. JAGGERNAUT. See JUGGERNAUT.

JAGHIRE, a district of the Carnatic, Hindostan, included in the collectorship of Chincleput. It extends from Madras northward to the Pullicat Lake; southwards to Allumparva; and westward beyond Conjeveram; being about 108 miles along shore, and forty-seven inland in the widest part, containing altogether 2440 square miles. See CHINCLEPUT.

JAGUIRE, in the Indian polity, a grant of land from a sovereign to a subject, revocable at pleasure, but generally a life-rent.

JAGO (Richard), an ingenious poet, vicar of Snitterfield in Warwickshire, and rector of Kimcote in Leicestershire. He was the intimate friend and correspondent of Shenstone, with whom he studied at University College, Oxford. He took the degree of A. M. July 9th, 1739. He was author of several poems in the fourth and fifth volumes of Dodsley's Collection, and pro-lished a Sermon on the Causes of Impatience, preached at Harbury in Warwickshire, where he was vicar. He also wrote a poem, entitled Edge-hill, for which he obtained a large subscription in 1767; and The Blackbirds, a beautiful elegy, in the Adventurer. He died May 28th, 1781.

JAGO (St.), or YAGO, the principal of the Cape Verd Islands, is forty miles long and twenty broad. It is mountainous, and barren, but with a few fertile spots which produce abundance of fruits and vegetables

St. Jago, the capital, is situated in a valley, but does not now contain more than half a dozen families.

Porto Praya, near the middle of the south side, is one of the best roads among these islands; being perfectly safe, except from the middle of August to the beginning of November, when southerly winds blow with great violence. The bay is about one mile and a half wide between the points, and the same depth, with from fourteen to four fathoms. On its west side is a small island called Quails, Green, or French Island, and off the west point of the bay, round Tuberon point, is a ledge of breakers running out onethird of a mile.

A fort is built on the cliff, at the head of the bay, and mounts a few iron guns. Midway between St. Jago and Bonavista is the Leton reef of coral on which the Lady Burgess East Indiaman was wrecked in 1807; abundance of fish are found near it.

JAGO (St.), a town and province of Chili, bounded by that of Aconcagua to the north, the Andes to the east, the river Maypo to the south, and Melipilla to the west. The province is fifteen leagues in extent from east to west, and twelve from north to south, watered by the rivers Mapocho, Colina, and Zampa, and by several other beautiful streams. It also contains the lake Pudaguel, about three leagues in length. It is the most fertile part of Chili, producing great quantities of corn, wine, and fruits, particularly peaches. The mountains of Caren also abound with gold mines, and that part of the Andes which is attached to it with silver. The former are worked only in the summer months, namely, December, January, February, and March.

Twenty leagues from the town, which stands on the Mapocho River, is the great mine of Kempu. Further towards the south is another, named Maipo, the metals of which are lowered down by engines from a very lofty mountain, called San Simon: here also are the mines De San Pedro Nolasco, which yield a considerable portion of massy silver. On the east of this place is Valle Blanco, where silk-worms breed. Besides these mines there are five lavaderos, or washing-places, in the mountain of Guindo, and some other veins in the old asiento of Tiltil. The top of Calen is covered with lavaderos of the richest gold. This province has also copper and tin mines; and in Lampa are three of silver and one of lead. In the small settlement of Montenegro a vein of jasper has been lately discovered.

The town of St. Jago is of noble appearance. The great square measures 450 feet on each side. In the midst is a handsome bronze fountain. The north side is occupied by the palaces of the presidents of the audience and city, beneath which are the public prisons. On the western are the cathedral and the palace of the archbishop. The private houses are handsome and pleasant, but, on account of earthquakes, are usually of but one story. There is a suburb to the south, called St. Isidore, separated from the city by a street four times as broad as the others called Cannada. Here is also what was once a royal university. Inhabitants altogether about 46,000. Fifty-five miles E. S. E. of Valparaiso.

JACO (St.), a town of the island of Cuba, on the south coast, and founded by Don Diego Velasquez in 1514. It has a fine port, defended by two castles and a battery, which was long considered as the capital of the island, but is now much reduced. It is the see of a bishop, and stands on a river of the same name about six miles from the sea.

JAGO (St.), DEALANGI, a town of Mexico, the capital of Veragua, is situated in a fertile country, producing maize, plantains, &c., with plenty of cattle, in which a regular trade is carried on with Panama. It has some mines in its district, and contains an elegant hospital: 110 miles south-west of Porto-Bello.

JAGO (St.), DE CACEM, a large town in the south-west of Portugal, in the province of Alentejo, on the bay called Laguna de Pera : thirtysix miles south of Setubal.

JAGO (St.), DE LOS CAVALLEROS, a town of the island of St. Domingo, ninety miles north of St. Domingo. Long. 75° 32' W., lat. 19° 36' N.

JAGO (St.), DE COMPOSTELLA. See Compos-Tella

JAGRA, or GIARRA, a country of Western Africa, to the south of the Gambia. It is about fifty miles from the sea, and rich in corn, particularly rice, and cotton. Park says, that the king and queen were, on one occasion, both put to death, in consequence of the former having disclosed to his wife the secret of Mumbo Jumbo.

JAJGUR, a town, fortress, and district of Hindostan, in the province of Ajmeer. It formerly belonged to the rajah of Odeypore, but

544

now to Kotsch. The fortress stands on a hill, and is strong: the district contains eighty-four villages, most of which are inhabited by a Hindoo tribe called Meena, who have the singular custom of the younger brothers marrying the widows of the elder: they are a predatory people, and carry off all the children of the villages they attack.

JAL

In this district the palmira flourishes, and is both cheap and abundant. The tari, or fermented juice, and the jagory, or inspissated juice, of this tree (the borassus flabelliformis) are more esteemed than those of the wild date.

JAIL, n. s. JAIL'BIRD, n. s. JAIL'ER, n. s. JAIL'ER, n. s. Jailbird, one who has been JAIL'ER, n. s.

This is as a *jailer*, to bring forth

Some monstrous malefactor. Shakspeare. Away with the dotard, to the jail with him.

A dependent upon him paid six thousand pounds ready money, which, poor man, he lived to repent in a jail. Clarendon.

This jail I call the house of liberty

To thine, whose doors my feet shall never enter. Milton. Samson Agonistes.

Seeking many means to speak with her, and ever kept from it, as well because she shunned it, seeing and disdaining his mind, as because of her jealous juilers. Sidncy.

His power to hollow caverns is confined; There let him reign, the *jailer* of the wind; With hoarse commands his breathing subjects call, And boast and bluster in his empty hall.

Dryden.

Palamon, the pris'ner knight,

Restless for foe, arose before the light;

And, with his jailer's leave, desired to breathe

An air more welcome than the damp beneath.

Id.

He sighed and turned his eyes, because he knew Twas but a larger *jail* he had in view. Id.

One jail did all their criminals restrain, Which now the walls of Rome can scarce contain. Id.

Mark how the palace lifts a lying front,

Concealing often in magnific jail Proud want; a deep unanimated gloom !

Thomson.

There the sycopliant, and he

That with bare-headed, and obsequious bows, Begs a warm office, doomed to a cold *jail*, And groat per diem, if his patron frown.

Cowper.

JA'KES, n. s. Of uncertain etymology. A house of office.

I will tread this inbolted villain into mortar, and daub the walls of *jakes* with him. Shakspeare.

Their sordid avarice rakes

In excrements, and hires the very jakes.

Dryden. Some have fished the very jakes for papers left there by men of wit. Swift.

JA'LAP, n. s. Fr. jalap; low Lat. jalapium.

Jalap is a firm and solid root, of a wrinkled surface, and generally cut into slices, heavy and hard to break; of a faintish smell, and of an acrid and uauscous taste. It had its name jalapium, or jalapa, from Xalapa, a town in New Spain, in the neighbourhood of which it was discovered; though it is now principally brought from the Madeiras. It is an excellent purgative where serous humours are to be evacuated. Hill's Mat. Med.

JALAP. See CONVOLVULUS. This root is brought in thin transverse slices from Xalapa in New Spain. Such pieces should be chosen as are most compact, hard, weighty, dark-colored, and bound most with black circular striæ. Slices of bryony root, when mixed with those of jalap, may be easily distinguished by their whiter color and less compact texture. Jalap in substance, taken in a dose of about half a drain in plethoric, or cold phlegmatic habits, proves an effectual, and in general a safe purgative. In hypochondriacal disorders, and hot bilious temperaments, it gripes violently, but rarely takes effect as a purge. An extract made by water purges almost universally, but weakly, and has a considerable effect by urine. The root remaining after this process gripes violently. The pure resin, prepared by spirit of wine, occasions most violent gripings, and other distressing symptoms, but scarce proves at all cathartic: triturated with sugar or with almonds into the form of an emulsion, or dissolved in spirits, and mixed with syrups, it purges plentifully in a small dose, without eccasioning much disorder: the part of the jalap remaining, after the separation of the resin, yields to water an extract, which has no effect as a cathartic, but operates powerfully by urine. Its officinal preparations are an extract made with water and spirit, a simple tincture and compound powder. By M. Henry's analysis, the constituents of this root are,

JALEMUS, in antiquity, a kind of mournful song, used upon occasion of death, or any other affecting accident. Hence the Greek proverbs, $\iota \alpha \lambda \epsilon \mu s \ o \kappa \rho \sigma \epsilon \rho o c$, i. e. more sad than a jalemus; $\epsilon \iota \tau \tau s \iota \alpha \lambda \epsilon \mu s \epsilon \epsilon \gamma \rho a \pi \tau \epsilon o c$, worthy to be ranked among jalemuses.

JALLONKADOO, a considerable country of Western Africa, which includes the sources of the Bafing, and of almost all the other rivers which form the Senegal. It is mountainous, and in many parts barren. The inhabitants are governed by a number of petty chiefs, commonly at enmity with each other; and their language differs considerably from that of the Mandingos, though there is a great affinity in many words. Caravans travel for five days here without seeing a human habitation; and if any of the party is unable to keep up with the rest, he has little hope but of perishing with hunger, or by wild beasts.

JALNAH, a district of Hindostan, in the province of Aurungabad, situated between the nineteenth and twentieth degrees of northern latitude. It was taken by the British from the Vot. XI.

Mahrattas in 1803, and by them ceded to the Nizam.

JALNAH, or JALNAPORE, a town and fortress of Hindostan, the capital of the above district, is now the head-quarters of the nizam's subsidiary force. The town and fort are on opposite sides of the river. Long. 76° 34' E., lat. 19° 45' N.

JALOFFS, or OUALOFFS, are a people of Africa, who occupy most of the country between the lower part of the Gambia and that of the Senegal. Their territory is reckoned by Mr. Golberry to occupy 4800 square leagues. They are of handsome person for negroes, their color being a fine bright black, and their features, upon the whole, regular and graceful. They boast of being the most ancient nation in this part of Africa, and were formerly subject to a common sovereign, called the Burb-y-Jaloff, who still occupies a considerable country in the inte-The Jaloffs profess Mahommedanism, rior. but combine with it many of their own superstitions. They are fearless hunters and brave warriors. Those inhabiting the towns rank also among the most expert thieves in the world, using their toes with the same dexterity as their fingers. They excel in the manufacture of cotton cloth, to which they give a superior dye; and great quantities of a particular bean are exported to Morocco for the purposes of dyeing. The language of the Jaloffs is agreeable and soft; but they have a singular mode of numeration, using as its basis the number five; and all their calculations are performed by the motion of the

fingers, for they write nothing. JAM, n. s. Arab. *jama*. A conserve of fruits boiled with sugar and water.

JAMAICA, the most considerable and valuable of the British West India Islands, is separated from the west end of St. Domingo, by the channel called by our seamen the Windward Passage. The island is 150 miles long and forty broad, containing 4,080,000 acres; thus distributed:

690,000 acres are under sugar canes, and wood for the use of the sugar-works.

700,000 in pasture.

350,000 all other species of agriculture.

The Blue Mountains are an elevated ridge, which runs through the island longitudinally, and is covered with vast forests of mahogany, lignum vitæ, iron wood, log-wood, brazilletto, and many other heavy and close-grained woods. On the north, at a small distance from the sea, the land rises in small round-topped hills, feathered with spontaneous groves of pimento, under whose shade is a beautiful turfy carpet. This side of the island is also finely watered, every valley having its rivulet and every hill its cascade, many of which tumble from overhanging cliffs into the sea. In the back ground a vast amphitheatre of forest presents itself, melting gradually into the distant Blue Mountains, whose heads are lost in the clouds. On the south coast the picture is more sublime, but less pleasing. The mountains, approaching the sea in stupendous ridges, first present to the na

2 N

^{1,740,000,} leaving upwards of 2,000,000 of acres of unproductive mountain land, of which not above a quarter is improvable.

vigator a scene of magnificent savageness; but on nearing the land the picture softens, cultivated spots being perceived on the sides of the hills, and at last the vast savannahs, covered with sugar canes, stretching from the sea to the foot of the mountains, offer the pleasing indication of human industry.

Jamaica has upwards of 100 rivers, rising in the mountains and running with torrent rapidity to the sea. This rapidity, as well as the obstructions from rocks, renders them unnavigable by any thing but cances. The decpest is Black River on the south coast, which flows gently through a considerable tract of level country, and is navigable by flat boats thirty miles. The island has also some medicinal springs, warm, sulphureous, and chalybeate.

Appearances of metals are observed in the island, but the industry of the English colonists has always been more wisely employed in the certain profits of agriculture.

The climate of this island, even on the coasts, is temperate, the medium heat at Kingston throughout the year being 80° and the least 70° . In ascending towards the mountains, the temperature quickly alters with the elevation. Eight miles from Kingston the maximum is but 70° ; at fourteen miles, where the elevation is 4200 feet, the general range is 55° to 65°, and the minimum in winter 44°. On the highest summit, called Blue Mountain Peak, 7431 feet above the sea, the range in the summer is from 47° at sunrise to 58° at noon, and the minimum in winter is 42°.

Besides the staple exports, consisting of sugar, indigo, coffee and cotton, the cultivated vegetables of Jamaica are maize, Guinea corn, and calavances, for the food of the negroes; and almost all the kitchen vegetables of Europe, together with many indigenous ones, as the sweet potatoe, yam, eddoe root, callaloo (a kind of spinach, and the commonest substitute for greens), cassava, okery, &c.

Few of the northern European fruits thrive, but the indigenous ones are numerous and delicious; the principal are the plantain, cocoanut, guava, sour-sop, sweet-sop, papaw custard apple, mammee apple, avocado pear, star apple,

cashew apple, granadilla, prickly pear, pine apple, &c. The orange, lime, lemon, mango, and grape have been naturalised, as well as the cinnamon tree, of which there are now conside-rable plantations. The horned cattle, sheep, and hogs, of the island are abundant and their flesh excellent. The indigenous quadrupeds of Jamaica are the armadillo, the opossum, the racoon, the agouti, the pecare or Mexican hog, the muskrat, the alco, and the monkey. Of these only the agouti and the monkey now remain. Of the lizard there are many varieties. The woods and marshes abound in great variety of wild fowl, some of them of exquisite flavor. Of these the most highly esteemed is the ortolan or October bird, or rice bird of South Carolina. These birds arrive in South Carolina in the month of September, to devour the rice; and, remaining there about three weeks, arrive in prodigious flights in Jamaica, about the month of October. Parrots are still found in the groves. The following was the progressive population of Jamaica to 1812 :-

	Whites.	Free people of color.	Slaves.
1658	4,500		1,400
1670	7,500		8,000
1734	7,644		86,146
1746	10,000		112,428

Total			474	85,888	9344

The revenues are perpetual and annual. The perpetual revenue law, which was passed in the year 1728, raises about £12,000 per annum. The other public revenues are derived from occasional grants of the legislature. The principal taxes consist of a duty of twenty shillings per head on all negroes imported, a duty on all rum and other spirits consumed within the island, a poll tax on all slaves and stock, and a rate on rents and wheel carriages. There is also a penalty imposed on all persons who fail to keep one white person for every thirty blacks, which has become a productive source of revenue.

Jamaica is divided into three counties, viz.

	Parishes.	Town.	Villages.
Middlesex .	8	1	13
Surrey	7	2	8
Cornwall .	5	3	6

The capital is St. Jago de la Vega, or Spanish Town, on the river Cobre, six miles from the south coast, and in the county of Middlesex. It contains about 5000 inhabitants, and is the residence of the governor, whose palace is a magnificent building.

The *legislature* of the island is composed of the governor, a council nominated by the crown, consisting of twelve gentlemen, and a house of assembly containing forty-three members, elected by the freeholders. The power of making laws is vested in the assembly and the governor, who has the privilege of a veto on the acts of the legislative body; and a further power of rejection is reserved to the crown. Until his majesty's pleasure is known, however, laws are valid.

The two towns of the county of Surrey are Kingston and Port Royal; the latter situated on a narrow sandy peninsula that separates Port Royal Bay from Kingston Harbour. In 1692 this town contained 2000 houses, when an earthquake swallowed nine-tenths of it, covering the houses with seven fathoms water. It was immediately rebuilt, but ten years after it was destroyed by fire, and being again rebuilt, was a third time destroyed by a hurricane in 1722. This succession of calamities caused the inhabitants to remove to Kingston, on the west side of the harbour, five miles from Port Royal; and here the chief government offices have been built, but the royal naval arsenal, for careening and refitting ships, is at Port Royal.

The town of Kingston contains about 2000 well-built houses: the harbour can hold 1000 ships, and those of 200 lay at the quays. Both the harbour and bay are protected by strong fortifications, which place them beyond all possible insult from an enemy.

The towns of the county of Cornwall arc, Savannah le Mar, which, being destroyed by the hurricane of 1780, now contains but sixty to seventy houses : it is at the south-west end of the island. Montego Bay Town, on the north coast, contains 225 houses : seventy large ships and eighty smaller vessels load here annually. Falmouth, the third town, is also on the north coast, on the south side of Martha Brea Harbour; including the villages of Martha Brea and the Rock, the number of houses is 250. Thirty large ships, besides small vessels, load here for England.

The villages of Jamaica are generally small hamlets on the bays, where the produce is shipped in the droggers to be conveyed to the ports of clearance. The few other places worthy of mention are Lucea Harbour on the north coast, and Bluefields and Carlisle Bay on the south.

Jamaica was discovered in 1494 by Columbus. He was shipwrecked on it in 1503; and remained here on this occasion, in considerable distress, more than twelve months. A Spanish colony was established on it in the year 1509; all whose establishments were abandoned in 1655, except St. Jago de la Vega. Diego, the son of Columbus, according to the powers granted to his father by the king of Spain, appointed Esquivel, a noble Castilian, as governor of the newly discovered island, in the year 1506, who built a town, called Sevilla Nueva, near the spot where Columbus was shipwrecked. In the year 1596 Sir Anthony Shirley invaded and plundered Jamaica, and about forty years afterwards it was again plundered by a party of English, under colonel Jackson. In the year 1655 this island was taken by the English, under the com-mand of Penn and Venables, who had been sent by Cromwell to seize on Hispaniola: it was afterwards settled by 3000 soldiers, disbanded from the parliamentary army; and these were followed by 1500 royalists. From this time the colony has gradually increased in importance, though its tranquillity has been occasionally disturbed by the inroads of the Maroons, the slaves of the Spanish settlers, who, on the surrender of the island to the English, fled to the mountains, where they have since lived in an almost savage In 1738 a treaty was concluded with state. them, by which their freedom was secured, along with a grant of 1500 acres of land. They remained peaceable till the year 1795, when a new war commenced between them and the white inhabitants. Being vigorously attacked, how-ever, and the barbarous expedient of bloodhounds being resorted to, for the purpose of tracing their haunts, they were at last compelled to surrender at discretion to their enemies the whites, by whom about 600 of them were transported to Nova Scotia. Long. 76° 45' W., lat. 18° 12' N.

JAMB, n. s. Fr. jambe, a leg. Any sup porter on either side, as the posts of a door.

No timber is to be laid within twelve inches of the foreside of the chimney jambs. Moxon.

IAMBE, in fabulous history, a servant girl of Metanira, afterwards wife of Celeus, king of Eleusis, who endeavoured to exhilarate Ceres, when she travelled in search of Proserpine. From the humor she displayed on that occasion, free and satirical verses are said to have been called iambics.

IA'MBIC, n. s. Fr. iambique; Lat. iambicus. Verses composed of iambic feet, or a 2 N 2

short and long syllable alternately : used originally in satire, therefore taken for satire.

In thy felonious heart though venom lies, It does but touch thy Irish pen, and dies: Thy genius calls thee not to purchase fame In keen *iambicks*, but mild anagram. Dryden.

IAMBICS, in ancient poetry. See IAMBUS. There are two kinds of iambics, viz. dimeter and trimeter; the former contains four feet, and the latter six. See VERSE.

latter six. See VERSE. JAMBLICUS, a celebrated Platonic philosopher of Colchis, whom Julian equals to Plato. He was the disciple of Anatolius and Porphyry, and died in the reign of Constantine the Great.

JAMELICUS, another celebrated Platonic philosopher, born at Apamea, in Syria, and nearly contemporary with the former. Julian wrote several letters to him, and it is said he was poisoned under the reign of Valens. It is not certainly known to which of the two we ought to attribute the works in Greek under the name of Jamblicus, viz. 1. The History of the Life of Pythagoras, and the sect of the Pythagoreans. 2. An Exhortation to the Study of Philosophy. 3. A piece against Porphyry's letter, on the mysteries of the Egyptians.

IAMBUS, in the Greek and Latin prosody, a poetical foot, consisting of a short syllable followed by a long one; as in

$\theta_{\epsilon \vartheta} \lambda_{\epsilon \gamma \omega}$, Dei meas.

Horace calls the iambus pes citus, a swift rapid foot. The name, according to some, took its rise from Iambus, the son of Pan and Echo, who invented this foot. Others derive it from Iambe, queen of Eleusis. Others from the Greek tog, poison; or $\iota \alpha \mu \beta \iota \zeta_{0}$, I rail; because iambics were at first only used in satire.

JAMES I., king of Scotland in 1423, fell into the hands of his enemies in his thirteenth year, when flying from the snares of his ambitious uncle, who governed his dominious, and was suspected of designs against his life. Having secretly embarked for France, the ship was taken by an English privateer off Flamborough Head; and the prince and his attendants, among whom was the earl of Orkney, were confined in a neighbouring castle until they were sent to London. He was detained till summer 1417, when Henry V. carried him with him into France in his second expedition. Hector Boece tells us, that Henry IV. and V. furnished their royal prisoner with the best teachers in all the arts and sciences; and that, by their assistance, he made great proficiency in every part of learning; that he became a perfect master in grammar, rhetoric, poetry, music, and all the secrets of natural philosophy, and was inferior to none in divinity and law. Above a century after his death he was celebrated in Italy by Alexander Tassoni, a writer of undoubted credit: 'We may reckon among moderns (says he) James, king of Scotland, who not only composed many sacred pieces of vocal music, but also of himself in-vented a new kind of music, plaintive and melancholy, different from all other; in which he hath been imitated by Carlo Gesualdo, prince of

Venosa, who, in our age, hath improved music with new and admirable inventions.' As James I. was one of the most accomplished princes that ever filled a throne, he was also one of the most unfortunate. After spending almost twenty years in captivity, and encountering many difficulties on his return into his native kingdom, he was murdered by assassins in the prime of life. Only three of his poems are now extant, viz. Christ's Kirk on the Green, Peebles at the Play, and the King's Quair.

JAMES II., king of Scotland, succeeded his father in 1447, when not seven years of age; and was killed at the siege of Roxburgh in 1460, aged twenty-nine.

JAMES III. succeeded his father in 1460, in the seventh year of his age. The most striking feature in his character was his excessive fondness for the fine arts, and for those who excelled in them, on whom he bestowed his confidence and favor. This excited in his fierce and haughty nobles dislike and contempt of their sovereign, and indignation against the objects of his favor; which produced the most pernicious consequences, and ended in a rebellion that proved fatal to James, who was slain in 1488, aged thirty-six.

JAMES IV. succeeded his father in 1488. He subdued his rebellious subjects; and afterwards, taking part with Louis XII. against Henry VIII. of England, he was slain in the battle of Flodden-Field in 1513, aged forty-one. His Latin epistles are classical, compared with the barbarous style of the foreign princes with whom he corresponded. The attention he paid to the civilisation of his people, and his distribution of justice, merit the highest praise.

JAMES V. king of Scotland, in 1513, was but eighteen months old when his father lost his life. When of age, he assisted Francis I. of France against the emperor Charles V., for which service Francis gave him his eldest daughter in marriage in 1535. This princess died in two years; and James married Mary of Lorraine, daughter of Claud, duke of Guise, and widow of Lewis of Orleans, by whom he had one child, the unfortunate Mary queen of Scots, born only eight days before his death, which happened December 14th, 1542, in his thirty-fifth year.

JAMES I. king of England, and VI. of Scotland, was the son of Mary queen of Scots, whom he succeeded in Scotland in 1567, as he did Elizabeth in England in 1603. Strongly attached to the Protestant religion, he signalised himself in its support; which gave rise to the conspiracy of the Papists to destroy him and all the English nobility by the gunpowder plot, discovered No-vember 5th, 1605. The chief glory of this king's reign consisted in the establishment of new colonies, and the introduction of some manufactures. The nation enjoyed peace, and commerce flourished during his reign. Yet his administration was despised both at home and abroad for, being the head of the Protestant cause in Europe, he did not support it in the war of Bohemia; abandoning his son-in-law, the elector palatine; negociating when he should have fought, deceived at the same time by the courts of Vienna and Madrid; and continually sending illustrious ambassadors to foreign powers, but never making a single ally. He valued himself much upon his polemical writings; and was so fond of theological disputations, that he founded, for this express purpose, Chelsea College; which was converted to a much better use by Charles II. His Basilicon Doron, Commentary on the Revelation, writings against Bellarmine, and his Dæmonologia, or Doctrine of Witchcraft, are sufficiently known. There is a collection of his writings and speeches in one folio volume. Several other pieces of his are extant; some of them in the Caballa, others in MS. in the British Museum, and others in Howard's collection. He died in 1625, in the fifty-ninth year of his age, and twenty-third of his reign.

JAMES II. of England and VII. of Scotland, grandson of James I., succeeded his brother Charles II. in 1685. A bigot from his infancy to the Romish religion and hierarchy, he sacrificed every thing to establish them, in direct contradiction to the experience he had acquired, during the long reign of his brother, of the genius and character of the people he was to govern. Guided by the Jesuit Peters, his confessor, and the infamous chancellor Jeffries, he violated the laws enacted for the security of the Protestant religion; and he rather chose to live and die, as he believed, a saint, than to support the dignity of his ancestors, or perish beneath the ruins of his throne. The consequence was the revolution in 1688. James II. died in France in 1710, aged sixty-eight. He wrote, 1. Memoirs of his own Life and Campaigns to the Restoration; the original of which is preserved in the Scotch College at Paris. This piece is printed at the end of Ramsay's Life of Marshal Turenne. 2. Memoirs of the English Affairs, chiefly naval, from the year 1660 to 1673. 3. The Royal Sufferer, king James II., consisting of meditations, soliloquies, vows, &c., composed at St. Germain's.

JAMES (Dr. Thomas), a learned English critic and divine, born about 1571. He was educated at Winchester, and studied at Oxford, where he took his degree of D.D. and was appointed keeper of the public library. He distinguished himself by the arduous undertaking of publishing a catalogue of the MSS. in each college library at both universities. He was elected to this office in 1602, and held it eighteen years, when he resigned it. In the convocation held with the parliament at Oxford, in 1625, of which he was a member, he moved to have proper commissioners appointed to collate the MSS. of the fathers in all the libraries in England, with the Popish editions, in order to detect any forgeries; but, this proposal not meeting with the desired encouragement, he engaged in the laborious task himself, which he continued until his death in 1629. He left behind him a great number of learned works.

JAMES (Robert), M.D., an English physician of great eminence, and particularly distinguished by his fever powder, was born at Kinverston, in Staffordshire, 1703. He was of St. John's College in Oxford, where he took the degree of A.B., and afterwards practised physic at Sheffield,

Litchfield, and Birmingham. Thence he removed to London, became a licentiate in the College of Physicians, practised physic, and, in 1743, published a Medicinal Dictionary, in 3 vols. folio. Soon after he published an English translation, with a Supplement, by himself, of Rammazini de Morbis Artificum; to which he prefixed a piece of Frederic Hoffman upon Endemial Distempers, 8vo. In 1746 he published the Practice of Physic, 2 vols. 8vo.; in 1760 on Canine Madness, 8vo.; in 1764 a Dispensatory, 8vo. In 1755, the king being at Cambridge, he was admitted M.D. by mandamus. In 1778 were published a Dissertation upon Fevers, and a Vindication of the Fever Powder, 8vo.; with a short Treatise on the Disorders of Children. This was the eighth edition of the Dissertation, of which the first was printed in 1751; and the purpose of it was, to set forth the success of this powder, as well as to describe more par-ticularly the manner of administering it. The Vindication was posthumous and unfinished : for he died March 23d, 1776, while employed upon it.

JAMES (St.), surnamed Major, or the Greater, the son of Zebedee, and the brother of John the evangelist, was born at Bethsaida, in Galilee. The only authentic accounts we have of him are recorded by the evangelists. It is believed that St. James first preached the gospel to the dispersed Jews; and afterwards returned to Judea, where he preached at Jerusalem, when the Jews excited Herod Agrippa against him, who put him to a cruel death about A. D. 44. Thus he was the first of the apostles who suffered martyrdom. St. Clement, of Alexandria, relates, that his accuser was so struck with his constancy, that he became converted, and suffered with him. The Spaniards pretend that they had St. James for their apostle, and boast of possessing his body.

JAMES (St.), surnamed Minor, or the Less, an apostle, the brother of Jude, and the son of Cleophas and Mary, the sister of the mother of our Lord, is called in Scripture the Just, and the brother of Jesus, who appeared to him in particular after his resurrection. He was the first bishop of Jerusalem, when Ananias II., high priest of the Jews, caused him to be condemned, and delivered him into the hands of the people and the Pharisees, who threw him down from the steps of the temple, when a fuller dashed out his brains with a club, about the year 62. His life was so holy, that Josephus considers the ruin of Jerusalem as a punishment inflicted on that city for his murder. He was the author of the epistle which bears his name.

JAMES (St.), an hospital and burying ground near Basil, in the Helvetic republic, and near the small river Birs. It is famous for a desperate battle fought by about 3000 Swiss against an army of 30,000 French, commanded by the dauphin, afterwards Louis XI., in which only thirty-two of the former remained alive, desperately wounded, on the field of battle. Sixteen that escaped from the field were branded with infamy, for not having sacrificed their lives in defence of their country. The conquerorhimself, who was compelled to refire with his army into Alsace, declared that such another victory would ruin it.

JAMES (St.), EPISTLE OF, a canonical book of the New Testament, being the first of the catholic or general epistles; which are so called, as not being written to one but to several Christian churches. It is addressed partly to believing and partly to infidel Jews.

JAMES (St.), OF THE SWORD, San Jago del Espada, a military order in Spain, instituted in 1170, by Ferdinand II. king of Leon and Gallicia, to stop the incursions of the Moors; three knights obliging themselves by a vow to secure the roads. A union was proposed and agreed to in 1170 between these and the canons of St. Eloy; and the order was confirmed by the pope in 1175. The highest dignity is that of grand master, which is held by the king of Spain. The knights are obliged to make proof of their descent from families that have been noble for four generations on both sides; they must also make it appear that these their ancestors have neither been Jews, Saracens, nor heretics; nor even called in question by the inquisition. The novices are obliged to serve six months in the galleys, and to live a month in a monastery. Formerly they took a vow of celibacy, but Alexander III. gave them permission to marry. They now make no vows but of poverty, obedience, and conjugal fidelity; to which, since 1652, they have added that of defending the immaculate conception of the holy virgin. Their habit is a white cloak, with a red cross on the breast. This is esteemed the most considerable of all the military orders in Spain; the king carefully preserves the office of grand master in his family, on account of the rich revenues and offices, whereof it gives him the disposal. The number of knights is much greater now than formerly, all the grandees choosing rather to be received into this than into the order of the golden fleece; insomuch as this gives them many considerable privileges in all the provinces of Spain, but especially in Catalonia.

JAMES RIVER, or the JAMES, or the Fluvana, a large navigable river of Virginia, which rises on the west side of Jackson's Mountain, and, running a south-west course, under the name of Jackson's River, receives Carpenter Creek from the Allegany Mountains, after which it is named James River; thence, running south-east, it waters eight counties of Virginia, and at last falls into Chesapeake Bay near James Town. Its navigation is interrupted at Richmond by falls.

JAMES'S POWDER, a medicine prepared by Dr. R. James, of which the basis has been long known to chemists, though the particular receipt for making it lay concealed in chancery till made public by Dr. Monro, who gives the following copy of it: 'Take antimony, calcine it with a continued protracted heat, in a flat, unglazed, earthen vessel, adding to it from time to time a sufficient quantity of any animal oil and salt, well dephlegmated; then boil it in melted uitre for a considerable time, and separate the powder from the nitre by dissolving it in water.' Dr. Monro adds, that 'when the doctor first administered his powder, he used to join one grain of a mercurial preparation to thirty-eight grains of his

antimonial powder; but in the latter part of his life he often declared that he had long laid aside the addition of the mercurial.' Dr. James, at the end of the receipt given into chancery, says . the dose of these medicines is uncertain ; but in general thirty grains of the antimonial, and one grain of the mercurial, is a moderate dose.' Of this medicine Dr. Monro says, 'Lake other active preparations of antimony, it sometimes operates with great violence, even when given in small doses; at other times a large dose produces very little visible effects. I have seen three grains operate briskly, both upwards and downwards; and I was once called to a patient to whom Dr. James had himself given five grains of it, and it purged and vomited the lady for twenty-four hours, and in that time gave her between twenty and thirty stools; at other times I have seen a scruple produce little or no visible effect. So far as I have observed, I think that the dose of this powder to an adult, is from five to twenty grains; and that when it is administered, one ought to begin by giving small doses. Where patients are strong, and a free evacuation is wanted, this is a useful remedy: and it may be given, in small repeated doses, as an alterative in many cases; but where patients are weakly, and in low fevers, it often acts with too great violence; and I have myself seen instances, and have heard of others, where patients have been hurried to their graves by the use of this powder in a very short time.'

JAMESONE (George), an excellent painter, justly termed the Vandyck of Scotland, was the son of Andrew Jamesone, architect; and was born at Aberdeen in 1586. He studied under Rubens, at Antwerp; and, after his return, applied with indefatigable industry to portraits in oil, though he sometimes practised in miniature, and also in history and landscapes. His largest portraits were somewhat less than life. His excellence consists in delicacy and softness, with a clear and beautiful coloring; his shades not charged, but varnished, with little appearance of the pencil. When king Charles I. visited Scotland, in 1633, the magistrates of Edinburgh employed Jamesone to make drawings of the Scottish monarchs ; with which the king was so pleased, that, enquiring for the painter, he sat to him, and rewarded him with a diamond ring from his own finger. Jamesone always drew himself with his hat on, either in imitation of his master Rubens, or on having been indulged in that liberty by the king when he sat to him. Many of Jameson's works are in both the colleges of Aberdeen; and he is said to have drawn the Sybils from living beauties in that city. His best works are from 1630 to his death, which happened at Edinburgh in 1644.

JAMTLAND, a mountainous province of Sweden, near Norway, of an oval form, seventy miles long and sixty broad, annexed to Sweden by the treaty of Roschild, in 1658. It abounds with mines of copper, lead, salt-petre, alum, lapis ollarius, rock-crystals, &c. It is thinly peopled; but the east part is fertile in corn, &c.

but the east part is fertile in corn, &c. JAMYN (Amadis), a celebrated French poet in the sixteenth century. He is esteemed the rival of Ronsard, who was his contemporary and friend. He was secretary to Charles IX., and died about 1585. He wrote, 1. Poetical Works, 2 vols.; 2. Philosophical Discourses to Pasicharis and Rodanthe, with Seven Academical Discourses; 3. A Translation of the Iliad of Homer, begun by Hugh Sabel, and finished by Jamyn; with a translation into French verse of the three first books of the Odyssey.

JANE OF FLANDERS was the wife of John de Mountfort, a competitor for the dukedom of Brittany upon the death of John III. This duke, dying without issue, left his dominions to his niece Jane, wife of Charles de Blois, nephew to the king of France; but John Mountfort, brother to the late duke, though by a second marriage, claimed the duchy, and was received as successor by the people of Nantes. The greatest part of the nobility swore fealty to Charles de Blois. This dispute occasioned a civil war; in the course of which John was taken prisoner, and sent to Paris. This misfortune would have ruined his party, had not his interest been supported by the extraordinary abilities of his wife, Jane. Bold, daring, and intrepid, she fought like a warrior in the field; shrewd, sensible, and sagacious, she spoke like a politician in the council; and, endowed with the most amiable manners and winning address, she was able to move the minds of her subjects by the force of her eloquence, and mould them to her pleasure. She was at Rennes when she received the news of her husband's captivity; but that disaster served only to rouse her native courage and fortitude. She forthwith assembled the citizens; and, holding in her arms her infant son, recommended him to their care and protection in the most pathetic terms, as the male heir of their ancient dukes, who had always governed them with lenity and indulgence, and to whom they had ever professed the most zealous attachment. She declared herself willing to run all hazards with them in so just a cause; pointed out their resources in the alliance of England; earnestly beseeching them to make one vigorous effort against a usurper, who, being forced upon them by the intrigues of France, would, as a mark of his gratitude, sacrifice the liberties of Brittany to his protector. The people, moved by the affecting appearance, and animated by the noble conduct of the princess, vowed to live and die with her in defending the rights of her family; and their example was followed by almost all the Britons. The countess went from place to place, encouraging the garrisons of the several fortresses, and providing them with every thing necessary for their subsistence ; after which she shut herself up with her son in Hennebon, where she resolved to wait for the succours which Edward III. had promised to send to her assistance. Charles de Blois, accompanied by the dukes of Burgundy and Bourbon, and many other noblemen, took the field with a numerous army, and, having re-duced Rennes, laid siege to Hennebon, which was defended by the countess in person. This heroine repulsed the assailants in all their attacks with the most undaunted courage; and, observing one day that their whole army had left the camp to join in a general storm, she rushed forth at a postern gate, with 300 horse, set fire to

551

their tents and baggage, killed their sutlers and servants, and raised such a terror and consternation through all their quarters, that the enemy gave over their assault, and, getting betwixt her and the walls, endeavoured to cut off her retreat into the city. Thus intercepted, she put the spurs to her horse, and, without halting, galloped directly to Brest, which lay at the distance of two and twenty miles from the scene of action. There, being supplied with a body of 500 horse, she immediately returned, and, fighting her way through part of the French camp, was received into Hennebon, amidst the acclamations of the people. Soon after this the English succours appeared, and obliged the enemy to raise the siege.

JANEIRO, RIO DE, a jurisdiction of Brasil, in South America, seated between the Tropic of Capricorn and lat. 22° S. It is bounded on the north by Spirito Sancto, on the east and south by the Atlantic Ocean, and on the west by the Minas Geraes. It is extremely fertile for a mountainous country, particularly in sugar, which is one of its chief exports. Besides the river Janeiro, twenty-seven other streams of inferior magnitude water this region : and the plains are consequently clothed with the richest pastures. But indolence reigns triumphant : the population is very thin and badly clothed, badly fed, and sensible, as it would seem, of none of these advantages.

JANEIRO, RIO DE, a city of Brasil, and its capital, stands for the greater part on a plain on the west side of the bay close to the sea. An accumulation of hills of various elevations rise to the south. It extends about two miles from east to west, and its northern side is enclosed by five mountains, which merely leave a space for a single street between their base and the ocean. The houses are chiefly built of stone, and balconied, but consist only of one story. The ground-floors, which are not occupied as shops or stores, exhibit the gloomy aspect of closelylatticed windows and doors. In the upper part, also, wooden lattices are frequently introduced. The streets cross each other at right angles. The principal one runs north and south, and is the head of several more that stretch towards the west, and are crossed again by others parallel to the first. Most of the streets are narrow and badly paved. The open spaces denominated squares are very irregular, and meanly laid out. The palace square is the principal in point of buildings, and is about 150 yards long, and eighty wide. The royal residence occupies one side, while the convent of the Carmelites, and the senate-house, forms another. The square of Roceo is about 180 yards long, and 100 wide. The other principal public buildings are the mint, the armoury, the naval and military arsenals, and the enstom-house. A neat theatre has also been built. The cathedral is a recent and tolerably respectable modern structure. Water is conveyed from the neighbouring hills by means of a noble aqueduct of a double tier of arches, from which it is conducted to various fountains.

Provisions are ill supplied to this capital. poultry, fish, and even beef are dear, and illattended to; and mutton is not often seen Pork is the best meat, and the vegetables are fine; but living is said to be as dear as in London, without half its comforts.

The entrance to the port of Rio Janeiro is twenty-one leagues west of Cape Frio; it is known by some islands off it, viz. Redonda, two leagues and a half south by west of Santa Cruz fort. It is high, round, and rocky, with two rocky islets two leagues east of it, and four miles off shore is Razor Island, four leagues south of Santa Cruz fort. The entrance is also known by a remarkable break in the land, between two perpendicular and naked mountains of granite; that on the left is insulated, and has the exact form of a sugar loaf, the peak of which is 680 feet above the sea; that on the right is a mountain attached to the coast, which rises to the same height as the former, but with a gentle ascent to the summit. A small island lies in the entrance, and narrows the channel to threequarters of a mile; when through this narrow entrance, a beautiful basin opens of at least 100 miles in circumference, being thirty miles long, and ten to fourteen wide, with several small, but exuberantly fertile islands, covered with the most beautiful trees and shrubs. The shores of the basin rise in general abruptly to hills of moderate height, behind which are other ridges, increasing in elevation till their summits are lost in the clouds. There is reason to suppose that this vast basin was once a lake, separated from the sea by a narrow bank, the less solid parts of which have been worn away, leaving only the rocky bar which now crosses the entrance from two miles without Santa Cruz fort to the sugar loaf, with seven to ten fathoms water on it towards the east, while at its west extremity the rocks are above water. Both within and without this bar the depth is eighteen fathoms. All parts of the port afford anchorage to the most numerous fleets, and with the greatest facility of access and egress, by means of the sea and land breezes, which are regular. The entrance is defended by the forts of Santa Cruz and St. Lucia.

This is of course the chief mart of the Brasils, particularly of the mining districts. Troops of mules are constantly seen traversing the roads between these districts and this place; each carrying a burden of about 3 cwt. to the distance, perhaps, of 1500 or 2000 miles. Their homeward freight consists generally of salt or iron. The prosperity of Rio de Janeiro is marked by the rapid increase of its inhabitants, particularly since the residence of the court here. Mr. Mawe states the population, including the negroes, which are the most numerous class, at 100,000; Mr. Henderson, at 150,000.

JANEWAY (James), a dissenting clergyman of the seventeenth century, was born in Hertfordshire about the year 1636. He obtained a studentship at Christ Church, Oxford, but resigned his situation and all hopes of future preferment in 1662, for his refusal to comply with the test act. He now came to London, and was for several years pastor of a congregation at Rotherhithe. His works are, Heaven on Earth, and the Saints' Encouragement to Diligence, &c., &vo.; A Token for Children, which has gone through several editions; A Legary to

552

my Friends (printed after his decease); and several other devotional tracts, besides the life of his brother John Janeway. His death took place in 1674.

JAN'GLE, v. n. & n. s. Fr. jangler. To JAN'GLE, n. s. Altercate; to quarrel; to bicker in words; to make an inharmonious sound : jangler, a quarrelsome, noisy, chattering fellow.

Jangling, as whan man speketh to moche before folk, and clappeth as a mille, and taketh no kepe what he sayth. Chaucer. The Persones Tale.

Good wits will be *jangling*; but, gentles agree, This civil war of wits were much better used

On Navarre and his book-men. Shakspeare. Now see that noble and that sovereign reason, Like sweet bells *jangled* out of tune and harsh.

Id. Hamlet.

Prior.

There is no errour which hath not some appearance of probability resembling truth, which when men, who study to be singular, find out, straining reason, they then publish to the world matter of contention and jangling. Raleigh.

Ere Gothic forms were known in Greece,

And in our verse ere monkish rhimes

Had *jangled* their fantastic chimes.

JANICULARIS, or JANICULUM, a hill of ancient Rome, added by Ancus Martius; the burial-place of Numa, and of Statius Cæcilius the poet: having the Tiber on the east and south; the fields on the west; and a part of the Vatican on the north. It was so called, either from an ancient city, or because it was a janua, or gate, whence they issued out and made excursions on the Tuscans. Virg. Val. Flaccus. It is now called Montorius, a corruption of Mons Aureus, from its sparkling sands. From this hill, on account of its height, is the most extensive prospect of Rome.

JANIZARY, n. s. A Turkish word, compounded of *jengi*, young, and *cheri*, a soldier; a young or raw soldier. One of the guards of the Turkish king.

His grand vizir, presuming to invest The chief imperial city of the West, With the first charge compelled in haste to rise; The standards lost, and *janizaries* slain, Render the hopes he gave his master vain.

Waller.

JANISSARIES, or JANIZARIES, an order of infantry in the Turkish armies, formerly reputed the grand seignior's foot-guards, but lately dis-solved. The word 'genizers,' in the Turkish language signifies novi homines, or new troops. D'Herbelot tells us, that jenitcheri signifies a new band; and that the name was first given by Amurath I., who, choosing out one-fifth of his Greek Christian prisoners, and instructing them in the discipline of war and the doctrines of their religion, sent them to Hagi Bektasche (a person whose pretended piety rendered him extremely revered among the Turks), that he might confer his blessing on them, and at the same time give them some mark to distinguish them from the rest of the troops. Bektasche, after blessing them, cut off one of the sleeves of his fur gown, and put it on the head of the leader of this new militia; from which time (viz. A. D. 1361) they retained the name jenitcheri, and the fur cap. As, in the Turkish

army, the European troops are distinguished from those of Asia; the janissaries were also distinguished into janissaries of Constantinople, and Damascus. Their dress consisted of a dolyman, or long gown, with short sleeves, which was given them annually by the grand They seignior on the first day of Ramazan. wore no turban, but a kind of cap which they called zarcola, and a long hood of the same stuff hanging on their shoulders. On solemn days they were adorned with feathers, which were stuck in a little case on the fore part of the bonnet. Their arms in Europe, in time of war, were a sabre, a carabine or musket, and a cartouchbox hanging on the left side. At Constantinople, in time of peace, they carried a long staff. Iu Asia, where powder and fire-arms are more uncommon, they carried a bow and arrows, with a poniard, which they called haniare. They were at first called jaja, that is, footmen, to distinguish them from the other Turks, the troops whereof con-sisted mostly of cavalry. The number of janissaries was generally above 40,000; divided into 162 companies or chambers called odas, where they lived together at Constantinople as in a convent. They were of a superior rank to all other soldiers, and were also more arrogant and factious; and it was by them that the public tranquillity was oftenest disturbed. The government might therefore be said to be in the hands of the janissaries. They were employed to escort travellers, and especially ambassadors and persons of high rank on the road; in which cases they behaved with the utmost zeal and fidelity.

JANIZARIES, at Rome, are officers of the pope, called also participantes, on account of certain duties which they enjoy in the annates, bulls, or expeditions, being officers of the third bench or college of the Roman chancery. The first bench consists of writers, the second of abbreviators, and the third of janizaries, who are a kind of correctors and revisors of the pope's bulls.

JANOWITZ, a town of Bohemia, in the circle of Kaushim, famous for a battle in 1645 between the Swedes and the Imperialists, when the latter were defeated. It is forty-eight miles south-east of Prague. Long. 15° 38' E., lat. 49° 45' N.

JANSEN, or JANSENIUS (Cornelius), D. D., bishop of Ypres, and professor of divinity, in the universities of Louvain and Douay, was one of the most learned divines of the seventeenth century, and founder of the sect of Jansenists. He was born in Holland of Catholic parents, and studied at Louvain. Being sent to transact some business of consequence relating to the university, into Spain, the Catholic king, viewing with a jeatous eye the intriguing policy of France, engaged with him to write a book to expose the French as not good Catholics, as they formed alliances with Protestant states. Jansen performed this task in his Mars Gallicus; and was rewarded with the see of Ypres in 1635. He had, among other writings before this, maintained a controversy against the Protestants upon the subjects of grace and predestination; but his Augustinus was the principal labor of his life, on which he spent above twenty years. See JANSENISTS.

553

JANSENISTS, in church history, a sect of Roman Catholics in France, who followed the opinions of Jansenius, in relation to grace and predestination. In 1640 the universities of Louvain and Douay, and particularly F. Molina and F. Leonard Celsus, condemned the opinions of the Jesuits on grace and free-will. This having set the controversy on foot, Jansenius opposed to the doctrine of the Jesuits the sentiments of St. Augustine; and wrote a treatise on grace entitled Augustinus. This treatise was attacked by the Jesuits, who accused Jansenius of maintaining heretical opinions; and after-wards, in 1642, obtained of pope Urban VIII. a formal condemnation of Jansenius's treatise; when the partisans of Jansenius gave out that the bull was spurious, and composed by a person devoted to the Jesuits. After the death of Urban, Jansenism began to be more warmly controverted, and one published The Torch of St. Augustine; another found Snuffers for St. Augustine's torch, and father Veron found A gag for the Jansenists, &c. In 1650 sixty-eight bishops of France subscribed a letter to pope Innocent X. requesting an enquiry into and condemnation of the five following propositions, extracted from Jansenius's Augustinus :-- 1. Some of God's commandments are impossible to be observed by the righteous, even though they endeavour with all their power to accomplish them. 2. In the state of corrupted nature we are incapable of resisting inward grace. 3. Merit and demerit, in a state of corrupted nature, does not depend on a liberty which excludes necessity; but on a liberty which excludes constraint. 4. The Semipelagians admitted the necessity of an inward preventing grace for the performance of each particular act, even for the beginning of faith; but they were heretics in maintaining that this grace was of such a nature, that the will of man was able either to resist or obey it. 5. It is Semipelagianism to say, that Jesus Christ died, or shed his blood for all mankind in general. In 1652 the pope appointed a congregation for examining into the dispute. Jansenius was condemned; and the bull of condemnation, published in 1653, filled all the pulpits in Paris with violent outcries against the heresy of the Jansenists. In 1656 pope Alexander VII. issued out another bull, in which he condemned the five propositions of Jansenius. At last Clement XI, put an end to the dispute by his constitution of July 17th, 1705; in which, after having recited the constitution of his predecessors in this affair, he declares, 'that in order to pay a proper obedience to the papal constitutions concerning the present quetion, it is necessary to receive them with a respectful silence.' The clergy of Paris, the same year, approved and accepted this bull, and none dared to oppose it. This is the famous bull Unigenitus, so called from its beginning with the words Unigenitus Dei Filius, &c., which occasioned so much confusion in France.

JANSENIUS (Cornelius), bishop of Ghent, was born at Hulst, in Flanders, in 1510. He distinguished himself at the council of Trent by his learning and modesty. He wrote a Harmony of the Gospels, and other works; and died at Ghent in 1576.

JANSSEN (Cornelius), called also Johnson, an eminent portrait-painter, born at Amsterdam. He resided in England for several years; where he was engaged in the service of king James I. and painted several excellent portraits of that monarch, his children, and the principal nobility. He had not the freedom of hand nor the grace of Vandyck; but, in other respects, he was accounted his equal, and in finishing superior. His paintings are easily distinguished by their smooth, clear, and delicate tints, and by a strong character of truth and nature. He generally painted on board; and, for the most part, his draperies are black; probably because the opposition of that tint made his flesh colors appear more beautifully bright, especially in his female figures. It is said, that he used a quan-tity of ultra-marine in the black colors, as well as in his carnations; which may be one great cause of their preserving their original lustre even to this day. IIe often painted in a small ize in oil, and often copied his own works in hat manner. His fame began to be obscured on the arrival of Vandyck in England; and, the civil war breaking out some time after, he returned to his own country, where his paintings were in the highest esteem. He died in 1685.

JANSSENS (Abraham), an historical painter, was born at Antwerp in 1569. He was contemporary with Rubens, and, in many of the finest parts of the art, was accounted not inferior to him. He once challenged him to a competition, but Rubens modestly replied, that the world would certainly do them both justice. Sandrart assures us, that he not only gave a fine roundness and relief to his figures, but also such a warmth and clearness to the carnations, that they had all the look of real flesh; and his coloring was as durable as it was beautiful, retaining its original lustre for many years. His finest performance is a resurrection of Lazarus, in the cabinet of the elector Palatine, and is greatly admired.

JANSSENS (Victor Honorius), historical painter, was born at Brussels in 1664, and was a disciple of Volders, under whom he continued seven years. He afterwards went to Rome, where he studied the works of Raphael, designed after the antiques, and sketched the beautiful scenes around that city. His paintings rose in esteem, and the principal nobility of Rome employed him. He associated with Tempesta, the celebrated landscape painter, for several years, and painted the figures in the works of that great master as long as they resided together. He composed historical subjects, both in a small and a large size; but he found the demand for his small pictures so considerable, that he was induced to paint most frequently in that size. Returning to Brussels, his performances were as much admired there as they had been in Italy; and he adorned most of the churches and palaces of Brussels with his compositions. His invention was fruitful; he designed correctly, his coloring is natural, his pencil free, and his heads beautiful and elegant. His large and small paintings, in correctness and taste, had equal merit, but the coloring of the former appears more raw and cold than that of the latter.

For small historical pictures, he was preferable to all the painters of his time. JAN'TY, *adj.* Corrupted from Fr. *gentil.*

Showy; fluttering.

This sort of woman is a janty slattern : she hangs on her cloths, plays her head, and varies her posture. Spectator.

JANUARIUS (St.), the patron saint of Naples, where his head is occasionally carried in procession, in order to stop the eruptions of Ve-The liquefaction of his blood is a suvius. famous miracle at Naples. The saint suffered martyrdom about the end of the third century. When he was beheaded, a pious lady of Naples caught about an ounce of his blood, which, tradition says, has been carefully preserved in a bottle ever since, without having lost a single grain of its weight. This of itself, were it demonstrable, might be considered as a greater miracle than the circumstance on which the Neapolitans lay so much stress, viz. that the blood, which has congealed and acquired a solid form by age, is no sooner brought near the head of the saint, than, as a mark of veneration, it immediately liquefies. This experiment is made thrice a-year, and is considered by the Neapolitans as a miracle of the first magnitude. The substance in the bottle, which is exhibited for the blood of the saint, is supposed to be something naturally solid, but which melts with a small degree of heat. When first brought out of the cold chapel, it is in its solid state; but when brought before the saint by the priest, and rubbed between his warni hands, it melts. The head and blood of the saint are kept in a kind of press, with folding doors of silver, in the chapel of St. Janu-arius belonging to the cathedral church. The real head is probably not so fresh and well preserved as the blood. On that account it is not exposed to the eyes of the public; but is enclosed in a large silver bust, gilt and enriched with jewels of high value. The blood is kept in a small repository by itself. The chemical process for imitating this pretended miracle is by a solution of gold by the muriatic acid. Though this acid has no action on gold in its metallic state, yet if the metal is previously attenuated, or reduced to a calx, either by precipitation from aqua regia, or by calcination in mixture with calcinable metals, this acid will perfectly dissolve it, and keep it in solution. This solution is of a yellow color, gives a purple stain to the skin, bones, and other solid parts of animals, and strikes a red color with tin. In distillation the nitrous acid arises, and the muriatic acid remains combined with the gold in a blood-red mass, soluble in spirit of wine. If, towards the end of the distillation, the fire is hastily raised, part of the gold distils in a high saffron-colored liquor, and part sublimes into the neck of the retort, in clusters of long slender crystals of a deep red color, fusible in a small heat, deliquating in the air, and easily soluble in water. This red sublimate of gold being easily fusible by the heat of one's hand, is exhibited by the Neapolitan priests for St. Januarius's blood.

JAN'UARY, n. s. Lat. Januarius. The first month of the year, from Janus, to whom it was among the Romans consecrated.

January is clad in white, the colour of the earth at this time, blowing bis nails. This month had the name from Janus, painted with two faces, signifying Providence. Peacham.

JANUARY may also be derived from janua, a gate, this month being, as it were, the gate of the year. January and February were introduced into the year by Numa Pompilius; Romulus's year beginning in March. The kalends, or 1st of this month, was under the protection of Juno, and consecrated to Janus by an offering of a cake made of new meal and new salt, with new frankincense and new wine. On this day the consuls elect took possession of their office, and, with the flamines, offered sacrifices and prayers for the prosperity of the empire: all animosities were suspended, and friends gave and received Strenæ, or new-year's gifts.

JANUS, in fabulous history and mythology, the first king of Italy, who received Saturn hospitably, when he was driven from Arcadia by Jupiter. He tempered the manners of his sub-jects, and taught them civility; and from him they learned to improve the vine, to sow corn, and to make bread. After his death he was adored as a god. He was thought to preside over all new undertakings. Hence, in all sacrifices, the first libations of wine and wheat were offered to Janus; all prayers were prefaced with a short address to him; and the first month of the year was dedicated to and named from him. See JANUARY. Janus was represented with two faces, either to denote his prudence, or that he views at once the past and approaching years; he had a sceptre in his right hand, and a key in his left, to signify his extensive authority, and his invention of locks.

JANUS was also the name of a street in Rome, chiefly inhabited by bankers and usurers. It was so called from two statues of Janus erected in it, one at the top, the other at the bottom. The top of the street was therefore called Janus summus, the bottom Janus imus, and the middle Janus medius. Hence Horace, lib. i. Epist. 1. v. 54.

Hæe Janus summus ab imo Perdocet :

and Sat. 3. lib. ii.

Postquam omnis res mea Janum Ad medium fracta est.

JANUS, TEMPLE OF, in ancient history, a square building at Rome, as some say, of entire brass, erected by Romulus, containing a statue of Janus five feet high, with brazen gates on each side, which were always kept open in war, and shut in time of peace. But the Romans were so much engaged in war, that this temple was shut only twice from the foundation of Rome till the reign of Augustus, and six times afterwards. It was shut, 1. During the long reign of Numa, who instituted this ccremony. 2. Īn A. U. C. 519, after the end of the first Punic war. 3. By Augustus after the battle of Actium, A.U.C. 725. 4. On Augustus's return from the war against the Cantabrians in Spain, A. U. C. 729. 5. Under the same emperor, in A. U. C. 744, and A. A. C. 5.; when there was a general peace throughout the whole Roman empire, which lasted twelve years. 6. Under

Nero, A. U. C. 811. 7. Under Vespasian, in 824. 8. Under Constantius, when, upon Magnentius's death, he was left sole possessor of the empire, in 1105. Some dispute this, however, and say that the last time it was shut was under Gordian, about A. U. C. 994. Virgil gives us a noble description of this custom, Æn. lib. iii. ver. 607, &c.

JAPAN. The isles or empire of Japan consists of three considerable, and a great number of small islands, separated from the peninsula of Corea, and the coast of Chinese Tartary, by the strait of Corea and the sea of Japan, and extending between the latitudes of 30° and 41°. These islands were first made known to Europe by Marco Paulo, who collected some details respecting them from the Chinese, under the name of Zipangri. In 1535, or 1548, they were visited by the Portuguese.

The word Japan (Je-pen or Je-paun) is Chinese, and signifies the country of the rising sun. The three principal islands are Niphon, Kiusiu, and Sikokf. Their surface presents a variety of mountains, hills, and valleys. Many of the mountains contain volcanoes, but in general they are well clothed with evergreen trees, and give birth to numerous rivulets, which fertilise the valleys, but seldom arrive at the magnitude of rivers. The hills are cultivated to their summits, and present the smiling picture of human industry, in the midst of vestiges of physical convulsions. In the island of Niphon, in the centre of an extensive valley, is a lake, said to be in length equal to fifty hours of a horse's pace, and one-third of that in breadth. The east coasts are lined with rocks, against which the sea beats with incessant fury. The climate approaches to humid, the most abundant rains falling after Midsummer, and during this season it thunders almost every night. The maximum of the thermometer, at Nangasaki, in August, is 98°, and the minimum in January 35°. The summer heat is, however, moderated by frequent sea breezes; and the snow never lies on the ground more than a few days.

Rice is the principal grain cultivated, but wheat, barley, rye, and Indian corn, are also produced; the potatoes are indifferent, but peas, beans, cabbages, and turnips, are equal to those of Europe. The islands have no apple trees, but pears grow to a very large size; and oranges, figs, shaddocks, bananas, cocoa-nuts, jacks, and other fruits of the tropics, arrive at perfection; ginger, black pepper, sugar, cotton, and indigo, are cultivated in great quantity; the tea shrub grows wild in the hedges; and on the sides of the smaller mountains are found the Indian laurel and camphor. The islands also afford other medicinal plants, such as the muquet of Japan, the aromatic acore, squine root, cerete of Japan, moxa, snakewood, murgo root, the opium poppy, jalap, &c. The cypress, larch, and weeping-willow, are common.

These islands have but a scanty proportion of quadrupeds, there being but few hogs, and neither goats nor sheep; the first two are considered as injurious to agriculture, and therefore are not allowed to propagate. The horses and black cattle are in small number, and the only animals used in agriculture are buffaloes and very small cows. The wild animals are confined to wolves and bears, chiefly towards the north, and foxes. The flesh of the bear is eaten, but foxes are held in abhorrence, under the belief that they are evil spirits which have assumed this shape. Dogs, however, make up for the scarcity of other quadrupeds; for by a law of one of the emperors, particularly attached to the canine race, and which has become a sacred custom, they are protected and nourished at the expense of the towns. The only game are pheasants and partridges.

The Japanese Islands abound in the precious metals, and the sovereign claims two-thirds of the produce of the mines. They have also rich mines of copper, mixed with considerable quantities of gold, which afford the most lucrative object of forcign commerce. Iron is the scarcest metal, but it is still found in sufficient quantity for the necessary domestic utensils and arms. Sulphur and pummice stone are in abundance; and coal is said to be found to the north. The islands have also white marble, red agates, asbestos, potters' earth, and other minerals. A kind of red naphtha is burned in lamps. Hot mineral springs are frequent, and are had recourse to in various diseases.

The Japanese are of a middle size, well made and robust, their complexion either brown or pale white like the Chinese; but their distinctive feature is the eye, which is small, oblong, and sunk in the head. They have the head large, the neck short, the nose large, hair black, thick, and shining, from the oil they rub into it. These characteristics seem to denote their origin from the Chinese, with a mixture of Mongul or Manchou Tartars, but their language has no affinity to that of either of these people. According to their traditions, there formerly existed in the island of Niphon two other races, the Mosins, or Hairy Kuriliens on the north, and a nation of Negroes on the south.

The ancient government of Japan resembled that of Thibet, the Daïri, or sovereign pontiff, answering to the grand lama. In the year 1143 (according to the Japanese annals) this prince confided the military government of his dominions to a kubo, whose office became hereditary. His power at last predominated over that of the dairi; and, in 1585, the latter was deprived of even the shadow of political authority. Since that period the government of Japan may be considered as an hereditary absolute monarchy, controlled by a great number of hereditary absolute princes, of whom the mutual jealousies, and the hostages they are obliged to deliver, secure their submission to the supreme power. Each of these petty sovereigns keeps a standing army on foot. The laws of Japan have been greatly praised by some travellers, while by others they have been as greatly decried. The former tell us, that justice is expeditious, and executed with rigor, without respect to persons, except that the nobles may commute certain punishments by pecuniary fines. That the police is well organised and vigilant, and that, the inhabitants of every street being made responsible for the crimes committed by any individual of it, crimes are consequently rare. But on the other hand, we

are informed that the punishments are barbarously cruel, that mincing a criminal to pieces, opening the belly with a knife, suspending him by iron hooks through the ribs, or boiling him in oil, are the most common. Though, in such a system of legislation, crimes must certainly be rare, it at the same time deprives innocence of its tranquillity, and society of its happiness; and surely it is better to run the risque of being once or twice robbed in the course of life, than to be every day in fear of being boiled in oil, to explate a crime committed by another. The standing armies of the different princes of Japan are estimated at 468,000 infantry and 58,000 cavalry, which would suppose a population of 20,000,000 to 30,000,000; but most probably there is in these estimates a great deal of exaggeration.

The Japanese appear to be less advanced in navigation than the Chinese, the government strictly prohibiting the going out of sight of land; and, to insure the compliance with this restriction, the junks are built in a manner that unfits them for the open sea. Those seen by Broughton were from 30 to 300 tons, with but one mast and a single sail of cotton: they are unable to tack, but wear in a short compass; their anchors resemble graplings with a number of hooks. Other navigators describe them as so low abaft, as to be unable to go before the wind, when it blows fresh, without great danger. The Japanese use a compass nearly similar to that of the Chinese. It has four grand divisions, answering to the four cardinal points, and each of these is subdivided into three, making twelve subdivisions, to which are given the names of the signs of the Zodiac, viz.

North, Koutta.

- 1 Division, Ue, the rat.
- 2 Division, Oas, the ox.
- 3 Division, Tora, the tiger.

East, Fagasi.

- 1 Division, Oa, the hare.
- 2 Division, Tats, the dragon.
- 3 Division, Mi, the serpent.

South, Minou-ami.

- 1 Division, Oama, the horse.
- 2 Division, Foo tooei, the sheep.
- 3 Division, Saroo, the monkey.

West, Nis.

- 1 Division, Ton, the fowl.
- 2 Division, Mov, the dog.
- 3 Division, I, the wild hog.

The Japanese pretend to have anciently navigated to Formosa and Java, and on the north to the coast of America, but at present their voyages extend no farther north than Jesso. The roads throughout Japan are wide, with ditches to carry off the water, and kept in the highest order, which is not, however, difficult, there being no wheeled carriages, the common modes of travelling being either on horseback or in palanquins.

The Japanese are divided into two religious sects, called Sinto and Budso: the former believe in a Supreme Being, but who they conceive is too exalted to concern himself with their affairs, but they invoke divinities of an inferior order as mediators;—they believe that the souls of the good inhabit luminous regions near the empire, while those of the wicked wander in the air, until they have explated their faults. The Sintos abstain from animal food, not from a belief in the metempsychosis, but because they abhor the effusion of blood, and dare not touch a dead body.

The sect of Budso is the same as that of Budha, or Boudh of India, mixed with some foreign superstitions.

Between 1549 and 1638 the Jesuits were employed in introducing Christianity into Japan; but two persecutions annihilated the infant church. In the first, in 1590, 20,000 Christians were massacred, and in 1638 37,000, according to the account of the missionaries, shared the same fate. The political intrigues of the Jesuits, and their violent intolerance, is generally supposed to have been the chief cause that rendered the Christian doctrine odious to the sovereigns and people of Japan; and since the last epoch it has been held in abhorrence by the Japanese of all classes.

The civilisation of the Japanese appears to have been long stationary, like that of the Chinese; but several particulars, in which the two people differ, afford a much greater probability of improvement in the former than the latter. A more manly character and a greater degree of political liberty bring the Japanese nearer to the European. Their learned language is said to be that of the ancient Chinese, but their alphabet instead of whole words designs single letters only. A number of the Japanese read and speak Dutch, and the elements of natural history and medicine have began to be taught according to works in that language.

The Japanese are confined to one wife, but the concubines live in the house with her, and neither are shut up as in China. The dead bodies of people of distinction are burned, those of the common class buried.

The most considerable commerce of the Japanese is with China; whence they procure sugar, turpentine, drugs and raw silk, in exchange for copper, varnish, and gum lac. For further particulars of the separate islands, NIPHON, KIU-SIU and SIROKF, see those articles.

The smaller Japan islands are numerous but are little known. Ufu-Sima is the principal of a group of eight, between the Lieu-Kieu Islands and Kiusiu. Tanaa-sima is the largest of a group of seven, south-west of Kiusiu. Li-Keo is separated from the south end of this latter island by the strait of Van-Diemen. The inhabitants of Li-Keo are described as cultivating their fields to the music of lyres, and gathering two crops of rice a year. Cangox-Sima is worthy of notice as being the spot where the Portuguese first landed.

The Gotto Isles are a group off the west point of Kiusiu. Tsus-Sima, in the middle of the strait of Corea, is tributary to Japan; it is of moderate height, the valleys well cultivated, and the west coast lined with rocks. The Oki Isles are a group north of the south end of Niphon. South-east of Niphon is a group of volcanic islands, of which Fatsisio is the largest, though only three or four miles long. Its shores rise perpendicularly to the height of eighty fathoms, and are only accessible by rope ladders; hence probably it is that this island is appropriated as a state prison. One of the islands throws out flames.

JAPAN', n. s. & v. a. From Japan in Asia, JAPAN'NER, n. s. Where figured work was originally done. Work varnished and raised in gold and colors. It is commonly used with another substantive, and therefore may be considered as an adjective. To varnish and embellish; to black and gloss shoes: japanner, one skilled in japanning work; a shoe-blacker, so called because he makes the shoes to shine.

The god of fire

Among these generous presents joins his part And aids with soot the new *japanning* art. Gay.

The poor have the same itch ;

They change their weekly barber, weekly news, Prefer a new *japanner* to their shoes.

Pope's Homer.

Id.

The poor girl had broken a large japan glass, of great value, with a stroke of her brush. Swift.

For not the desk with silver nails, Nor bureau of expence, Nor standish well *japanned*, avails The writing of good sense.

JAPANNING, as an art, was more encouraged in former times in this country, than it is at present. It consists in forming and varnishing figures on wood, in the manner practised by the natives of Japan. The substances which admit of being japanned are almost every kind that are dry and rigid, or not too flexible; as wood, metals, leather, and paper.

The varnish said to be used in China and Japan is composed of turpentine and a curious sort of oil, which they boil up to a proper consistence. Persons who work in this business are liable to swellings and inflammations in the hands and face, but these are produced from the lack and not from the varnish. The lack is the sap or juice of a tree, which flows on cutting the lower part of the trunk, and is received in vessels set under the incisions. This juice is of the color and consistence of cream, when it runs from the tree, but as it comes in contact with the air it becomes black. It is only used in this state: the method of preparing it is to set it out in the open air, in large flat bowls; and, that the whole may be of the same uniform color, it is kept continually stirring for many hours. By this method it becomes of a fine deep black; burnt wood is now mixed with it, and then, spreading it thin over any board or substance which they mean to japan, they dry it in the sun, and it is soon harder than the board on which it is laid. When this is quite dry it is polished with a smooth stone and water, till it is as even as glass, and then, wiping it dry, they lay on the varnish, made of oil and turpentine. If the work is to be of any other color than black, that color is to be mixed with the varnish, and then the whole spread on evenly and thin, because on this depends the principal art of varnishing. When there are to te figures in gold and silver, these must be traced out with a pencil in the varnish, over the rest of the work; and, when this varnish is almost dry, the leaf-gold, or silver, is to be laid on, and polished afterwards with some smooth substance.

Wood and metals do not require any other preparation, but to have their surface perfectly even and clean: but leather should be strained either on frames or on boards; as its bending or forming folds would otherwise crack and force off the coats of varnish: and paper should be treated in the same manner, and have a previous strong coat of some kind of size; but it is rarely made the subject of japanning till it is converted into papier machè, or wrought by other means into such form that its original state, particularly with respect to flexibility, is lost.

One principal variation from the method formerly used in japanning is, the using or omitting any priming or undercoat on the work to be japanned. In the older practice, such priming was always used; and is at present retained in the French manner of japanning coaches and snuff-boxes of the papier maché; but, in the Birmingham manufacture, it has been always rejected. The advantage of using such priming or under-coat is, that it makes a saving in the quantity of varnish used : because the matter of which the priming is composed fills up the inequalities of the body to be varnished; and makes it easy, by means of rubbing and water-polishing, to gain an even surface for the varnish : this was, therefore, such a convenience in the case of wood, as the giving a hardness and firmness to the ground was also in the case of leather, that it became an established method. There is this inconvenience always attending the use of an under-coat of size, that the japan coats of varnish and color will be constantly liable to be cracked and peeled off by any violence, and will not endure so long as the bodies japanned in the same manner, but without any such priming; as may be easily observed in comparing the wear of the Paris and Birmingham snuff-boxes; the latter, when good of their kind, never peeling or cracking, unless by great violence, or such a continued rubbing as wastes away the substance of the varnish; while the japan coats of the Parisians crack and fly off in flakes, after any knock or fall, particularly near the edges.

The laying on the colors in gum-water, instead of varnish, is also another variation from the method of japanning formerly practised; but the much greater strength of the work, where they are laid on in varnish or oil, has occasioned this way to be exploded in most regular manufactories : however, they who practise japanning on cabinets, or other such pieces as are not exposed to much wear and violence, may not find it worth their while to encumber themselves with the preparations necessary for the other methods, and may paint with water-colors on an under-coat laid on the wood, or other substance, of which the piece to be japanned is formed; and then finish with the proper coats of varnish, according to the methods below taught: if the colors are tempered with the strongest isinglass, size, and honey, instead of gum-water, and laid on very flat and even, the work will not be much inferior in appearance to that done by the other method, and will last as long as the old japan.

Priming .- The priming is of the same nature with that called clear-coating, by house-painters; and consists only in laying on, and drying in the most even manner, a composition of size and whiting, or, sometimes, lime instead of the latter. The common size has been generally used for this purpose : but, where the work is of a nicer kind, it is better to employ the glovers', or the parchment size; and if a third of isinglass be added, it will be still better, and, if not laid on too thick, is much less liable to peel and crack. The work should be prepared by this priming, by being well smoothed with the fish-skiu, or a glass-shaver ; and, being made thoroughly clean, should be brushed over once or twice with hot size, and diluted with two-thirds of water, if it be of the common strength. The priming should then be laid on with a brush as evenly as possible; and should be formed of a size whose consistence is betwixt the common kind and glue, mixed with as much whiting as will give it a sufficient body of color to hide the surface of whatever it is laid upon, but not more.

If the surface be very clean on which the priming is used, two coats of it laid on in this man-ner will be sufficient; but if, on trial with a fine wet rag, it will not receive a proper water-polish on account of any inequalities not sufficiently filled up, one or more coats must be given it; and, whether a greater or less number be used, the work should be smoothed, after the last coat but one is dry, by rubbing it with Dutch rushes. When the last coat is dry, the water-polish should be given, by passing over every part of it with a fine rag gently moistened, till the whole appear perfectly plain and even. The priming will then be completed, and the work ready to receive the painting, or colored varnish : the rest of the proceedings being the same in this case as where no priming is used.

When wood or leather is to be japanned, and no priming is used, the best preparation is to lay two or three coats of coarse varnish, composed in the following manner :-- Take of rectified spirits of wine one pint, and of coarse seed-lac and resin, each, two ounces. Dissolve the seedlac and resin in the spirit; and then strain off the varnish. The varnish, as well as all others formed of spirits of wine, must be laid on in a warm place; and, if it can be conveniently managed, the piece of work to be varnished should be made warm likewise; and, for the same reason, all dampness should be avoided; for either cold or moisture chills this kind of varnish. and prevents its taking proper hold of the substance on which it is laid.

Japan-grounds.—When the work is so prepared, or by the priming with the composition of size and whiting above described, the proper japanground must be laid on ; which is much the best formed of shell-lac varnish, and the color desired, if white be not in question, which demands a peculiar treatment, or great brightness be not required, when also other means must be pursued. The colors used with the shell-lac varnish may be any pigments whatever, which give the tint of the ground desired ; and they may be mixed together to form browns or any compound colors.

As metals never require to be under-coated with whiting, they may be treated in the same manner as wood or leather, when the under coat is omitted, except in the instances referred to below.

White japan-grounds .- The forming a ground perfectly white, and of the first degree of hardness, remains hitherto a desideratum in the art of japanning, as there are no substances which form a very hard varnish but what have too much color not to injure the whiteness, when laid on of a due thickness over the work. The nearest approach, however, to a perfect white varnish, already known, is made by the following composition :- Take flake-white, or white-lead, washed over and ground up with a sixth of its weight of starch, and then dried; and temper it properly for spreading with the mastich-varnish. Lay these on the body to be japanned, prepared either with or without the under-coat of whiting, in the manner as above ordered ; and then varnish it over with five or six coats of the following varnish :- Provide any quantity of the best seed-lac, and pick out of it all the clearest and whitest grains, reserving the more colored and fouler parts for the coarse varnishes, such as that used for priming or preparing wood or leather. Take of this picked seed-lactwo ounces, and of gum-anime three ounces, and dissolve them (being previously reduced to a gross powder) in about a quart of spirit of wine, and strain off the clear varnish. The seed-lac will yet give a slight tinge to this composition, but cannot be omitted where the varnish is wanted to be hard; though, when a softer will answer the end, the proportion may be diminished, and a little crude turpentine added to the gum-anime to take off the brittleness.

A very good varnish, free entirely from all brittleness, may be formed by dissolving as much gum-anime as the oil will take in old nut or poppy oil, which must be made to boil gently when the gum is put into it. The ground of white color itself may be laid on in this varnish, and then a coat or two of it may be put over the ground; but it must be well diluted with oil of turpentine when it is used. This, though free from brittleness, is nevertheless liable to suffer by being indented or bruised by any slight strokes; and it will not well bear any polish, but may be brought to a very smooth surface without, if it be judiciously managed in the laying it on. It is likewise somewhat tedious in drying, and will require some time where several coats are laid on; as the last ought not to contain much oil of turpentine.

Blue japan grounds.—Grounds may be formed of bright Prussian blue, or verditer glazed over by Prussian blue, or of smalt. The color may be best mixed with shell-lac varnish, and brought to a polishing state by five or six coats of varnish of seed-lac: but the varnish, nevertheless, will somewhat injure the color by giving to a true blue a cast of green, and fouling, in some degree, a warm blue by the yellow it contains; where, therefore, a bright blue is required, and a less degree of hardness can be dispensed with, the method before directed in the case of white grounds must be pursued.

For a scarlet japan ground, vermilion may be used : but the vermilion has a glaring effect that renders it much less beautiful than the crimson produced by glazing it over with carmine or fine lake : or even with rose-pink, which has a very good effect used for this purpose. For a very bright crimson, nevertheless, instead of glazing with carmine the Indian lake should be used, dissolved in the spirit of which the varnish is compounded, which it readily admits of when good; and in this case, instead of glazing with the shell-lac varnish, the upper or polishing coats need only be used, as they will equally receive and convey the tinge of the Indian lake, which may be actually dissolved by spirit of wine; and this will be found a much cheaper method than the using carmine. If, nevertheless, the highest degree of brightness be required, the white varnishes must be used.

For bright *yellow* grounds, the king's yellow, or the turpeth mineral should be employed, either alone or mixed with fine Dutch pink; and the effect may be still more heightened by dissolving powdered turmeric root in the spirit of wine, of which the upper or polishing coat is made; which spirit of wine must be strained from off the dregs before the seed-lac be added to it to form the varnish.

Gréen grounds may be produced by mixing the king's yellow and bright Prussian blue, or rather the turpeth mineral and Prussian blue; and a cheap but less perfect kind by verdigris with a little of the above-mentioned yellows or Dutch pink. But where a very bright green is wanted, the crystals of verdigris, called distilled verdigris, should be employed; and, to heighten the effect, they should be laid on a ground of leaf-gold, which renders the color extremely brilliant and pleasing.

Orange-colored japan grounds may be formed by mixing vermilion or red lead with king's yellow or Dutch pink, or the orange-lac, which will make a brighter orange ground than can be produced by any mixture.

Purple japan grounds may be produced by the mixture of lake and Prussian blue; another kind may be made by vermilion and Prussian blue. They may be treated as the rest with respect to the varnish.

Black grounds may be formed by either ivoryblack or lamp black : but the former is preferable where it is perfectly good. These may be always laid on with shell-lac varnish, and have their upper or polishing coats of common seedlac varnish, as the tinge or fulness of the varnish can be here no injury. For forming the common black japan grounds, by means of heat on metal, the piece of work to be japanned must be painted over with drying oil : and, when it is of moderate dryness, must be put into a stove of such a degree of heat as will change the oil to black, without burning it so as to destroy or weaken its tenacity. The stove should not be too hot when the work is put into it, nor the heat increased too fast, either of which errors would make it blister; but the slower the heat is augmented, and the longer it is continued provided it be restrained within the due degree, the harder will be the coat of japan. This kind of varnish requires no polish, having received, when properly managed, a sufficient one from the heat.

The best kind of tortoise-shell ground produced by heat is not less valuable for its great hardness, and enduring to be made hotter than boiling water without damage, than for its beautiful appearance. It is to be made by means of a varnish prepared in the following manner : take of good linseed-oil one gallon, and of umber half a pound; boil them together till the oil become very brown and thick; strain it then through a coarse cloth, and set it again to boil, in which state it must be continued till it acquire a pitchy consistence, when it will be fit for use. Having prepared thus the varnish, clean well the metal plate which is to be japanned; and then lay vermilion tempered with shell-lac varnish, or with drying oil diluted with oil of turpentine, very thinly, on the places intended to imitate the more transparent parts of the tortoise-shell. When the vermilion is dry, brush over the whole with the black varnish, tempered to a due consistence with oil of turpentine; and, when it is set and firm, put the work into a stove, where it may undergo a very strong heat, and be continued a considerable time ; if even three weeks or a month, it will be the better. This was given amongst other receipts by Kunckel; but appears to have been neglected till it was revived with great success in the Birmingham manufactures, where it was not only the ground of snuff-boxes, dressing-boxes, and other such smaller pieces, but of those beautiful tea-waiters that have been so justly esteemed and admired in several parts of Europe to which they have been sent. This ground may be decorated with painting and gilding in the same manner as any other varnished surface, which had best be done after the ground has been duly hardened by the hot stove; but it is well to give a second annealing with a more gentle heat after it is finished.

Method of painting japan work.—Japan work ought properly to be painted with colors in varnish, though, for the greater despatch, and in some very nice and small works for the freer use of the pencil, the colors are frequently tempered in oil; which should previously have a fourth part of its weight of gum-anime dissolved in it; or, in default of that, of the gums sandarac or mastich. When the oil is thus used it should be well diluted with spirit of turpentine, that the colors may be laid more evenly and thin; by which means fewer of the polishing or upper coats of varnish become nccessary.

In some instances water colors are laid on grounds of gold, in the manner of other paintings; and are best when so used in their proper appearance, without any varnish over them; they are also sometimes so managed as to have the effect of embossed work. The colors employed in this way for painting are both prepared by means of isinglass size, corrected with honey or sugar-candy. The body of which the

embossed work is raised need not, however, be tinged with the exterior color, but is best formed of very strong gum-water, thickened to a proper consistence by bole-armenian and whiting in equal parts; which, being laid on the proper figure and repaired when dry, may be then painted with the proper colors tempered in the isinglass size, or in the general manner with shell-lac varnish.

Method of varnishing japan work.-The last and finishing part of japanning lies in the laying on and polishing the outer coats of varnish; which are necessary, as well in the pieces that have only one simple ground of color, as with those that are painted. This is in general best done with common seed-lac varnish, except in the instances and on those occasions where we have already shown other methods to be more expedient: and the same resaons which decide as to the fitness or impropriety of the varnishes, with respect to the colors of the ground, hold equally with regard to those of the painting: for where brightness is the most material point, and a tinge of yellow will injure it, seed-lac must give way to the whiter gums; but where hardness and a greater tenacity are most essential, it must be adhered to; and where both are so necessary, that it is proper one should give way to the other in a certain degree reciprocally, a mixed varnish must be adopted.

This mixed varnish, as we have already ob-served, should be made of the picked seed-lac. The common seed-lac varnish, which is the most useful preparation of the kind hitherto invented, may be thus made :- Take of seed-lac three ounces, and put it into water to free it from the sticks and filth that are frequently intermixed with it; and which must be done by stirring it about, and then pouring off the water and adding fresh quantities in order to repeat the operation till it be freed from all impurities, as it very effectually may be by this means. Dry it then and powder it grossly and put it with a pint of rectified spirit of wine into a bottle, of which it will not fill above two-thirds. Shake the mixture well together, and place the bottle in a gentle heat, till the seed appear to be dissolved, the shaking being in the mean time repeated as often as may be convenient; and then pour off all that can be obtained clear by this method, and strain the remainder through a coarse cloth. The varnish thus prepared must be kept for use in a bottle well stopped. When the spirit of wine is very strong it will dissolve a greater proportion of the seed-lac: but this will saturate the common, which is seldom of a strength sufficient for making varnishes in perfection. As the chilling, which is the most inconvenient accident attending those of this kind, is prevented or produced more frequently, according to the strength of the spirit; we shall therefore take this opportunity of showing a method by which weaker rectified spirits may with great ease at any time be freed from the phlegm, and rendered of the first degree of strength.

Take a pint of the common rectified spirit of wine, and put it into a bottle of which it will not fill above three-parts. Add to it half an ounce of pearl-ashes, salt of tartar, or any other alkaline salt, heated red-hot and powdered as well as it can be without much loss of its heat; shake the mixture frequently for the space of half an hour, before which time a great part of the phlegm will be separated from the spirit, and will appear, together with the undissolved part of the salts, in the bottom of the bottle. Let the spirit then be poured off or freed from the phlegm and salts by means of a tritorium or separating funnel; and let half an ounce of the pearl ashes, heated and powdered as before, be added to it, and the same treatment repeated. This may be done a third time if the quantity of phlegm separated by the addition of the pearlashes appear considerable. An ounce of alum, reduced to powder and made hot, but not burnt, must then be put into the spirit, and suffered to remain some hours, the bottle being frequently shaken: after which the spirit, being poured off from it, will be fit for use.

The manner of using the seed-lac or white varnishes is the same, except with regard to the substance, used in polishing; which, where a pure white, or great clearness of other colors is in question, should be itself white : whereas the browner sorts of polishing dust, as being cheaper and doing their business with greater despatch, may be used in other cases. The pieces of work to be varnished should be placed near a fire, or in a room where there is a stove, and made perfectly dry; and then the varnish may be rubbed over them by the proper brushes made for that purpose, beginning in the middle and passing the brush to one end; and then with another stroke from the middle passing it to the other. But no part should be crossed or twice passed over in forming one coat, where it can possibly be avoided. When one coat is dry another must be laid over it, and this must be continued at least five or six times or more, if on trial there be not sufficient thickness of varnish to bear the polish without laying bare the painting or the groundcolor underneath.

When a sufficient number of coats is thus laid on, the work is fit to be polished; which must be done, in common cases, by rubbing it with a rag dipped in Tripoli or pumice-stone, commonly called rotten stone, finely powdered ; but towards the end of the rubbing a little oil of any kind should be used along with the powder; and, when the work appears sufficiently bright and glossy, it should be well rubbed with the oil alone, to clean it from the powder, and give it a still brighter lustre. In the case of white grounds, instead of the Tripoli or pumicestone, fine putty or whiting must be used, both which should be washed over to prevent the danger of damaging the work from any sand or other gritty matter that may happen to be commixed with them.

It is a great improvement in all kinds of japan work to harden the varnish by means of heat, which in every degree that it can be applied short of what would burn or calcine the matter, tends to give it a more firm texture. Where metals form the body, therefore, a very hot stove may be used, and the pieces of work may be continued in it a considerable time; especially if the heat be gradually increased; but, where wood is in VOL. XI.

question, heat must be sparingly used, as it would otherwise warp or shrink the body so as to injure the general figure.

JAPETUS, in fabulous history, the son of Cœlus, or Titan, and Terra. He married Asia, or Clymene, by whom he had Prometheus, Epimetheus, Atlas, and Menœtius. The Greeks considered him as the father of all mankind.

JAPHETH, the son of Noah. His descendants possessed all Europe and the isles in the Mediterranean, including those which depend on Asia. They had all Asia Minor, and the northern parts of Asia above the sources of the Tigris and Euphrates. Noah, when he blessed Japheth, said, God shall enlarge Japheth, and he shall dwell in the tents of Shem, and Canaan shall be his servant.' This blessing or rather prophecy of Noah was accomplished when the Greeks, and after them the Romans, carried their conquests into Asia and Africa, where were the dominions of the posterity of Shem and Canaan. The sons of Japheth were Gomer, Magog, Madai, Javan, Tubal, Meshech, and Tiras. The Scripture says, 'that they peopled the isles of the Gentiles, and settled in different countries, each according to his language, family, and people.' It is supposed that Gomer was the father of the Cimbri, or Cimmerians; Magog of the Scythians; Madai of the Medes; Javan of the Ionians and Greeks; Tubal of the Tibareni; Meshech of the Muscovites or Russians, and Tiras of the Thracians. By the isles of the Gentiles, the Hebrews understand the isles of the Mediterranean, and all the countries separated by the sea from the continent of Palestine; whither also the Hebrews could go by sea only, as Spain, Gaul, Italy, Greece, and Asia Minor. The name of Japheth was very little altered by profane authors, who call him Japetus. The poets made him the father of heaven and earth. The Greeks believe that he was the father of their race, and acknowledge nothing more ancient than him. Besides the seven sons above-mentioned, the Septuagint, Eusebius, the Alexandrian Chronicle, and St. Austin, give him an eighth, called Eliza, who is not mentioned either in the Hebrew or Chaldee.

JAR, v. n. & n. s. Sax. eoppe, anger, or Fr. guerre, war, or old Teut. garren, to clamor. To strike together with a kind of short rattle: to sound untuneably : figuratively, to clash; to interfere; to quarrel; to dispute : jar, a discordant sound; discord; debate; a state in which a door unfastened may strike the post; an earthen vessel, from Ital. giano.

Nath'less, my brother, since we passed are Unto this point, we will appease our jar.

When those renowned noble peers of Greece, Through stubborn pride, among themselves did jar, Forgetful of the famous golden fleece,

Then Orpheus with his harp their strife did bar. Spenser.

He maketh war, he maketh peace again, And yet his peace is but continual jar O miserable men, that to him subject are ! Id. Faerie Quccne.

At last, though long, our jurring notes agree. Shakspeare.

Hubberd.

²⁰

I perceive you delight not in musick. -Not a whit, when it jars so. O, you kind gods !

Cure this great breach in his abused nature.

The' untuned and jarring senses, O, wind up, Of this child-changed father ! Id. King Lear.

For orders and degrees

Jar not with liberty, but well consist. Milton. Paradisc Lost.

On a sudden open fly,

With impetuous recoil and jarring sound, The' infernal doors, and on their hinges grate Harsh thunder, that the lowest bottom shook Id. Of Erebus.

First was the world as one great cymbal made, Where jarring winds to infant nature played.

Marvell.

562

Id.

A string may jar in the best master's hand, And the most skilful archer miss his aim.

Roscommon.

About the upper part of the jar there appeared a Boyle. good number of bubbles.

In r, the tongue is held stiffly at its whole length, by the force of the muscles; so as when the impulse of breath strikes upon the end of the tongue, where it finds passage, it shakes and agitates the whole tongue, whereby the sound is affected with a trembling jar.

Holder's Elements of Speech.

The rings of iron, that on the doors were hung, Sent out a jarring sound, and harshly rung.

Dryden.

He mead for cooling drink prepares, Id. Of virgin honey in the jars.

They must be sometimes ignorant of the means conducing to those ends, in which alone they can jar Id. and oppose each other.

The state is out of tune ; distracting fears

And jealous doubts jar in our public counsels.

Rowe's Jane Shore.

Warriors welter on the ground, Whilst empty jars the dire defeat resound. Garth. My knees tremble with the jarring blow. Gay.

The chaffering with dissenters, and dodging about this or t'other ceremony, is but like opening a few wickets, and leaving them a-jar, by which no more than one can get in as a time. Swift.

He keeps his tempered mind serene and pure, And every passion aptly harmonized Amid a jarring world. Thomson's Seasons .- Summer.

JARCHI (Solomon), called also Raschi and Isaaki, a famous rabbi, born at Troyes, who flourished in the twelfth century. He was a perfect master of the Talmud and Gemara. A great part of his commentaries are printed in Hebrew, and some have been translated into Latin by the Christians. They are all greatly esteemed by the Jews, who have bestowed on the author the title of prince of commentators.

JA'RDES, n. s. Fr. Hard callous tumors in horses, a little below the bending of the ham on the outside. This distemper in time will make the horse halt, and grow so painful as to cause him to pine away, and become light-bellied. It is most common to maneged horses, that have been kept too much upon their haunches .--Farrier's Dictionary.

JARDINS (Mary Catharine Des), an ingenious, but profligate French writer, born at Alencon, in 1640. Being obliged to leave Alençonon account of an intrigue, she went to Paris, where she wrote plays and novels, which occupy 10 vols. 12mo. She dicd in 1683.

JARDYN (Karel, or Charles Du), a celebrated painter, born at Amsterdam in 1640. He was a disciple of Nicholas Berchem, and travelled in Italy when a young man; but, arriving at Rome, he gave himself up alternately to study and dissipation. Yet his paintings rose into high repute, and they were bought up at great prices. To revisit his native city he at last left Rome, but, passing through Lyons, he was prevailed upon to stay there for some time, and found as much employment in that city as he could execute. But the profits of his paintings were not adequate to his profusion ; and, to extricate himself from the incumbrances in which his extravagance had involved him, he married his hostess, who was very old, but also very rich. Ashamea of this adventure, he returned to Amsterdam, accompanied by his wife, and there for some time followed his profession with as much success as he had met with in Italy or Lyons. He returned to Rome the second time; and, after a year or two spent there in his usual extravagant manner, he settled at Venice. In that city his merit was well known, which procured him a very honorable reception. He lived there highly caressed, and continually employed; but died at the age of thirty-eight. In his coloring and touch he resembled his master, but he added a force which distinguishes the great painters of Italy. Most of his pictures seem to express the warmth of the sun, and the light of mid-day. They are not much encumbered; a few figures, some animals, and a little landscape for the back grounds, generally comprise the whole of his However, some of his subjects composition. are more extensive, containing more objects, and a larger design. His works are much sought after, but not easily met with.

JARGEAU, an ancient town of France, in the department of Loiret, and late province of Orleanois, taken by the English in 1438, and retaken by Joan of Arc the next year. It is ten miles south-east of Orleans, and seventy southwest of Paris.

JAR'GON, n.s. Fr. jargon ; Span. gericonça. Unintelligible talk; gabble; gibberish.

Nothing is clearer than mathematical demonstration; yet, let one, who is altogether ignorant in mathematicks, hear it, and he will hold it to be plain Bramhall. fustian or jargon.

From this last toil again what knowledge flows? Just as much, perhaps, as shows

That all his predecessor's rules

Were empty cant, all jargon of the schools. Prior. During the usurpation an infusion of enthusiastic

jargon prevailed in every writing. Swift.

The merest word that ever fooled the ear, From out the schoolman's jargon I should deem The golden secret, the sought ' Kalon' found, Byron. And sealed in my soul.

JARGON, in lithology, a kind of precious stone, of the nature of the diamond, but softer; found in Brazil, according to M. de Bomare; but in Ceylon, according to M. Romé de L'Isle. Its specific gravity is nearly equal to that of the ponderous spar, being 4416. Its crystals consist of two tetrahedral pyramids of equal sides, separated by a short prism; so that the jargen is properly of a dodecahedral form. Accor lin,

563

to some lapidaries, the jargon comes nearest to the sapphire in hardness; and as it has, when cut and polished, a great resemblance to the diamond, jargons are called by some soft diamonds; and one may be easily imposed upon in purchasing these for the true kind, when they are made up in any sort of jewellery work. On exposing this stone to a violent fire, M. D'Arcet found the surface a little vitrified where it stuck to the porcelain test in which it was set; whence it appears, that the jargon has not the least resemblance to the diamond in its essence.

JARGONELLE', n. s. A species of pear. See PEAR.

JARGONIA, in mineralogy, a new kind of earth discovered by Klaproth in the jargon of Cevion. It resembles argill more than any other earth, though it differs essentially from it in some respects. Its color is white, and its specific gravity probably exceeds 4000. It is incapable of uniting to fixed air; at least, when precipitated from acids by mild alkalies, it takes up none. It is soluble in dilute vitriolic acid (as also in the nitrous and muriatic); and with a slight excess of this acid it forms, in a moderate heat, by spontaneous evaporation, stelliform crystals of an astringent taste, easily soluble in water. Its solutions, like those of argill, are precipitable by volatile caustic, as well as by fixed alkali. It is also soluble in the concentrated acetous acid; this solution will not crystallise; but, if it be evaporated to dryness, the saline powder thus had will not attract the moisture of the air, as acetous alum does; neither does the acetous acid act so powerfully on argill as on this earth. It is insoluble in a boiling solution of caustic fixed alkali, in which argill is perfectly soluble. It is infusible, not only by fixed alkalies, but also by microcosmic salt, to which argill yields. Borax, however, melts it, but without any effervescence, in which respect also it differs from argill.

JARNAC, a town of France, in the department of the Charente, containing 1700 inhabitants. It is remarkable for a victory obtained by Henry III. (then duke of Anjou), over the Hugonots, in 1596, when their general Louis I. prince of Condé was killed. It is seated on the Charente, eighteen miles north-west of Angoulème.

JAROSLAV, a city and government of European Russia, bounded by Vologda, Kostroma, Vladimir, Tver, and Novogorod, and lying between 37° 45' and 41° 15' of E. long., and 56° 44' and 58° 52' of N. lat. The territorial extent of this government is above 14,000 square miles, and its population 800,000. The surface consists of large undulating plains, traversed by the Wolga, the Schekna, the Mologa, and numerous smaller rivers. The lakes are also numcrous. The soil, where it is not marshy, is sand, clay, or black mould. The climate is not particularly severe; but agriculture is in' a backward state, and large quantities of corn are imported for consumption. The inhabitants rear cattle, and trade in wood to great extent; flax and hemp are likewise cultivated, and a few manufactures appear. The government is divided into ten circles or districts; but the steppes of Jaroslav are distinct from them.

JAROSLAV, the capital of the foregoing government, and a bishop's see, is situated on the Wolga, 146 miles N. N. E. of Moscow, and 360 E.S.E. of St. Petersburg. It is built almost entirely of wood; but the manufactures of silk, linen, and Russia leather, are on a large scale, and it has a noted bell-foundry. Here is an academy endowed with valuable lands for the education of superior youth. The number of students hardly ever exceeds fifty; but there is also a high-school for the education of those of less elevated birth, and a theological seminary on a considerable scale. Peter the Great founded its manufactures; but they were still more indebted to the fostering care of John Ernest, duke of Courland, who resided here many years. Population 19,000.

JAROSLAW, a large town of Austrian Poland, in Galicia, on the river San. Its manufactures are of wax and cloth, but they are very indolently conducted; the chief trade is in linen and flax; a large fair is held on the 15th of August. It is forty-eight miles W.N.W. of Lemburg, and 110 east of Cracow.

JASHER, a book which Joshua mentions, and refers to in chapter x. 13. 'Is not this written in the book of Jasher?' It is difficult to determine what this book of Jasher, or the upright, is. St. Jerome and the Jews believed it to be Genesis, or some other book of the Pentateuch. Some think it was public annals, or records, which were styled justice or upright, because they contained a faithful account of the history of the Israelites. Grotius believes, that this book was a song, made to celebrate this miracle and this victory, because the words cited by Joshua as taken from this work, ' Sun, stand thou still upon Gibeon, and thou moon in the valley of Ajalon,' are such poetical expressions as do not suit with historical memoirs; and in the second book of Samuel (i. 18.) mention is made of a book under the same title, on account of a song made on the death of Saul and Jonathan. See AJALON.

JASIONE, in botany, a genus of the monogynia order, and syngenesia class of plants; natural order twenty-ninth, campanaceæ: CAL. ten-leaved: cor. five regular petals: CAPS. beneath, two-celled. Species one only—J. montana, a native of Europe.

JASION, or JASIUS, in fabulous history, the son of Jupiter and Electra, and king of Arcadia. Ilaving improved agriculture, he was fabled to have married the goddess Ceres, by whom he had three sons, Plutus, the god of riches, Philomelus, and Corybas. All the gods were present at the wedding. He was killed by lightning, and worshipped by the Arcadians.

JASK, a town of Croatia.

JAS'MINE, *n. s.* Fr. *gelseminum*, *jasmin*. It is often pronounced jessamine. A creeping shrub with a fragrant flower.

Thou, like the harmless bee, mayst freely range; From *jasmine* grove to grove may'st wander.

Thomson.

JASMINUM, jasmine or jessamine tree, in botany, a genus of the monogynia order, and diandria class of plants; natural order forty-fourth, sepiariæ: con. quinquefid, the berry dicoccous,

202

the seers arillated, and the antheræ within the tube. The species are numerous, the principal are,

1. J. azoricum, the azorian white jessamine, has shrubby, long, slender stalks and branches, rising upon supports fifteen or twenty feet high. with pretty large flowers of a pure white color; coming out in loose bunches from the ends of the branches, and appearing most part of the summer and autumn.

2. J. fruticans, the shrubby yellow jasmine or jessamine, has shrubby, angular, trailing stalks and branches, rising upon supports eight or ten feet high; trifoliate and simple alternate leaves; with yellow flowers from the sides and ends of the branches, appearing in June; frequently producing berries of a black color. This species is remarkable for sending up many suckers from its roots; often so plentifully as to overspread the ground, if not taken up annually.

3. J. grandiflorum, the great-flowered Catalonian jessamine, has a shrubby, firm, upright stem, branching out into a spreading head from about three to six or eight feet high, with large flowers of a bluish-red color without, and white within, appearing from July to November. Of this there is a variety with semi-double flowers,

having two series of petals. 4. J. humile, the dwarf yellow jessamine, has shrubby firm stalks, and angular branches, of low, somewhat robust and bushy growth; broad, trifoliate, and pinnated leaves; and large yellow flowers in July, sometimes succeeded by berries.

5. J. odoratissimum, the most sweet-scented yellow Indian jessamine, has a shrubby upright stalk, branching erect, without supports, six or eight feet high, with bright yellow flowers in bunches from the ends of the branches; flowering from July till October, and emitting a most fragrant odor. This species, as well as the first and third, may be increased by layers or seeds, or by grafting and budding them upon the common white and shrubby yellow jessamine. They are tender, and require shelter in a greenhouse in winter, and therefore must always be kept in pots to move them out and in occasionally. The pots must be filled with light, rich earth, frequently watered in summer, but moderately, about once a-week in winter. Prune off all the decayed wood when it appears, and retrench the rambling shoots, to preserve the heads somewhat regular; managing them in other respects as the common greenhouse plants.

6. J. officinale, the common white jessamine, has shrubby, long, slender, stalks and branches, rising upon supporters fifteen or twenty feet high, with numerous white flowers from the joints and ends, of a very fragrant odor. There is a variety with white-striped, and another with yellow-striped leaves. This species, with the fruticans and humile, are sufficiently hardy to thrive in this climate without shelter. They may be easily propagated by layers and cuttings; and the striped varieties by grafting or budding on stocks of the common kind.

JASON, the Greek hero who undertook the Argonautic expedition, was the son of Æson and Alcimede (See Æson), and was educated by Chiron the Centaur. His uncle Pelias having usurped ais father's kingdom, Jason boldly demanded it of him, but was advised by him first to go to Colchis and recover the golden fleece previous to the restoration of it. Æetes, king of Colchis, subjected him to several arduous enterprises, all which Jason, by the aid of Juno and Medea, accomplished, and then set sail for Europe with Medea, to whom he proved faithful for ten years, but afterwards deserted her. See AR-GONAUTS.

JAS'PER, n. s. Fr. jaspe; Lat. iaspis. A hard stone of a bright beautiful green color, sometimes clouded with white, found in masses of various sizes and shapes. It is capable of a very elegant polish, and is found in many parts of the East Indies, and in Egypt, Africa, Tartary, and China .- Hill.

And upon pillers grete, of *jusper* long, I sawe a temple of brasse ifounded strong.

Chaucer. The Assemble of Foules.

And underneath a bright sea flowed Of jasper, or of liquid pearl, whereon Who after came from earth sailing arrived, Wafted by angels, or flew o'cr the lake

Rapt in a chariot drawn by fiery steeds.

Milton. Paradise Lost. The most valuable pillars about Rome are four columns of oriental jasper in St. Paulina's chapel, and one of transparent oriental jasper in the vatican library. Addison on Italy.

The basis of jasper is usually of a greenish hue, and spotted with red, yellow, and white. Woodward.

What is her pyramid of precious stones ?

Of porphyry, jasper, agate and all hues

- Of gcm and marble, to encrust the bones
- Of merchant dukes? Byron. Childe Harold.

JASPER, in mineralogy, a genus of silicious earths, or a sub-species of the rhomboidal quartz of Jameson. Kirwan distinguishes three families, viz. common jasper, Ægyptian pebble, and striped jasper. The colors of common jasper are milkwhite, grayish-white, or yellowish-white, citron, ochre-yellow, brownish-yellow, blood-red, brownish dark red, brown, olive, or dark green; and variegated, spotted or veined with many of these.

It is met with either in large masses, or blunt detached fragments. Gerhard found some ir-regularly crystallised, in hexahedral prisms, among the fossils sent to him by Beyer from Schneeberg; and Baron Born mentions some found in the Palatinate. Its lustre is 2.1; its transparency 0, or nearly, 1; its fracture conchoidal, sometimes imperfectly, sometimes flatly; its hardness, from 9 to 19; specific gravity from 2.58 to 2.7. The heavier sort seems evidently contaminated with metallic particles. Jasper, when heated, does not decrepitate or harden. Alkalies and microcosmic salt flux it with difficulty; borax better, and without effervescence. Even by oxygen jasper is scarcely, and but imperfectly melted, as appears by the experiments of Lavoisier. As Gerhard found it to yield in a chalk crucible, in the parts that touched the chalk, it is probable it contains a small portion of argill, with a much larger of silex. Unless very impure, it does not wither by exposure to the air. Its transitions are into hornstone, opal, argillite, and lithomarga; it is often intimately mixed with chalcedony. The mineral acids have no immediate effect upon it, but corrode it by some months immersion. On treating a small

565

piece of green jasper with vitriolic acid, some crystals of alum and green vitriol were obtained; which shows that iron and clay are ingredients in its composition. It occurs principally in veins as a constituent of agate. It is found in the Pentland Hills, and in trap and transition rocks in Ayrshire and Dumfriesshire. It receives a good polish.

The *Egyptian jasper* often exhibits a variety of colors in the same specimen, either in regular, or irregular, concentric and alternating stripes, or layers, or in dots and dendritical figures. The most usual colors are the yellow, brown, gray, milk-white, leek-green, and black; this last only in dots. It is found in spheroidal, or flat rounded masses, which are enveloped in a coarse rough crust. The lustre is glimmering, the fracture conchoidal. It is feebly translucent at the edges, and as hard as horn-stone. Its specific gravity is 2.63. It occurs loose in the sands of Egypt.

Striped jasper is known by its bands of gray, green, yellow, and red; and is therefore termed banded jasper by Werner. It occurs massive in whole beds. The fracture is conchoidal and opaque; less hard than Egyptian jasper, and rather easily frangible. Specific gravity 2.5. It occurs in secondary clay-porphyry in the Pentland Hills, and near Friburg in Saxony. It receives a fine polish.

Jasper martialis, or sinople, is also a family of this genus. It is a dark red stone, containing eighteen or twenty per cent. of metal. Near Chemnitz, where it forms very considerable veins, as Brunnich informs us, it has frequently specks of marcasite, cubic lead ores, and blend. It has likewise much gold. There are several varieties differing in the coarseness and fineness of their texture, as well as the shade of their color; varying from a deep brown to a yellow. The last is attracted by the magnet after calcination.

JASSY, a considerable city of European Turkey, the capital of Moldavia, and residence of the hospodar, who is a vassal of the grand seignior. In 1753 the whole city, with the palace of the hospodar, some popish convents, and a new Lutheran church, were destroyed by fire; and in 1772 it was desolated by the plague : it is still in a ruinous state. It is seated on the Pruth, and is defended by a castle. However, it has been several times taken in the wars between the Turks and the Russians and Austrians; the last time by the latter in 1788, who restored it at the peace of Reichenbach in 1790. In 1792 a peace was concluded here. Long. 27° 35' E., lat. 47° 8' N.

JASZBERENY, a large and central town of Hungary, on the Sadwa, the residence of the military commandant of the provinces of Jazyga and Kumania. The environs are fertile in corn and pasturage; and a good trade in the former, and in horses and cattle, centres here. The town contains a Franciscan monastery, and is remarkable as having been the residence of the famous Attila, whose tomb is still exhibited to strangers. Population 12,000. Thirty-eight miles east of Pest.

IATROLEP'TIC, adj. Fr. iatroleptique; Gr. iaτρός and άλέιφω. That which cures by anointing. JATROPHA, the cassada plant ; a genus of the monadelphia order, and monœcia class of plants; natural order thirty-eighth, tricoccæ. Male cal. none: con. monopetalous and funnelshaped; there are ten stamina, one alternately longer than the other. Female cal. none: con. pentapetalous and patent; there are three bifd styles: caps. trilocular, with one seed in each cell. There are seventeen species. The most remarkable are the following :—

1. J. curcas, the English physic nut, with leaves cordate and angular, is a knotty shrub, growing about ten or twelve feet high. The extremities of the branches are covered with leaves; and the flowers, which are of a green herbaceous kind, are set on in an umbel round the extremities of the branches, but especially round the main stalks. These are succeeded by as many nuts, whose outward tegument is green and husky, which being peeled off discovers the nut, whose shell is black and easily cracked: this contains an almond-like kernel, divided into two parts; between which separation lie two milkwhite thin membranaceous leaves, easily separable from each other. These have not only a resemblance to perfect leaves, but have, in particular, every part,---the stalk, the middle rib, and transverse ones, as visible as in any leaf whatsoever. This species is a native of the West Indies, and is planted round negro gardens. A decoction of the leaves of it, and of the third species (which grows wild), Dr. Wright says, is often used with advantage in spasmodic grippings, attended with vomiting: it sits easier on the stomach than any thing else, and seldom fails to bring about a discharge by stool.

2. J. elastica, with ternate leaves, elliptic, very entire, hoary underneath, and longly petioled. This is the hevea Guianensis of Aublet, which yields the caoutchouc or Indian rubber; for a particular account of which, see CREMISTRY and CAOUTCHOUC.

3. J. gossypifolia, cotton-leaved jatropha or belly-ache bush, the leaves of which are quinquepartite, with lobes ovate and entire, and glandular branchy bristles. The stem, which is covered with a light grayish bark, grows to about three or four feet high, soon dividing into several widely extended branches. These are neither decorated with leaves nor flowers till near the top, which is then surrounded by the former: their foot-stalks, as well as the young buds on the extremity of the branches, are guarded round with stiff hairy bristles, which are always tipt with glutinous liquid drops. From among these rise several small deep-red pentapetalous flowers, the pistil of each being thick set at the top with yellow farinaceous dust, which blows off when ripe; these are succeeded by hexagonal, husky, blackish berries, which when ripe open by the heat of the sun, emitting a great number of small dark-colored seeds, which serve as food for grounddoves.

4. J. manihot, the bitter cassada, has palmated leaves; the lobes lanceolate, very entire, and polished. It is a native of the West Indies, where it is used as food. The root of bitter cassada has no fibrous or woody filaments in the heart, and neither boils nor roasts soft. It may be de-

prived of the noxious qualities, which reside in the juice, by heat. Cassada bread, therefore, is thus made :- The roots are washed and scraped clean; then grated into a tub or trough: after this they are put into a hair bag, and strongly pressed, to squeeze out the juice, and the meal or farina is dried in a hot stone basin over the fire, and made into cakes. It also makes excel-' leut puddings, equal to millet. The scrapings of fresh bitter cassada are successfully applied to ulcers. Cassada roots yield a great quantity of starch, which the Brasilians export in httle lumps, under the name of tapioca. According to F. Labat, the small pieces of manioe which have escaped the grater, and the clods which have not passed the sieve, are not useless. They are dried in the stove after the flour is roasted, and then pounded in a mortar to a fine white powder, with which they make soup. It is likewise used for making a kind of thick coarse cassada, which is roasted till almost burnt; of this, fermented with molasses and West India poatoes, they prepare a drink called ouycou. 5. J. multifida, or French physic nut, with leaves

many-parted and polished, and stipules bristly and multifid, grows to ten feet high. The main stalk divides into very few branches, and is covered with a gravish-white bark. The leaves stand upon six-inch foot-stalks, surrounding the main stalk, generally near the top, in an irregular order. The flowers grow in bunches, umbelfashion, upon the extremities of each large stalk, very much resembling, at their first appearance, a bunch of rcd coral: these afterwards open into small five-leaved purple flowers, and are succeeded by nuts, which resemble those of the curcas. This species is a native of the West Indies, and is cultivated there as an ornamental shrub. The seeds of this, as well as of the curcas and gossypifolia, are drastic purgatives and emetics. They yield, by decoction, an oil of the same uses and virtues as the oleum ricini.

JAVA, an important island of the Eastern Seas, separated from Sumatra by the strait of Sunda, about five leagues wide where narrowest. The island is 250 leagues long and from thirty to fifty broad. Its name, according to some, signifies great, while others derive it from the Malay, *djav*, the name of a grain that grows on it. The Arabs and Persians call it Gezira al Maha Rajah, the island of the great king.

Java is traversed by a chain of high mountains from east to west, approaching nearest to the south coast, and giving rise to innumerable torrents, which, in the rainy season, inundate all the low lands: but their mouths are choked with sand, and admit only small vessels. The greatest elevation of the chain is towards the east, and the highest summits are on the narrowest part of the island behind Cheribon. Several of the mountains are volcances; that named Geté 8000 feet above the level of the sea.

The year is here divided into two seasons; one of which is called the east or dry monsoon, and the other the west monsoon, or rainy season. The east or good monsoon commences in the months of April and May, and finishes the end of September, or the beginning of October. The trade winds then blow from four or five leagues off shore, through the whole of the Indian Seas to the south of the line from the south-east and E. S. E. at times going as far south as S. S. E. with fine dry weather. The west or bad mon-soon begins the latter end of November, or early in December. While it continues, the wind often blows with great violence, and is accompanied by heavy torrents of rain, which render the season generally unhealthy. The same winds are found to prevail every where to the south of the line, and last until the conclusion of February, or commencement of March, from which time they are very variable until April, when the easterly winds begin to blow. Hence these three months, as also October and part of November, are called the shifting months, and the breaking up of the monsoons are considered at Batavia as the most unhealthy season of the year. As far as nine or ten degrees south of the line, when the westerly winds prevail, the contrary takes place at the same time and distance to the north of it; and vice versâ, when to the north the westerly winds blow, the easterly prevail to the south of the line; which alteration greatly assists the navigation of Java.

Along the coast of Java the land and sea breezes blow every day, without exception, and moderate the intensity of the heat.

The northern coast of the island is, in general, low and considered unhealthy, from the marshes, stagnant waters, and thick vegetation. At the distance of some leagues from the sea the climate becomes salubrious, and the cold increases in ascending from the foot of the mountains, until at a country house of the governor of Batavia, only six leagues from the city, fires are agreeable morning and evening.

Java may be considered, on the whole, the most fertile and best cultivated of all the eastern islands. At the foot of the mountains is a rich alluvial soil of from ten to even fifty feet deep. Rice and maize are its staple agricultural products; but coffee, tobacco, and cotton, which have all been introduced by Europeans, are also grown in abundance. Agriculture has received that degree of attention here which the bounties of nature seem to demand; its implements are much superior to those found in Hindostan, and, though there are few of the extensive tanks here constructed in the latter country, the brooks and rivers are advantageously employed for irrigation. The rice of Java is exported to China, and sometimes even to Europe: it is considered inferior to that of Carolina and Bengal. The former will sell for 18s. a cwt., and the latter for 11s. 3d., when that of Java fetches only 9s. 9d. This is attributed to the careless modes of husking and drying here used. The Java maize is not a superior grain. But coffee has been found to flourish very decidedly in this island; and particularly suits the land unfit for rice. It is said to be far superior to any we receive from the West Indies: and is exported to the amount of 26,000,000 lbs. In 1818 27,400,000 lbs. of clayed sugar were exported. The molasses, mixed with thirty-five parts of rice, and three of palm wine, (out of 100) yield the arrack for which Java is famous. Of tobacco, 5,000,000 lbs. are said

to be exported annually; and of the birds' nests which are reckoned a luxury in China, 27,000 lbs.

But the teak of this island is its most important production, and the Duch show their estimation of it by subjecting it to a rigid monopoly: its forests, it is said, would yield 50,000 beams for ship-building annually; and, under the more liberal system adopted by the British, their produce was enquired after throughout Bengal. Latterly the price of Java teak has risen, but the article has almost disappeared.

The quantity of pepper produced in Java was once considerable : in 1777 it was 6,000,000 lbs.; but the European consumption has decreased, and the supplies from other eastern countries have much diminished the return for this article here.

Java is abundant in fruit and fruit trees, among which may be enumerated the cocoa nut and many other palms, shaddocks, oranges, lemons, citrons, tamarinds, the jack tree, mangoes, mangosteens, pine-apples, bananas, the sweetsop, custard-apple, the rambutan, and guava; in addition to which are grapes, melons, pumpkins, pomegranates, and figs. The mangosteen, reckoned the most delicious fruit of the east, is of a singularly good flavor. The tree on which it grows is extremely beautiful, bearing, like the orange, its fine spherical fruit and flowers at the same 'The celebrated upas, or poison tree, of time. which the account by Foersch attracted little attention, until it was inserted as a note to Dr. Darwin's Poem of the Botanic Garden, is now established,' says Mr. Hamilton, ' to be entirely of fabulous existence.' The animal tribes are those of all the eastern islands. The buffalo supplies milk, butter, and beef, and is the animal principally employed in domestic labor. While working, it is extremely slow, but steady; its work, however, falls short of what might be expected, from its size and strength. They are not found in a wild state, being too much exposed to the attacks of the tiger, which is here of a large size. Horses are used in many parts, but the breed is small. Reptiles and inferior animals are v y abundant. 'A glass of water, taken out of the canal at Batavia, becomes,' says Mr. Hamilton, 'in a few hours a collection of animated matter; the minute portions of which, multiplying by division and subdivision, move about with astonishing rapidity; and the bay, swarming with myriads of living creatures, exhibits in the night time a phos-phorescent light.' The insect tribes are also The last extremely numerous and annoying. mentioned writer specifies snakes, scorpions, spiders, ants, musquitoes, fire-flies, and many other dangerous and disgusting vermin, as swarming in the roads, houses, and bed-chambers. 'A venomous spider is very common in the thickets of Java, the body of which is two inches in diameter, and the length of the fore legs or claws four inches, covered with hair, the color black, and the mouth red.'

Some compensation is found for these annoyances in the immense number and variety of birds in Java; from the cassowary to the humming bird, which is little larger than a common bee. This department of nature abounds in noble and beautiful species. Among them are lories and parroquets, argus pheasants, the golden thrush, and the kings-fisher.

The present native inhabitants are a brown colored, healthy race, professing Mahommedanism : but in the mountains there is still said to be found a tribe, who, adhering to the original religion, abstain from animal food, and believe in the metempsychosis. There are also found some descendants of an ancient Chinese colony, and many ancient Chinese temples are scattered over the island. The yellow color reserved for the habits of the emperor seems also to have been adopted from China.

Sir Stamford Raffles, the late intelligent British governor here, gives a far more favorable picture of the Javanese than the Dutch writers. 'They are,' he says, ' warm-hearted, generous, and very susceptible of grateful attachment. The English, who placed confidence in them, found them honest in the intercourse of common life; and they share only in a slight degree those habits of piracy for which the Malay tribes are so notorious. In society they are uncommonly goodhumored, courteous, and polite, and are scarcely ever seen in a passion, unless on those occasions when they are hurried to the last extreme of violence. These unhappily, however, too often occur, under the impulse of that violent jealousy and revenge which form their ruling passions."

Human life, indeed, seems held cheaper in this, than in any other part of the East: an assassin may be hired for the moderate sum of fifteen or twenty shillings; but, in general, the injured party conceives it more honorable to decline this cheap mode of redress, and to seek vengeance with his own hand. Some of the Malay tribes found here driven to desperation, run furiously into the streets, and kill indiscriminately all whom they meet, till they are themselves overpowered or cut down; an atrocity which, by a corruption of the native term, is called 'running a muck.'

The Javanese language is a copious dialect of the Sanscrit; and is very beautiful in the written character. In general terms, however, it is said to be deficient: such as those of space, nature, solidity, &c., being entirely wanting. Their literature is chiefly metrical, and may be divided into lyrical compositions or songs; romances founded on Hindoo legends, and on modern story; histories of modern transactions, and legal and ethical tracts. Of these the songs, in which feeling and passion are simply expressed, are the most pleasing. Its history, which only commences with the Mahommedan invasion, is chiefly a metrical legend, written under the eye of successive princes.

Their interior government is absolute : all rank emanates from the sovereign ; and no bounds are set to the marks of respect shown by the inferior to the higher classes. No individual can stand in the presence of his superior, not even the heir apparent in that of the sovereign. Whenever a chief appears, in public, his inferiors must throw themselves into a posture, best described by the English term 'squatting;' in which they remain till he disappears. Sir S. Raffles was much annoved, in one of hus progresses, by observing the whole population quitting their work, and remaining fixed in this uneasy posture so long as he remained in sight.

The lot of the *female* sex differs here considerably, however, from what is usual in Asiatic society. They are much more unconstrained; and suffered to mix with general society. British gentlemen have been admitted to visit the harams of the sultans and chiefs, where they were received by the ladies with a dignified propriety that appeared very striking. The commercial and pecuniary affairs of the family are almost wholly entrusted to women. The right of divorce, however, with which they are indulged equally with the other sex, is said to be carried by them beyond all bounds. It is very common for a woman, before the age of thirty, to have divorced three or four husbands; and Mr. Crawfurd had one pointed out to him who was living with her twelfth. Little difficulty occurs in regard to the disposal of the children, for, in Java, they are never viewed in the light of a burden. They are both few in number (a eircumstance ascribed to the hard labor which the mothers undergo) and easily supported. Polygamy is permitted by law, but is chiefly confined to the great; with whom the first wife alone is of their own rank, and mistress of the family; the others occupy a decidedly inferior place.

The population is divisible into that portion subject to European power, and which amounts to about 3,000,000 : and that portion still under the native government, which comprises about 1,500,000 souls. The European towns are Batavia (which see), Surabaga, and Samarang ; the first containing perhaps 60,000 souls, and the last two half that number. The native capitals, Surakerta and 'Yas Yukerta, contain about 100,000 inhabitants each. The Chinese in the island here are estimated at nearly another 100,000 : and the manufacture of sugar, salt, and arrack, is wholly engrossed by them. The slaves are about 30,000.

Java was long subject to the Dutch. But on the 4th of August, 1811, a British force was landed here, and, on the 10th, it took Batavia by storm; the Dutch general, Janssens, retreating to the eastern extremity of the island, and finally capitulating for the general surrender of it. In the following year the British government engaged in a war with the native sovereign, which ended in the cession of extensive and important districts. Under the excellent government of Sir Stamford Raffles it rapidly improved. But upon the downfal of the French Empire, and the restoration of independence to Holland, this possession was restored to that country. At the close of 1816 the Dutch re-took possession of Java

JAUCOURT (Louis de), a French compiler who conducted the Bibliotheque Raisonée, from its commencement to 1740; and had a share in the French Encyclopedie and Musœum Sabæanum. He also compiled a Lexicon Medicum Universale, but the MS. was lost in the vessel taking it to Holland. He died in 1740.

JAVEL, v. a. & n. s. For jable. To bemire; to soil over with dirt through unnecessary tra-

568

versing and travelling. This word is still retained in Scotland and the northern counties. Javel, a wandering dirty fellow.

When as time, flying with wings swift, Expired had the term that those two *javels* Should tender up a reckoning of their travels.

Hubberd.

Sir Thomas More, preparing himself for execution, put on his best apparel, which the lieutenant compelled him to put off again, saying, That he who should have them was but a *javel*. What, says Sir Thomas, shall I account him a *javel*, who shall this day do me so great a benefit? More.

JAV'ELIN, n. s. Fr. javeline. A spear or half-pike, which anciently was used either by foot or borse. It had an iron head pointed.

Others, from the wall, defend

With dart and *javelin*, stones and sulphurous fire; On each hand slaughter and gigantick deeds.

Milton.

She shakes her myrtle *javelin*: and, behind, Her Lycian quiver dances in the wind. Dryden. Flics the *javelin* swifter to its mark,

Launched from the vigour of a Roman arm?

Addison.

The JAVELIN, in antiquity, was five feet and a half long; the shaft was of wood, and the point of steel. Every soldier in the Roman armies had seven of these, which were very light and slender.

JAUN'DICE, n. s. Fr. jaunisse, jaune, yellow. A distemper from obstructions of the glands of the liver. See ICTERUS. Jaundiced, infected with the jaundice.

Why should a man, whose blood is warm within, Sit like his grandsire cut in alabaster?

Sleep when he wakes, and creep into the jaundice

By being peevish? Shakspeare. Merchant of Venice.

Those were thy thoughts, and thou couldst judge aright,

'Till int'rest made a *jaundice* in thy sight. Dryden. All seems infected, that the' infected spy,

As all looks yellow to the *jaundiced* eye. Pope.

The eyes of a man in the *jaundice* make yellow observations on every thing; and the soul, tinctured with any passion, diffuses a false color over the appearances of things. *Watts.*

JAUNDICE. See MEDICINE.

JAUER, a principality of Prussia, in Lower Silesia, forming part of the government of Liegnitz, bounded on the south and west by Bohemia and Lusatia. It has only a superficial extent of 300 square miles, but about 200,000 inhabitants. The surface is diversified with woody bills and fruitful plains. Here are also mines of pit-coal and iron. Corn is imported; but the manufactures are extensive; and it exports linen, gauze, iron, glass, and porcelain. The chief towns are Jauer, Hirschberg, Lowenberg, and Bunzlau, the capitals of small districts.

JAUER, CIRCLE OR DISTRICT OF, is a part of the above principality, comprising 147 square miles, with a population of 22,000 inhabitants.

JAUER, a fortified town of Silesia, and the capital of the principality and circle of that name, stands on the river Jauer, otherwise called the Wuttend Neisse (or raging Neisse), from its ravages when swelled by rains or ice. It contains five Catholic churches and monasteries, and a Lutheran church. Here is a woollen and cotton manufacture, and a good trade in flax and yarn In 1776 most part of this place was burnt down; but it has been rebuilt with improvements. Sixteen miles north-west of Schweidnitz, and thirty-one west of Breslau.

JAUNT, v.n. & n.s. Fr. Junce, Jaunt, a there; to ramble; to bustle about: jaunt, a flight, or excursion, commonly used ludicrously, but solemnly by Milton: jauntiness, airiness; flutter; gentility.

I was not made a horse,

And yet I bear a burthen like an ass ;

Spur-galled and tired by jaunting Bolingbroke.

Shakspeare. Richard II. Our Saviour meek, and with untroubled mind, After his airy jaunt, though hurryed sore, Hungry and cold betook him to his rest. Milton.

He sends me out on many a jaunt, He sends me out on many a jaunt, Hudibras.

Old houses in the night to haunt.

If you are for a merry jaunt, I'll try for once who can foot it farthest. Dryden's Spanish Fryar.

They parted, and away posts the cavalier in quest of his new mistress : his first jaunt is to court.

L'Estrange.

A certain stiffness in my limbs entirely destroyed that jauntiness of air I was once master of. Addison.

Thus much of the scheme of my design in this part have I run over, and led my reader a long and tedious jaunt in tracing out those metallic and mineral bodies.

Woodward.

JAUTS, a people of Hindostan, first mentioned about the beginning of the eleventh century, on the invasion of India by Mahmoud the Gaznevide. He found them established on the eastern bank of the Indus, and preparing to oppose his passage by a large fleet of boats, to the number of several thousands. They were, however, completely defeated, and driven into the neighbouring mountainous districts. In the reign of Aurengzebe, Churamana, a Jaut of distinction, collected some troops, and gradually rose from a captain of banditti to be a powerful chieftain. He had once the audacity to attack and plunder the rear of that monarch's army: when pursued, he took refuge among the mountains of Narwar. The Jauts, on the decline of the power of Aurengzebe's successors, gradually rose into notice, particularly under their chief Sooraje Mull, who at last almost dictated in the counsels of the Mogul emperor. Ahmed Shaw, however, the Caubul sovereign, defeated this chieftain, and compelled him to seek the alliance of the Mahrattas. His son, Jowaliar Sing, was assassinated, and in the hand of his successor (at his father's death an infant), all the power of this tribe was diminished to the possession of the fortress of Bhurtpoor, and a small district around. Here, in 1805, the rajah Runjeet Sing received Holkar and his army, after their defeat by lord Lake, and the British in the siege of that place sacrificed a vast number of lives. Ultimately, however, it capitulated, and the Jaut rajah was compelled to pay twenty lacks of rupees.

JAW, n. s. Fr. joue, a cheek; whence joowbone, or cheekbone, then jaw. The bone of the mouth in which the teeth are fixed : the mouth.

My tongue cleaveth to my jaws, and thou hast Psalm xxii. 15. brought me into the dust of death.

JAY

A generation whose teeth are as swords, and their jaw teeth as knives, to devour the poor. Prov. xxx.

My bended hook shall pierce their slimy jaws. Shakspeare.

I from the jaws of a gardener's bitch Did snatch these bones and then leaped the ditch. Ben Jonson.

O that fortune

Had brought me to the field where thou art famed To have wrought such wonders with an ass's jaw.

Milton. Samson Agonistes. The jaw bones, hearts, and galls of pikes are very medicinable. Walton's Angler.

More formidable hydra stands within,

Whose jaws with iron teeth severely grin. Dryden. Piso, who probably speaks Aristotle's meaning, said that the crocodile doth not only move his upper jaw, Grew.

but that his nether jaw is immoveable. A smeary foam works o'er my grinding jaws,

And utmost anguish shakes my laboring frame.

Rowe.

(The creature was his father's dog, that died) Now feeling all the vulture in his jaws,

With some remorse received (though first denied), As a great favour one of the fore-paws.

Byron. Don Juan.

JAXT, a river of Germany, in Wirtemberg, which rising in Oettingen, flows through the principality of Ellwangen, and runs into the Neckar, opposite Wimpfen in Suabia. lts volume of water is large, and it serves for floating wood, but is not navigable.

JAXT, in Germany, a northern department of the kingdom of Wirtemberg, deriving its name from the above river, and having the Baden territory on the west, and Bavaria on the east. This name, formerly given to a province with an extent of 700 square miles and 130,000 inhabitants, is, since the year 1818, extended to a track of country of more than twice that size and population.

JAY, n. s. Named from his cry.-Skinner. A bird; pica glandaria.

The chattering pie;

The scorning jaie; the eles foe the heroune;

The false lapwing, all full of trecherie. Chaucer. The Assemble of Foules. Two sharp-winged sheers

Decked with divers plumes, like painted jays,

Were fixed at his beck, to cut his airy ways.

Faerie Queene.

We'll use this unwholesome humidity, this gross watery pumpion-we'll teach him to know turtles from Shakspeare. jays.

What, is the jay more precious than the lark, Because his feathers are more beautiful? Id. I am highly delighted to see the jay or the thrush

hopping about my walks. Spectator. Admires the jay the insect's gilded wings

Or hears the hawk when Philomela sings ? Pope. Ten thousand warblers cheer the day, and one

The live-long night; nor these alone, whose notes Nice-fingered art must emulate in vain, But cawing rooks, and kites that swarm sublime In still-repeated circles, screaming loud; The jay, the pie, and e'en the boding owl,

That hails the rising moon, have charms for me.

Cowper.

JAY, in ornithology. See Convus.

JAY (Guy Michael le), a French gentleman, who distinguished himself by causing a polyglot Bible to be printed at his own expense in 10

569

vols. folio. This undertaking however proved his ruin; for he printed it with his own name, and thus offended cardinal Richelieu, who, after the example of cardinal Ximenes, was ambitious of eternising his name, by affixing it to such a noble copy of the Holy Scriptures. He also made it too dear for the English market; on which Dr. Walton undertook his polyglot Bible, which, being more commodious, reduced the price of M. le Jay's. After the death of his wife, M. le Jay took orders, was made dean of Vezelay in the Nivernois, and Louis XIV. gave him the post of counsellor of state. He died in 1675.

JAZEL, n. s. A precious stone of an azure or blue color.

JAZER, or JASER, in ancient geography, a Levitical city in the territory of the Amorites, beyond Jordan, ten miles west, or rather southwest, of Philadelphia, and fifteen miles from Esebon; and therefore situated between Philadelphia and Heshbon, on the east border of the tribe of Gad, supposed to be the Jazorem of Josephus.

IBABA, one of the largest towns in Abyssinia, and the capital of the province of Maitsha. It is little inferior to Gondar in extent, and the country around is remarkably fertile.

IBARRA, a fertile province of South America, in Quito, bounded east by the province of Sucumbios, and by the woods of the Indians; north by the province of Pastos; west by that of Esmeraldas; and south by that of Otavalo. It is twenty leagues in length from north-west to south-east, and, for the most part, of a hot climate. It abounds in excellent corn, and sugarcanes. Great quantities of cotton and fruit are also grown. Its principal commerce consists in fine cotton stuffs. It is fertilised by many rivers. Those of chief importance are the Pisco, the Taguando, and the Blanco, which, being united, form the Mira.

IBARRA, the capital of the foregoing province, is situated on an extensive and delightful plain, watered on the east by the river Taguando, and west by Ajavi. The streets are wide and convenient, and the buildings of good construction. It has several convents and a monastery; and the suburbs are inhabited by Indians. Population 12,000. Forty-two miles north-east from Quito.

IBBERVILLE, a river, or rather a natural canal, of West Florida, which in May, June, and July, when the Mississipi overflows and runs into it, forms a communication for vessels drawing three or four feet, from the Mississipi to the Gulf of Mexico east, through lakes Mauripas and Pontchartrain; but is dry all the rest of the year.

IBERIA, the ancient name of Spain, so called from the river Iberus, now Ebro.

IBERTA was also the name of an inland country of Asia, having Colchis and a part of Pontus on the west, Mount Caucasus on the north, Albania on the east, and Armenia Major on the south. It is now the western part of Georgia.

The IBERIAN MOUNTAINS are the most exposition. An ode, entitled Alcastensive mountain range in Spain, and commence sydeh Almacsoureh, has been commented on by at the north of that country, west of the Ebro. a multitude of critics: and it has engaged the They separate the two Castiles from Arragon, attention of modern orientalists. It was pub-

and extending on the shores of the Mediterranean, traverse, under different names, Valencia, Granada, and Murcia; terninating on the Mediterranean, in the promontories of Oropesa, Martino, Palos, and Gata. The Sierra de Oca, in the province of Burgos, forms part of this range. The highest point is the Cabeço de Maria, in the Sierra de Alcarraz, having an elevation of 7300 feet. Among other ascertained elevations are the peak of the Sierra Espadan, 4160; the Casueleda, in the Sierra of that name, 3300; and the peak of Penaglosa 2770 feet in height.

IBN

IBERIS, sciatica cresses, or candy-tuft, a genus of the siliquosa order, and tetradynamia class of plants: con. irregular; the two exterior petals larger than the interior ones; the silicula polyspermous, emarginated. There are eighteen species :--

1. I. amara, the bitter candy-tuft, has branching stalks like the umbellata, which rise from eight to twelve inches high; small, spear-shaped, and slightly-indented leaves; and all the branches terminated by racemose bunches of white flowers in June and July.

2. I. semperflorens, the ever-flowering shrubby iberis, has low undershrubby stalks, very branchy, growing to the height of eighteen inches, with white flowers in umbels at the ends of the branches, appearing at all times of the year.

3. I. sempervirens, the tree candy-tuft, has low undershrubby stalks, very branchy and bushy, rising to the height of ten or twelve inches, with white flowers in umbels at the ends of the branches, appearing great part of the summer. This and the last species are tender, and must be put in pots, to be sheltered from the winter frosts. They are easily propagated by slips or cuttings.

4. I. umbellata, the common candy-tuft, has herbaceous, short, round, and very branchy stalks of tufty growth, from about six to ten inches high; small spear-shaped leaves, the lower ones serrated, the upper entire; and all the stalks and branches terminated by umbellate clusters of flowers of different colors in the varieties. This species and the amara, No. 1, being hardy annuals, may be sowed in any common soil in March, till Midsummer, and will thus afford a succession of flowers from June to September.

IBIS. See TANTALUS.

IBN DOREID, or DOREIDI, a famous Arabic poet of the ninth century, was a native of Bassora, but, in consequence of a foreign invasion, resided twelve years with a relative at Oman, after which he returned to his native place. Some years after this he went to Fars, and was employed in the administration of the finances there. He is said to have been reduced to great indigence by his generosity, and retiring to Bagdad, when his patron was displaced, attracted the notice of the caliph Moctadez, who gave him a pension. He died at Bagdad A. D. 933. His works are numerous, comprising every species of poetical composition. An ode, entitled Alcassydeh Almacsoureh, has been commented on by a multitude of critics: and it has engaged the

570

lished by Scheidius at Harderwick, in 1768; and by Haitsma, at Franeker, in 1773, 4to. with a Latin translation.

IEN EL ALAM (Ali Ben al Hassan), a celebrated Arabian astronomer, the author of an astronomical table, containing the result of numerous observations made at Bagdad in the reign of Adadodawla: but this work is lost. After the death of Adadodawla he left his country on a pilgrimage, and died on his return, at Osaila, in 985.

IBN KHILCAN (Schems-eddin Abou'l Abbas Ahmed), an Arabian historian, descended from the family of the Barmecides, was born at Arbel in 1211: he went early in life into Syria, and thence to Egypt: in 1261, after having filled the office of cadi at Cairo, he was promoted to the station of cadi of Damascus. He continued there till 1270, when we find him professor in one of the colleges at Cairo. In 1277 he was re-installed in his post at Damascus, soon after which he joined in the revolt of the governor of that city against the sultan. The attempt was unsuccessful, and Ibn Khilcan was condemned to death, but afterwards pardoned, and again restored to his office. He died at Damascus in 1282. His principal work is a biographical dic-tionary, entitled The Decease of eminent Personages, and the Lives of Contemporaries. An outline of it was published by M. B. Fred. Tydeman, at Leyden, in 1809, under the title of Specimen Philologicum Exhibens Conspectum operis Ibn Chalicani de vitis Illustrium Virorum, 4to.

IEN YOUNIS (Ali Ben Abdalrahman), an illustrious Arabian astronomer, born of a noble family, A. D. 979. The caliph Azyz facilitated his studies in that science, and Ibn Younis soon justified the generosity of his patron. He carried on his researches in an observatory near Cairo; and embodied the result of his observations in a work called Zydj Ibn Younis, in which he corrected many of the errors of preceding astronomers. He was also skilled in music. His death took place A. D. 1008.

IBRAHIM, sultan of the Turks, succeeded his brother Amurath, or Morad IV., in 1640, be-ing then in his twenty-third year. He had been long kept a prisoner by Morad, who would have put him to death, had he not been prevented by his mother; and such was the state of his mind, that he refused admission to the great officers of the government when they came to announce his brother's death, and his own accession to the throne, nor could he be prevailed on to open the doors of his dungeon till the dead body of Morad was laid in his view. Ibrahim was ill fitted for the cares of a crown, and resigned the duties of his station to his ministers, contenting himself with triffing amusements and gross voluptuousness. One of the first events of his reign was the capture of Azof, the principal post of the Cossack pirates, who infested the Black Sea; by which measure their depredations were repressed, and the navigation rendered clear to Constantinople. An attempt was made upon the island of Candia, but it was not successful. The voluptuousness of Ibrahim was the cause of his death; he had violated the chastity of the beautiful

daughter of the mufti, who resolved upon revenge, and took such means as to effect the end. He ordered the sultan to appear before him, which he refused ; he then declared him an infidel, and incapable of exercising the authority of government. The janissaries took the part of the head of the church, and he was almost immediately strangled. This was in the year 1649. He left several sons, of whom three successively filled the throne.

IBRAHIM EFFENDI, a distinguished Turk in the seventeenth century, who was a member of the body of Ulema, or lawyers, and, being skilled in the Persian and Arabic languages, occupied several posts of importance at Constantinople. The gospel history, on examination, produced a conviction on his mind of the truth of Christianity, and he was baptised at Pera in 1671. Thence he retired to Venice, and was confirmed in the church of St. John the Baptist. Two years after he assumed the habit of St. Dominic, and the name of Paul Anthony Effendi. He left to the library of St. John and St. Paul the Four Evangelists, translated into Arabic, with the Psalms, Canticles, and other books of the Old Testament; and died in 1697, at the age of fifty-six.

IBYCUS, a Greek lyric poet, of whose works there are only a few fragments remaining, flourished A. A. C. 550. It is said that he was assassinated by robbers; and that, dying, he called upon some cranes he saw flying to bear witness. Some time after one of the nurdercrs, seeing some cranes, said to his companions, 'There are the witnesses of Ibycus's death:' which being reported to the magistrates, the assassins were put to the torture, and, having confessed the fact, were hanged. Thence arose the proverb Ibyci Grues.

ICA, a province of Peru, bounded east by Castro Vireyna and Lucanas, south-east and south by Cumana, and west by the Pacific Ocean. It is fifty leagues in length from north to south, and in extreme breadth twenty-four from east to west. It is of a hot temperature, especially towards the coast, where various desert tracks are found. But, in general, the province may be said to be fertile in fruits, grain, and pulse, particularly grapes, the vines yielding in many parts solely from the moisture they derive from the earth. The wines and brandies manufactured are carried to Lima, Panama, and Guayaquil, and the mountainous provinces of the Sierra. Olive plantations are also numerous. The produce is conveyed by means of asses, which abound here. The country is watered by several rivers.

Ica, the capital of the above province, situated in a valley twenty-five miles south of Pisco, has several convents and a college, which formerly belonged to the Jesuits. A glass foundry is also established here. It carries on a brisk traffic in wine and brandy. It is 140 miles E.S.E.from Lima.

ICE, n. s. & v. a. \supset
ICE-HOUSE, n.s.
ICE'LANDER, n. s.
l'CICLE, n. s.
I'CINESS, n. s.
I'cy, adi.

Saxon, 17; Swed. is; Gothic, ise; Belgic, cyse. Water, or other liquor, made solid by cold; concreted sugar: to break the lice, is to make the first opening to any attempt : ice, to cover with ice; to turn to ice; to cover with concreted sugar: ice-house, a place in which ice is deposited against the warm months : Icelander, an inhabitant of Iceland : icicle, a shoot of ice hanging from a pedicle: iciness, the state of generating ice; sensation of severe cold: icy, in a figurative sense, cold-hearted; free from passion; impenetrable.

Nowe hote for colde, now colde for hete again ; Now cold as yse; and now, as coles red, For hete I brenne.

Chaucer. Complaint of the Blacke Knight. You naked trees, whose shady leaves are lost,

Wherein the birds were wont to build their bowre, And now are clothed with mosse and hearie frost, Insteede of blosomes, wherewith your buds did flowre ; I see your teares, that from your boughes do raine, Whose drops in drerie ysicles remaine.

Spenser. Shepheardes Calender.

If you break the ice, and do this feat, Atchieve the elder, set the younger free For our access, whose hap shall be to have her, Will not so graceless be to be ingrate. Shakspearc. Id.

Thou art all ice, thy kindness freezes.

You are no surer, no,

Than is the coal of fire upon the ice, Or hailstone in the sun. Id. Coriolanus.

If thou do'st find him tractable to us,

Encourage him, and tell him all our reasons; If he be leaden, icy, cold, unwilling, Be thou so too. Id. Richard III.

Thou wouldest have never learned

The icy precepts of respect. Id. Timon. Thus have I broken the ice to invention, for the lively representation of floods and rivers necessary for our painters and poets. Peacham on Drawing.

After he'd a while looked wise,

Hudibras.

At last broke silence and the ice. If distilled vinegar or aqua-fortis be poured into the powder of loadstone, the subsiding powder, dried, retains some magnetical virtue ; but if the menstruum be evaporated to a consistence, and afterwards doth shoot into icicles, or crystals, the loadstone hath no Browne's Vulgar Errours. power upon them.

He relates the excessive coldness of the water they met with in summer, in that icy region where they were forced to winter. Boyle.

From locks uncombed, and from the frozen beard, Long icicles depend, and cracking sounds are heard. Dryden.

In thy fair brow there's such a legend writ Of chastity, as blinds the adult'rous eye :

Not the mountain ice,

Congealed to chrystal, is so frosty chaste

As thy victorious soul which conquers man

And man's proud tyrant passion.

If I should ask whether ice and water were two distinct species of things, I doubt not but I should be answered in the affirmative. Locke.

The common dropstone consists principally of spar, and is frequently found in form of an icicle, hanging down from the tops and sides of grottos.

Woodward's Natural History.

Id.

Bear Britain's thunder and her cross display To the bright regions of the rising day ;

Tempt icy seas, where scarce the waters roll,

Where clearer flames glow round the frozen pole. Pope.

'Tis here all meet !

The shivering Icelander, and sun-burnt Moor. Blair's Grave.

Ice, in physiology, a solid, transparent, and brittle body, formed of some fluid, particularly water, by means of cold. See articles CHEMIS-TRY, COLD, FREEZING, FROST, and HEAT.

Galileo was the first that observed ice to be lighter than the water which composed it; and hence it happens, that ice floats upon water, its specific gravity being to that of water as 8 to 9. This rarefaction of ice seems to be owing to the air-bubbles produced in water by freezing; and which, being considerably large in proportion to the water frozen, render the body so much specifically lighter : these air-bubbles, during their production, acquire a great expansive power, so as to burst the containing vessels, though ever so strong. M. Merian, in a dissertation on ice, attributes the increase of its bulk chiefly to a different arrangement of the parts of the water from which it is formed; the icy skin on the water being composed of filaments, which are constantly and regularly joined at an angle of 60°; and which, by this angular disposition, occupy a greater volume than if they were parallel. He found the augmentation of the volume of water by freezing, in different trials, a 14th, an 18th, a 19th, and when the water was previously purged of air, only a 22d part: that ice, even after its formation, continues to expand by cold, for, after water had been frozen to some thickness, the fluid part being let out by a hole in the bottom of the vessel, a continuance of the cold made the ice convex; and a piece of ice, which was at first only a 14th part specifically lighter than water, on being exposed some days to the frost, became a 12th part lighter. To this cause he attributes the bursting of ice on ponds. On Lake Champlain, and other American lakes, and even on narrow rivers, fissures and rents of enormous magnitude are often made in the ice, and are always accompanied with loud reports, like those of cannon. The unwary traveller, who, with his sleighs and horses, adventures by night, and sometimes even by day, across the great northern lakes, is frequently swallowed up in the openings, which are thus unexpectedly made in the ice. When the weather grows warm again, before the ice melts, the fissures close, and sometimes the edges of them even overlap. Wax, resins, and animal fats, made fluid by fire, instead of expanding like watery liquors, shrink in their return to solidity : for solid pieces of the same bodies sink to the bottom of the respective fluids; a proof that these bodies are more dense in their solid than in their fluid state. The oils which congeal by cold, as olive oil, and the essential oil of aniseeds, appear also to shrink in their congelation. Hence, the different dispositions of different kinds of trees to be burst by, or to resist, strong frosts, are by some attributed to the juices with which the tree abounds; being in the one case watery, and in the other resinous or oily.

Though it has been generally supposed that the natural crystals of ice are stars of six rays, forming angles of 60° with each other, yet this crystallisation of water, as it may properly be called, seems to be as much affected by circumstances as that of salts. Hence we find a considerable difference in the accounts of those who nave undertaken to describe these crystals. M. Merian informs us, that they are stars with six radii; and his opinion is confirmed by observing the figure of frost on glass. M. Romé de L'Isle determines the form of the solid crystal to be an equilateral octahedron. M. Hassenfratz found it to be a prismatic hexahedron.

On the 3d of January 1821 the late Dr. Clarke observed at Cambridge regular crystals of ice, many of which were more than an inch long. He exhibited them to several members of the University, and frequently in their presence measured the angles of the rhombic crystals, with the goniometer of Carangeau, which he found to be 120° and 60°. After a thaw took place, the crystals preserved in melting the same inclination of their planes. The above very interesting results confirm the anticipation of Dr. Brewster, who, from the optical structure of ice, referred it to the rhomboidal or pyramidal systems of professor Mohs.

Ice forms generally on the surface of water; but this, too, like the crystallisation, may be varied by an alteration in the circumstances. In Germany, particularly in the northern parts, there are three kinds of ice. 1. That which forms on the surface. 2. That formed in the middle of the water, resembling nuclei or small hail. 3. The ground ice which is produced at the bottom, especially where there is any fibrous substance to which it may adhere. This is full of cells like a wasp's nest, but less regular, and frequently raises very heavy bodies from the bottom by means of its inferiority in specific gravity to the water in which it is formed. This ice differs from that continuous kind which is formed along the edge of rivers, and particularly in places where the water is quiet; it never forms in lakes, pools, or other stagnant water, and motion appears to be a condition essential to its existence. At first sight it might be taken for an aggregation of snow penetrated by water, swimming at the surface, rather than for ice; but a closer examination will not fail to discover its true characters. In fact it is formed of an assemblage of a multititude of small, thin, and rounded plates of ice, having a diameter of a few lines. They are individually transparent, but their aggregation presents at a distance the appearance of a semitransparent mass like wet snow. It is known that, before rivers begin to carry the ground-ice, the temperature of the air must have been for several days previous some degrees below zero; and it is observed, in general, that a cold wind, blowing in a direction contrary to the current of the river, is singularly favorable to the formation of this sort of ice.

Plot, in his Ilistory of Oxfordshire, observes, that all the watermen, with whom he has had an opportunity of speaking on the subject, agree in thinking, that the rivers of the country always begin to freeze at the bottom. He describes the manner in which the small pieces of ice, called ice-meers, rise from the bottom to the surface, and mentions their frequently containing gravel or stones, which they have carried along with them. Hales confirms these observations; and says, that the watermen of the Thames assert, that, some days before that river is frozen at

the surface, they feel the ice at the bottom with their poles, and that they see it rising to the surface. Mr. Streake relates, that, in February 1806, at Pillau, chains of iron, six feet in length, which had remained a long time lost at the bottom of the water, a cable thirty fathoms long, and stones weighing from three to six pounds, were raised to the surface, enclosed in a thick envelope of ice; and that an anchor, after having remained an hour in the water, was taken out covered with a layer of ice.

The following explanation of this phenomenon is what M. Merian considers the most natural. If it be true, that, in winter, running water is first cooled at the surface, it is also true, that its constant agitation, especially when aided by a wind blowing in a direction contrary to that of the current, continually mixes the water of the surface and that of the bottom, notwithstanding the inconsiderable difference of their specific gravities. The temperature of the bottom and that of the surface, even in pretty deep rivers, does not present any remarkable difference, while the prominent bodies fixed at the bottom present points of attachment to the forming ice, much more advantageous than a constantly agitated surface; and it is well known what influence these points or nuclei have in general upon crystallisation. The water sufficiently cooled begins therefore to be converted into ice at the bottom, particularly in places where shelter is afforded by prominences from the impetuosity of the current.

In many countries the warmth of the climate renders ice not only a desirable, but even a necessary article; so that it becomes an object of some consequence to discover a ready and cheap method of procuring it.

ICEBERGS, large bodies of ice filling the vallevs between the high mountains in northern latitudes. Among the most remarkable are those of the east coast of Spitzbergen; see GREEN-LAND, and SPITZBERGEN. They are seven in number, but at considerable distances from each other : each fills the valleys for tracts unknown, in a region totally inaccessible in the internal parts. The glaciers of Switzerland seem contemptible to these; but present often a similar front into some lower valley. The last exhibits over the sea a front 500 feet high, emulating the emerald in color; cataracts of melted snow precipitate down various parts, and black spiring mountains, streaked with white, bound the sides, and rise, crag above crag, as far as eye can reach in the back ground. At times immense fragments break off, and tumble into the water, with a most dreadful noise. Masses have been seen resembling a Gothic church, with arched windows and doors, and all the rich drapery of that style, composed of crystals of the richest sapphirine blue; tables with one or more feet; and often immense flat roofed temples, like those of Luxor on the Nile, supported by round transparent columns of cœrulcan hue, float by the astonished spectator. These icebergs are the creation of ages, and receive annually additional height by the falling of snows and rain, which often instantly freezes, and repairs the loss occasioned by the influence of the melting sun.

The following account of an excursion to the Seven Icebergs, in July 1818, is given by captain Scoresby. A strong north-westerly swell having for some hours been beating on the shore, had loosened a number of fragments attached to the iceberg, and various héaps of broken ice denoted recent shoots of the sea-ward edge. 'As we rowed,' says he, ' towards it, with a view of proceeding close to its base, I observed a few little pieces fall from the top; and, while my eye was fixed upon the place, an immense column, probably fifty feet square, and 159 feet high, began to leave the parent ice at the top, and, leaning majestically forward, with an accelerated velocity fell with an awful crash into the sea. The water into which it plunged was converted into an appearance of vapor or smoke, like that from a furious cannonading. The noise was equal to that of thunder, which it nearly resembled. The column which fell was nearly square, and in magnitude resembled a church. It broke into thousands of pieces. This iceberg was full of rents, as high as any of our people ascended upon it, extending in a direction perpendicularly downward, and dividing it into innumerable columns. The surface was very uneven, being furrowed and cracked all over. This roughness appeared to be occasioned by the melting of the snow, some streams of water being seen running over the surface; and others could still be heard pursuing their course through sub-glacial channels to the front of the iceberg, where, in transparent streams, or in small cascades, they fell into the sea. In some places chasms of several yards in width were seen, in others they were only a few inches or feet across. One of the sailors, who attempted to walk across the iceberg, imprudently stept into a narrow chasm filled up with snow to the general level. He instantly plunged up to his shoulders, and might, but for the sudden extension of his arms, have been buried in the gulf.'

In the first ages of the Spitzbergen fishery, when the ships sometimes moored close to the shore, many serious disasters were occasioned by the fall of pieces of icebergs. One of the Russia Company's ships, which was on the whale-fishery in the year 1619, was driven on shore in Bell Sound, by ice setting in from the sea. The captain, with most of his crew and boats, was absent at the time of the accident; but, on the first intelligence, caused his boats to be hauled up on the ice, and proceeded on board to endeavour to get the ship off. After they had been using every endeavour for this purpose, during about an hour, a main piece of an adjoining ice-cliff came down, and almost overwhelmed the vessel and her crew in its ruins. The shock must have been tremendous. The ice which fell struck the ship so high and so forcibly, that it carried away the foremast, broke the main-mast, sprung the bowsprit, and flung the ship over with such violence, that a piece of ordnance was thrown overboard from under the half deck; and the captain and some of the crew were projected in the same way. The captain, notwithstanding his imminent danger, with fragments of ice flying in all directions, and the masts of the ship falling around him, escaped unhurt; but the mate, and

two more of the crew, were killed, and many others were wounded.

ICE-CREAM, cream cooled by ice. Take a sufficient quantity of cream, and when it is to be mixed with raspberry, or currant, or pine, a quarter part as much of the juice or jam as of the cream ; after beating, and straining the mixture through a cloth, put it with a little juice of lemon into the mould, which is a pewter vessel, and varying in size and shape at pleasure ; cover the mould, and place it in a pail about twothirds full of ice, into which two handfuls of salt have been thrown; turn the mould by the handhold with a quick motion to and fro, in the manner used for milling chocolate, for eight or ten minutes; then let it rest as long, and turn it again for the same time; and, having left it to stand half an hour, it is fit to be turned out of the mould, and to be sent to table. Lemon-juice and sugar, and the juices of various kinds of fruits, are frozen without cream; and when cream is used, it should be well mixed.

ICE-HILL, a sort of structure common upon the Neva at Petersburgh, which affords a perpetual fund of amusement to the populace. It is constructed in the following manner :--- A scaffolding is raised upon the river about thirty feet in height, with a landing place on the top, the ascent to which is by a ladder. From this summit a sloping plain of boards, about four yards broad and thirty long, descends to the superficies of the river; it is supported by strong poles gradually decreasing in height, and its sides are defended by a parapet of planks. Upon these boards are laid square masses of ice about four inches thick, which, being first smoothed with the axe and laid close to each other, are then sprinkled with water; by these means they coalesce, and, adhering to the boards, immediately form an inclined plain of pure ice. From the bottom of this plain the snow is cleared away for the length of 200 yards, and the breadth of four, upon the level bed of the river; and the sides of this course, as well as the sides and top of the scaffolding, are ornamented with firs and pines. Each person, being provided with a sledge, mounts the ladder; and, having attained the summit, he sets himself upon his sledge at the upper extremity of the inclined plain, down which he suffers it to glide with considerable rapidity, poising it as he goes down; when the velocity acquired by the descent carries it above 100 yards upon the level ice of the river. At the end of this course there is usually a similar icc-hill, nearly parallel to the former, which begins where the other ends; so that he immediately mounts again, and in the same manner glides down the other inclined plane of ice. This diversion he repeats as often as he pleases. These ice-hills exhibit a pleasing appearance upon the river, from the trees with which they are ornamented, as well as from the moving objects which at particular times of the day are descending without intermission.

ICEHOUSE, a house in which ice is reposited against the warm months. The aspect of icehouses should be towards the east or south-east, for the advantage of the morning sun to expel the damp air, as that is more pernicious than warmth; for which reason, trees in the vicinity of an ice-house tend to its disadvantage. The best soil for an ice-house to be made in is chalk, as it conveys away the waste water without any artificial drain; next to that loose stony earth or gravelly soil. Its situation should be on the side of a hill, for the advantage of entering the cell upon a level.

To construct an ice house, first choose a proper place at a convenient distance from the house or houses it is to serve : dig a cavity of the figure of an inverted cone, sinking the bottom in a concave form, to make a reservoin for the waste water till it can drain off; if the soil require it, cut a drain to a considerable distance, or so far as will come out at the side of the hill, or into a well, to make it communicate with the springs; and in that drain form an air-trap by sinking the drain so much lower in that place as it is high, and bring a partition from the top an inch or more into the water, which will consequently be ir the trap, and will keep the well air-tight. Work up a sufficient number of brick piers to receive a cart-wheel, to be laid with its convex side upwards to receive the ice; lay hurdles and straw upon the wheel, which will let the melted ice drain through, and serve as a floor. The sides and dome of the cone are to be nine inches thick, and the sides to be done in steened brickwork, i. e. without mortar, and wrought at right angles to the face of the work: the filling in behind should be with gravel, loose stones, or brick-bats, that the water which drains through the sides may the more easily escape into the well. The doors of the ice-house should be made as close as possible, and bundles of straw placed always before the inner door to keep out the air. The ice when to be put in should be collected during the frost, broken into several pieces, and rammed, down in strata of not above a foot, to make it one complete body; the care in putting it in, and well ramming it, tends much to its preservation. In a season when ice is not to be had it sufficient quantities, snow may be substituted. Ice may be preserved in a dry place under ground, by covering it well with chaff, straw, or reeds. Chaff is much used for this purpose in Italy.

ICE ISLAND, a name given by sailors to a great quantity of ice collected into one huge solid mass, and floating about upon the seas near or within the polar circles. In the midst of those tremendous masses navigators have been arrested and frozen to death. In this manner the brave Sir Hugh Willoughby perished with all his crew in 1553; and in the year 1773 lord Mulgrave was caught in the ice, and was near experiencing the same unhappy fate. The forms assumed by the ice in this chilling climate are very pleasing. The surface of that which is congealed from the sea water is flat and even, hard, and opaque, resembling white sugar. The greater pieces, or fields, are many leagues in length : the smaller are the meadows of the seals, on which those animals at times frolic by hundreds. The motion of the smaller pieces is as rapid as the currents: the greater, which are sometimes 200 leagues long, and sixty or eighty broad, move slow and "majestically, often fix for a time, im-

moveable by the power of the scean, and then produce near the horizon that bright white appearance called the blink. The approximation of two great fields produces a most singular phenomenon : the larger forces the less out of the water, and adds it to its surface: a second and often a third succeeds; so that the whole forms an aggregate of a tremendous height. These float in the sea like so many rugged mountains, and are sometimes 500 or 600 yards thick; but the far greater part is concealed beneath the water. These are continually increased in height by the freezing of the spray of the sea, or of the melting of the snow, which falls on them. Those which remain in this frozen climate receive continual increase; others are gradually wafted by the northern winds into southern latitudes, and melt by degrees by the heat of the sun, till they waste away in the boundless element. The collision of the great fields of ice, in high latitudes, is often attended with a noise that for a time takes away the sense of hearing any thing else; and the less with a grinding of unspeakable horror. The water which dashes against the mountainous ice freezes into an infinite variety of forms; and gives the voyager ideal towns, streets, churches, steeples, and every shape which imagination can frame.

ICELAND, an island of the North Atlancic Ocean, belonging to Denmark, extends according to Henderson from lat. 63° 20' to 67° 20', and between 15° 30' and 22° 30' W. long. It is of an irregular oval figure, about 380 miles in length, and about 230 in its greatest breadth, containing upwards of 60,000 square miles: Dr. Henderson says 67,000; but the estimates of its size vary considerably. The coast is indented all round with numerous deep gulfs, bays, and creeks; several of which form excellent harbours.

When this island was discovered by the Norwegians, in 860, it was uninhabited : that nation first colonised it in 878; since which its history has been very accurately kept. The whole coun-try is composed of stony and barren mountains, whose summits, though the highest does not reach 5000 feet, are covered with glaciers (Snaefell Jokul, the highest point, is 4558 feet). These mountains present two distinct characters; first, those formed by thirty to forty regular horizontal strata of rock; while the second are composed of various substances mingled and confused, such as great masses of rock, agglomerations of pu-mice stone, &c., cemented by gravel and clay. These are evidently of volcanic origin, and indeed the whole island may be considered as a vast cauldron filled with combustible matters, whose ignition produces frequent and sometimes most dreadful earthquakes and eruptions; amongst which those of 1783 were the most tremendous of any recorded in history. 'In that year,' says the abbé Ordinaire, ' it was feared, that this island would fall to pieces, so dreadful and multiplied were the convulsions produced by its volcanoes and internal fires. A thick sulphureous smoke rendered the island absolutely invisible to mariners at sea, while the people on shore were in danger of being suffocated by it. The fog, which about this time spread over all

Europe, was considered as an effect of these exhalations. Frightful hollow roarings proceeded from the bottom of the sea. From Mount Shap-ton-gluber (Skaptar Jokul) there poured a terrific torrent of liquid fire for six weeks, which ran ninety miles to the sea and was fifty miles in breadth, and the perpendicular height of its sides from eighty to 100 feet; it dried up twelve rivers and filled extensive valleys, so that the whole surface of the country was in a state of igneous fluidity, and resembled an immense lake of melted metal.

Not equal to the above in its terrific consequences, but still worth recording, was the eruption of the old volcano of Eyafjeld Jokul in December 1821.

Europe had this month experienced a remarkable fall of the barometer, accompanied with an agitation of the magnetic needle, which indicated, in the opinion of many persons, some extraordinary convulsion of nature. It was afterwards found that this old Icelandic volcano, which had been quiet since 1612, was suddenly on the 16th in a state of great activity.

This mountain, otherwise called Cape Hecla, is about 5666 feet in height. It is nearly equidistant from Kolla and Hecla, and is the southernmost of the chain where the dreadful eruption broke out about the middle of the last century.

On the 19th of December, 1821, the eruption began. The crater was formed at the distance of five miles, from the minister's house at Holt, and discharged itself through the thick mass of ice that enveloped it, and which is seldom melted. The ice was dispersed in every direction, and a mass, eighteen feet high and sixty feet in circumference, fell towards the north. cumference, fell towards the north. A number of stones, of different sizes, rolled down the mountain, accompanied with a noise like thunder; and this was immediately followed by a discharge of an enormous and lofty column of flame, which illuminated the whole country, and allowed the people at Holt to read as perfectly within their houses at night as if it had been day. Ashes, stones, gravel, and heavy melted masses of rock, some of which weighed about fifty pounds, were thrown up, and one of these last was found at the distance of five miles from the crater. On the day immediately following the eruption, a great quantity of the fine grayishwhite powder of pumice was discharged, and carried about by the wind so as to fall like snow, and cover the adjacent country. It penetrated into the houses through every opening. It exhaled a disagreeable smell of sulphur, brought on affections of the eyes, and occasioned diseases among the sheep in Vester Eyafjeld and Oster Landoe. On the 25th a violent storm raged from the south, and, by the united action of the wind and the rain, the fields were cleared of the sulphurcous dust which had covered them. On the 26th and 27th of December there was a heavy storm from the north-east, and the barometer, which had been gradually falling since the 18th of December, when it was 29° 16', had reached on the 26th of December its lowest point at 28° 49'. On the 18th of February the barometer, which had been at 29° 42', on the 11th fell to 27° 72'. So late as the 23rd of Fe-

bruary the Eyafjeld Jokul emitted smoke greatly resembling the steam of boiling water; and some persons were of opinion that the mountain had decreased, and was lower near the crater, as it evidently appeared to be when viewed from north to south. It is stated that the water, in the rivers that flow from the Jokul and the surrounding mountains, had been considerably enlarged during the first day's eruption. A constant rumbling noise was heard in the vicinity of the volcano, attended occasionally by a dreadful crash as if the immense masses of stones and ice were on the eve of being precipitated down the mountain.

The total number of previous eruptions of volcanoes in Iceland appears to be the following :---

From Hecla, since the year	1004 inclusive	22
From Kattlagiau Jokul	900	7
From Krabla	1724	4
In different parts of the Guld	1-	
bringe Syssel	1000	3
At sea	1583	2
From the lake Grimsvatn, in	1716	1
From Eyafialla Jokul in	1717	1
From Eyrefa Jokul, in	1720	1
Prom Skaptar Jokul, in	1783	1
		10

In chronological order, the different eruptions mentioned by Icelandic authors stand thus : In the years 900, 1000, 1104, 1137, 1222, 1300, 1340, 1341, 1362, 1389, 1422, 1538 (Vesuvius erupted the same year), 1554 (Ætna), 1538, 1619, 1636 (Ætna), 1693 (Vesuvius, 1692; Ætna 1694), 1716, 1717 (Vesuvius), 1720, 1724, 1728, 1730 (Vesuvius), 1754 (Vesuvius), 1755 (Ætna), 1756, 1766 (Ætna and Vesuvius), 1771, and 1772, Thus it appears, flames seen on Hecla; 1783. that many of the eruptions that are known to have taken place, since Iceland was inhabited, have not been particularly noticed; and it is very probable that numerous eruptions of less note have been passed over. We may reckon active all those mountains which have burned within the last century. Of these there are six ;---Hecla, Krabla, Cattlagiau, Eyafialla, Eyrefa, and Skaptar Jokul.

These internal fires have produced a great number of yawning fissures and caverns, and give rise to innumerable boiling springs, which the natives use both medicinally and to cook their victuals without fire. The most celebrated is that of Geyser, near Skalholt, the approach to which is announced by a noise resembling the fall of a great cataract. At intervals, several times a day, it throws up a column of boiling water many feet in thickness, to the height of nearly 100 feet. Mineral springs are also common, and basaltic columns are scattered over the island, sometimes covering spaces of two or three miles in length without interruption : they have generally from three to seven sides, are from five to seven feet in thickness, and from twelve to sixteen yards in length.

Specimens of silver, copper, and iron ores have been found in Iceland, and induce the supposition that it has mines of these metals: in other mineral substances it is extremely rich, having sulphur, onyx, zeolite, chalcedony, porpumice-stone, rock-crystal, jasper, phyry, agate, carneoles, the celebrated calcareous spath or Iceland spar, that gives a double refraction, several varieties of argillaceous earth, clay for porcelain, limestone, &c.

The gulfs of the shores are filled with islands, and abound in fish, amphibious animals of the genus of phoca, and sea birds. The rivers, or rather torrents, are numerous, and, as well as the lakes, some of which are of considerable size, are well stocked with salmon and trout.

The climate of Iceland is not extremely cold, but the seasons are variable. The sea, at a small distance from the shores, is seldom frozen; and very little ice is ever seen near the west coast, notwithstanding its proximity to Green-land. On the east coast, the floating ice does not drift farther south than Berufiord in 641°. The prevailing winds are from the north, and the extremes of the temperature are between 35° below the freezing point to 70° . In some years the month of January is accompanied by violent storms from the north-west that drive vast mountains of ice into the bays of the north coast, which chill the atmosphere and prolong the winter. On this ice arrive herds of white bears, which commit great ravages among the sheep, but are soon destroyed, government paying ten dollars a head for their destruction, besides purchasing their skins. Thunder is very rarely heard, and never but in winter and in the vicinity of the volcanoes.

The most attractive curiosity of an Iceland winter is the aurora borealis; which is no where more beautiful or more constantly exhibited. Dr. Henderson says, 'I had the opportunity of contemplating the northern lights almost every clear night the whole winter, sometimes shooting across the hemisphere in a straight line, and presenting to the view, for a whole evening, one vast steady stream of light, but more commonly they kept dancing and running about with amazing velocity, and a tremulous motion, exhibiting as they advanced some of the most beautiful curvated appearances. On gaining one point of the hemisphere, they generally collected, as if to muster their forces, and then began to branch out in numerous ranks, which steered off to the greatest distances from each other as they passed the zenith, yet so as always to preserve the whole of the phenomena in an oval shape, when they contracted nearly in the same way as they had expanded, and, after uniting in a common point, they either returned in a few minutes, or were lost in a stream of light, which grew fainter and fainter, the nearer it approached the opposite side of the heavens. They were mostly of a dunnish yellow, yet often assumed mixtures of red and green. They almost always took their rise from the summit of Mount Erian, which is about due north-east from Reykeavik, and proceeded in a south-west direction. When visible the whole length of the hemisphere, they were uniformly strongest towards the north and north-east, and were always sure to be seen in that quarter when they appeared no where else.

Once or twice I observed them in the south, but they were faint and stationary.

Though the island at present produces no trees of importance, there can be no doubt but that it was formerly well wooded, the roots and trunks of trees, chiefly birch, being found in the morasses; and a species of fossil or imperfectly petrified wood, apparently oak, called surtur brand, is met with in large quantities, principally in the mountains, and partly supplies the inhabitants with fuel, the deficiency of which necessary is made up towards the south by turf and cow-dung. On the north coast drift wood is generally abundant.

According to the Icelandic annals, wheat was formerly sown here with success, but this grain will not now come to maturity; and the ripening of rye, oats, and barley, is so very precarious, that agriculture is almost entirely confined to the manuring some meadows for pasture and hay. In the island are reckoned 300 gardens, producing potatoes, cabbages, carrots, and tur-nips, but no fruit trees of any kind. The most useful indigenous plants are some cochlearia, and the Iceland moss used in dyeing. It seems probable, that the destruction of the woods, and the feebleness of vegetation in general; is owing to the increased severity of the cold, caused by the accumulation of ice between this island and Greenland, which now forms a solid mass precluding all approach to the latter, though, according to the annals, the communication was formerly open.

The wild animals of Iceland are the arctic or white, and the brown or blue fox, wild cats, rats and mice. The domestic are rein-deer, horses, black cattle, sheep, goats, dogs, and cats. The rein-deer introduced from Norway have rapidly multiplied. The horses are of a small but largeboned breed, and capable of great fatigue; they are the only land conveyances, the want of roads precluding the use of wheel carriages. The black cattle are small and without horns, while the sheep are all furnished with them. In 1810, the island had, horses, 27,000; black cattle, 20,000; sheep, 225,000. Goats are chiefly found in the north, and there are no hogs. The dogs are of three varieties, the sheep or Icelandic dog of Buffon, and two other varicties of the Danish dog. The only poultry reared, from the dearness of corn, are a few common cocks and hens. The wild birds, which the Icelanders take either for their feathers or as food, are the swan, wild geese, ducks, puffins, and other aquatic birds, the woodcock, heathcock, &c. The eider duck builds its nest in the rocks of the coast, and its down is carefully collected, but there is a heavy fine for killing the bird. It disappears in autumn, but where it retires to is unknown. The Iceland falcons are considered the best of Europe for sport, and considerable numbers were formerly sent to Copenhagen for the royal amusement, but this tribute is no longer demanded.

Besides the destructive effects of earthquakes and volcanoes, the Icelanders have to fear almost equally the disruptions of the secondary or agglomerated mountains, and the avalanches. The

Vol. XI.

former usually happen in summer, after heavy rains, which washing away the clay that sup-ported the masses of rock, they roll into the valleys, and carry destruction with them. The principal diseases to which the Icelanders are subject are catarrhal fevers, pleurisy, diarrhea, leprosy, and hypochondria. Their general food consists of dried or fresh fish, milk, cheese, curds, and bread. As luxuries, meat stewed in milk, smoked meat, porridge of wheat or barley flour and milk, sour and salted butter. The Icelanders observe Lent so strictly, that they not only do not touch meat, but even abstain from mentioning it during this season. Their chief beverage is tolerable beer, of their own brewing, and a fermented liquor produced from milk. The higher classes have, of late years, become habituated to the use of tea, sugar, and coffee, wines, brandy, &c.

The Icelanders fabricate almost all their domestic utensils, and manufacture the whole of their wool into a coarse cloth called wadmar, or into stockings, gloves, jackets, carpets, &c. The men as well as women are employed during winter in their domestic manufactures. As soon as the ice is melted cutting turf begins, and, when the thawed waters have run off from the meadows, they are cleared of the straw and other rubbish collected on them during winter, and which, by preventing the sun's rays from penetrating the ground would hinder the grass from shooting. When this operation is completed, a thin layer of manure is spread on them, which finishes the field labor until the time of mowing, which usually commences in the middle of July, and lasts till September.

The fishery principally occupies the inhabitants of the south and west coasts. Its chief objects are cod and herrings: the former, as abundant as in Newfoundland, are cured in the same manner as in Norway. The herrings arrive in shoals in June and July. About 2000 boats are usually employed in the fisheries. The Icelanders also take for their oil the arctic shark, small whales, and seals, which arrive at the same time as the white bears on the ice. A part of the fish is, after being dried, reduced to powder, and serves to feed the cattle in winter. The extent of the fisheries, considered as a branch of commercial industry, is, however, very confined, both from the imperfection of the boats and nets and from the want of capital.

Iceland is politically divided into four quarters, or amts, named after the cardinal points, which are subdivided into eighteen syssels, or districts, and these again into less jurisdictions, called hreppar. The island is governed by a grand bailiff, who is also bailiff of the southern quarter: the other three quarters are under the immediate superintendance of two subordinate bailiffs. The written laws are according to the Norwegian code, and there is an appeal to the supreme tribunal at Copenhagen. The island has no regular troops.

The population of Iceland in former times is said to have exceeded 100,000. In 1810 it was estimated at 47,000, or about thirty-three persons to a square mile for the whole island, or 102 to another recent traveller observes, 'I have fre-104, considering only the habitable parts. Dr. quently been astonished at the familiarity with

Henderson takes it at 50,000. In 1824, according to Gieman's dsecription of Iceland, it was 50,092; the whole being extended over a considerable space, and having but one physician, four surgeons, and 154 Christian pastors. Volcanic convulsions, and other accidents, epidemical diseases, and more particularly the system of commercial monopoly, which by keeping the people poor discourages marriage, are given as the causes of this decreased population.

The revenue raised in the island is about 30,000 rixdollars, the whole of which is supposed to be absorbed in the expense of its government and various establishments; so that the nett revenue to the king of Denmark is confined to the produce of the customs, which is reckoned at little more than 6000 rixdollars. The official communication between Denmark and Iceland is by packet.

Iceland has scarcely any collection of houses that deserves the name of a town. In the ancient system of commercial monopoly twentyfive ports were allowed the privilege of importation, and at each of these the company had an establishment of three or four houses. In 1787 six of these ports were granted considerable privileges, and as they become inhabited are to enjoy the rank of cities: they are Reikiavik, Westmanna, Grennefiord, Isafiord, Eyafiord, and Eskefiord. Reikiavik is now considered the capital, containing 500 inhabitants, whose houses capital, containing 500 initiagitation, red clay; the are of wood coated with tar and red clay; the church and prison alone being of stone. harbour is sheltered by several small islands, which render it safe. Skalholt, often called the capital in books of geography, probably because it is the residence of one of the two bishops, consists of only the bishop's house, the church, and a few wooden cottages. In all the other parts of the island the habitations, even of the better sort of Icelanders, are miserable hovels of turf, without windows, and the huts of the common class are such wretched dens, that it is wonderful how any thing in the human form can breathe in them.

Dr. Henderson speaks highly of the personal dispositions of the Icelanders; and all travellers notice their general intelligence and abilities. 'I have been surprised,' says Dr. H., ' at the degree of cheerfulness and vivacity which I found to prevail among them, and that not unfrequently under extreme depression and want. Their predominant character is that of unsuspecting frankness, pious contentment, and a steady liveliness of temperament, combined with a strength of intellect and acuteness of mind seldom to be met with in any other part of the world. They have also been noted for the unconquerable attachment which they feel for their native island. With all their privations, and exposed, as they are, to numerous dangers from the operation of physical causes, they live under the practical influence of one of their common proverbs : Island er hinn besta land sem solinn kinnar uppå. Iceland is the best land on which the sun shines.

On the subject of their literary attainments

which many of these self-taught peasants have double but a multiple refraction. A single discoursed on subjects which, in other countries, we should expect to hear started by those only who fill the professor's chair, or who have otherwise devoted their lives to the study of science.' The same traveller remarks, in another place, 'it is no uncommon thing to hear youths repeat passages from Greek and Latin authors, who have never been farther than a few miles from the place where they were born. Nor do I scarcely ever recollect entering a hut where I did not find some individual capable of entering into conversation with me on topics which would be reckoned altogether above the understanding of people of the same rank of society in other countries of Europe. On many occasions, indeed, the common Icelanders discover an acquaintance with the history and literature of other nations which is perfectly astonishing."

ICELANDIC CRYSTAL, in mineralogy, a pure calcareous spar, in oblique rhomboidal prisms, principally known for its double refraction. With respect to the figure of Iceland crystals, they are not all of the regular form of an oblique parallelopiped, though the generality of them are such. For this crystal spar, like many others, shoots out from a large base on the rock, into many irregular, uneven-sided scalenous pyramids, small and large; which, when broken by gentle strokes with a hammer, readily split into many pieces, parallel-wise to the base; and those on the outside are of irregular forms, with opposite sides and angles unequal. Some are like a wedge or isosceles prisms, some quadrangular pyramids. Again, some of these spars are very hard, and will take a fine polish; others are softer. Some of these pieces are colorless and transparent as glass itself, though few of these are to be met with, the greatest part being foul with mundic, and other opacous matter. Some pieces are of a yellowish hue, and others of a darker complexion; but all agree in having a double refraction and a double focus, when ground into lenses; but they differ in other respects, according to their different species. Iceland crystal will bear a red heat without losing its transparency; and, in a very intense heat, calcines without fusion; steeped a day or two in water it loses its natural polish. It is easily scratched with the point of a pin; it will not give fire on being struck against steel; and ferments and is dissolved in aqua fortis. It is found in Iceland, whence it has its name; and in France, Germany, and many other places. The phenomena of this stone are very remarkable, were first suggested by Bartholine, and have been examined with great accuracy by M. Huygens and Sir Isaac Newton. In other pellucid bodies it is well known that there is only one refraction, in this there are two; so that objects viewed through it appear double. In other transparent bodies a ray falling perpendicularly on the surface passes straight through, without suffering any refraction; and an oblique ray is always divided; but, in Iceland crystal, every ray, whether perpendicular or oblique, becomes divided into two, by means of the double refraction. Mr. B. Martin prepared several prisms of Iceland crystal which exhibited not only a

prism produced a six-fold refraction, and a prism which afforded two images applied to one of six produced twelve images. He farther observes, with respect to leeland crystal, that, though the sides of its plane of perpendicular refraction be parallel to one another, a beam of light transmitted through them will not be colorless; in which property it differs from all other known substances. See Optics.

ICENI, an ancient nation of South Britain, who inhabited the counties now called Suffolk, Norfolk, Cambridgeshire, Huntingdonshire, and the 1sle of Ely.

ICE-PLANT. See MESEMBRYANTHEMUM. ICHE, a town of France in the department of Vosges, four miles S.S.E. of Marche, and four and a quarter N. N. E. of Chatillon sur Saone.

ICHNEU'MON, n. s. Gr. ιχνέυμων. Α small animal that breaks the eggs of the crocodile.

ICHNEUMON, in zoology. See VIVERRA.

ICHNEUMONFLY, n. s. A sort of fly. The generation of the ichneumonfly is in the bodies

of caterpillars, and other nymphæ of insects.

Derham's Physico-Theology. ICHNEUMON, the ichneumon fly, in entomology, a genus of flies of the hymenoptera order. The mouth is armed with jaws, without any tongue; the antennæ have above thirty joints; the abdomen is generally petiolated,

joined to the body by a pedicle or stalk; the tail is armed with a sting, enclosed in a double-valved cylindrical sheath; the wings are lanceolated and plain. This genus is very numerous. In Gmelin's edition of the Systema Naturæ 415 species are enumerated. They are divided into families, from the color of their scutellum and antennæ, as follow: 1. Those with a whitish scutcheon, and antennæ annulated with a whitish band. 2. Those which have a white escutcheon and antennæ entirely black. 3. With a scutcheon of the same color as the thorax; the antennæ encompassed with a fillet. 4. With a scutcheon of the same color as the thorax; the antennæ black and setaceous. 5. With setaceous clay-colored antennæ. 6. With small filiform antennæ, and the abdomen oval and slender. One striking character of these species of flies is the almost continual agitation of their antennæ. The name ichneumon has been applied to them from the service they do by destroying caterpillars, plant-lice, and other insects; as the ichneumon or mangouse is said to destroy the crocodiles. The variety to be found in the species of ichneumons is prodigious; among the smaller species there are males who perform their amorous preludes in the most passionate and gallant manuer. The posterior part of the females is armed with a wimble, visible in some species, no ways discoverable in others; and that instrument, though so fine, is able to penetrate through mortar and plaster; the structure of it is more easily seen in the long-wimbled fly. The fooil of the family to be produced by this family is the larva of wasps or mason bees; for it no sooner espies one of those nests, but it fixes on it with its wimble, and bores through the mortar of

2 P 2

which it is built. The wimble itself consists of three pieces: two collateral ones, hollowed out into a gutter, serve as a sheath, and contain a compact, solid, dentated stem, along which runs a groove that conveys the egg from the animal, who supports the wimble with its hinder legs, lest it should break; and, by a variety of movements, which it dexterously performs, it bores through the building, and deposits one or more eggs, according to the size of the ichneumon, though the largest drop but one or two. Some agglutinate their eggs upon caterpillars; others penetrate through the caterpillar's eggs, though very hard, and deposit their own in the inside. When the larva is hatched, its head is so situated, that it pierces the caterpillar, and penetrates to its very entrails. These larv α suck out the nutritious juices of the caterpillar, without attacking the vitals of the creature, who appears healthy, and even sometimes transforms itself to a chrysalis. It is not uncommon to see those caterpillars fixed upon trees, as if they were sitting upon their eggs; and it is afterwards discovered that the larvæ, which were within their bodies, have spun their threads, with which, as with cords, the caterpillars are fastened down, and so perish miserably. Plant-lice, the larvæ of the curculiones, and spider's eggs, are also sometimes the cradle of the ichneumon fly. Carcases of plant-lice, void of motion, are often found on rose-tree leaves; they are the habitation of a small larva, which, after having eaten up the entrails, destroys the springs and inward economy of the plant-louse, performs its metamorphosis under shelter of the pellicle which enfolds it, contrives itself a small circular outlet, and sallies forth into open air. There are ichneumons in the woods, who dare attack spiders, run them through with their sting, tear them to pieces, and thus avenge the whole nation of flies of so formidable a foe: others, destitute of wings, and those are females, deposit their eggs in spiders' nests. The ichneumon of the bedeguar, or sweet-briar sponge, and that of the rose-tree, perhaps only deposit their eggs in those places, because they find other insects on which they feed.

ICHNOG'RAPHY, n. s. Gr. ίχνος and γράφω. The ground plot.

It will be more intelligible to have a draught of each front in a paper by itself, and also to have a draught of the ground-plot or *ichnography* of every story in a paper by itself. Maron.

ICHNOGRAPHY, in perspective, from $\iota \chi \nu o c$, footstep, and $\gamma \rho a \phi \omega$, to write, is the view of any thing cut off by a plane parallel to the horizon, just at the base of it.

ICUNOGRAPHY, among painters, signifies a description of images or of ancient statues of marble and copper, of busts and semi-busts, of paintings in fresco, mosaic works, and ancient pieces of miniature.

I'CHOR, n. s. Gr. $i_{\chi\omega\rho}$. A thin sanious I'CHOROUS, adj. Watery fluid like serum : ichorous, a serous, sanious, undigested state of a wound or ulcer.

The lung-growth is imputed to a superficial sanious or ichorous exulceration. Harvey on Consumption. The pus from an u.cer of the liver, growing thin and *ichorous*, corrodes the vessels. Arbuthnot on Diet.

Milk, drawn from some animals that feed only upon flesh, will be more apt to turn ranced and putrify, acquiring first a saline taste, which is a sign of putrefaction, and then it will turn into an *ichor*.

Arbuthnot on Aliments.

ICHOR, in surgery, is sometimes used for a thicker kind of humor flowing from ulcers, called also sanies.

ICHTHYOCOLLA, isinglass, or fish-glue, from $\iota \chi \theta v_c$, fish, and $\iota o \lambda \lambda a$, glue, a preparation from the fish named huso. See Accipenser and CHEMISTRY. The best description of isinglass, and of the method of making it, is that given by Humphrey Jackson, esq., in the sixty-third volume of the Philosophical Transactions. 'All authors (he says) who have hitherto delivered processes for making ichthyocolla, fish-glue, or isinglass, have greatly mistaken both its con-stituent matter and preparation.' No artificial heat is necessary to the production of isinglass, neither is the matter dissolved for this purpose ; for, as the continuity of its fibres would be destroyed by solution, the mass would become brittle in drying, and snap short asunder, which is always the case with glue, but never with isinglass. The latter, indeed, may be resolved into glue with boiling water; but its fibrous recomposition would be found impracticable afterwards, and a fibrous texture is one of the most distinguishing characteristics of genuine isinglass. A due consideration that an imperfect solution of isinglass, called fining by the brewers, possessed a peculiar property of clarifying malt liquors, induced me to attempt its analysis in cold subacid menstruums. One ounce and a half of good isinglass, steeped a few days in a gallon of stale beer, was converted into good fining, of a remarkably thick consistence; the same quantity of glue, under similar treatment, yielded only a mucilaginous liquor resembling diluted gum-water, which, instead of clarifying beer, increased both its tenacity and turbidness, and communicated other properties in no respect corresponding with those of genuine fining. If what is commercially termed long or short stapled isinglass be steeped a few hours in fair cold water, the entwisted membranes will expand, and re-assume their original beautiful hue, and, by a dexterous address, may be perfectly unfolded.' The sounds, or air-bladders, of freshwater fish in general, are preferred for this purpose, as being the most transparent, flexible, delicate substances. These constitute the finest sorts of isinglass; those called book and ordinary staple are made of the intestines, and probably of the peritonzum of the fish. The belluga yields the greatest quantity, as being the largest and most plentiful fish in the Muscovy rivers; but the sounds of all fresh-water fish yield more or less fine isinglass, particularly the smaller sorts, found in prodigious quantities in the Caspian Sea, and several hundred miles beyond Astrakhan, in the Wolga, Yaik, Don, and even as far as Siberia, where it is called kle or kla by the natives, which implies a glutinous matter; it is the basis of the Russian glue, which is preferred to all other kinds for its strength. The

sounds, which yield the finer isinglass, consist of parallel lines, and are easily rent longitudinally; but the ordinary sorts are found composed of double membranes, whose fibres cross each other obliquely, resembling the coats of a bladder; hence the former are more readily pervaded and divided with subacid liquors; but the latter, through a peculiar kind of interwoven texture, are with great difficulty torn asunder, and long resist the power of the same menstruum; yet, when duly resolved, are found to act with equal energy in clarifying liquors. Isinglass receives its different shapes in the following manner: the parts of which it is composed, particularly the sounds, are taken from the fish while sweet and fresh, slit open, washed from their slimy sordes, divested of every thin membrane which enve-lopes the sound, and then exposed to stiffen a little in the air. In this state they are formed into rolls about the thickness of a finger, and in length according to the intended size of the staple; a thin membrane is generally selected for the centre of the roll, round which the rest are folded alternately, and about half an inch of each extremity of the roll is turned inwards. The due dimensions being thus obtained, the two ends of what is called short staple are pinned together with a small wooden peg; the middle of the roll is then pressed a little downwards, which gives it the resemblance of a heart shape; and thus it is laid on boards, or hung up to dry. The sounds which compose the long staple are longer than the former; but the operator lengthens this sort at pleasure by interfolding the ends of one or more pieces of the sound with each other. The extremities are fastened with a peg like the former; but the middle part of the roll is bent more considerably downwards; and, to preserve the shape of the three obtuse angles thus formed, a piece of round stick, about a quarter of an inch diameter, is fastened in each angle with small wooden pegs, in the same manner as the ends. In this state it is permitted to dry long enough to retain its form, when the pegs and sticks are taken out, and the drying completed; lastly, the pieces of isinglass are colligated in rows, by running packthread through the peg-holes, for convenience of package and exportation. The membranes of the book sort, being thick and refractory, will not admit a similar formation with the preceding; the pieces, therefore, after their sides are folded inwardly, are bent in the centre, in such a manner that the opposite sides resemble the cover of a book, whence the name; a peg, being thus run across the middle, fastens the sides together, and thus it is dried like the former. This sort is interleaved, and the pegs run across the ends, the better to prevent its unfolding. Cake isinglass is formed of the fragments of the staple sorts, put into a flat metalline pan, with a very little water, and heated just enough to make the parts cohere like a pancake when it is dried; but frequently it is overheated, and such pieces are useless in fining. Experience has taught the consumers to reject them. Isinglass is best made in summer, as frost gives it a disagreeable color, deprives it of weight, and impairs its gelatinous principles; its fashionable forms are unnecessary,

and frequently injurious to its native qualities. Isinglass is sometimes used in medicine; and mdy be given in a thin acrimonious state of the juices, in the same manner as the vegetable gums and mucilages, regard being had to their different disposition to putrescence. Women subject to the fluor albus take it dissolved in milk. See CUEMISTRY.

ICHTHYOL'OGY, n. s. Fr. ichthyologie; Gr. $i\chi\theta vo\lambda o\gamma ia$, from $i\chi\theta v_{2}$ and $\lambda i_{\gamma}\omega$. The doctrine of the nature of fish.

Some there are, as camels and sheep, which carry no name in *ichthyology*. Browne's Vulgar Errours.

ICHTHYOLOGY. See PISCES.

ICHTHYOPH'AGY, n. s. Gr. $i\chi\theta\dot{v}g$ and $\phi\dot{a}\gamma\omega$. Diet of fish; the practice of eating fish.

ICHTHYOPHAGI (from $i\chi \theta v g$, fish and $\phi a \gamma i v$ to eat), nations who according to the fabulous accounts of Herodotus lived only upon fish. They had cattle, but made no use of them, excepting to feed their fish withal: they made their houses of large fish-bones, the ribs of whales serving them for their beams. The jaws of these animals served them for doors; and the mortars wherein they pounded their fish, and baked it in the sun, were nothing else but their vertebræ.

ICHTHYPERIA, in natural history, a name given by Hill to the bony palates and mouths of fishes, usually met with fossile, either in single pieces or fragments. They are of the same substance with the bufonitæ; and are of very various figures, some broad and short, others longer and slender; some very gibbose, and others plainly arched. They are likewise of various sizes, from the tenth of an inch to two inches long, and an inch in breadth.

ICKENILD STREET, an old Roman highway, so called from the Iceni, which extended from Yarmouth in Norfolk, the east part of the kingdom of the Iceni, to Barley in Hertfordshire, giving name in the way to several villages, as Ickworth, Icklingham, and Ickleton. From Barley to Royston it divides the counties of Cambridge and Hertford. From Ickleford it goes by Tring, crosses Bucks and Oxfordshire, passes the Thames at Goring, and extends to the west of England.

ICOLMKILL, or Icolumbkill, a celebrated island of Scotland, and one of the Hebrides; called also I, Hy, Hii, and anciently Iona: famous for the monastery founded in it by St. Columba. These ruins are much dilapidated, but they are now preserved by a strong wall crected round the chief parts, at the expense of the Argyle family. The cathedral is thirty-eight yards long, and eight broad; the east window of which is a beautiful specimen of Gothic workmanship. In the middle stood a tower, three stories high, supported by four arches. Near the altar-place is a beautiful tomb of black marble, with the figure of the abbot Macfingone. On the north of the cathedral are some remains of the bishop's house, and on the south is a small neat chapel, in which are many curious tombs to the memory of the lords of the isles. Here is also an enclosed burying-ground, containing the tombs of forty-eight Scottish kings, four kings of Ireland, eight of Norway, and one of France, all buried

here from the supposed peculiar sanctity of the ground. Bede calls it 11i; but the proper name is I, which in the Gaehe signifies an island. The name Iona is now quite lost, and it is always called I, except when the speaker would wish to lay an emphasis upon the word; it is then called Icolumkill. 'It lies in the Atlantic, and is separated from the west point of Ross by a narrow channel, called the Sound of I. It is about three miles long, and from half a mile to a mile in breadth. It is flat, consisting of heath, green pasture, rocks, and arable ground, very fertile.'

I'CON, n. s. IcoN'OCLAST, n. s. IcoNOL'OGY, n. s. iconoclast, a breaker of images: iconology, the doctriue of representation by a picture.

Some of our own nation, and many Netherlanders, whose names and *icons* are published, have deserved good commendation. Hahewill on Providence.

Boysardus, in his tract of divination, hath set forth the *icons* of these ten, yet added two others.

Browne's Vulgar Errors.

ICONIUM, in ancient geography, the capital city of Lycaonia in Asia Minor, now called Cogni. St. Paul coming to Iconium (Acts xiii. 51; xiv. 1, &c.), in A. D. 45, converted many Jews and Gentiles there. But some incredulous Jews excited the Gentiles to rise against Paul and Barnabas, which obliged them to fly to the neighbouring cities. St. Paul undertook a second journey to Iconium, A. D. 51.

ICONOCLASTIE, ICONOCLASTES, ICONO-CLASTS, are titles which the church of Rome gives to all who reject the use of images. Not only the reformed, but some of the eastern churches, are called Iconoclastæ, and esteemed by them hereties, as opposing the worship of the images of God and the sainsts, and breaking their representations in churches. The opposition to images began in Greece under the emperor Bardanes, soon after the commencement of the eighth century, when the worship of them became common. But the tumults occasioned by it were quelled by a revolution, which, in 713, deprived Bardanes of the imperial throne. The dispute, however, broke out with redoubled fury under Leo the Isaurian, who issued out an edict, in 726, abrogating the worship of images. This edict occasioned a civil war, which broke out in the islands of the Archipelago, and ravaged a part of Asia, and afterwards reached Italy. The civil commotions in Italy were chiefly promoted by the Roman pontiffs, Gregory I. and II. Leo was excommunicated, and his subjects in the Italian provinces, rising in arms, either massacred or banished all the emperor's officers. Leo however assembled a council at Constantinople in 730, which degraded Germanus, the bishop of that city, who was a patron of images; and ordered all the images to be publicly burnt. But the zeal of Gregory II. in favor of imageworship was surpassed by his successor Gregory III.; in consequence of which the Italian provinces were torn from the Grecian empire. Constantine Copronymus, in 754, convened a council at Constantinople, regarded by the Greeks as the seventh œcumenical council, which solemnly

condemned the worship and use of images; and his successor Leo IV. pursued the same measures, and enacted penal statutes to extirpate idolatry. Irene, who poisoned her husband Leo in 780, and usurped the throne during the minority of her son Constantine, summoned a council at Nice in Bithynia, in 786, called the second Nicene council, which restored the worship of images, and denounced severe punishments against those who maintained, that God was the only object of religious adoration. Charlemagne distinguished himself as a mediator in this con troversy : 'he ordered four books to be composed, refuting the arguments urged by the Nicene bishops to justify the worship of images; which he sent to pope Adrian in 700, to engage him to withdraw his approbation of the decrees of the last council of Nice. Adrian wrote an answer; and in 794 a council of 300 bishops, assembled by Charlemagne at Frankfort on the Maine, confirmed the opinion contained in the four books. and solemnly condemned the worship of images. In the Greek church, after the banishment of Irene, the controversy concerning images broke out anew, and was carried on by the contending parties, during half the ninth century, with va-rious success. The emperor Nicephorus appears to have been an enemy to this worship; but his successor, Michael Curopalates, patronised and encouraged it. But the scene changed on the accession of Leo the Armenian, who assembled a council at Constantinople in 814, that abolished the decrees of the Nicene council. His successor, Michael Balbus, disapproved the worship of images, and his son Theophilus treated the idolaters with great severity. However, the empress Theodora, after his death, and during the minority of her son, assembled a council at Constantinople in 842, which approved the decrees of the second Nicene council, and restored image-worship. The council held under Photius in 879, reckoned by the Greeks the eighth general council, also confirmed the Nicene decrees; upon which a festival was instituted by the Greeks, called the feast of orthodoxy. The council of Paris, assembled in 824 by Louis the Meek, allowed the use of images in churches, but prohibited rendering them religious worship. But, towards the conclusion of this century, the Gallican clergy began to pay a kind of religious homage to the images of saints, and their example was followed by the Germans and other nations. However, the lconoclastæ still had their adherents among the Latins; the most eminent of whom was Claudius, bishop of Turin, who, in 823, ordered all images, and even the cross, to be cast out of the churches, and burnt; and he wrote a treatise against the use and worship of them. The controversy was again revived by Leo bishop of Chalcedon, in the eleventh century, on the emperor Alexius's converting the silver images that adorned the churches into money, to supply the exigencies of the state. The bishop maintained that he had been guilty of sacrilege, and published a treatise to show that in these images there resided an inherent sanctity, and that the adoration of Christians ought to be extended to them. Alexius assembled a council at Constantinople, which determined, that the images of

5

.

Christ and the saints were to be honored only with a relative worship; and that invocation and worship were to be addressed to the saints only as the servants of Christ. In the western church the worship of images was opposed by several considerable parties, as the Petrobrussians, Albigenses, Waldenses, &c., till at length this idolatrous practice was entirely abolished in many parts of the Christian world by the Reformation.

ICONOGRAPHIA, or ICONOGRAPHY, from ϵ_{IKOV} , and $\gamma_{\rho a \phi \omega}$, I describe. The description of images or ancient statues of marble and copper; also of busts and semi-busts, penates, paintings in fresco, mosaic works, and ancient pieces of miniature.

ICONOLATRÆ, or ICONOLATRES, from εικον, and *latpevw*, I worship, or Iconoduli, those who worship images: a name which the Iconoclastæ give to those of the Romish communion on account of their adoring images. See Icono-CLASTÆ.

ICOSAHEDRON, in geometry, a regular solid, consisting of twenty triangular pyramids, whose vertexes meet in the centre of a sphere supposed to circumscribe it; and therefore have their height and bases equal: wherefore the solidity of one of these pyramids multiplied by twenty, the number of bases, gives the solid contents of the icosahedron.

ICOSANDRIA, from $\epsilon_{i\kappa_0\sigma_i}$, twenty, and $\alpha\nu\eta_0$, a husband, the name of the twelfth class in Linnæus's sexual method, consisting of plants with hermaphrodite flowers, which are furnished with twenty or more stamina, inserted into the inner side of the calyx or petals. See BOTANY.

ICTER'ICAL, n. s. Fr. icterique ; Lat. icte-Afflicted with the jaundice : a term applied TUS. to remedies for the cure of jaundice.

In the jaundice the choler is wanting, and the icterical have a great sourness, and gripes with windiness. Floyer.

ICTERUS, the jaundice. See MEDICINE.

ICY CAPE, the most north-western head-land of North America, opposite to Cape North in Asia. The opening into Bhering's Straits runs between them.

IDA, in ancient geography, a mountain in the heart of Crete, the highest in the island; sixty stadia in compass; the nursing place of Jupiter. Also the name of the mountain of Mysia, or rather a chain of mountains, extending from Zeleia, on the south of the territory of Cyzicus, to Lectum, the utmost promontory of Troas, &c. It was covered with green wood, and the elevation of its top opened a fine extensive view of the Hellespont and the adjacent countries; for which reason it was frequented by the gods during the Trojan war, according to Homer. The top was called Gangara, and celebrated by the poets for the judgment of Paris. See PARIS.

IDALIUM, in ancient geography, a promontory on the cast side of Cyprus, now called Capo di Griego; with a high rugged eminence rising over it, in the form of a table ; sacred to Venus. The eminence was covered with a grove.

Fr. idée; Gr. idea. Mental IDE'A, n. s. Fr. uce; On attaining to image: ideal, pertaining to intellectual; IDE'AL, adj. IDE'ALLY, udv.) mind; mental; intellectual; fanciful; not perceived by the senses.

Our Saviour himself, being to set down the perfect idea of that which we are to pray and wish for on carth, did not teach to pray or wish for more than only that here it might be with us, as with them it is in heaven. Hooker.

I did infer your lineaments,

583

Being the right idea of your father ;

Both in your form and nobleness of mind.

Shakspeare. Her sweet idea wandered through his thoughts. Fairfax.

How good, how fair,

Answering his great idea ! Milton's Paradise Lost. A transmission is made materially from some parts, and ideally from every one. Browne's Vulgar Errours.

Happy you that may to the saint, your only idea

Although simply attired, your manly affection utter. Sidney.

If Chaucer by the best idea wrought,

The fairest nymph before his eyes he set. Dryden. Whatsoever the mind perceives in itself, or is the immediate object of perception, thought, or understanding, that I call idea. Locke.

There is a two-fold knowledge of material things; one real, when the thing, and real impression of things on our senses, is perceived; the other *ideal*, when the image or *idea* of a thing, absent in itself, is represented to and considered on the imagination.

Cheyne's Philosophical Principles.

The form under which these things appear to the mind, or the result of our apprehension, is called an idea. Watts.

Delightful task! to rear the tender thought,

To teach the young idea how to shoot,

To pour the fresh instruction o'er the mind,

To breathe the enlivening spirit, and to fix

The generous purpose, in the glowing breast.

Thomson.

IDEN'TITY, n.s. Fr. identite, seed to Sameness, as opposed to whether apdiversity, whether ap-IDEN'TIC, adj. plied to persons or things; comprising the same idea.

Their majus is identical with magis. Hale.

The beard's the identick beard you knew,

Hudibras. The same numerically true. There is fallacy of equivocation from a society in name, inferring an identity in nature : by this fallacy was he deceived that drank aqua-fortis for strong water. Browne's Vulgar Errours.

Those ridiculous identical propositions, that faith is faith, and rule is a rule, are first principles in this controversy of the rule of faith, without which nothing can be solidly concluded either about rule or faith. Tillotson's Sermons.

Considering any thing as existing, at any determined time and place, we compare it with self existing at another time, and thereon form the ideas of Locke. identity and diversity.

Certainly those actions must needs be regular, where there is an *identity* between the rule and the faculty. South's Sermons.

By cutting off the sense at the end of every first line which must always rhime to the next following, is produced too frequent an identity in sound, and brings Prior. every couplet to the point of an epigram.

If this pre-existent eternity is not compatible with a successive duration, as we clearly and distinctly perceive that it is not, then it remains, that some being, though infinitely above our finite comprehensions, must have had an identical, invariable continuance from all eternity, which being is no other than God. Bentley's Sermons.

IDES, n s. Fr. ides; Lat. idus. A term anciently used among the Romans, and still re-

Life is a tale,

Told by an ideot, full of sound and fury,

Signifying nothing. Shakspeare. Macbeth.

What else doth he herein, than by a kind of circumlocution tell his humble suppliants that he holds them ideots, or base wretches, not able to get relief ?

Raleigh's Essays.

I stand not upon their idiocy in thinking that horses did cat their bits. Bacon.

Embryos and idiots, eremites and friars, White, black and grey, with all their trumpery.

Milton.

Scholars sometimes in common speech, or writing, in their native language, give terminations and idiotisms suitable to their native language unto words newly invented. Hale.

Many idiots will believe that they see what they only hear. Dennis.

IDIOCY, and Lunacy, in law, excuse from the guilt of crimes. See CRIME. 'For the rule of law,' says Blackstone, 'as to lunatics, which also may be easily adapted to idiots, is, that furiosus furore solum punitur. In criminal cases, therefore, idiots and lunatics are not chargeable for their own acts, if committed when under these incapacities; no, not even for treason itself.'

ID'IOM, n.s. ID'IOM, n.s. IDIOMAT'ICAL, adj. Fr. idiome ; Gr. i $\delta i \omega \mu a$. A mode of speaking pe-LDIOMAT'IC, adj. Fr. idiome ; Gr. iδιωμα. dialect; the particular cast of a tongue; a phrase; phraseology.

He did Romanize our tongue, leaving the words translated as much Latin as he found them ; wherein he followed their language, but did not comply with the idiom of ours. Dryden.

Some that with care true eloquence shall teach, And to just idioms fix our doubtful speech. Prior.

Since phrases used in conversation 'contract meanness by passing through the mouths of the vulgar, a poet should guard himself against idiomatick ways of Spectator. speaking.

IDIOP'ATHY, n.s. Fr. idiopathie ; Gr. idiog and $\pi \alpha \theta o \varsigma$. A primary disease that neither depends on nor proceeds from another.

IDIOPATHY, in medicine, is opposed to sympathy. Thus, an epilepsy is idiopathic when it happens merely through some injury in the brain ; and sympathetic when it is the consequence of some other disorder.

IDIOT, or IDEOT, in law, denotes a fool from his birth. See IDIOCY and LUNACY. A person who has understanding enough to measure a yard of cloth, number twenty rightly, and tell the days of the week, &c., is not an idiot in the eye of the law. But a man who is born deaf, dumb, and blind, is considered by the law in the same state as an idiot. Indeed it is doubted, if ever such an unfortunate human being has existed. See ANATOMY.

I'DLE, adj. & v. n. YDLE-HEADED, adj. Lazy; averse from labor; Lazy; averse from labor; Lazy; averse from labor; I'DLENESS, n. s. I'DLER, n.s.I'DLY, adv.

disengaged; useless; yain; unfruitful; bar-ren; trifling; unimpor-

tant : idle, to lose time in laziness or inactivity : idleheaded, foolish; unreasonable; delirious; infatuated : idleness, laziness; want of employment; omission of business; unimportance; inefficacy; uselessness; foolishness; mad-

tained in the Romish kalendar. It is the 13th day of each month, except in the months of March, May, July and October, in which it is the 15th day, because in these four months it was six days before the nones, and in the others four days.

IDI

A soothsayer bids you beware of the ides of March. Shakspeare.

IDES, in the ancient Roman kalendar, the name given to the thirteenth day of the month, except in March, May, July, and October, in which it fell on the fiftcenth. The origin of the word is contested. Some will have it formed from $i\delta \epsilon i \nu$, to see; because the full moon was commonly seen on the days of the ides : others from eroos, figure, from the image of the full moon then visible: others from the Hetrurian word iduo, i. e. I divide, because the ides divided the moon The ides came into two nearly equal parts. between the kalends and the nones; and, like them, were reckoned backwards. Thus they them, were reckoned backwards. called the fourteenth day of March, May, July, and October, and the twelfth of the other months, pridie idus, or the day before the ides; the next preceding day they called the tertia idus; the next quarta, and so on, reckoning always backwards till they came to the nones. This method of reckoning time is still retained in the chancery of Rome, and in the kalendar of the breviary. The ides of May were consecrated to Mercury: the ides of March were esteemed unhappy, after the murder of Cæsar on that day; the ides of August were consecrated to Diana, and were observed as a feast-day by the slaves. On the ides of September, auguries were taken for appointing the magistrates, who formerly entered into their offices on the ides of May, afterwards on those of March.

IDES (Evert Ysbrant), a Russian traveller employed by Peter the Great, was a native of Gluckstadt in Holstein, and, entering into the service of the czar, was in 1692 sent on an embassy to China. After his return to Europe he published the Travels of Ysbrant Ides from Moscow to China, which were translated into English, and printed in 1 vol. 4to. in 1706.

IDIOC'RACY, n. s. Fr. idiocrase; Greek IDIOCRAT'ICAL, adj. διδιος, κρασις and συν. IDIOSYN'CRASY, n. s. Peculiarity of constitution; peculiar temperament or disposition of body.

Whether quails, from any idiosyncrasy or peculiarity of constitution, do innocuously feed upon hellebore, or rather sometimes but medicinally use the same.

Browne's Vulgar Errours. The understanding also hath its idiosyncrasics, as well as other faculties. Glanville's Scepsis.

ID'IOCY, n. s.~ Fr. idiot; Latin idiota; (Gr. ιδιωτια, ιδιωτης, ιδιωτ-I D'10T, n.s.

ID'IOTISM, n. s. IDIOT'IC, adj. Idiot is a fool; a IDIOT'IC, adj. Idiot is a fool; a without the powers of reason: idiocy want of understanding : idiotism, folly; mental imbecility; also peculiarity of expression; more properly called idiom: idiotic, foolish; weak; seuseless; like an idiotic. This word is often used in a meaning inferior to its full import.

By idle boys and ideots vilified,

Who me and my calamities deride. Sandys.

ness: idly, lazily; foolishly; carelessly: idler, a sluggard; a lazy person.

A few sheep, spinning on the feld she kept; She woulde not ben idel til she slept.

Chaucer. The Clerkes Talo. And as for hire that crouned is in grene,

It is Flora, of these floures goddesse.

And all that hire, on hire awaiting, bene,--

It are such folke that loved idelnesse.

And not delite in no kind besinesse.

Id. The Flowre and the Leafe.

Suffice it then, thou money god, quoth he,

That all thine idle offers I refuse ;

All that I need I have : what needeth me

To covet more than I have cause to use ?

Faerie Queene.

Let this and other allegations, suitable unto it, cease to bark any longer idly against the truth, the course and passage whereof it is not in them to hinder. Hooker.

For often have you writ to her; and she in modesty,

Or else for want of idle time, could not again reply. Shakspcare.

Of antres vast, and desarts idle,

It was my hent to speak. Id. Othello. He was met even now,

Crowned with rank fumiter and furrow weeds, Darnel, and all the idle weeds that grow Id. King Lear. In our sustaining corn.

I will slay myself,

For living idly here in pomp and ease.

Shakspeare. Ten thousand harms, more than the ills I know, My idleness doth hatch. Id. Antony and Cleopatra.

Nature being liberal to all without labour, necessity imposing no industry or travel, idleness bringeth forth no other fruits than vain thoughts and licentious pleasures. Raleigh.

Many of these poor fishermen and idlers, that are commonly presented to his majesty's ships, are so ignorant in sea-service, as that they know not the namo Id. of a rope.

There is no heat of affection, but is joined with some Bacon's War with Spain. idleness of brain.

These idleheaded seekers resort thither. Carew.

They astonished, all resistance lost, All courage ; down their idle weapons dropped.

Milton.

Thenceforth I set myse f to play My solitary time away; With this, and very well content, Could so mine idle life have spent.

Marvell.

All which yet could not make us accuse her, though it made us pine away for spite, to lose any of our time in so troublesome an idleness. Sidney.

And threatening France, placed like a painted Jove,

Held idle thunder in his lifted hand. Dryden.

These are the effects of doting age, vain doubts, and idle cares, and over caution. Id.

He, fearing idleness, the nurse of ill,

In sculpture exercised his happy skill. Id. Upon this loss she fell idleheaded, and to this very L'Estrange. day stands near the place still.

Children generally hate to be idle ; all the care then is, that their busy humour should be constantly employed in something of use to them. Locke.

Supposing, among a multitude embarked in the same vessel, there are several that in a tempest will rather perish than work ; would it not be madness in the rest to stand idle, and rather chuse to sink than do more than comes to their share ? Addison.

Nor is excess the only thing by which sin breaks men in their health, and the comfortable enjoyment of themselves ; but many are also brought to a very ill and languishing habit of body by mere idleness, and idleness is both itself a great sin, and the cause of South's Sermons. many more.

And modern Asgil, whose capricious thought Is yet with stores of wilder notions fraught, Too soon convinced shall yield that fleeting breath, Which played so idly with the darts of death.

Prior.

Yet free from this poetic madness, Next page he says, in sober sadness, That she, and all her fellow-gods, Sit idling in their high abodes.

Id.

Id.

But shall we take the muse abroad, To drop her idly on the road? And leave our subject in the middle, As Butler did his bear and fiddle ?

He wishes to recal the precious hours he has spent in trifles, and loitered away in idle and unprofitable diversions. Rogers.

An idle reason lessens the weight of the good ones you gave before. Swift.

Now every splendid object of ambition Which lately with their various glosses played

Upon my brain, and fooled my idle heart,

Are taken from me by a little mist

And all the world is vanished. Young's Busiris. How various his employments, whom the world

Calls idle, and who justly in return

Esteems that busy world an idler too ! Cowper. For health and idleness to passion's flame are oil and gunpowder. Byron. Don Juan.

IDLENESS. In China it is a maxim, that if there be a man who does not work, or a woman that is idle, in the empire, somebody must suffer cold or hunger: the produce of the lands not being more than sufficient, with culture, to maintain the inhabitants: and therefore, though the idle person may shift off the want from himself, yet it must fall somewhere. The court of Areopagus at Athens punished idleness, and examined every citizen how he spent his time. The intention was that the Athenians, knowing they were to give an account of their occupations, should follow only such as were laudable, and that there might be no room left for such as lived by unlawful arts. The civil law expelled all vagrants from the city : and, in the English law, all idle persons or vagabonds, whom our ancient statutes describe to be ' such as wake on the night, and sleep on the day, and haunt customable taverns and ale-houses, and routs about; and no man wot from whence they come, ne whither they go;' or such as are more particularly described by stat. 17 Geo. II. c. 5, and divided into three classes, idle and disorderly persons, rogues and vagabonds, and incorrigible rogues : all these are offenders against the good order, and blemishes in the government, of any kingdom. They are therefore all to be punished by the statute last mentioned. Persons harboring vagrants are liable to a fine of forty shillings and to pay all expenses brought upon the parish thereby: in the same manner as, by the ancient laws, whoever harboured any stranger for more than two nights, was answerable to the public for any offence that such his inmate migl.t commit

I'DOL, n. s. IDOL'ATER, n. s. IDOL'ATRIZE, v. a. IDOL'ATROUS, adj. IDOL'ATROUSLY, adv. IDOL'ATRY, n. s. I'DOLIST, n. s. I'DOLIZE, r. a.

Gr. $arepsilon \delta o v$; Lat. *idolum*; Fr. *idole*. The primary meaning here is similitude: an idol is an image; a counterfeit; a representation; an image worshipped as the representative of odowtive, idoletar, one

Deity; one loved to adoration: idolater, one who pays divine honors to idols; one who worships for God that which is not God; this conduct is called idolatry, from Gr. \mathfrak{sloc} and $\lambda arpeta$, cultus: idolist is a poetic word signifying a worshipper of images: to idolize is to love supremely, tenderly, or to adoration; to reverence.

Woo to the idol shepherd that leaveth his flock.

Zech. ii. 17.

They did sacrifice upon the *idol* altar, which was upon the altar of God. 1 *Mac.* i. 59.

The (then), shewed him Cecile, all open and plain,

That all idoles nis but a thing in vain,

For they ben dombe, and therto they hen deve ;

And charged him his idoles for to leve.

Chaucer. The Nonnes Second Tale.

He was a lechour and an idolastre.

And in his elde he veray God forsoke.

Id. The Merchantes Tale.

Men beholding so great excellence,

And rare perfection in mortality,

Do her adore with sacred reverence, As the *idol* of her maker's great magnificence.

Faerie Qucene.

The state of *idolaters* is two ways miserable : first, in that which they worship they find no succour; and secondly, at his hands, whom they ought to serve, there is no other thing to be looked for but the effects of most just displeasure, the withdrawing of grace, dereliction in this world, and in the world to come confusion. *Hooker.*

Not therefore whatsoever idelaters have either thought or done; but let whatsoever they have either thought or done idelatrously, be so far forth abhorred. Id.

Thou shalt be worshipped, kissed, loved, and adored;

And, were there sense in his idolatry,

My substance should be statued in thy stead.

Shakspeare.

He's honoured and loved by all;

The soldier's god, and people's idol.

Denham's Sophy.

Those who are generous, humble, just, and wise, Who not their gold, nor themselves *idolize*.

Denham. A nation from one faithful man to spring,

Him on this side Euphrates yet residing,

Bred up in idol worship. Milton's Paradise Lost. I to God have brought

Dishonour, obloguy, and oped the mouths

Of *idolists* and atheists. *Id. Agonistes*. One who would change the worship of all climates, And make a new religion whereso'er she comes,

Unite the differing faiths of all the world To *idolise* her face. Dryden's Love, Triumphant. Never did art so well with nature strive,

Nor ever idol seemed so much alive ;

So like the man, so golden to the sight ;

So base within, so counterfeit and light.

Dryden.

Idolatry is not only an accounting or worshipping that for God which is not God, but it is also a worshipping the true God in a way unsuitable to his nature; and particularly by the mediation of images and corporeal resemblances. South.

So gracious is their idol, dear variety,

That for another's love they would forego An angel's form, to mingle with a devil's.

Rowe's Ambitious Stepmother.

The kings were distinguished by judgments or blessings, according as they promoted *idolatry*, or the worship of the true God. Addison's Spectator.

The apostle is there arguing against the gnosticks, who joined in the *idol* feasts, and whom he therefore accuses of participating of the *idol* god. Atterbury.

An astrologer may be no Christian; he may be an idolater or a pagan; but I would hardly think astrology to be compatible with rank atheism.

Bentley's Sermons. See there he comes, the exalted *idol* comes.

Somervile.

Like a coy maiden, ease, when courted most, Farthest retires-an idol at whose shrine

Who oft'nest sacrifice are favored least. Cowper.

Parties, with the greatest violation of Christian unity, denominate themselves, not from the grand author and finisher of our faith, but from the first broacher of their *idolized* opinions. Decay of Piety.

For man, to man so oft unjust,

Is always so to women, one sole bond Awaits them, treachery is all their trust,

 Taught to conceal, their bursting hearts despond

 Over their idol.

 Byron. Don Juan.

IDOLATRY may be distinguished into two kinds. By the first, men adore the works of God, the sun, the moon, the stars, angels, demons, men, and animals; by the second, men worship the work of their own hands, as statues, pictures, and the like. The celestial bodies were the first objects of idolatrous worship. Afterwards, as men became more corrupt, they began to form images, and to entertain the opinion, that by virtue of consecration, the gods were called down to inhabit their statues; though it is certain, that the wiser heathens considered them only as figures designed to recal to their minds the memory of their gods. But the people in general believed the statues themselves to be gods, and paid divine worship to stocks Soon after the flood, idolatry and stones. seems to have prevailed : for, so early as the time of Abraham, we scarcely find any other worship. And it appears, from Scripture, that Abraham's forefathers, and even Abraham himself, were for a time idolaters. The Hebrews were expressly forbidden to make any representation of God; they were not so much as to look upon an idol : and, from the time of the Maccabees to the destruction of Jerusalem, the Jews extended this precept to the making the figure of any man: by the law of Moses they were commanded to destroy all the images they found, and were forbidden to apply any of the gold or silver to their own use, that no one might receive the least profit from any thing belonging to an idol. The Jewish rabbies even asserted that it was unlawful to use any vessel that had been employed in sacrificing to a false god, to warm themselves with the wood of a grove after it was cut down, or to shelter themselves under its shade. But the Christian religion, wherever it prevailed, entirely rooted out the Pagan idolatry; as did also the Mahommedan, which is

built upon the worship of one God. Protestant best in that collection, the term idyllion is ap-Christians, however, still charge those of the church of Rome with paying an idolatrous worship to the pictures or images of saints and martyrs; before which they burn lamps, wax-candles, and incense; and, kneeling, offer up their vows and petitions : they, like the Pagans, are said to believe that the saint to whom the image is dedicated presides in a particular manner about its shrine, and works miracles by the intervention of its image; and that, if the image were destroyed or taken away, the saint would no longer perform any miracle in that place. See MYTHOLOGY.

17

4

IDOMENEUS, one of the heroes at the Trojan war, succeeded his father Deucalion on the throne of Crete. He accompanied the Greeks to Troy with a fleet of ninety ships, and behaved with great valor. At his return he made a vow to Neptune in a dangerous tempest, that, if he escaped from the fury of the seas and storms, he would offer to the god whatever living creature first presented itself to his eye on the Cretan shore. Unfortunately his son came to congratulate him upon his safe return. Idomeneus performed his vow, but the inhumanity of this sacrifice rendered him so odious in the eyes of his subjects, that he left Crete, and migrated in quest of a settlement. He came to Italy, and founded a city on the coast of Calabria, which he called Salentum. He died in an extreme old age, after he had had the satisfaction of seeing his new kingdom flourish, and his subjects happy. According to the Greek scholiast on Lycophron, Idomeneus, during his absence in the Trojan war, entrusted the management of his kingdom to Leucos, to whom he promised his daughter Clisithere in marriage at his return. Leucos at first governed with moderation, but he was persuaded by Nauplius, king of Eubœa, to put to death Mada, the wife of his master, with her daughter Clisithere, and to seize the kingdom. After these violent mea-sures he strengthened himself on the throne of Crete, and Idomeneus at his return found it impossible to expel the usurper.

IDOMENEUS, a Greek historian, a native of Lampsacus, who flourished in the age of Epicurus. He wrote a history of Samothracia.

IDO'NEOUS, adj. Lat. idoneus. Proper; convenient ; adequate.

You entangle, and so fix their saline part, by making them corrode some idoneous body. Boyle.

An ecclesiastical benefice is sometime void de jure et facto, and then it ought to be conferred on an idoneous person. Ayliffe.

I'DYL, n. s. Lat. idyllium; Gr. ειδυλλιον. A small short poem.

I. E. for id est, or that is.

That which raises the natural interest of money is the same that raises the rent of land, i. e. its aptness to bring in yearly, to him that manages it, a greater overplus of income above his rent, as a reward to his labour. Locke.

IDYLLION, in ancient poetry, a diminutive of the word eidos, properly signifying any poem of moderate extent. But, as the collection of Theocritus's poems were called idyllia, and the pastoral pieces were by far the

propriated to pastoral pieces.

JEAL'OUS, adj. Fr. jaloux ; Lat. zelo-Fr. jaloux; Lat. zelo-sus; Gr. ζηλος. Sus-JEAL'OUSY, n. s. JEAL'OUSLY, adv. picious in love; emu-JEAL'OUSNESS, n.s. lous; cautious against dishonor; vigilant; careful; fearful; always, however, connected with suspicion.

I have been very jealous for the Lord God of hosts. 1 Kings.

I am jealous over you with godly jealousy. 2 Cor. ii. 2.

And night and day did ever his diligence Hire for to please and don hire reverence :

Save only, if that I the soth shall sain

Jelous he was. Chaucer. The Manciples Tale. And jealousie,

That wered of yelive goldes a gerlond,

And hadde a cuckow sitting on hire hond.

Id. The Knightes Tale.

But gnawing jealousy out of their sight Sitting alone, his bitter lips did bite.

Faerie Queene.

How all the other passions fleet to air, As doubtful thoughts, and rash embraced despair ; And shuddering fear, and green-cyed jealousy ! O love, be moderate ; allay thine extasy.

Shakspeare.

Why did you suffer Jachimo,

Slight thing of Italy,

To taint his noble heart and brain

With needless *jealousy*? Id. Cymbeline. To both these sisters have I sworn my love :

Each jealous of the other, as the stung

Are of the adder. Id. King Lear.

Wear your eye thus; not jealous, nor secure : I would not have your free and noble nature, Out of self-bounty, be abused : look to't.

Shakspeare.

Mistress Ford, the honest woman, the virtuous creature, that hath the jealous fool to her husband !

Although he were a prince in military virtue approved, and jealous of the honour of the English nation; yet his cruelties and parricides weighed down his virtues. Baeon's Henry VIII.

We cannot be too jealous, we cannot suspect ourselves too much to labor under the disease of pride which cleaves the closer to us by our belief or confidence that we are quite without it.

Lord Clarendon.

The obstinacy in Essex, in refusing to treat with the king, proceeded only from his jealousy, that when the king had got him into his hands he would take revenge upou him. Id.

They, jealous of their secrets, fiercely opposed My journey strange, with clamorous uproar Protesting fate supreme. Milton.

'Tis doing wrong creates such doubts as these ; Renders us jealcus, and destreys our peace.

Waller.

Small jealousies, 'tis true, inflame desire ; Too great, not fan, but quite blow out the fire.

Dryden.

A jealous empress lies within your arms, Too haughty to endure neglected charms. Id.

I could not, without extreme reluctance, resign tho theme of your beauty to another hand : give me leavo to acquaint the world that I am jealous of this subject.

Id. Oh jealousy ! thou bane of pleasing friendship, Thou worst invader of our tender bosoms.

Rowe's Jane Shore.

In Process' bosom when she saw the dart, She justly blames her own suspicious heart, Imputes her discontent to *jealous* fear,

And knows her Strephon's constancy sincere. Gay.

While the people are so *jealous* of the clergy's ambition, I do not see any other method left for them to reform the world, than by using all honest arts to make themselves acceptable to the laity. Swift.

Thy numbers, jealousy, to nought were fixed,

Sad proof of thy distressful state ?

Of differing themes the veering song was mixed. And now it courted love, now raving called on hate.

Collins's Odes.

How nicely *jealous* is every one of us of his own repute, and yet how maliciously prodigal of other men's ! Decay of Piety.

That's noble, and hespeaks a nation proud And *jeulous* of the blessing. Cowper's Task.

JEALOUSY, WATERS OF, under the Mosaic law, were a species of ordeal, which seem to have given rise to numerous similar appeals to a divine decision of doubtful cases. The rabbies comment on the text, Num. v., in the following manner :--- When any man, prompted by the spirit of jealousy, suspected his wife to have committed adultery, he brought her first before the judges, and accused her of the crime; but as she asserted her innocency, and refused to acknowledge herself guilty, and as he had no witnesses to produce, he required that she should be sentenced to drink the waters of bitterness, which the law had appointed; that God, by this means, might discover what she wished to conceal. After the judges had heard the accusation and the denial, the man and his wife were both sent to Jerusalem, to appear before the sanhedrim, who were the sole judges in such matters. The rabbies say, that the judges of the sanhedrim, at first, endeavoured, with threatenings, to confound the woman, and cause her to confess her crimewhen she still persisted in her innocence, she was led to the eastern gate of the court of Israel, where she was stripped of the clothes she wore, and dressed in black, before a number of persons of her own sex. The priest then told her, that, if she knew herself to be innocent, she had no evil to apprehend; but, if she were guilty, she might expect to suffer all that the law threatened; to which she answered, Amen, Amen.

⁴ If a strange man have not come near thee, and thou art not polluted by forsaking the bed of thy husband, these bitter waters which I have cursed will not hurt thee: but, if thou have gone astray from thy husband, and have polluted thyself by coming near to another man, may thou be accursed of the Lord, and become an example for all his people; may thy thigh rot, and thy belly swell till it burst! may these cursed waters enter into thy belly, and, being swelled therewith, may thy thigh putrefy !'

After this the priest took a new pitcher, filled

it with water out of the brazen basin that was near the altar of burnt offerings, cast some dust into it taken from the pavement of the temple, mingled something bitter, as wormwood, with it, and having read the curses above-mentioned to the woman, and received her answer of Amen, he scraped off the curses from the vellum into the pitcher of water. During this time another priest tore her clothes as low as her bosom, made her head bare, untied the tresses of her hair, fastened her torn clothes with a girdle below her breast, and presented her with the tenth part of an ephah, or about three pints of barley meal, which was in a frying pan, without oil or incense.

The other priest, who had prepared the waters of jealousy, then gave them to be drank by the accused person, and, as soon as she had swallowed them, he put the pan with the meal in it into hand. This was waved before the Lord, and a part of it thrown into the fire of the altar. If the woman were innocent she returned with her husband; and the waters, instead of incommoding her, made her more healthy and fruitful than ever; if, on the contrary, she were guilty, she was seen immediately to grow pale, her eyes started out of her head, and, lest the temple should be defiled with her death, she was carried out, and died instantly with all the ignominious circumstances related in the curses, which the rabbies say had the same effect on him with whom she had been criminal, though he were absent, and at a distance. They add, however, that if the husband himself had been guilty with another woman, then the waters had no bad effect even on his criminal wife; as in that case the transgression on the one part was, in a certain sense, balanced by the transgression on the other.

There is no instance in the Scriptures of this kind of ordeal having ever been resorted to; and probably it never was during the purer times of the Hebrew republic.

JEAN BON ST. ANDRE, baron, originally a French Protestant minister, and then a revolutionary statesman, was born at Montauban in 1749. At the commencement of the revolution in September, 1792, he was nominated deputy to the National Convention, from the department of Lot, and joined the party of the Mountain ; voting for the death of the king, and contributing to the destruction of the Girondists. He was a member of the committee of public safety during the tyranny of Robespierre, and on board the French fleet in the battle with lord Howe, on the 1st of June, 1794, as a commissary of the convention. He subsequently became more moderate in his political conduct, and amnesty of October, 1795, having restored him to liberty, he was sent as consul to Algiers. After this he became prefect of Mayence, in which station he is said to have distinguished himself by his integrity and intelligence. Having held the post thirteen years, he died, much regretted, in December, 1815.

JEANNIN (Peter), in biography, was born in 1540, and brought up to the law. Becoming, at an early age, advocate in the parliament of Burgundy, and distinguished by his eloquence, 589

he was appointed agent for the affairs of the province. In this capacity, though a zealous Catholic, he resisted the order for perpetrating the massacre of the Protestants on St. Bartholomew's day, at Dijon; but joined the leaguers in support of the established religion. Being deputed by the duke of Mayenne to negociate with Philip of Spain, the protector of the league, he soon discovered the real design of that prince was to gam possession of some of the best provinces of France: and, on his return, exerted himself to detach the duke from the Spaniards. Henry IV. made him a member of his council, and nothing was for a time undertaken without his advice. He died at the age of eighty-two, in the year 1622, having witnessed the succession of seven kings to the throne of France. His Memoirs and Negociations, published in 1659 at Paris in folio, have since been printed in 4 vols. 12mo.

JEARS, or GEERS, in the sea-language, an assemblage of tackles, by which the lower yards of a ship are hoisted along the mast to their usual station, or lowered thence as occasion requires; the former of which operations is called swaying, and the latter striking.

JEBB (Samuel), M. D., a learned physician, born at Nottingham, and educated at Cambridge. He settled at Stratford-le-Bow, where he practised with great credit till his death. He published, 1. S. Justini Martyris cum Tryphone Dialogus; 1729, 8vo. 2. Bibliotheca Literaria, a learned compilation, of which only ten numbers were published, 1722. 3. De Vita et Rebus gestis Mariæ Scotorum reginæ; 8vo. 4. An edition of Aristides with notes; 2 vols. 4to. 1728. 5. An elegant edition of Caii de Canibus Britannicis, &c.; 8vo. 1729. 6. Another of Baconi Opus Majus; folio, 1733. 7. Another of Hodii de Græcis illustribus Linguæ Græcæ instauratoribus; 8vo. 1742. He died March the 9th, 1772.

JEBB (Sir Richard), Baronet, M. D., born at Stratford, in Essex, was educated at Oxford ; but, being by principle a non-juror, he could not be matriculated, nor take any degree at that university. He afterwards studied medicine at London and Leyden; and obtained, from the latter university, the degree of doctor of medicine. Upon settling in London he became licentiate of the college of physicians; and, in the year 1768, was elected a fellow of that body. He was now for some time physician to St. George's Hospital, and to the Westminster infirmary. About 1777 he was made physician-extraordinary to the king; and in 1780 physician in ordinary to the prince of Wales. On the death of Sir Edward Wilmot, in 1768, he was appointed one of the physicians in ordinary to his majesty; but this office he did not enjoy many months; for, being in attendance on two of the princesses, who were affected with the measles, he was suddenly attacked with fever in their apartments at Windsor, and died, after a few days' illness, on the 4th day of July, 1787, in the fifty-eighth year of his

JEBB (John), M.D., a modern divine, who seceded from the establishment, was born in London in 1736, and received his early education in Ireland; whence he removed to Peter

House, Cambridge, and took the degree of B. A. there in 1757. In 1761 he proceeded M. A., and obtained a fellowship, which he relinquished on being presented in 1764 to the rectory of Ovington, Norfolk. He published in 1765, in con-junction with the Rev. Messrs. Thorpe and Wollaston, Excerpta quædam e Newtoni Principiis Philosophiæ Naturalis, cum Notis Variorum, 4to. In 1766 he returned to Cambridge, and resumed the office of tutor; delivering in 1768 a course of lectures on the Greek Testament. Next year he obtained three livings in the county of Suffolk, and was appointed chaplain to the earl of Harborough, having married into that nobleman's family. About 1772 he warmly espoused the scheme of archdeacon Blackburne, to procure the abolition of clerical subscription, and, the freedom of his opinions having rendered his situation in the university and church unpleasant, he determined to relinquish both his clerical and university appointments. This he did in September, 1775, and imme-diately published a statement of his motives. He now took up his residence in the metropolis, and adopted the profession of physic. Having procured a diploma from the university of St. Andrew's, and being admitted a licentiate of the college of physicians, as well as a fellow of the Royal Society, he commenced practice in 1778. His practice was very successful. In the latter part of his life he actively engaged in the discussions relating to the American war, and was a frequent speaker in the popular assemblies of the metropolis. His death took place March 2d, 1786. The year following a collection of his works, theological, political, and medical, was published, with memoirs of his life, by Dr. Disney, 3 vols. 8vo.

JEBUSÆI, JEBUSITES, one of the seven ancient nations of Canaan, descendants of Jebusi, a son of Canaan; so warlike and brave, as to have maintained their ground, especially in Jebus, afterwards called Jerusalem, to the time of David.

JECHONIAII, or JECHONIAS, king of Judah, succeeded his father Jehoiakim, A. A. C. 599, when he was only eight years old; and had reigned only three months and ten days when he was carried to Babylon by Nebuchadnezzar. He was afterwards promoted by Evil-Merodach, about A. A. C. 562.

JEDBURGH, a town of Scotland, capital of Roxburghshire, situated nearly in the middle of the county, on the banks of the river Jed, whence its name. It is well built and populous, and has a good market for corn and cattle. On the west side of the river, near its junction with the Teviot, stand the beautiful ruins of an abbey founded by David I., a part of which ancient pile still serves for a parish-church. Jedburgh is the seat of the sheriff's court and presbytery; and is a barony in the family of Lothian. The original name Gadborough is said to be derived from the Gadeni, a tribe who anciently inhabited the whole tract of country between Northumberland and the Teviot. In a charter granted by king William the Lion in 1165, to the abbot and monks of Jedburgh, the name is often spelt Jedwarth.

Id.

JEDDO, or YEDDO. See YEDDO.

JEER, v. a. & n. s. JEER'ER, n. s. JEER'INGLY, adv. Gothic gar; Belgie, scheer; Italian xinocare. To scoff; flout; ridicule or mock: jeerer; a scorner; a mocker.

The merry world did on a day

With his trainbands and mates agree,

To meet together where I lay,

And all in sport to jeer at me. Herbert.

My children abroad are driven to disavow me, for fear of being jeered. Howel's England's Tears.

Abstain from dissolute laughter, petu ant uncomely jests, loud talking and *jeering*, which are called indecencies, and incivilities. Taylor.

He jceringly demandeth, whether the sonorous rays are refracted. Derham.

Midas, exposed to all the jeers, Had lost his art, and kept his ears. Swift. They tipt the forehead in a jeer,

As who should say-she wants it here;

She may be handsome, yonng, and rich; But none will burn her for a witch.

JEFFERSON (Thomas, esq.) late president of the United States. He was born April 2d, 1743, according to some accounts, in the county of Albemarle, Virginia, at Shadwell, a country seat which now belongs to his grandson, within a short distance of Monticello, and about half a mile distant from his Ravannah mills; but, according to others, in Chesterfield county. His family were amongst the earliest emigrants to Virginia; of which colony his grandfather, Thomas Jefferson was a native. His father Peter Jefferson, and colonel Fry, were commissioned to determine the boundary line between Virginia and North Carolina in the year 1747. Mr. Jefferson was educated in America : he received the highest honors at the college of William and Mary; and studied law under the celebrated George Wythe, late chancellor of Virginia. He applied himself closely to the study of geometry, geography, natural history, and astronomy; and he was devotedly attached to literature and the fine arts. When he came of age, in 1764, he was put into the nomination of justices of the county in which he lived; at the first election following he became one of its representatives in the legislature, and, before he had attained his twenty-fifth year, he was a dis-tinguished member of the Virginia assembly, taking an active part in all the measures adopted in opposition to the English government. In 1775 he is said to have been the author of the Protest against the Propositions of lord North. From the assembly of Virginia he was sent to the old congress, which brought about the revolution, and was there distinguished by the warmth of his sentiments and the energy of his compositions. He was afterwards employed from 1777 to 1779 with Mr. Pendleton and Mr. Wythe in the revisal and reduction to a single code of the whole body of the English statutes, the acts of the Virginia assembly, and certain parts of the common law. In 1780 (succeeding Patrick Henry, the successor of lord Dunmorc), he was elected governor of Virginia, an office which he held during the whole of the revolutionary war. Much difference of opinion occurred respecting his conduct as governor, at the time of the invasion of Virginia by Cornwallis

and Arnold; but, as he received the thanks of his fellow-citizens, it must be presumed that by them, at least, it was deemed satisfactory. In 1783 he was employed in drawing up a constitution for Virginia. He was nominated ambassador to Spain, but his destination was subsequently changed to France. There, obtaining the confidence of Vergennes and Calonne, he obtained many concessions in favor of American commerce. From France he came over to England, went back to Versailles, and returned to America in 1789, rendering to Mr. Jay, the minister to foreign affairs, a satisfactory account of his negociations. Shortly after his return he was appointed secretary of state to the new government. Soon after the house of representatives directed him to form a plan for reducing the currency, weights, and measures, to one standard; and subsequently he was also employed to draw up a report respecting the fisheries. Early in 1794 he resigned his office as secretary of state, and retired to his seat at Monticello. From that period he was regarded as the chief of the opposition. After remaining some time in retirement he was, in 1797, called on to fill the vice-president's chair, under Mr. Adams, and, on the expiration of that gentleman's term, in 1801, elected his successor. In 1805 he was re-elected; and, in his first message to the senate and house of representatives, he developed his project of improvement in the public administration. In 1807, in consequence of the differences which arose between the governments of Great Britain and the United States, he called a meeting extraordinary of the congress, and submitted to them his plan for defending the country. To preserve the shipping and commerce of America from the cruisers of France and England, he laid an embargo on all the ports of the United States, until the danger was over. When his second term of presidentship had nearly expired he was solicited by the assembly of Pennsylvania to accept the office a third time. This, however, he resolutely refused, was succeeded by Mr. Maddison, and, like his friend Washington, retired to private life, in which he died 4th July, 1826. Mr. Jefferson in 1774 published A summary View of the Rights of British America. In 1781 appeared his Notes on Virginia. He has also written Memoirs on the Fossil Bones found in America. As an agriculturist he was active, and fond of experiment. He invented a new plough, or rather effected an improvement in the old one. At an early age Mr. Jefferson married the daughter of Mr. Wright, a barrister in Virginia. By her, who has been some years dead, he had four daughters,

only one of whom, we believe, survives. JEFFERSON, a county of Indiana, United States, bounded on the east by Switzerland county, on the south by the river Ohio, on the west by the county of Clark, and on the north by Indian lands. It contains excellent land, and is watered by several streams running into the Ohio.

JEFFERSON, another county of the United States, in Kentucky, bounded north and west by the Ohio River, south by Nelson county, and south-east and east by Shelby. Louisville, at the rapids of the Ohio, is the chief town.

590

591

JEFFERSON, a county of the United States, in Ohio, bounded on the north by Columbiana county, on the west by Harrison county, on the south by Belmont county, and on the east by the Ohio. The chief town is Steubenville.

JEFFERSON, a county of the United States, in East Tennessee. Dandridge, the chief town.

JEFFERSON, a county of Georgia, erected in 1796 from the counties of Burke and Warren.

JEFFERSON'S RIVER, one of the three branches into which the Missouri is divided, near its source, and so called in honor of the late president Jefferson, by captains Lewis and Clarke, in 1806. It abounds with beavers, by whose operations the channel is almost dammed up, and falls into the Missouri, 2848 miles from its mouth, in lat. 45° 22′ 34″ N.

JEFFERSONIA, a genus of plants so named in honor of the late president of the United States. Class and order pentandria monogynia : CAL. below, composed of five short oval imbricated leaves; cor. monophyllous, funnel-shaped on the receptacle, sub-pentangular, bearing the filaments near the base, its margin hypocrateriform, divided into five round ducts nearly equal; style petiform, shorter than the petal, but longer than the stamens; stigma quadrifid; anthere erect, linear, sagittated; fruit two univalved, carinated, polyspermous capsules, united at the base, opening on their tops and contiguous sides, having flat seeds, with a marginal wing. Only one species is as yet discovered, viz:—

J. sempervirens. It is a shrub with round polished twining stems, which climb up on bushes and small trees; the petioles short, opposite; leaves oblong, narrow, entire, evergreen, acute; flowers axillary, yellow, having a sweet odor. The woods in Georgia are full of this delightful shrub, which is covered with blossoms for many months in the year.

JEFFREYS (Sir George), baron Wem, commonly called Judge Jeffreys, was the sixth son of John Jeffreys, esq., of Acton in Denbighshire; and was educated at Westminster; whence he removed to the Inner Temple, where he applied himself to the study of the law. He soon became recorder of London, and was next made solicitor to the duke of York; and in 1689 was knighted, and made chief justice of Chester. At length, resigning the recordership, he obtained the post of chief-justice of the King's bench, and, soon after the accession of James II., the great seal. During the reign of king Charles II. he had shown himself a bitter enemy to those dissenting ministers, who, in that time of persecution, were tried by him ; and was one of the greatest advisers and promoters of all the oppressions and arbitrary measures carried on in the reign of James II.; and his sanguinary and inhuman proceedings against Monmouth's adherents in the west will ever render his name infamous. See ENGLAND. Whenever the prisoner was of a different party, or he could please James by condemning him, instead of appearing, according to the duty of his office, as his counsel, he would scarcely allow him to speak for himself; but would load him with the grossest and most vulgar abuse, browbcating, insulting, and ridiculing the witnesses that spoke in his behalf;

and even threatening the jury with fines and imprisonment, if they made the least hestitation in bringing in the prisoner guilty. Yet it is said, that, when he was under no state influence, he could occasionally act uprightly. The mayor and aldermen of Bristol had been used to transport convicted criminals to the American plantations, and sell them for their own private emolument, privately threatening to hang petty thieves if they did not petition for transportation. This infamous trade, which had been carried on many years, coming to the knowledge of the lord chief-justice, he made the mayor stand at the bar in his scarlet and fur, with his guilty brethren the aldermen, and plead as common criminals. He then obliged them to give securities to answer informations; but the proceedings were stopped by the revolution. On the arrival of the prince of Orange, the lord chancellor, dreading the public resentment, disguised himself in a seaman's dress, in order to leave the kingdom; and was drinking in a cellar, when he was recognised by a scrivener, who gave notice that he was there; and the mob rushing in, seized him, and carried him before the lord mayor; who sent him with a strong guard to the lords of the council, by whom he was committed to the Tower, where he died April 18th, 1689.

JE'GGET, n. s. A kind of sausage.

JEHOVAH, or JAH, 'TAIT, 'General', signifies the Being who is self-existent, and gives existence to others. The Jews had so great a veneration for this name that they left off the custom of pronouncing it, whereby its true pronunciation was forgotten. They call it tetragrammaton, or the name with four letters; and assert, that whoever knows the true pronunciation of it cannot fail to be heard by God.

JEHUD, or JOUD, mountains in the northwest part of Hindostan Proper, extending from Attock east, to Bember. They are part of the territory of the mountaineers, called Gickers, Gehkers, or Kakares. After Timur had passed the Indus, in 1398, the chiefs of these mountains came to make their submission to him; as Ambisares, the king of the same country, did to Alexander about 1730 years before.

JEJUNE', adj. Lat. jejunus. Empty; JEJUNE'NESS, n. s. vacant; hungry; dry: deficient in matter; jejuneness, penury; poverty.

Causes of fixation are, the even spreading both parts, and the *jejuneness*, or extreme comminution of spirits. Bacon.

Gold is the only substance which hath nothing in it volatile, and yet melteth without much difficulty; the melting sheweth that it is not jejune, or scarce in spirit. Id.

In gross and turbid streams there might be contained nutriment, and not in *jejune* or limpid water. Browne,

You may look upon an enquiry made up of mero nurratives, as somewhat jejune. Boyle.

 $\exists EL/LIED, adj.$ Latin gclatium. See $\exists EL/LIED, adj.$ GeLLY. Any thing brought to a state of gluten; a sweetmeat.

They, distilled

Almost to jelly with the effect of fear,

Stand dumb, and speak not to him. Shakspeare.

The kiss that sips

The jellied philtre of her lips. Cleaveland. The desert came on, and jellies brought.

King. That jelly's rich, this malmsey healing; Pray d p your whiskers.

Pope's Satire of Horace.

592

JELLY is a form of food, or medicine, prepared from the juice of ripe fruits, boiled to a proper consistence with sugar; or the strong decoctions of the horns, bones, or extremities of animals, boiled to such a height as to be stiff and firm when cold, without the addition of sugar. The jellies of fruits are cooling, saponaceous, and acescent, and therefore are good in all disorders of the primæ viæ, arising from alkalescent Jellies made from animal substances juices. are all alkalescent, and, therefore, good in all cases in which an acidity of the humors prevails : the alkalescent quality is, however, in a great measure taken off by the addition of lemon juice and sugar. A sort of jellies were formerly much in use, called compound jellies; these had the restorative medicinal drugs added to them, but they are now seldom prescribed.

JELLY, OAT, a preparation of common oats, recommended by many of the German physicians in hectic disorders, to be taken with broth of snails or cray-fish. It is made by boiling a large quantity of oats, after the husk is taken off, with some hartshorn and currants, together with a leg of veal cut in pieces, and with the bones all broken. These are to be set over the fire with a large quantity of water, till the whole is reduced to a jelly; which, when strained and cold, will be very firm. A few spoonfuls are to be taken every morning, diluted with a basin of either of the above-mentioned broths, or any other warm liquor.

JEMAULABAD, formerly Narsinga Augady, a town and fortress of India, in the province of Canara. The fort, which has existed from time immemorial, was thoroughly repaired by Tippoo Sultan, and is built upon an immense rock, wholly inaccessible except by one narrow path; it may, indeed, be deemed impregnable. It yielded, however, to the British arms after a few days bombardment in 1799. Long. 75° 24' E., lat. 13º N.

JEMME, EL, the ancient Tisdra, or Tisdrus, a town of Tunis, in Africa, distinguished by its splendid remains of antiquity. Here is a spacious and beautiful amphitheatre, which consisted originally of sixty-four arches, and four ranges of columns. The highest range is nearly fallen; and Mahomet Bey, during a revolt of the Arabs, lately caused four of the arches to be blown up, in order that it might not be converted into a fortress. In other respects this monument is entire. El Jemme also contains many altars with defaced inscriptions, columns and fragments, one of which is a naked trunk of a Venus, in the posture and dimensions of the Medicean. Ninety miles south of Tunis.

JENA, a small town of the interior of Germany, on the Saale, in the grand duchy of Saxe-Weimar. It is surrounded on every side by hills of considerable elevation; and has above 5000 inhabitants, who derive their subsistence

chiefly from the university, the three yearly fairs, and some small manufactures of linen and hats. The only public building worth notice is the ducal castle, where a branch of the family of Weimar resides, and in which there is a good library, a museum, and cabinet of natural history. In the vicinity is the old castle of Kirchberg, now in ruins.

Jena is most remarkable for its university, founded in 1558. It belongs to four proprietors, the grand duke having one-half, and the other half being shared between Saxe-Gotha, Saxe-Coburg, and Saxe Meinungen. It has four faculties, viz. divinity, law, medicine, and philosophy, which are taught by eighteen regular and fifteen extraordinary professors : there are also private teachers in the town. The number of students varies considerably; in 1818 they did not exceed 600. Here are also two literary societies; one called the Latin Society, established in 1734: the other a Society for the investigation of the natural history of Germany : the members of both have distinguished themselves; and the literary journals of this place are in great repute in Germany. Another considerable institution at Jena is its court of appeal, which received a considerable extension of jurisdiction in 1816. It is forty-three miles south-west of Leipsic, and thirteen miles east by south of Weimar. For an account of the sanguinary battle of Jena, see PRUSSIA.

JENGHIZ, or JENGHIZ KHAN, khan or emperor of the Moguls, one of the most bloody conquerors that ever existed, was born in 1193, and began to reign when he was only thirteen years of age. He conquered Cathay, Corea, the greatest part of China, and almost all Asia. He destroyed about 14,000,000 of the human race, under pretence of extirpating superstition, and establishing the worship of one God. See Mo-GULS. He died A. D. 1237.

JENKIN (Robert), a learned English divine in the eighteenth century, who was educated at Cambridge, became master of St. John's College, and wrote several books much esteemed; viz. 1. An Historical examination of the authority of General Councils, 4to.; 2. The Reasonableness and Certainty of the Christian Religion, 2 vols. 8vo; 3. Defensio S. Augustini; written against M. Le Clerc; 4. A Translation from the French of the Life of Apollonius Tyanæus.

JENKINS (Sir Leoline), a learned civilian and able statesman of the eighteenth century, born in Glamorganshire about 1623. Being obnoxious to the parliament, during the civil war, he went abroad ; but, returning on the Restoration, he was admitted an advocate in the court of the arches, and succeeded Dr. Exton as judge. When the queen-mother Henrietta died in 1669, at Paris, her whole estate, real and personal, was claimed by her nephew, Louis XIV.; upon which Dr. Jenkins's opinion being called for, and approved, he went to Paris, with three others, on a commission, and recovered her effects; for which he received the honor of knighthood. He officiated as one of the mediators at the treaty of Nimeguen; in which tedious negociation he was engaged about four years and a half; and

-

593

war afterwards made a privy counsellor and secretary of state. He died in 1685, and, as he never married, bequeathed his whole estate to charitable uses, and became so great a benefactor to Jesus College, Oxford, that he is generally looked on as the second founder. All his letters and papers were collected and printed in 1724, in 2 vols. folio.

JENKINSON (Charles), first earl of Liverpool, was the eldest son of colonel Jenkinson, the youngest son of Sir Robert Jenkinson, the second baronet of the family, which had been respectably settled at Walcot, near Charlbury, Oxon. for above a century. He was born in 1727, and educated at the Charter House, on the foundation: whence he removed to University College, Oxford, and took his degree of M.A.there in 1752. The family was not at this time opulent: and Mr. Jenkinson is said to have assisted himself considerably in early life by his literary talents. He printed Verses on the Death of Frederick, prince of Wales, which attracted some notice; and in 1756 published A Discourse on the Establishment of a Constitutional Force in England; this was succeeded by A Discourse on the Conduct of Great Britain in regard to Neutral Nations, during the present War, 1758. He was also a contributor to the early numbers of the Monthly In 1761 he obtained a seat in par-Review. liament through the influence of lord Bute, and was made under-secretary of state. In 1766 he became a lord of the Admiralty, from which board he subsequently removed to that of the In 1772 he was appointed vice-Treasury. treasurer of Ireland, and soon after obtained the sinecure of the clerkship of the Pells. In 1778 he was secretary at war, and, on the dissolution of the administration of lord North, joined that portion of it which supported Mr. Pitt. He now became president of the board of trade, to which office he united in 1786 the chancellorship of the duchy of Lancaster. In the same year he was elevated to the peerage, by the title of baron Hawkesbury, of Hawkesbury, in the county of Gloucester; and in 1796 became earl of Liverpool. His death took place on the 7th of De-cember, 1808. Lord Liverpool was thought to enjoy, in a particular manner, the favor and confidence of George III.; and, having early devoted his attention to politics, he became exceedingly conversant with the law of nations, and the principles and details of commerce. Besides the works above-mentioned he was the author of A Collection of Treatises from 1646 to 1673, 3 vols. 8vo., 1785; and A Treatise on the Coins of the Realm, in a Letter to the King, 1805.

JENNENS (Charles), generally known by the jocose appellation which his profusion gained him, of Solyman the Magnificent. He was a native of Gopsal, in Leicestershire, and employed a large fortune, acquired by his family in trade at Birmingham, as well in the encouragement of literature as in the most unbounded hospitality, and in the keeping up of a princely establishment. The selection of the words for Handel's celebrated oratorio, the Messiah, is ascribed to him, and he had in contemplation a splendid edition of the works of Shakspeare.

VOL. XI

JENNER (Edward), M. D., F. R. S., was the son of the Rev. Stephen Jenner, vicar of Berkeley, in Gloucestershire, where he was born, May 17th, 1749. He was apprenticed to Mr. Ludlow, a surgeon, at Cirencester, on leaving whom, he became a pupil of the celebrated John Hunter, at St. George's Hospital, and while there received an offer to go out with captain Cook in his first voyage; and another to accompany Mr. Warren Hastings to Bengal. These proposals were declined ; and he chose to settle at Berkeley, where he studied natural history; and communicated to the Royal Society a paper on the habits of the cuckoo, which was inserted in their Transactions for 1788. Prior to this period he had been endeavouring to investigate the nature of cow-pox, from observing, that among the dairy people of Gloucestershire many resisted inoculation. On enquiry, he found that the cause of this lay uniformly in the patients' having been infected with another cutaneous disease, contracted from their cows. Mr. Jenner now proceeded in a course of experiments to ascertain whether the matter of the cow-pox, transmitted from one inoculated person to another, would prove a preventive of the small-pox. The result was confirmatory of his expectations, and in 1798, having previously taken his doctor's degree at Edinburgh, he published An Enquiry into the Causes and Effects of the Cow-pox, which was followed the next year by Farther Observations on the Variolæ Vaccinæ. The subject now became one of general interest, and honors and rewards crowded in upon the author; the University of Oxford presented him with a medical degree by diploma; he was chosen a fellow of the royal and various literary societies; and he received the grant of £20,000 from parliament. After a career of successful practice at Cheltenham as a physician, and a life devoted to the benefit of mankind, Dr. Jenner died suddenly of an apoplectic stroke at Berkeley, January 25th, 1823. The emperor of Russia, when in this country in 1814, sought an interview with Dr. Jenner, treated him with great attention, and offered, it is said, to bestow a Russian order of nobility on He also visited the king of Prussia, marhim. shal Blucher, and the cossack general count Platoff, the latter of whom said to him, ' Doctor, you have extinguished the most pestilental disorder that ever appeared on the banks of the Don.'

JENNET, See GENNET. A Spanish horse.

On the twelfth of December yearly, the emperor rides into the field, which is without the city, with all his nobility, on *jennets* and Turkey horses in great state. *Milton. History of Muscovia.*

The Spanish king presents a jennet, To shew his love. Prior.

JEN'NETING, n.s. Corrupted from Juneting, an apple ripe in June. A species of apple soon ripe, and of a pleasant taste.

JENNINGS (David), D.D., a learned dissenting divine, was the son of an ejected minister, and born at Kibworth, in Leicestershire, in 1691. He was respectably educated in London, and in 1714 entered on the pastoral duty. He

2 Q

eventually was chosen minister of an independent congregation, meeting in Old Gravel-lane, Wapping. In 1743 he became a trustee of the charities of Mr. William Coward, and one of his lecturers at the chapel in Little St. Helen's, and the next year theological tutor at the academy founded by that gentlemen. He now published several works of merit for the use of the students, particularly An Introduction to the use of the Globes and the Orrery, and also the application of Astronomy to Chronology, &c. 8vo. 1747. An Appeal to Reason and Common Sense for the truth of the Holy Scriptures. An Introduction to the Knowledge of Medals, 8vo.; and a treatise on Jewish Antiquities, 2 vols. 8vo., which is one of the best works extant on the subject. He died September 16th, 1762.

JENSON, or JANSONIUS (Nicholas), a French printer and type founder, who flourished at Venice in the fifteenth century. He was the first who fixed the form and proportions of the Roman character, and his editions are still valued for the beauty of the printing. The first book he printed was Decor Puellarum, in 4to., 1471. He died about 1481.

JENTACULUM, among the ancient Romans, a morning refreshment like our breakfast. It was exceedingly simple, consisting, for the most part, of bread alone. The Greeks distinguished this meal by the names of akpariopog, or akpaτισμα.

JENYNS (Soame), esq., a celebrated English writer, born in London in 1704. He was the only son of Sir Roger Jenyns of Bottisham, Kt. He was entered a fellow commoner at St. John's College, Cambridge, where his genius soon appeared in juvenile essays and poetical effusions, many of which were published in Dodley's Collection. He was elected M. P. for Cambridge in 1741, and, being repeatedly re-elected, continued to sit in parliament till 1780. In 1775 he was appointed a lord of trade, which post he held till the board was abolished in 1780. In one part of his life he was a deist : but, upon a closer enquiry into the evidences of Christianity, his faith and piety returned, in which he continued stedfast till his death. He published 1. A Poem on the Art of Drawing, 1728; 2. Poems in 2 vols. 12mo. 3. Various Essays in the Periodical Paper entitled The World, 1753. 4. An Enquiry into the Nature and Origin of Evil, 12mo, 1757. 5. Political essays and poems, 2 vols. 12mo., 1761. 6. Thoughts on the Causes and Consequences of the present High Price of Provisions, 1761. 7. A View of the Internal Evidence of the Christian Religion, 1776. 8. Disquisitions on Several Subjects; which last produced several anonymous criticisms. He died at Lon-don, December 18th, 1787. The intellectual powers of Soame Jenyns were of a superior Burke said, Soame Jenyns was one of order. those who wrote the purest English, that is, the simplest and most aboriginal language, the least qualified with foreign impregnation.

JEOFAILE, from J'ay faillé, I have failed, a term in law, used for an oversight in pleading or other proceedings at law.

JEOP'ARD, v. a. Supposed to be derived JEOP'ARDOUS, adj. from j' ai perdu, or jeu JEOP'ARDY, n.s Skinner and Ju-

JER nius. Hazard; danger; peril. A word not now in use. To jeopard is to put in peril.

He had been accused of Judaism, and did boldly jeopard his body and life for the religion of the Jews. 2 Mac.

And harde it is, sothe, for a man to seche-

Upon the point of deth, in jeopardye-

Unto his foe, to finden remedye.

Chaucer. Complaint of the Blacke Knight.

And would ye not poor fellowship expel, Myself would offer you t'accompany,

In this adventure's chanceful jeopardy.

Hubberd. Thy rage shall burn thee up, and thou shalt turn To ashes, ere our blood shall quench that fire : Look to thyself, thou art in jeopardy. Shakspeare.

We may impute to all excellencies in compositions a kind of poverty, or at least a casualty or jeopardy. Bacon.

JEPHTHAH, judge of Israel, and successor to Jair in the government of the Hebrew republic, was a native of Mispeh, and the son of one Gilead by a harlot. The unkindness of his brethren, his promotion to the command of the army, his message to the king of the Ammonites, his rash vow, and its melancholy consequences, with his important victories over the Ammonites and Ephraimites, are recorded in Judges xi. and xii. These events happened about A. M. 2817. Jephthah, after judging Israel six years, died, and was buried in the city of Gilead. St. Paul (Heb. xi. 32) places Jephthah among the saints of the Old Testament, whose faith distinguished them. With regard to Jephthah's vow, most commentators believe that this daughter of Jephthah was not sacrificed, as that would have been a violation of the law of Moses; and especially when, by the same law, he might have redeemed her for ten shekels of silver; therefore they contend, that Jephthah only devoted her to a state of celibacy, or dedicated her to the service of God .- On the other hand, those who maintain that Jephthah's daughter was actually sacrificed, urge, that vows of perpetual virginity are institutions of a modern date; and, had there been no more in it, there would have been little occasion for rending his clothes, and bemoaning himself as he did; besides the bitter lamentations made by herself, and by the daughters of Israel in succeeding times. But in answer to this it is observed, 1. That these lamentations are expressly recorded to have been made (Jud. xi. 37, 38), not for her untimely death, but on account of her virginity; which, though no nun-neries were instituted by the law of Moses might be (and in all probability was) the alternative of Jephthah's vow. And, as a decisive evidence, there was an alternative, the Hebrew word vau, rendered and in our translation, likewise signifies or; and therefore the vow ran in these terms—' Whatsoever cometh forth of the doors of my house to meet me, shall surely be the Lord's, or I will offer it up for a hurnt offering,' i. e. provided it be proper for being sacrificed.

JEREMIAH, an inspired writer of the race of the priests, the son of Hilkia of Anathoth, of the tribe of Benjamin. He was called to the prophetic office when very young, about the 13th year of Josiah, and continued in the discharge 595

of it about forty years. He was not carried captive to Babylon with the other Jews, but remained in Judea to lament the desolation of his country. He was afterwards a prisoner in Egypt with his disciple Baruch, where it is supposed he died in a very advanced age. Some of the Christian fathers say he was stoned to death by the Jews, for preaching against their idolatry; others, that he was put to death by Pharaoh Hophrah, because of his prophecy against him.

JEREMIAH, THE PROPHECY OF, a canonical book of the Old Testament. Part of this prophecy relates to the time after the captivity of Israel, and before that of Judah, from the first chapter to the forty-fourth; part of it to that of the latter captivity, from the forty-fourth chapter to the end. Jeremiah predicts the grievous calamities that were approaching, particularly the seventy years captivity in Chaldea. He also foretels their deliverance and happy return, and the recompence which Babylon, Moab, and other enemies of the Jews, should meet with in due time. There are likewise several intimations in this prophecy concerning the kingdom of the Messiah; also several remarkable visions and types, and historical passages relating to those times. The fifty-second chapter does not belong to the prophecy of Jeremiah, but probably was added by Ezra, and contains a narrative of the taking of Jerusalem, and of what happened during the captivity, to the death of Jechonias. St. Jerome has observed that Jeremiah's style is more easy than that of Isaiah and Hosea; that he retains something of the rusticity of the village where he was born; but that he is also at times learned and majestic.

JERICHO, or HIERICHUS, in ancient geogra-phy, a city of Judea, between Jordan and Jerusalem, 150 stadia from the latter, and sixty from the former. Josephus says, 'the whole space from Jerusalem is desert and rocky, and equally barren and uncultivated from Jericho to the lake Asphaltites; yet the places near the town and above it are extremely fertile and delicious, so that it may be justly called a divine plain, surpassing the rest of the land of Canaan, and surrounded by hills in the manner of an amphitheatre.' It produces dates; from which it is called the city of palm trees, by Moses. It is now called Raha; and is situated, Volney informs us, 'in a plain six or seven leagues long, by three wide, around which are a number of barren mountains, that render it extremely hot. Here formerly was cultivated the balm of Mecca.

JERK, v. a., v. n. & n. s. Saxon zeneccan. To strike with a quick smart blow; to lash. It is sometimes written yerk; to strike up suddenly, as an angler withdraws his line on perceiving a bite; to accost eagerly. Jerk, a smart quick lash; a sudden spring; a jilt.

I lack iniquity

Sometimes to do me service : nine or ten times I thought to've *jerked* him here under the ribs.

Shakspeure.

Well run Tawney, the abbot's churl; His jade gave him a jerk,

As he would have his rider hurl

His blood after the kirk. Ben Jonson.

Contemn the silly taunts of fleering buffoonery; and the *jerks* of that wit, that is but a kind of confident folly. *Glanville*.

Nor blush, should he some grave acquaintance meet,

But, proud of being known, will jerk and greet.

Dryden.

Wit is not the *jerk* or sting of an epigram, nor the seeming contradiction of a poor antithesis, neither is it so much the morality of a grave sentence, affected by Lucan, but more sparingly used by Virgil. *Id.*

Lobsters use their tails as fins, wherewith they commonly swim backwards by *jerks*, or springs, reaching ten yards at once. Grew.

Bastings heavy, dry, obtuse,

Only dullness can produce;

While a little gentle jerking

Sets the spirits all a-working. Swift.

JERKIN, n. s. Sax. cyprelkin. A jacket; a short coat; a close waistcoat.

A man may wear it on both sides like a leather jerkin. Shakspeare.

Then strip thee of thy carnal jerkin,

And give thy outward fellow a firking.

Hudibras.

Unless we should expect that nature should make jerkins and stockings grow out of the ground, what could she do better than afford us wool? Mors. Imagine an ambassador presenting himself in a

poor frize jerkin, and tattered clothes, certainly he would have but small audience. South's Sermons.

I walked into the sea, in my leathern *jerkin*, about an hour before high water. *Gulliver's Travels.*

JERKIN, n. s. A kind of hawk.—Ainsworth. This should be written gyrkin.

JERNINGHAM (Edward), a modern English poet and dramatic writer was descended from the ancient Roman Catholic family of this name in Norfolk, and brother of Sir William Jerningham, bart. Born in 1727, he was sent to the English College at Douay, in Flanders, for his education, and afterwards removed to Paris. On his return to England, however, he became a member of the established church. One of his earliest productions was a poem in favor of the Magdalen, which was followed by The Deserter, 1769; The Funeral of Arabert, Monk of La Trappe, 1771; Faldoni and Teresa, 1773; The Swedish Curate; The Fall of Mexico, 1775; Honoria, or the Day of all Souls, 1782; The Rise and Progress of Scandinavian Poetry, 1784; Enthusiasm, 1789; &c. His play, called Margaret of Anjou, was acted in 1777; the siege of Berwick, a tragedy, in 1794; and the Welsh Heiress, a comedy, in 1795. A collection of his works appeared in 4 vols. 8vo. 1806. He also published An Essay on the Mild Tenor of Christianity, and other religious tracts. His death took place November 17th, 1812. Mr. Jerningham is spoken of with respect by lord Byron in his English Bards, and was a very amiable man.

JEROME, or HIERONYMUS, (St.), a famous doctor of the church, and the most learned of all the Latin fathers, was the son of Eusebius; and was born at Stridon, a city of ancient Pannonia, about A. D. 340. He studied at Rome under Donatus, the learned grammarian. After being baptized, he went into Gaul, and transcribed St. Hilary's book De Synodis. He then went into Aquileia, where he contracted a friendship with Heliodorus, who prevailed on him to travel with him into Thrace, Pontus, Bithynia, Galatia, and Cappadocia. In 372 he retired into a desert in Syria, where he was persecuted by the orthodox of Melitius's party, as a Sabellian, because he made use of the word hypostasis, as used by the council of Rome in 369. This obliged him to go to Jerusalem; where he studied the Hebrew language, to acquire a more perfect knowledge of the Holy Scriptures; and consented to be ordained, provided he should not be confined to any particular church. In 381 he went to Constantinople to hear St. Gregory of Nazianzen; and in 332 returned to Rome, where he was made secretary to pope Damasus. Ile soon, however, returned to the monastery of Bethlehem, where he held a controversy with John of Jerusalem and Rufinus concerning the Origenists ; and was the first who wrote against Pelagius. He died on the 30th of September, 420, about eighty years of age. The last edition of his works is that of Verona, in 11 vols. folio. His principal works are, 1. A Latin Version of the Scriptures, commonly called the Vulgate. 2. Commentaries on the Prophets, Ecclesiasties, St. Matthew, and the Epistles to the Galatians, Ephesians, Titus, and Philemon. 3. Polemical creatises against Montanus, Helvidius, Jovinian, Vigilantius, and Pelagius. 4. A treatise on the lives and writings of the Ecclesiastical authors who had flourished before his time. His style is lively and animated, and sometimes sublime.

JEROME OF PRAGUE, so called from the place of his birth, in Bohemia. Having embraced the opinions of John Huss, he began to propagate them in 1480. The council of Nice cited him to appear before them, and give an account of his faith. In obedience to this citation, he went to Constance; but on his arrival, in 1415, finding Huss in prison, he set out for his own coun-try. Being seized, however, on the way, imprisoned, and examined, he was so intimidated, that he retracted, and pretended to approve of the condemnation of the opinions of Wickliff and Huss; but on the 26th of May, 1416, he condemned that recantation, and sentence was accordingly passed on him; in pursuance of which he was burnt in 1416. He was a person of great talents, learning, and elocution.

JERSEY is a populous island of the English channel, twelve miles long and six broad. The north side is composed of rocky cliffs forty to fifty fathoms high, while the south shore is nearly level with the sea; a ridge of hills runs through the centre, whose sides are covered with orchards, 24,000 hogsheads of cyder have been yielded by their fruit in one year. The other chief pursuit is the rearing cattle, particularly sheep, whose wool, together with cyder, form the only exports; the island is obliged to import corn from France and England. The number of inhabitants is upwards of 20,000.

The two towns of Jersey are St. Helier and St. Aubin. The former, being the chief place, is situated nearly in the middle of the south side of the bay of St. Aubin, the best road of the island, but still dangerous, from numerous rocks scattered round the entrance. The town consists of several good streets, and is defended by numerous batteries, but chiefly by Elizabeth Castle, standing on a rock insulated at high water.

On the west side of the island is St. Ouen's Bay, and on the east St. Catherine's Bay, which are safe roads according to the wind. All the accessible parts of the island are defended by batteries or towers. See GUERNEEY.

Christianity was first planted here, it is believed, in the sixth century, and the island made part of the see of Dol in Bretagne. It is now governed by a dean. Besides the abbey of St. Helier, there were four priories, Noirmont, St. Clement, Bonnenuit, and le Leck, and above twenty chapels, now mostly in ruins. During the American war this island was twice invaded by the French. The first attempt was in 1779. About 6000 men were embarked in flat-bot-tomed boats, and endeavoured to land in the bay of St. Ouen, on the 1st of May, supported by five frigates, and other armed vessels; but they met with such vigorous resistance, that they were compelled to retire without having landed a single person. Another attempt was now resolved on. The troops and seamen were equally desirous of retrieving their honor; but they were for some time prevented from making any attempt by bad weather; and, before another opportunity offered, the squadron designed to cover their descent was attacked by Sir James Wallace, who drove them ashore on the coast of Normandy, silenced a battery under whose guns they had taken shelter, captured a frigate of thirty-four guns, with two rich prizes, burnt two other large frigates, and a considerable number of smaller vessels. The scheme, though thus totally disconcerted, was resumed in 1781. The conduct of this expedition was given to baron Rullecourt, a man of courage, but very deficient in the prudence requisite for such an enterprise. His force consisted of 2000 men; with whom he embarked in tempestuous weather, hoping that he might thus be able to surprise the garrison. Many of his transports, however, were dispersed, and he himself, with the remainder, obliged to take shelter in some islands in the neighbourhood. As soon as the weather grew calm, he landed, in a dark night, at Grouville, where he made prisoners of a party of militia. Hence he proceeded with the utmost expedition to St. Helier, and, being wholly unexpected, seized on a party of men who guarded it, together with the commanding officer, and the magistrates. Rullecourt then drew up a capitulation, the terms of which were, that the island should be instantly surrendered to the French, and the garrison sent to England ; threatening the town with immediate destruction in case of non-compliance. This point being gained, he summoned Elisabeth Castle to surrender in virtue of the capitulation just concluded. To this a peremptory refusal was given, and followed by such a vigorous discharge of artillery, that he was obliged to retire into the town. In the mean time the British troops stationed in the island under the command of major Pierson began to assemble from every quarter : being required by the French commander to submit, that officer replied, that if the French themselves did not,

within twenty minutes, lay down their arms, he would attack them. An attack was accordingly made with such impetuosity, that the French were totally routed in less than half an hour, and driven into the market-place, where they endea-voured to make a stand. Their commander, exasperated at this change of affairs, endeavoured to wreak his vengeance on the captive governor, whom he obliged to stand by his side during the whole time of the conflict. This, however, was quickly over; the French were broken on all sides, the baron himself mortally wounded, and the next in command obliged to surrender himself and the whole party prisoners of war; the captive governor escaped without a wound. This last disaster put an end to all hopes of the French ministry of being able to reduce the island, and was indeed no small mortification to them; 800 troops having been landed at that time, of which not one escaped. During the late wars Jersey flourished, and was we believe never attacked

JERSEY, NEW, one of the United States of North America, is bounded north by New York, east by the Hudson and the Atlantic, south by the Atlantic, and west by Delaware Bay and River, which separates it from the states of Delaware and Pennsylvania. It is 163 miles long, and fifty-two broad; containing 8320 square miles. Population, in 1790, 184,189; in 1800 211,149; and, in 1810, 245,592, of whom 10,851 were slaves, and 7843 free blacks. The number of militia, in 1817, amounted to 35,169.

Trenton is the seat of government. The other most considerable towns are Newark, New Brunswick, Elizabeth-town, Burlington, and Amboy.

There are fourteen banks in this state; and the counties, number of townships, population, and chief towns, are thus exhibited :---

Counties.	Town- ships.	Popula- tion.	Chief Towns.
Bergen	7	16,603	Hackinsack Burlington
Burlington	12	24,979	Bordentown Mount Holly
Cape May	3	3,632	
Cumberland	8	12,670	Bridgetown
Essex	10	25,984	NewarkElizabethtown
Gloucester	10	19,744	& Gloucester Woodbury
llunterdon	10	24,553	Trenton
Middlesex	8	20,381	N. Brunswick
Monmouth	7	22,150	Freehold
Morris	10	21,828	Morristown
Salem	9	12,761	Salem
Somerset	7	14,728	Boundbrook
Sussex	15	25,549	Newton.
	116	245,562	

Delaware River separates this state from Pennsylvania, and the Hudson forms the northern part of the eastern boundary. The other most considerable rivers are the Raritan, Passuic, Hackinsack, Great Egg Harbour River, and Musconecunk.

The three northern counties Sussex, Morris, and Bergen, are mountainous The next four, Hunterdon, Somerset, Essex, and Middlesex, are agreeably diversified with hills and valleys. South Mountain, a great ridge of the Alleghany range, crosses the state in lat. 41° N., and the Kittatinny ridge crosses a little to the north of South Mountain. The greater part of the six southern counties is composed of the long range of level country, which commences at Sandy Hook, and lines the coast of the middle and southern states. Much of this range is nearly barren, producing only shrub oaks and yellow pines; but the rest of the state has a large proportion of good soil, excellent for grazing, and for the various purposes of agriculture. The productions are wheat, rye, maize, buck-wheat, potatoes, oats, and barley. Great numbers of cattle are raised in the mountainous parts for the markets of New York and Philadelphia. Large quantities of butter and cheese are also made. New Jersey is remarkable for an excellent breed of horses. The exports are flour, wheat, horses, cattle, hams, cyder, lumber, flax seed, leather, and iron. The greater part of the produce exported from this state passes through New York and Philadelphia.

Great quantities of leather are manufactured at the valuable tanneries of Trenton, Newark, and Elizabethtown. Large quantities of shoes are made at Newark. There is a glass-house in Gloucester county, and there are paper mills and nail manufactories in various parts of the state. But the most important manufacture is that of iron. In the county of Morris there are seven rich iron mines, two furnaces, two rolling and slitting mills, and about thirty forges. The annual produce of these works is about 540 tons of bar iron, 800 tons of pig, besides large quantities of hollow ware, sheet iron, and nail rods. There are also iron-works in the counties of Burlington, Gloucester, Sussex, &c. The annual produce in the whole state is computed at about 1200 tons of bar iron, 1200 tons of pig, and eighty tons of nails, exclusive of small articles.

Two colleges have been incorporated in this state, one at Princeton, and one at New Brunswick. The latter is not at present in operation. There are theological seminaries at Princeton and New Brunswick; and academies have been established at Amboy, Amwell, Baskingridge, Bedminster, Bergen, Bloomfield, Bordentown, Bridgetown, Burlington, Camden, Elizabethtown, Flemington, Hackinsack, Morristown, New Brunswick, Newark, Newton, Salem, Springfield, Somerville, and Trenton. Most of these academies have but small funds, and five or six of them are not incorporated.

The most numerous denomination of Christians in New Jersey is the English Presbyterians, who have seventy-four churches, and fifty-nine clergymen. The Datch Reformed have thirty-one churches, and twenty clergymen; the Baptists have thirty churches, and twenty-three clergymen; the Episcopalians have twenty-four churches, and eleven clergymen; the Congregationalists have nine churches, and five clergymen; the Friends have forty-four meeting-houses. The Methodists are numerous; the number of communicants was stated, in 1811, at 6739. The legislature is composed of a legislative council, and a house of assembly; the former consisting of thirteen members, one from each county, and the latter of thirty-five members, all chosen annually. The executive is composed of a governor chosen annually by a joint vote of both branches of the legislature, a vice-president chosen by the council, and a privy council, composed of three members of the legislative council. The annual elections are in October. New Jersey sends six representatives to congress.

JER'SEY, n. s. From the island of Jersey, where much yarn is spun. Combed wool, and yarn made of combed wool.

JERVIS (John), earl of St. Vincent, a late distinguished naval commander, was descended of an ancient family in Staffordshire. His father, Swynfen Jervis esq., was auditor of Greenwich Hospital. Our admiral was born at Meaford Hall, January 9th, 1734 (old style). At the age of fourteen he was a midshipman on board the Gloucester, of fifty guns; and, in 1755, served as lieutenant under Sir C. Saunders, in the expedition againt Quebec. Soon after he was appointed as commander to the Experiment, and afterwards to the Albany sloop. In 1760 he obtained the rank of captain of the Foudroyant, and fought in the action between admiral Keppel and the French fleet in July 1778. In 1782 he engaged and took the Pegasé, of seventy-four guns and 700 men. Receiving a severe wound in the head from a splinter, he obtained the red riband as a reward for this gallant conduct.

In 1794 he had the command of a squadron equipped for the West Indies, and reduced Martinique, Guadaloupe, and St. Lucie; for which he received the thanks of parliament, and the freedom of the city of London. On the 14th of February 1797, however, he obtained his great victory. Being in command of the Mediterranean fleet of fifteen sail, he engaged and defeated twenty-seven Spanish ships of the line, the smallest carrying seventy-four guns, and seven of them mounting from 112 to 130 each. He was now raised to the English peerage, by the titles of baron Jervis and earl of St. Vincent. To this was added a pension of £3000 a year, and a gold medal from the king. In 1801 he became first lord of the admiralty; in which capacity he undertook and executed many salutary reforms in naval expenditure, but resigned his post in 1804. May, 1814, lord St. Vincent was appointed general of marines, and July 19th, 1821, admiral of the fleet. He died March 15th, 1823, in his eighty-ninth year, and a monument was voted by the house of commons to be erected to his memory in St. Paul's cathedral.

JERUSALEM, Heb. from ירו they shall see, and שלש, Salem, Peace, a famous and ancient city, capital of Judea, now a province of Turkey in Asia. According to Manetho, an Egyptian historian, it was founded by the shepherds who invaded Egypt in an unknown period of antiquity. See EGYPT. According to Josephus, it was the capital of Melchisedek's kingdom, called Salem in the book of Genesis: and the Arabians assert, that it was built in honor of Melchisedek by twelve neighbouring kings. We know nothing of it with certainty, however, till the time

of king David, who took it from the Jebusites. and made it the capital of his kingdom, which it ever after continued to be. It was first taken in the days of Joash, by Hazael, king of Syria, who slew all the nobility, but did not destroy the city. It was afterwards taken by Nebuchadnezzar king of Babylon, who destroyed it, and carried away the inhabitants. Seventy years after it was rebuilt, by permission of Cyrus king of Persia, and it continued to be the capital of Judea (though frequently suffering much from the Grecian monarchs of Syria and Egypt), till the time of Vespasian emperor of Rome, by whose son Titus it was totally destroyed. See JEWS. It was, however, rebuilt by Adrian : and seemed likely to have recovered its former grandeur, being surrounded with walls, and adorned with several noble buildings; the Christians also being permitted to settle in it. But this was a short-lived change; for when the empress Helena, mother of Constantine the Great, visited this city, she found it in the most ruinous situation. Having formed a design of restoring it to its ancient lustre, she caused, with a great deal of cost and labor, all the rubbish that had been thrown upon those places where our Saviour had suffered, been buried, &c., to be removed. In doing this, they found the cross on which he died, as well as those of the two malefactors who suffered with him; and (as the writers of those times relate) discovered by a miracle that which had borne the Saviour of mankind. She then caused a magnificent church to be built, which enclosed as many of the scenes of our Saviour's sufferings as could conveniently be done, and adorned the city with several other buildings. The emperor Julian is said to have formed a design of rebuilding the temple of Jerusalem, and of restoring the Jewish worship, on purpose to give the lie to our Saviour's prophecy concerning the temple and city of Jerusalem; namely, that the temple should be totally destroyed, without one stone being left upon another: and that the city should be trodden down of the Gentiles till the times of the gentiles were fulfilled. In this attempt, however, according to the accounts of the Christian writers of that age, the emperor was frustrated by an earthquake and fiery eruption from the earth, which totally destroyed the work, consumed the materials which had been collected, and killed a great number of the workmen. This event has been the subject of much dispute. Bishop Warburton published a treatise expressly on the truth of this fact, and collected testimonies in favor of it, from Ammianus Marcellinus, and Gregory of Nazianzen; for which we shall refer our readers to the bishop and the original authors. But it is a matter of very little consequence, whether this event happened, with the circumstances related by these authors, and quoted by the hishop, or not. If Julian did make any attempt to rebuild the temple, it is certain that something obstructed his attempt, because the temple was never rebuilt. If he made no such attempt, the prophecy of our Saviour still holds good; and it surely cannot detract from the merit of a prophecy, that nobo ly ever attempted to elude it, or prove it to be a falsehood. Jerusalem continued in the hands of the castern emperors till the reign of the caliph Omar, who reduced it under his subjection. The Saracens continued in possession of it till 1099, when it was taken by the Crusaders, They founded a new kingdom, of which Jerusalem was the capital, and Godfrey the first king. See GODFREY. The Christian kingdom of Jerusalem lasted eighty-eight years under nine kings, when it was taken by Saladin, sultan of Egypt in 1187. See Egypt. In 1217 the Saracens were expelled by the Turks, who have ever since continued in possession of it. Jerusalen, in its most flourishing state, was divided into four parts, each enclosed with its own walls; viz. 1. The old city of Jebus, which stood on mount Zion, where the prophets dwelt, and where David built a magnificent castle and palace, which became the residence both of himself and successors; on which account it was emphatically called the city of David. 2. The lower city, called also the Daughter of Zion, being built after it; on which stood the two magnificent palaces which Solomon built for himself and his queen; that of the Maccabæan princes; and the stately amphitheatre built by Herod, capable of containing 80,000 spectators; the strong citadel built by Antiochus, to command and overtop the temple, but afterwards razed by Simon the Maccabee, who recovered the city from the Syrians ; and lastly, a second citadel, built by Herod, upon a high and craggy rock, and called by him Antonia. 3. The new city, mostly inhabited by tradesmen, artificers, and merchants; and, 4, Mount Moriah, on which was built the famed temple of Solomon, described in 2 Kings vi. and vii.; and, since then, that rebuilt by the Jews on their return from Babylon, and afterwards built almost anew, and greatly adorned and enriched by Herod. Some idea of the magnificence of this temple may be had from the following considerations: 1. That there were no fewer than 164,300 men employed in the work; 2. That, notwithstanding this prodigious number of hands, it took up seven years in building : 3. That the height of this building was 120 cubits, or eighty two yards; and the courts round it about half as high: 4. That the front, on the east side, was sustained by ramparts of square stone, of vast bulk, and built up from the valley below; which last was 300 cubits high, and being added to that of the edifice amounted to 420 cubits; to which, if we add, 5, The height of the principal tower above all the rest, viz. sixty, it will bring it to 480 cubits, which, reckoning at two feet to a cubit, will amount to 960 feet; but, according to the length of that measure, as others reckon it, viz. at two feet and a half, it will amount to 1200 feet; a prodigious height from the ground, and such as might well make Josephus say, that the very design of it was sufficient to have turned the brain of any but Solomon. 6. These ramparts, which were raised in this manner, to fill up the prodigious chasm made by the deep valley below, and to make the area of a sufficient breadth and length for the edifice, were 1000 cubits in length at the bottom, and 800 at the top, and the breadth of them 100 more. 7. The huge buttresses which supported the ramparts were of the same height, square at the top, and fifty cubits broad, and jutted out 150 cubits at

the bottom. 8. The stones of which they were built were, according to Josephus, forty cubits long, twelve thick, and eight high, all of marble, and so exquisitely joined, that they seemed one continued piece, or rather polished rock. 9. According to the same Jewish historian, there were 1453 columns of Parian marble, and 2906 pilasters; of such thickness, that three men could hardly encircle them; with height and capitals proportionable, of the Corinthian order. But it is probable, that Josephus has given us these last two articles from the temple of Herod, there being nothing like them mentioned by the sacred historians, but a great deal about the prodigious cedars of Lebanon used in that noble edifice, the excellent workmanship of them adapted to their several ends; together with their gilding and other ornaments. At present Jerusalem is called by the Turks Cudsembaric, Coudsheriff, and Heleods, or the Holy City.

Dr. Clarke, on his recent visit to this spot, did not find it, as a whole, that picture of desolation which he had been prepared to expect. On reaching an eminence, to the north of the city, he observes, 'the sight burst upon us all. We had not been prepared for the grandeur of the spectacle which the city alone exhibited. Instead of a wretched and ruined town, by some described as the desolated remnant of Jerusalem, we beheld, as it were, a flourishing and stately metropolis, presenting a magnificent assemblage of domes, towers, palaces, churches, and monasteries; all of which, glittering in the sun's rays, shone with inconceivable splendor.' Ali Bey speaks of the streets as tolerably regular, straight, and well paved, several of them having foot-paths, but they are narrow and dull, and many of them on a descent. The houses are two or three stories high, with few windows and very small doors. Most of them are constructed of free-stone, and their fronts wholly without ornament; so that, in walking the streets, it does not require any great stretch of fancy to conceive one's self in the corridors of a vast prison. The population is estimated at 30,000, more than 20,000 of whom are said to be Christians, with about 7000 Mussulmans, besides Arabs, Turks, Jews, &c. Dr. Clarke says, ' in Jerusalem there are sects of every denomination, and perhaps of almost every religion upon the earth. As to those who call themselves Christians, in opposition to the Moslems, we found them divided into sects, with whose distinctions we were often unacquainted. It is said there are no Lutherans; and if we add, that, under the name of Christignity, every degrading superstition and profane rite, equally remote from the enlightened tenets of the gospel and the dignity of human nature, are professed and tolerated, we shall afford a true picture of the state of society in this country.

The edifice most resorted to by Christian pilgrims is that called the Church of the Holy Sepulchre. It was built, as already intimated, by the empress Helena, the mother of Constantine, and is a handsome structure, 300 feet long, and nearly 200 broad, professing to comprehend within these limits the scene of all the great events of the crucifixion, burial, and resurrection of the Messiah. Over the door is a bas relief of great antiquity, representing his entrance into Jerusalem, with the multitude strewing palm branches before him. On entering the church, the first thing shown is a slab of white marble in the pavement, surrounded by a balustrade. This is stated to be the spot where the body was anointed by Joseph of Arimathea. There appears next a large round fabric, standing in the midst of the principal aisle, and beneath the main dome.

The first part constitutes a kind of ante-chapel, containing what is said to be the sepulchre, before the mouth of which appears a block of white marble, stated to be the stone on which the angel sat. The sepulchre itself is composed of thick slates of that beautiful stone commonly called Verde antico, and the entrance, which is of the same substance, is broken and rugged, in consequence of the number of pieces carried off as relics. Here lamps are kept continually burning.

Beyond the sepulchre, and still beneath the roof of the same church, are shown two rooms, one above another. Close by the entrance to the lower chamber are the tombs of Godfrey of Bouillon and of Baldwin, the modern kings of Jerusalem, with Latin inscriptions in the Gothic character. At the extremity is exhibited a figure, or cleft, in the natural rock, which is said to be the rent produced at the crucifixion. On ascending to the upper apartment, the pilgrim is shown an altar, venerated as mount Calvary, the place of crucifixion; and on it are shown the marks or holes of the three crosses; and here again the same rent appears in the wall.

In galleries round the church, and in small buildings attached to it on the outside, are apartments for the reception of friars and pilgrims. They are occupied by a number of monks of different nations, who devote themselves to the service of the sepulchre, and many of whom do not stir for many years from the sepulchre. In the course of passion week, particularly, they perform a variety of ceremonies, which were witnessed by Maundrell and Pococke. They witnessed by Maundrell and Pococke. represent, for instance, the crucifixion in an effigy of wax; a sermon suited to the subject is preached, and a hymn sung. In due time the nails are taken out, and the image brought down and interred with all the ceremonies of the east. The next day is spent in singing the Lamentations of Jeremiah; and on the following morning, being supposed that of the resurrection, the sepulchre is opened, and all possible marks of joy exhibited. Pococke says that most of these ceremonies were carried on in a very tumultuous and indecent manner.

Dr. Clarke, however, disputes altogether the fact of this being the site of the real crucifixion and burial of Christ. Calvary, besides, is described as without the city, while the church of the sepulchre is within it; so that pilgrims are obliged to suppose that the walls of this fallen place have been extended, so as to include it. Again, while Calvary is said to be a mount, there is not here the least trace of a hill; the ground being entirely plain, except the small rise of about twenty steps leading up to the

altar, the supposed scene of crucifixion. This is so obvious, that travellers have been obliged to suppose that the empress Helena artificially levelled the whole of the ground, with a view to the more convenient erection of her church; but it seems very improbable that this pious princess should thus have studiously obliterated every trace of the events which she intended to commemorate. The altar also, although it professes to exhibit the marks of the three crosses, has no dimensions in the least capable of containing them; and the sepulchre, instead of being cut out of the living rock, is composed of pieces cemented together; and the stone, with which it was supposed to have been shut, does not fit Dr. Clarke thinks he discovered a place far it. more likely to be the real theatre of these transactions in riding out of the city, by what is called Sion gate, when he came to a deep dingle or trench, called Tophet or Gehennon, and abounding with sepulchral excavations, for a particular description of which we must refer the reader to his Travels.

Certainly, however, the most splendid edifice in Jerusalem is the Saracenic mosque of the caliph Omar. Into this no Christian is suffered to enter. Dr. Clarke considered it superior in its architecture to any other edifice he saw in Turkey. It appears to occupy part of the site of the ancient temple; and its numerous arcades, splendid dome, noble area, and high state of preservation, render it, especially when the pilgrims are passing to and fro in their imposing costume, a most magnificent display of Moslem superstition.

The monks here resident consisted originally of various nations and professions, each of which had a quarter assigned to it; but the number has of late been reduced to four, the Latins, Greeks, Armenians, and Copts, of which the last are now almost reduced to nothing. Each fraternity has altars and a sanctuary of its own; but the possession of the holy sepulchre has often been contested with great fury, especially between the Greeks and Latins. Maundrell saw upon some of the monks deep scars, which they had received in these combats. In 1690, however, through the indefatigable exertions of the French monarch, the Latins were secured in this possession; and, though Christians of all nations procure access to the church, they alone can solemnize service in it. These guardians of the holy sepulchre are called Terra Sancta friars, and live constantly within the walls. They have a fat and rosy appearance, and are thought to possess a considerable treasure. The Greek monastery consists of many separate, small, but well supported, establishments. The Armenian is the largest and most splendid in Jerusalem. Every thing here is oriental. The patriarch receives his visitors with royal stateliness, in a flowing vest of silk ; sits amidst clouds of incense; and regales them with all the luxuries of the east. The monks generally are said to be well acquainted with what is passing in Europe, and watch for the expected dissolution of the Turkish empire.

Jerusalem is included in the pachalic of Damascus; but the surrounding territory forms a sort of independent district. The grand seignior assigns the revenues here gathered to supplying the expenses of the ladies of the seraglio. For this purpose they are collected by agents, and transmitted to the kislar aga, or chief of the black eunuchs. The exactions of these agents, with the incursions of the Arabs, have of late greatly reduced the city and suburbs.

JERUSALEM ARTICHOKES, n, s. A species of sunflower.

Jerusalem artichokes are increased by small off-sets, and by quartering the roots. Mortimer.

JESS, n.s. Fr.gecte: Ital. getto; Lat. jacio. Short straps of leather tied about the legs of a hawk, with which she is held on the fist.

That like an hawke which feeling herself freed From bells and *iesses* which did let her flight, Him seemed his feet did fly and in their speed delight. Spenser. Faerie Queene.

If I prove her haggard.

Though that my jesses were her dear heart strings; I'd whistle her off, and let her down the wind To prey at Fortune. Shakspeare. Othello.

JES'SAMINE, n. s. See JASMINE. A fragrant flower.

Her goodly bosom, like a strawberry bed ;

JESSAMINE. See JASMINUM.

Her neck, like to a bunch of cullambines;

Her breast like lilies, ere their leaves be shed ; Her nipples like young blossomed *jessamines*.

Spenser.

JESSELMERE, a large, barren district of Hindostan, in the province of Ajmeer, situated about the twenty-eighth degree of northern latitude. The greater part of it is an uninterrupted tract of sand, without a single stream, and the well water only procurable at a very greatdepth. Being, however, within the influence of the periodical rains, some parts of it are cultivated; but are of little value. It is governed by its aboriginal chiefs.

JESSO, an island on the eastern coast of Asia, north of Japan, and forming one of an independent archipelago, very little known until the voyages of La Perouse and Broughton.

The island called by the Japanese Jesso (the shore) and Mosin (the body hairy) is named Chica by the natives, according to La Perouse, and Insu (Greenland) according to Broughton; it is separated from Niphon by the strait of Sangaar, five leagues broad, named by the Japanese Matsi, or Strait, and the town on the south Matsimay.

This name is sometimes applied to the whole island, which is entirely composed of high and well wooded mountains, whence descend numerous rivers. The trees are oak, elm, ash, maple, birch, beech, linden, yew, silver pine, poplar, yoke elm, willow, and a great variety of shrubs. The fruit trees are chestnuts, plums, with grapes, and many species of berries. Of esculent vegetables, most of those common to Europe are found here, either wild or uncultivated, such as wheat, maize, millet, French beans, peas, lentils, turnips, radishes, carrots, beet, garlic, onions, besides hemp, tobacco, &c. The wild animals are deer, bears, foxes, and rabbits ; the bears are taken when young, and reared like dogs till a

certain age, when they are confined in cages, where they are fattened for food. It is said, the women allow them to suck them when first taken ; and, although they feast on them with the rest of the family, they weep for their death, as for that of a child. The shores abound with seals and sea-otters, and the bays with fish, particularly sprats, which are driven into them in immense shoals by the whales. The rivers are also full of salmon.

The proper natives of Jesso, or Mosins, according to Krusenstern, call themselves Ainos; they are taller and stouter than the Japanese; their faces are covered with thick black beards, which mingles with their black and rather frizzled hair; and, according to Broughton, their bodies are also covered with hair more than any other people, whence their Japanese denomination of Mosin. Both sexes paint or tattoo figures of flowers or animals on the lips and back of the hands.

Their arms are the bow and arrow: they are said to be without laws, money, or writing, and the only religious worship observed amongst them is the pouring libations and lighting fires in honor of the Japanese divinity, Kamoi. They allow of polygamy, and punish adultery in both parties; but a man who receives from a woman her ear-rings is held guiltless, as it is then supposed that she has seduced him. Incest is not considered a crime, and brothers and sisters marry. Their language has no affinity to any other known one, but is neither rude nor disagreeable to the ear. The Mosins trade with the southern Kurilians by barter. When the latter want commodities they appear near the shores of Jesso, and the Mosins immediately lay the objects they are supposed to want on the beach and retire. The Kurilians then land, and, selecting those they mean to take, place them on one side, with the objects they intend to give in exchange by them, and retire in their turns, when the Mosins reappear; and it is by a succession of this silent bargaining that they at last arrive at an agreement. The chief objects of commerce are dried fish, dried sea-weed (fucus saccharinus) which is considered a delicacy by the Japanese, fish oil, beaver, zibelline, otter, fox, and bear skins, &c.

The dress of the Mosins is chiefly of cloth made from the inner bark of the linden: both sexes are fond of smoking. At the southern and western shores the Japanese have establishments, and are said to have fortified a portion of the latter, lately.

JESSORE, or KHALAFABED, a district of Bengal, north-east of Calcutta, bounded on the north by the Ganges, and on the east by Backergunge. The northern part is very fertile; but the southern, which extends into the sunderbunds or woods, produces only coarse rice and salt. The district is, however, very populous, and the inhabitants are in the proportion of nine Mahommedans to seven Hindoos.

JESSORE, or MOORLEY, the capital of the district of that name, is in the Ayeen Akberry, called Russoolpore. It is situated on the western side of the Boirub, and on the high road from Calcutta to Dacca. It was the residence of a

foujdar under the Mogul government, and it is still a flourishing place. Long. 89° 16' E., lat. 23° 7' N.

JEST, v. n. & n. s. Lat. gestus, gestuar. JESTER, n. s. To divert or make merry by words and actions. Jest, anything ludicrous; the object of jests; ludicrous; not serious; game; not earnest. A jester, one given to merriment or sarcasm; a buffoon; a licensed scoffer kept at court to the time of Charles I.

And, tho' [then] descended dounc from jestes old 'To Diomede; and thus she spake and told.

Chaucer. Troilus and Creseide. Another sort of light loose fellows do pass up and down, amongst gentlemen, by the name of jesters ; but are, indeed, notable rogues, and partakers not only of many stealths, but also privy to many traito-Spenser on Ireland. rous practices.

That high All seer, which I dallied with, Hath turned my feigned prayer on my head, And given in earnest, what I begged in jest. Shakspeare.

Fear you the boar, and go so unprovided ? -You may jest on : but I do not like these several

councils. Id. Richard III. But is this true, or is it else your pleasure,

Like pleasant travellers, to break a jest

Shakspeare. Upon the company you overtake? The skipping king, he rambled up and down With shallow jesters, and rash bavin wits ;

Soon kindled and soon burnt. Id. Henry IV.

If I suspect without cause, why then make sport at me; then let me be your jest, I deserve it.

Shakspeare.

As for jest, there be certain things which ought to be privileged from it; namely, religion, matters of state, and great persons. Bacon.

No man ought to have the less reverence for the principles of religion, or for the holy Scriptures, hecause idle and profane wits can break jests upon them. Tillotson.

When his playfellows chose him their king, he spoke and did those things in jest, which would have become a king in earnest. Grew.

Prior. He had turned all tragedy to jest.

Where are the jesters now ? the men of health Complexionedly pleasant? Blair's Grave. Now, as a jester, I accost you,

Which never yet one friend had lost you.

Swift. While thro' their cheerful land the rural talk The rural seandal and the rural jest The rural scandal and the future for the tedious time, Fly harmless, to deceive the tedious time, *Thomson.*

And steal unfelt the sultry hours away. When you the dullest of dull things have said,

And then ask pardon for the jest you made. Young. JESUA LEVITA, a learned Spanish rabbi, in the fiftcenth century, who wrote a curious work entitled Halichot Olam, or the Ways of Eternity; a useful introduction to the study of the Talmud. It was reprinted in Hebrew and Latin, at Hauover, in 1714, 4to.

JESUITS, or the society of Jesus, a celebrated religious order of the Romish church, founded by Ignatius Loyola. See Loyola. The plan of its constitution and laws was suggested, as the founder asserted, by the immediate inspiration of heaven. But, notwithstanding this high pretension, his design met at first with violent opposition. Pope Paul III., to whom Loyola had applied for his authority to confirm the institution, referred his petition to a committee of the cardinals. They represented the establishment to be unnecessary as well as dangerous, and Paul refused to grant his sanction. At last Loyola removed his scruples to the new foundation by an offer which it was impossible to resist. He proposed, that besides the vows of poverty and of monastic obedience, common to all the orders of regulars, the members of this society should take a third vow of obedience to the pope, binding themselves to go whithersoever he should command for the service of religion, and without requiring any thing from the holy see for their support. At a time when the papal authority had received such a shock by the revolt of so many nations from the Romish church, and also when every part of the popish system was attacked with so much violence and success, the acquisition of a body of men, thus peculiarly devoted to the see of Rome, and whom it might set in opposition to all its enemies, was an object of the highest consequence. Paul, instantly perceiving this, confirmed the institution of the Jesuists by his bull, granted the most ample privileges to the members of the society, and appointed Loyola to be the first general of the order. The event fully justified Paul's discernment. In less than half a century, the society obtained establishments in every country that adhered to the Roman Catholic church; its power and wealth increased amazingly; the number of its members became great; and the Jesuits were celebrated by the friends, and dreaded by the enemies of the Romish faith, as the most able and enterprising order in the church.

The constitution and laws of the society were perfected by Laynez and Aquaviva, the two generals who succeeded Loyola, men far superior to their master in abilities and in the science of government. They framed that system of profound and artful policy which distinguished the order. Many circumstances concurred in giving a peculiarity of character to the order of Jesuits, and in forming the members of it not only to take greater part in the affairs of the world than any other body of monks, but to acquire superior influence in the conduct of them. The primary object of almost all the monastic orders is to separate men from the world, and from any concern in its affairs. In the solitude and silence of the cloister the monk is called to work out his own salvation by extraordinary acts of mortification and piety. He is dead to the world, and ought not to mingle in its transactions. He can be of no benefit to mankind but by his example and his prayers. On the contrary, the Jesuits were taught to consider themselves as formed for action. They were chosen soldiers, bound to exert themselves continually in the service of God, and of the pope his vicar on earth. Whatever tends to instruct the ignorant, or can be of use to reclaim or to oppose the enemies of the holy see, was their object. That they might have leisure for this active service, they were totally exempted from those functions the performance of which is the chief business of other monks. They appeared in no processions; they practised no rigorous austerities; they did not consume their time in the repetition of tedious offices; but attended to all the transactions of the

world, with a view to their influence upon religion ; they were directed to study the dispositions of persons of high rank, and to cultivate their friendship; and, by the very constitution as well as genius of the order, a spirit of action and intrigue was infused into all its members. As the object of the society of Jesuits differed from that cf the other monastic orders, the diversity was no less in the form of its government. The other orders are voluntary associations, in which whatever affects the whole body is regulated by the common suffrage of all its members. The executive power is vested in the head of each society; the legislative authority resides in the community. Affairs of moment, relating to particular convents, are determined in conventual chapters; such as respect the whole are consi-But Loyola, dered in general congregations. full of the idea of implicit obedience, which he had derived from his military profession, ap-pointed that the government of his order should be purely monarchical. A general, chosen for life by deputies from the several provinces, possessed power supreme and independent, extending to every person and case. He nominated provincials, rectors, and every other officer employed in the government of the society, and could remove them at pleasure. In him was vested the sovereign administration of the revenues and funds of the order. Every member belonging to it was at his disposal: and by his uncontrollable mandate he could impose on them any task, or employ them as he pleased. To his commands they were required to yield not only outward obedience, but to resign to him their inclinations and sentiments. They were to listen to his injunctions as if they had been uttered by Christ himself. Under his direction they were to be mere passive instruments, like clay in the hands of the potter. Such a singular form of policy could not fail to impress its character on all the members of the order, and to give a peculiar force to all its operations. There is not in the annals of mankind, any example of such a perfect despotism exercised, not over monks shut up in a convent, but over men dispersed among all the nations of the earth. As the constitution of the order vested in the general such absolute dominion, it carefully provided for his being perfectly informed with respect to the character and abilities of his subjects. Every novice who offered himself a candidate was obliged to lay open his conscience to the superior, or a person appointed by him; and not only to confess his sins, but to discover the inclinations, the passions, and the bent of his soul. This was to be renewed every six months. The society, not satisfied with thus penetrating into the innermost recesses of the heart, directed each member to observe the words and actions of the novices : they were constituted spies upon their conduct, and were bound to disclose every thing of importance concerning them to the superior. That this scrutiny into their character might be as complete as possible, the noviciate was long, during which they passed through the several gradations of ranks in the society; and they must have attained the full age of thirtythree years before they could be admitted to take the final vows, by which they became members.

By these methods the superiors, under whose immediate inspection the novices were placed, acquired a thorough knowledge of their disposi-tions and talents. That the general, who was the soul that animated and moved the whole so. ciety, might have under his eye every thing necessary to direct him, the provincials and heads of houses were obliged to transmit to him regular and frequent reports of the members under their inspection. In these they descended into minute details with respect to the character, abilities, temper, and experience of each person, and the particular department for which he was best fitted. These reports were entered into registers kept on purpose, that the general might at one view survey the state of the society all over the globe; observe the talents of its members; and thus choose the instruments which his absolute power could employ in any service for which he thought proper to destine them.

As it was the professed intentior of the Jeauts to promote the salvation of men, this engaged them in many active functions. They considered the education of youth as their peculiar province; they aimed at being spiritual guides and con-fessors; they preached frequently in order to instruct the people; they set out as missionaries to convert unbelieving nations. The novelty of the institution, as well as the singularity of its objects, procured the order many admirers and patrons. The governors of the society availed themselves of every favorable circumstance; and the number and influence of its members increased rapidly. Before the expiration of the sixteenth century, they had obtained the chief direction of the education of youth in every catholic country in Europe. They had become the confessors of all its catholic monarchs; a function of importance in any reign, but, under a weak prince, superior even to that of the minister. They were the spiritual guides of almost every person eminent for rank or power. They possessed the highest interest with the papal court, as the most zealous and ablest champions for its authority. The advantages which they derived from all these circumstances are obvious. They formed the minds of men in their youth, and retained an ascendant over them in their advanced years. They possessed the direction of the most considerable courts in Europe. They mingled in all affairs. They took part in every intrigue and revolution. The general, by the extensive intelligence he received, regulated the operations of the order with perfect discernment : and, by means of his absolute power, carried them on with vigor and effect. Together with the power of the order, its wealth increased. Various expedients were devised for eluding the obligation of the vow of poverty. The order acquired ample possessions in every catholic country; and by the number and magnificence of its public buildings, with the value of its property, it vied with the most opulent of the monastic fraternities. Besides the sources of wealth common to the regular clergy, the Jesuits possessed one peculiar to themselves. Under pretext of promoting the success of their missions, and of facilitating the support of their missionaries, they obtained a special li-

cense from the court of Rome to trade with the nations which they labored to convert. In consequence of this they engaged in extensive and lucrative commerce both in the East and West Indies, and opened warehouses in Europe for vending their commodities. They imitated the example of other commercial societies; obtained settlements; and acquired possession of a large and fertile province in South America, and reigned as sovereigns over some hundred thousand subjects. Unhappily the vast influence which the Jesuits acquired, by all these different means, was often exerted with the most pernicious effect. Such was the tendency of that discipline observed by the society in forming its members, and such the fundamental maxims in its constitution, that every Jesuit was taught to regard the interest ofthe order as the capital object to which every consideration was to be sacrificed. This attachment to their order, the most ardent perhaps that ever influenced any body of men, was the characteristic principle of the Jesuits, and serves as a key to the genius of their policy, as well as the peculiarities of their conduct. As it was for the advantage of the society that its members should possess an ascendant over persons in high rank, or of great power, the desire of acquiring and preserving such an ascendant led the Jesuits to propagate a system of relaxed and pliant morality, which accommodates itself to the passions of men, justifies their vices, tolerates their imperfections, and authorises almost every action that the most audacious or crafty politician would wish to perpetrate. As the prosperity of the order was intimately connected with the preservation of the papal authority, the Jesuits, influenced by the same principle of attachment to the interests of their society, have been the most zealous patrons of those doctrines which tend to exalt ecclesiasical power on the min of civil government. They attributed to the court of Rome a jurisdiction as extensive and absolute as was claimed by the most presumptuous pontiffs in the dark ages. They contended for the entire independence of ecclesiastics on civil magistrates. They published such tenets concerning the duty of opposing princes, who were enemies of the Catholic faith, as countenanced the most atrocious crimes, and tended to dissolve all the ties which connect subjects with their rulers. As the order derived both reputation and authority from the zeal with which it stood forth in defence of the Romish church, its members considered it as their peculiar duty to combat the opinions and check the progress of the Protestants. They used every art, and employed every weapon against them. They opposed every gentle and tolerating mea-sure in their favor. They incessantly stirred up against them all the rage of ecclesiastical and civil persecution. Whoever considers the events which happened in Europe, during the sixteenth and seventeenth centuries, will find the Jesuits responsible for most of the pernicious effects arising from that corrupt casuistry, those extravagant tenets, and that intolerant spirit, which disgraced the church of Rome throughout that period, and which brought so many calamities upon civil society.

Amidst the many bad consequences flowing

from the institution of this order, mankind derived from it considerable advantages. As the Jesuits, in their first attempts to establish colleges, were violently opposed by the universities in different countries, it became necessary for them, in order to acquire the public favor, to surpass their rivals in science and industry. This prompted them to cultivate the study of ancient literature with extraordinary ardor, and engaged them in various methods for facilitating the instruction of youth. Nor has the order been successful only in teaching literature; it has produced likewise eminent masters in many branches of science, and can boast of a greater number of ingenious authors than all the other religious fraternities taken together. But it was in the new world, that the Jesuits exhibited the most wonderful display of their abilities, and contributed most effectually to the benefit of the human species. The conquerors of that unfortunate quar-ter of the globe had nothing in view but to plunder, enslave, and exterminate its inhabitants. The Jesuits alone made humanity the object of their settling there. About the beginning of the seventeenth century they obtained admission into the fertile province of Paraguay. They found the inhabitants strangers to the arts, subsisting precariously by hunting or fishing, and hardly acquainted with the first principles of government. The Jesuits instructed and civilised these savages. They taught them to cultivate the ground, to rear tame animals, and to build houses. They brought them to live together in villages; trained them to arts and manufactures; made them taste the sweets of society, and accustomed them to the blessings of security and order. These people became the subjects of their benefactors, who governed them with a tender and paternal attention. Respected and beloved, almost to adoration, a few Jesuits presided over several hundred thousand Indians. They maintained a perfect equality among all the members of the community. Each of them was obliged to labor, not for himself alone, but for the public. The produce of their fields, and the fruits of their industry, were deposited in store-houses, from which each individual received every necessary supply. By this institution almost all the passions which disturb the peace of society, and render the members of it unhappy, were restrained. A few magistrates, chosen by the Indians themselves, watched over the public tranquillity, and secured obedience to the laws. The sangunary punishments frequent under other governments were unknown. An admonition from a Jesuit, a slight mark of infamy, or, on some particular occasion, a few lashes with a whip, were quite sufficient to maintain good order among these innocent and happy people. But even in these meritorious efforts of the Jesnits for the good of mankind, the genius and spirit of their order appeared. They aimed at establishing in Paraguay an independent empire, subject to the society alone, and which, by the superior excellence of its constitution and police, could scarcely have failed to extend its dominions over all the south-ern continent of America. With this view, to prevent the Spaniards or Portuguese in the adjacent settlements from acquiring any dangerous

Y ...

influence over the people within the limits of the province subject to the society, the Jesuits endcavoured to inspire the Indians with hatred and contempt of these nations. They cut off all intercourse between their subjects and the Spanish or Portuguese settlements. They prohibited any private trader of either nation from entering their territories. When they were obliged to admit any person in a public character from the neighbouring governments, they did not permit him to have any conversation with their subjects; and no Indian was allowed even to enter the house where these strangers resided, unless in the presence of a Jesuit. To render any communication between them as difficult as possible, they industriously avoided giving the Indians any knowledge of the Spanish or any other European language; but encouraged the different tribes which they had civilised to acquire a certain dialect of the Indian tongue, and labored to make that the universal language throughout their dominions. To render this empire secure and permanent, they instructed their subjects in the European arts of war. They formed them into bodies of cavalry and infantry, completely armed, and regularly discip-lined. They provided a great train of artillery, as well as magazines stored with all the implements of war. Thus they established an army so numerous and well appointed, as to be formidable in a country where a few sickly and ill-disciplined battalions composed all the military force kept up by the Spaniards or Portuguese. Such were the laws, policy, and genius of this formidable order.

.

But the courts of Europe had observed for two centuries the ambition and power of the order. While they felt many fatal effects of these, they however could not fully discern the causes to which they were to be imputed. They were unacquainted with many of the singular regulations in the political constitution of the Jesuits, which formed the enterprising spirit of intrigue that distinguished its members, and elevated the society to such a height of power. It was a fundamental maxim with the Jesuits, from their institution, not to publish the rules of their order. These they kept concealed as an impenetrable mystery. They never communicated them to strangers, nor even to the greater part of their own members. They refused to produce them when required by courts of justice; and, by a strange solecism in policy, the civil power in different countries authorised or connived at the establishment of an order of men whose constitution and laws were concealed with a solicitude which alone was a reason for examining them. During the prosecutions carried on against them in Portugal and France, the Jesuits imprudently produced the mysterious volumes of their institute. By these authentic records the principles of their government were discovered, and the sources of their power investigated, with a degree of certainty which, previously to that event, it was impossible to attain. The pernicious effects of the constitution of this order had rendered it early obnoxious to some of the principal powers in Europe, and gradually brought on its downfal. The emperor Charles V. saw it expedient to check its progress in his dominions: it was expelled

England by proclamation, **2** James I., in 1604; Venice in 1606; Portugal in 1759; France in 1764; Spain and Sicily in 1767; and totally suppressed and abolished by pope Clement XIV. in 1773. See FRANCE.

Since the downfal of Napoleon the Jesuits have shown themselves in France, and various parts of the continent, in considerable numbers. They have at least two flourishing seminaries, we believe, also, in this country : we are, however, amongst those who believe the partial revival of this and every other form of popery is transient : in France we know it only confirms the educated and respectable classes in the Deism of the revolution.

JESUS, THE SON OF SIRACH, a native of Jerusalem, composed, about 200 B C., the book of Ecclesiasticus, called by the Greeks Havaperog, 'replenished with virtue;' who also quote it under the title of the Wisdom of Solomon the Son of Sirach. His grandson, who was also of the same name, and a native of Jerusalem, translated it from the Hebrew into Greek about 121 B. C. This Greek version is extant, but the Hebrew original is lost.

JET, n. s. & v. n. Sax zazac; Dut. get; JETTY, adj. S Lat. gagales. A beautiful fossil. See below. From Fr. jet: a spout or shoot of water; a yard. Jet, to shoot forward; to jut out; to strut or agitate the body by a proud gait; to jolt or be shaken; from Fr jetter. Jetty, made of jet; black as jet.

His bill wos black, and as the jet it shone; Like asure were his legges, and his tone.

Chaucer. The Nonnes Preestes Tale.

What orehard unrobbed escapes, Or pullet dare walk in their jet?

Tusser's Husbandry.

Contemplation makes a rare turkey-cock of him : how he jets under his advanced plumes. Shakspeare.

Think you	1 not how dangerous	
It is to jet upo	n a prince's right?	Id.

Black, forsooth; coal-black, as *jet*. *Id*. There is more difference between thy flesh and hers, than between *jet* and ivory. *Id*.

hers, than between *jet* and ivory. The bottom clear,

Now laid with many a set

Of seed pearl, ere she bathed her there,

Was known as black as jet. Drayton.

The people about Capo Negro, Cefala, and Madagascar, are of a *jetty* black.

Browne's Vulgar Errours.

Her hair Adown her shoulders loosely lay displayed, And in her jetty eurls ten thousand Cupids played. Prior.

Prodigious 'tis, that one attractive ray Should this way bend, the next an adverse way ! For should the' unseen magnetick *jets* descend All the same way, they could not gain their end. Blackmore.

Vied for his love in *jetty* howers below. *Pcpe*. Thus the small *jet*, which hasty hands unlock,

Spurts in the gardener's eyes who turns the cock.

One of us in glass is set, One of us you'll find in *jet*. Under flowing *jet*, The neck slight shaded.

Thomson's Summer.

JET, a black inflammable substance of the bituminous kind, harder than asphaltum, and susceptible of a good polish. It becomes electrical by rubbing, attracting light bodies like yellow amber. Its fracture is striated, and it splits more easily in the direction of the striæ. Its hardness from 6 to 7. The specific gravity of a piece extant in the king's cabinet, at Paris, was found by Brisson to be 1259. Yet Buffon tells us it floats on water, and Muschenbroek will have its specific gravity 1744. It burns with a greenish flame : and it has been frequently confounded with the lapis obsidianus, the specific gravity of which, according to Kirwan, is no less than 1744. It also resembles cannel coal extremely in its hardness, receiving a polish, not soiling the fingers, &c., so that it has also been confounded with this. The distinction, however, is easily made; for cannel coal wants the electrical properties of jet, and its specific gravity is no less than 1273. M. Magellan is of opinion that jet is a true amber, differing from the yellow kind only in the mere circumstance of color, and being lighter on account of the greater quantity of bituminous matter which enters into its composition. When burning it emits a bituminous smell. It is never found in strata or continued masses like fossil

JEW, n. s. Lat. Judzus; Gr. Iečauog; JEW'RY, n. s. Heb. jeludi. The descendants of Abraham, as distinguished from all the Gentile nations. Jewry, used by Chaucer as the district of any place inhabited by Jews.

She freyneth, and she praieth pitously To every Jew that dwelled in thilke place, To telle hire, if hire childe went out forth by. Chaucer. The Prioresses Tale. Ther was in Asie, in a gret citee, Amonges Cristen folk a Jewerie— Sustened by a lord (of that countree), For foule usure and lucre of vilanie.

Glory he requires, and glory he receives Promiscuous from all nations Jew or Greek. Milton's Paradise Regained.

' There's a pasty—a pasty,' repeated the Jew, ' I don't care if I keep a corner for't too;'

- "What the de'il mon, a pasty !' re-echoed the Scot,
- " Though splitting, I'll still keep a corner for that."
- "We'll all keep a corner,' the lady cried out,
- "We'll all keep a corner, 'was echoed about.

Goldsmith.

1d.

JEWS. This name seems first to have been given to the descendants of the patriarch Abraham, by his eldest son, Isaac, after their captivity in Babylon, and is derived from that of the patriarch Judah, the tribe of that name constituting, with the tribe of Benjamin, the chief part of this people that has been preserved distinct from other nations.

The history of the Jews is the most remarkable, and certainly the most ancient, in the world, taking its date before the commencement of profane history, and resting, in part, on the authenticity of the Old Testament, in which alone it is recorded; for the writings of Josephus seem chiefly to have been derived from that

stones; but always in separate and unconnected heaps like the true amber. Great quantities of it have been dug up in the Pyrenean Mountains; also near Batalha, a small town of Portugal; and in Galicia in Spain. It is found also in Ireland, Sweden, Prussia, Germany, and Italy. It is used in making small boxes, buttons, bracelets, mourning jewels, &c. Sometimes it is also employed in conjunction with oils in making varnishes. When mixed with lime in powder it is said to make an extraordinary hard and durable cement.

JET D'EAU, a French term, adopted into the English language, for a fountain that casts up water to a considerable height in the air. See HVDROSTATICS.

JET'SAM, n. s., French jetter. Goods or JET'SON. 5 other things which, having been cast over board in a storm, or after shipwreck, are thrown upon the shore, and belong to the lord-admiral.

JETTY HEAD, a name usually given in the royal dock-yards to that part of a wharf which projects beyond the rest; but more particularly the front of a wharf whose side forms one of the cheeks of a dry or wet dock.

J

source. To the Bible, therefore, we may refer our readers for the early account of this people, such as their descent from the twelve sons of Jacob, from whence arose their division into twelve tribes; their going down into Egypt; their treatment there; their Exodus, or departure from that country, under the conduct of Moses; their passage through the wilderness, and settlement in the land promised to Abraham. We begin this sketch of their history with their return from Babylon, and the rebuilding of their city and temple under Ezra and Nehemiah, at which time the Old Testament ceases, and profane historians first notice them. For a chronological list of their judges and kings during the commonwealth of Israel, to the taking of Samaria by the Assyrians, see the article ISRAEL; and for that of the kings of Judah, from Solomon's death to the captivity in Babylon, see the article JUDAII.

About 536 B. C. Cyrus the Great, after having subdued Babylon, and the whole of Western Asia, determined to restore the Jews to their native country, and to permit them to rebuild Jerusalem with its temple. He therefore published a decree, allowing them to carry home with them all their sacred vessels, and engaging himself to bear the expense of rebuilding the temple. Many, however, chose rather to stay in Chaldea; and the more zealous who returned were, as we have intimated, portions of the three tribes of Judah, Benjamin, and Levi, who set out under the conduct of Zerubbabel, and laid the foundations of the temple about 538 B.C. The building advanced (Ezra iv. 1), and every thing seemed to succeed with his countrymen, when they were opposed by the Samaritans, the descendants of those heathens who had colonised

the land of the ten tribes. These people, exasperated by the Jews refusal of their assistance in the work, determined to impede them; this they first attempted by misrepresentations of their motives to the Persian court, and prevailed so far as to procure an order for suspending their proceedings, and afterwards obstructed them by open force. The Jews, however, made their appeal to the government, and procured a new decree in their favor, on which they proceeded, maintaining their ground against their enemies by force of arms. When the temple was finished, Nehemiah endeavoured to restore the ancient worship, and to correct various abuses which had crept in among the people, in which he was assisted by Ezra.

The Jews, however, though restored to the free exercise of their religion, were at this time few in number, and their country only a province of Syria, dependent on the kings of Persia. The Syrian governors for a long time committed the administration of their affairs to the high priests, and to this circumstance may be attributed their subsequent misfortunes. Men were thus introduced into that important office through ambition or avarice, and contrary to the Mosaic institution, which had fixed it in the family of Aaron. A fatal proof of this occurred in the year 373 B.C. Bagoses, governor of Syria, having contracted a friendship with Joshua, the brother of Johanan, the high priest, promised to confer the office upon him not long after his brother had been invested with it; when, on an interview taking place between the brothers in the inner court of the temple, Joshua fell by the hands of Johanan, and the temple was thus most scandalously polluted. In consequence of this a heavy fine was laid on it, which was not taken off for seven years. The first public calamity which befel the Jewish nation, after this, happened in the year 351 B. C., when Darius Ochus, king of Persia, besieged and took Jericho, carrying off all the inhabitants into captivity. From this time they continued so faithful to the Persians, that they had almost incurred the displeasure of Alexander the Great. That monarch having resolved upon the siege of Tyre, and being informed that the city was wholly supplied with provisions from Judea, Samaria, and Galilee, sent to Jaddua, then high priest, to demand of him the tribute which he had been accustomed to pay to the Persians. The Jewish pontiff excused himself on account of his oath of fidelity to Darius. Alexander was on this so provoked, that he had no sooner completed the reduction of Tyre than he marched against Jerusalem. The inhabitants, in the greatest consternation, had recourse to prayers; and Jaddua is said to have been commanded, by an intimation from heaven, to go and meet Alexander. He accordingly set out, dressed in his pontifical robes, at the head of all his priests, and attended by the rest of the people attired in white garments. Alexander, it is said, was seized with such awful respect on seeing this venerable procession, that he embraced the high priest, and paid a kind of religious adoration to the name of God engraven on the front of his mitre. On his followers being surprised at this behaviour, the

Macedonian monarch informed them that he paid that respect not to the priest, but to his God, having seen a vision at Dia, of a person of the same appearance and dress as the pontiff before him, promising him the conquest of Persia, and encouraging him in his expedition. He afterwards accompanied Jaddua into Jerusalem. where he offered sacrifices in the temple. The high priest, it is said, showed him at this time the prophecies of Daniel, wherein the destruction of the Persian empire by himself is plainly foretold; in consequence of which the king went away highly satisfied, and at his departure asked Jaddua if there was any thing in which he could gratify him or his people. Jaddua then told him, that, according to the Mosaic law, they neither sowed nor ploughed on the seventh year, and therefore would esteem it a high favor if the king would remit their tribute that year. To this request Alexander readily yielded; and having confirmed all their privileges, particularly that of living under their own laws, he departed This story has been doubted by some writers; but, whatever credit may be attached to it, it is certain that the Jews enjoyed the favor of Alexander.

All their good fortune, however, seemed to expire with that prince. Situated between Syria and Egypt, Judea was necessarily involved in many of the quarrels of Alexander's ambitious successors, who governed those countries. It first fell to the portion of Laomedon, one of that monarch's generals, together with Syria and Phenicia; but soon afterwards, Ptolemy having deprived him of his possessions, Judea was called upon to yield to the conqueror. The Jews refusing to break their allegiance, to their former prince, Ptolemy now invaded them with a great army, soon reduced the open country, and laid siege to Jerusalem, which, being strongly fortified by nature and art, seemed likely to stand out for a long time. Taking advantage, however, of the Jews' superstitious fear of breaking the sabbath, he assaulted the place on that day, and easily took it; 100,000 of them are said to have been now carried into captivity; but Ptolemy, afterwards reflecting on their known fidelity to their conquerors, restored the Jews to all the privileges they had enjoyed under the Macedonian government. Some of his captives he put into garrisons, others he settled in Libya and Cyrene. From those who took up their residence in the latter of these countries descended the Cyrenean Jews, mentioned in the New Testament. Five years after, when he was forced to yield the country to Antigonus, merely reserving to himself Acre, Samaria, Joppa, and Gaza, he settled a multitude of Jews at Alexandria, and endowed them with considerable privileges. The conduct of Antigonus was so tyrannical, that numbers of his Jewish subjects fled into Egypt, and others took refuge with Seleucus, who also granted them considerable immunities. Thus this nation became gradually spread over Syria and Asia Minor, while Judea seemed in danger of being depopulated, when it was recovered by Ptolemy in 292 B. C.

The affairs of the Jews now took a more prosperous turn, and continued improving till the

reign of Ptolemy Philopater, when they were harassed by the incursions of the Samaritans; and Antiochus Theos, king of Syria, at the same time invaded Galilee. Ptolemy, however, marched against Antiochus, and defeated him; after which, having gone to Jerusalem to offer sacrifices, he ventured to enter the temple itself; and penetrated the two outer courts; but, as he was about to enter the sanctuary, he was, it is said, struck with such dread and terror, that he fell down half dead. On this he raised a dreadful persecution against the Jews, which was stopped by a still more extraordinary event (see the article EGYPT), and the Jews again restored to favor. About the year 204 B.C. Judea was subdued by Antiochus the Great; and on this occasion the Jews failed in their loyalty to the Egyptians, the whole nation readily submitting to the king of Syria. That monarch was so well pleased with this, that he sent a letter to his general, informing him that he designed to restore Jerusalem to its ancient splendor, and to recal all the Jews that had been scattered; that on account of his reverence for their God, he would repair their temple, and grant them 20,000 pieces of silver for the expenses of their worship, together with 1400 measures of fine wheat and 375 of salt for their offerings; that the public service should be restored, and the priests; and that no stranger or Jew, that was unpurified, should enter the holy place of the temple; de-nouncing a peralty of 3000 pieces of silver on any one who should transgress these regulations. He also exempted from taxes, for three years, all Jews who should settle in the metropolis, and set at liberty all that had been sold for slaves.

But this state of prosperity was very soon interrupted, a quarrel, the cause of which is unknown, arising in the year 176 B. C., between Onias the high priest, and Simon the governor of the temple, it led to the most fatal consequences. Simon, not being able to prevail over Onias, informed Apollonius, the governor of the country, that a great treasure was hid in the temple, which might be seized for the king of Syria. On hearing which, that monarch sent Heliodorus to take possession of the supposed treasure; but he, through a miraculous interposition, according to the Jews' account, could not enter the sacred precinct. Simon, upon this, accused the high priest of having invited Heliodorus to Jerusalem, and a civil war was at once excited. Soon after, however, on the complaint of Onias to the king, Simon was sent into exile; but Antiochus Epiphanes having succeeded to the crown of Syria, and being at that time in great want of money, Jason, the high priest's brother, purchased the office for 350 talents, and procured an order that his brother should be confined at Antioch for life. For 150 talents more, Jason obtained permission to build a gymnasium at Jerusalem, like those of the Grecian cities, and to confer the citizenship of Antioch on as many Jews as he pleased. By these means, his countrymen being great admirers of the Greek customs, he soon formed a strong party. A general apostasy now took place; the worship of the temple was neglected, and Jason

gave himself up to paganism. He was, however, soon supplanted by his brother Menelaus, whom he had sent with the tribute to Antiochus, and who, having offered 300 talents more than his brother had given, obtained the high priesthood, and returned with his commission to Jerusalem; but Jason was too powerful for him, and he was obliged to retire to Antioch. On this the Jews of the capital informed Antiochus that it was their determination to renounce their religion, and conform to that of the Greeks; and the tyrant granted them troops, by means of which they drove Jason out of the city, who fled for protection to the Ammonites. Menelaus now failing to pay the tribute, he was summoned to Antioch, and commissioned his brother Lysimachus to sell several of the golden vessels of the temple to raise the money. In the mean time his brother Onias, who was still a prisoner at Antioch, hearing of the sacrilege that had been committed, complained bitterly that an insurrection was about to break out among the Jews there, on which Menclaus bribed Andronicus, the governor of the city, to murder Onias. This produced vehement accusations against the murderer on Antiochus's return to the capital, who at length ordered Andronicus to be executed. Still Menelaus preserved his influence by means of his money; but the drawing of such large sums from Jerusalem incensed the people, and they massacred his brother Lysimachus, whom he had left governor.

0 1-12

After this, when Antiochus went to Tyre, the Jews sent deputies to him, justifying the death of Lysimachus, and accusing Menelaus of being the author of all their troubles; the latter, however, who was never at a loss while he could procure money, pleaded his cause with such effect, that the deputies were put to death; and, having thus obtained a complete victory, he became an absolute tyrant. At this time Jerusalem had no protectors; if there were any zealous men left in the sanhedrim, they were so much terrified that they did not venture to resist him, though they were well aware of his design to overthrow the religion and liberty of his country. While these things were passing, Antiochus was occupied in the conquest of Egypt; and it was rereported, that he was killed at the siege of Alexandria. On hearing this, the Jews imprudently manifested their joy, when Jason, taking advantage of the opportunity, appeared before Jerusalem with 1000 resolute men: the gates were soon opened by some of his friends, and, Menelaus retiring to the citadel, he filled the city with the most horrid butcheries. He was obliged, however, to leave both the city and country, on receiving the intelligence that Antiochus was marching against him with a powerful army. That prince, highly provoked at this rebellion, and especially at the rejoicings the Jews had made on the report of his death, now resolved to punish the city with the utmost severity. Accordingly, about 170 B.C., having made himself master of it, he treated them with such cruelty, that, within three days, no fewer than 40,000 are said to have been killed, and as many sold for slaves. In the midst of this dreadful calamity, the apostate Menelaus found means not only to escape the

general slaughter, but even to regain the favor of the kiug, who, having by his means plundered the temple of every thing valuable, returned to Antioch in triumph. But, before he departed, he put Judea under the government of one Philip, a barbarous Phrygian; made Andronicus, a person of a similar disposition, governor of Samaria; and left Menelaus, the most hateful of the three, in possession of the high priesthood. Though the Jews suffered exceedingly under these tyrannical governors, still greater calamities awaited them. About 168 B.C., Antiochus having been most severely humbled by the Romans, conceived the design of wreaking his vengeance on the unhappy Jews. For this purpose he despatched Apollonius at the head of 22,000 men, ordering him to plunder all the cities of Judea, to murder all the men, and sell the women and children for slaves. Apollonius, on his arrival, assumed an appearance of peaceable intentions; nor indeed was he suspected of hostile intentions by the Jews, as he usually had the management of the tribute in Palestine. On the sabbath, however, he suddenly commanded his men to arms. Some he sent to the temple and synagogues, with orders to cut in pieces all whom they found there; whilst the rest, going through the streets, massacred all that came in their way; the Jews not making the least resistance, for fear of breaking the sabbath. He next ordered the city to be plundered and set on fire, pulled down all the respectable buildings, demolished the walls, and carried away captive about 10,000, who had escaped the slaughter. From that time the service of the temple was totally suspended. The Syrian troops built a large fortress on an eminence in the city of David, which commanded that edifice; and strengthened it with a wall and stately towers. From this place the soldiers could easily see and sally out upon all that attempted to enter the temple; many were continually plundered by them, and the rest, not daring to stay any longer in the city, fled for refuge to the neighbouring nations. Antiochus, not yet satiated with the blood of the Jews, resolved either totally to abolish their religion, or to destroy their whole race. He therefore made a proclamation, that all nations within his dominions should forsake their old religion and gods, and worship those of the king under the most severe penalties. He sent overseers into every province to see these orders strictly executed; and, knowing that the Jews were the only people who would disobey them, special directions were given to treat them with the greatest severity. Athenæus, an old and cruel minister well versed in all the pagan rites, was sent on this occasion into Judea. He first dedicated the temple to Jupiter Olympius, setting up his statue on the altar of burnt-offerings. Another altar of smaller size was raised before it, on which they offered the sacrifices of that god. All who refused to come and worship the idol were either massacred or put to some cruel tortures, till they complied or expired under the hands of the executioners. Altars, groves, and statues, were also raised in every part of the country, and the inhabitants forced to conform to this false worship under the same severe penalties;

while it was instant death to observe the sabbath, circumcision, or any other institution of Moses.

609

These horrid scenes at length aroused the zea'. of a priest, named Mattathias, for the worship of his fathers. He had fled to Modin, his native town, during the persecution that was raging at Jerusalem; and, while he was there, Apelles, one of the king's officers, came to force the inhabitants to comply with the orders of Antiochus. Mattathias and his sons were earnestly entreated by him to give up their religion, and the greatest promises held out to them of the king's favor on their compliance; Mattathias however declared, that though the whole nation and all the world were to conform, he with his sons would continue faithful to their God. Perceiving one of his countrymen about to sacrifice to an idol, he ran upon him and slew him; while his sons, animated with the same spirit, despatched the officer and his men, overthrew the idol and the altar, and, running through the city, called upon all, who were zealous for the law of God, to follow them. They soon found themselves at the head of a considerable body of their countrymen, with whom they departed into one of the deserts of the country; and were followed thither by many more. Seeing the danger to which they were exposed by their too scrupulous observance of the sabbath, they now determined on defending themselves, if attacked, on that day.

Perceiving his followers daily increasing, Mattathias, in the year 167 B.C., made an at-tack upon the Syrian army, and the apostate Jews; having taken many of the latter, he put them to death, and obliged a great number to betake themselves to foreign countries. By these means he struck terror into his foes, and, marching from one city to another, overturned the idolatrous altars, re-opened the synagogues, made diligent search for the sacred books, and caused fresh copies of them to be taken; he also restored the reading of the Scriptures, and had all the males, born since the persecution, circumcised. Eventually he was so successful, that in one year he had extended this reformation through the greatest part of Judea; and would most probably have completely accomplished it, had he not been arrested in his course by death. He was succeeded, however, by his son Judas, surnamed Maccabæus, one of the most renowned heroes that the Jewish annals can boast. With a small body of 6000 men he took possession of some of the strongest fortresses in the country, and became the terror of the Syrians, the Samaritans, and apostate Jews. He defeated the Syrians in five pitched battles in one year, and entirely drove them out of the country; and afterwards purified the temple, restoring the worship of the true God, which had ceased for three years and a half. To pre-vent the Syrian garrison, whom he could not dispossess, from hindering the worship of the temple, he fortified the mountain on which it stood, leaving a garrison to defend it; and strengthened Bethzura, a fortress about twenty miles distant. In the mean time Antiochus, returning from an unsuccessful expedition into Persia, was informed that the Jews had revolted, driven his generals with their armies out of

Vol. XÍ.

Judea, and re-established their ancient worship. Filled with fury, at this intelligence, he threatened to exterminate the whole race, and commanded his charioteer to drive towards that country with the utmost speed : scarcely, however, had he given this order, when he was seized with a violent malady in his bowels, that no remedy could abate. Still he hurried forward, until he fell from his chariot, and was forced to be put into a litter. At last he was constrained to stop at Tabæ, a town on the frontiers of Persia and Babylonia, enduring, it is said, excruciating agonies from the vermin that bred in his intestines, and the stench which was insupportable even to himself. The torments of his mind were greater than those he endured in his body; Polybius, agreeing with the Jewish historians, tells us, that he was haunted by spectres and apparitions, which upbraided him with his wicked deeds, so that he was in a continual de-lirium. Having languished in this dreadful state for a considerable time, he expired; and thus the Jews were delivered from the most inveterate enemy they had ever known. Still the war was carried on by his generals, but Judas always defeated them, and in 163 B. C., obtained a peace on very advantageous terms. On the Syrian generals renewing hostilities, they met the same repulses as before; Judas obtained the victory over them in five engagements, but in the sixth, being abandoned by most of his men, he was slain, together with 800 who continued faithful to him.

This event filled his countrymen with the greatest consternation. Jonathan, his brother, however, succeeded him, and conducted their affairs with the same prudence and success, until he was treacherously seized and put to death by a Syrian usurper of the name of Tryphon, who afterwards murdered his own sovereign. After this the traitor prepared to invade Judea, but his designs were frustrated by Simon, the brother of Jonathan. This pontiff repaired and garrisoned the fortresses of the country, took Joppa and Gaza, and drove the Syrians out of the citadel of Jerusalem; when in the year 135, B.C., he was also murdered through the treachery of Ptolemy, his son in law.

Ilyrcanus I. succeeded him, who was the first person since the captivity that had assumed the regal dignity, and who raised the nation to greater prosperity than it had ever enjoyed since that period. He entirely shook off the Syrian yoke, subdued the Samaritans, demolished their capital city, and made himself master of all Syria, as well as Samaria and Galilee, of which he kept undisturbed possession till within a year of his death. In him, we are told by the author of the fourth book of Maccabees, were united three dignities, that never before met in any other person, namely, the royal dignity, the high priesthood, and the gift of prophecy; but the evidence of the last is very equivocal. He was much disturbed in the last year of his reign by a quarrel with the Pharisees, to whom he had been a great friend, and who had occupied the most honorable stations in the government; at length, however, one of them, named Eleazar, began to dispute the legitimacy of Hyrcanus,

saying that his mother was a slave, and therefore he could not enjoy the dignity of the priesthood. The whole sect affected to believe this report, which so incensed the king that he immediately joined the Sadducees, and would never be reconciled to their rivals, who raised all the seditions they could during the short time that he survived. He died about 107 years B. C., and was succeeded by Aristobulus, his eldest son, who conquered Iturea.

He was a most cruel tyrant, murdering one of his brothers, together with his mother, and keeping the rest closely confined during his reign, which happily proved but short. To him succeeded, in 105, Alexander Jannæus, the greatest conqueror, next to David, that ever wielded the Jewish sceptre. He was hated, however, by the Pharisees, and was once very near being killed in tumult excited by them ; but, having caused his guards to fall upon the mutinous mob, they killed 6000 of them, and dispersed the rest. After this, being unable to remain quiet in his own kingdom, he left Jerusalem, resolving to devote himself wholly to his conquests; but, while he was busied in subduing his enemies abroad, the Pharisees raised a rebellion against him. This was quelled in the year 86 B.C., and the rebels were treated most barbarously. The faction, however, was by these means so thoroughly crushed, that they never dared to lift up their heads as long as he lived. Having conquered several parts of Syria, he died 79, B.C.

Though Alexander had two sons, Hyrcanus and Aristobulus, he bequeathed the government to his wife Alexandra as long as she lived; and directed her just before his death to send for the principal leaders of the Pharisees, and pretend to be entirely devoted to them. With this advice the queen complied; but found afterwards great difficulty how to act with them, as they would at last be satisfied with nothing less than the extirpation of their adversaries. A most cruel persecution, therefore, took place against the Sadducees, which continued for four years; until, upon their earnest petition, they were sent into the several garrisons of the kingdom, to secure them from the rage of their enemies. Being not long after attacked with a dangerous sickness, her youngest son, Aristobulus, formed a strong party to secure the crown to himself: the queen, however, displeased with his conduct, appointed Hyrcanus, whom she had before made high priest, to be her successor also in the kingdom, and soon afterwards expired.

The Pharisees now raised an army against Aristobulus, which almost instantly deserted to him; Ilyrcanus, therefore, was obliged to make peace on the terms of abandoning the royal and pontifical dignity. But this did not extinguish his party. A new cabal was raised by Antipater, an Idumæan proselyte, the father of Herod the Great; who carried off Hyrcanus into Arabia, pretending that his life was in danger in Judea, and applied to Aretas, king of that country, who undertook to restore the deposed monarch. Having invaded Judea, he defeated Aristobulus, and closely besieged him in Jerusalem. The Iatter, therefore, now sought the alliance of the Romans; and having bribed Scaurus, one of

their generals, he defeated Aretas, cutting off 7000 of his men, and driving him quite out of the country. Soon after the two brothers sent presents to Pompey, at that time commander-inchief of the Roman forces in the east, making him arbitrator of their differences. But he, fearing that Aristobulus, against whom he intended to declare, might obstruct his intended expedition against the Nabatheans, dismissed them with a promise, that, as soon as he had subdued Aretas, he would come into Judea and decide their controversy. This so offended Aristobulus, that he departed without even taking leave of the general, who on his part took no less umbrage at this want of respect. The consequence was, that Pompey entered Judea, and summoned Aristobulus to appear before him. The Jewish prince would now gladly have excused himself, but he was forced by his own people to comply in order to avoid a war. He accordingly waited on him several times, and was dismissed with great marks of friendship. At last, Pompey insisting that he should deliver into his hands all the fortified places, Aristobulus plainly perceived that he was on his brother's side, upon which he fled to Jerusalem, resolving to oppose the Romans to the utmost of his power. Pompey quickly followed him, and, to prevent hostilities, Aristobulus was at last forced to throw himself at the feet of the haughty Roman, and promise him a considerable sum of money. This was accepted ; but, Gabinus being sent with some troops to receive the sum, the garrison of Jerusalem now shut the gates against him, and refused to fulfil the agreement. Pompey was so exasperated that he immediately marched with his whole army against the city, and laid regular siege to it. As the fortifications were strong, he might have found it very difficult to accomplish his design, had not the Jews been again seized with a qualm of conscience respecting the observance of the sabbath day. From the time of the Maccabees they had not scrupled to take up arms against an offending enemy on the sabbath; but now they thought, that, though it was lawful on that day to stand on their defence when attacked, it was unlawful to do any thing to prevent those preparations which the enemy might make. Never, therefore, attempting to hinder the erection of batteries, or the making of breaches in their walls on the sabbath, the beseigers at last made so great a breach, that the garrison could no longer resist them. The city was taken in the year 63 B.C.; 12,000 of the inhabitants were slaughtered, and many more put an end to their own lives: the priests, who were engaged in their usual service, choosing rather to be butchered with their brethren than to interrupt the worship. Hycanus, again made high priest, was now forbidden to assume the title of king, to wear a crown, or to extend his dominions beyond Judea. The walls of Jerusalem Pompey demolished, to prevent all future attempts at revolt, and left Scaurus as governor, with a strong force: before he departed, however, he offended the Jews more than ever, by penetrating into the sacred recesses of the temple, and taking a view of the golden table, the candlestick, the censers,

lamps, and other vessels; but he did not venture to touch them, and on retiring commanded the priests to purify the place in the usual manner

Pompey, after this, set out for Rome, taking with him as captives, Aristobulus, Alexander, and Antigonus, his sons, to adorn his triumph. Alexander made his escape into Judea, where he raised 10,000 foot, and 1500 horse, and fortified some strong holds, from which he made constant incursions into the neighbouring country : while Hyrcanus was no sooner delivered from the rivalship of his brother, than he became indolent as usual, and trusted the management of his affairs to Antipater, who took this opportunity to advance his own interests. He attempted by all means to ingratiate himself with the Romans, and Scaurus, being in great want of provisions for an army which he had marched against the metropolis of Arabia, received from him a plentiful supply of corn and other necessaries. Soon after this he prevailed on the king to pay 200 talents to the Romans, to preserve the country, as he alleged, from being ravaged by Alexander. The latter, now venturing a battle, was defeated with great loss, and besieged in the fortress of Alexandrion, where he would have been obliged to surrender, but his mother interceded for him with the Roman general. After this the fortresses were again demolished, and Hyrcanus reinstated in his pontifical dignity; the province being divided into five districts, with a separate court of judicature in each.

Thus the government was changed from a monarchy to an aristocracy, and the Jews became subject to a set of the most arbitrary tyrants. About this time Aristobulus, having escaped from Rome, formed new troubles in Judea, but was conquered and again taken prisoner; his son also renewed his attempts, but suffered a similar defeat and lost nearly 10,000 men. After this Crassus was made governor of the province, the only act of whose government, worthy of record, is his having plundered the temple of its treasures and sacred utensils, valued at more than £2,000,000 sterling. Having committed this sacrilege he set out on his expedition against Parthia, where he perished miserably, as a judgment, according to the Jews, for his impiety.

The nation had some respite from oppression during the war between Cæsar and Pompey, and this likewise afforded them an opportunity of gaining the favor of the former, of which the politic Antipater readily availed himself. Cæsar rewarded him for his services by confirming Hyrcanus in the priesthood, and entailing on his posterity the principality of Judea for ever. He restored the Jews to their ancient privileges, ordering a pillar to be crected on which these grants were to be engraved, together with his own decree; and soon after, coming himself to Judea, gave them permission to fortify the city and rebuild the wall which Pompey had demolished. During his life, the Jews, indeed, hardly seemed to feel the Roman yoke.

But after his death those great disorders ensued, which were not effectually checked, till Herod, who had been made king of Judea by 2 R 2

Marc Antony in the year 40 B. C., was settled on the throne. On this occasion another cruel massacre took place followed by the death of Antigonus, who maintained himself against Herod for three years, murdered his brother Phasael, and cut off Hyrcanus's ears to render him unfit for the high priesthood.

The circumstances of the Jews were not at all improved by this change of masters; Herod becoming one of the greatest tyrants that history has ever mentioned. At the beginning of his reign he put to death all those who had taken part with his rival Antigonus, and confiscated their goods for his own use. So jealous was he in this respect, that he stationed guards at the city gates, to watch the bodies as they were conveyed out, lest any of their riches should be carried with them. He next sent for Hyrcanus from Parthia, whither he had been banished, and put him to death in despite of the most solemn promises of safety. Having no other victims, to satiate his thirst for blood, his cruelty turned on his own family. He had married Mariamne, the daughter of Hyrcanus, whose brother Aristobulus, a young prince of great merit, the tyrant caused to be drowned in a bath. Afterwards being summoned to appear, first before Marc Antony and then before Augustus, to answer for some crimes laid to his charge, he left orders that if he was condemned, Mariamne should be put to death. The consequence was, she conceived the greatest aversion for him, and was not backward in showing it. Enraged at this, Herod caused her to be falsely accused of infidelity, and she was condemned and executed. But with her ended all the happiness of her husband. His love increased so much after her death, that for a long time he appeared like a distracted person. Her death was followed by that of her mother Alexandra, and soon after by that of several other persons who had joined her in an attempt to secure the kingdom to her grandsons. Having now freed himself from most of his supposed enemies, Herod began to show a contempt of the Jewish ceremonies, by introducing a number of Roman games at Jerusalem. Ten assassins at last resolved to enter the theatre, while the tyrant was celebrating these games, with daggers concealed under their clothes. They had the desperate satisfaction to think, that, if they perished, the tyrant would be rendered still more odious by the punishment they suffered. Herod, informed of their design, put this however to the proof, and caused them to be put to a most excruciating death : the people were so much exasperated against the informer, that they tore him to pieces, and cast his flesh to the dogs. For a long time he tried in vain to discover the authors of this affront ; but at last, by means of the rack, he extorted from some women the names of the principal persons concerned, whom he caused immediately to be put to death, together with their families. In consequence of this, disturbances arose, so that, apprehending nothing less than a general revolt, he began to fortify Jerusalem with several additional works, rebuilt Samaria, and put garrisons into several fortresses. About the year 23, B. C., he began to adorn the towns of Judea with many stately buildings. His

most remarkable and magnificent undertaking, however, was the rebuilding and beautifying the temple, which he is said to have accomplished in a style of grandeur superior even to that of Solomon's. Ten thousand artificers were set to work, under the direction of 1000 priests, all of whom were kept in constant pay: 1000 carts were employed in fetching materials; and such a number of other hands were employed, that every thing was got ready within two years. After this they set about pulling down the old building, and rearing up the new one with the same expedition; the holy place, or temple, properly so called, was finished in a year and a half. The remainder in somewhat more than eight years. The temple, or holy place, was sixty cubits high, and sixty broad : in the front he added two wings, which projected twenty cubits more on each side. The stones were white marble, twenty-five cubits in length, twelve in height, and nine in breadth, all wrought and polished with exquisite beauty. Instead of doors, the gates were closed with very costly veils, and on each side were planted two stately columns, from whose cornices hung golden festoons and vines, with clusters of grapes, leaves, &c., curi-ously wrought. The superstructure, however, which was reared on the old foundation without sufficient additions, proved too heavy, and sunk down about twenty cubits. Yet this foundation was of an astonishing strength and height. The platform was a regular square of a stadium or furlong on each side. Each front had a spacious gate, enriched with suitable ornaments; that on the west had four gates, one of which led to the palace, another to the city, and the two others to the suburbs and fields. This enclosure was surrounded with a strong and high wall of large stones, well cemented ; and on the inside had in each front a stately gallery, supported by columns of such a size, that three men could but just em-brace them. There were 162 of them, which supported a cedar ceiling of beautiful workmanship, and formed four galleries, the middlemost of which was the largest and highest, being fortyfive feet in breadth, and 100 in height; those on each side were but thirty feet wide and fifty high. The piazzas and court were paved with marble of various colors; and, at small distance from the galleries, was a second enclosure, surrounded with a flight of beautiful marble rails, with stately columns at proper distances, on which were engraven admonitions in Greek and Latin, forbidding strangers and Jews that were not purified, to proceed farther under pain of death. This enclosure had but one gate on the east side, none on the west, but on the north and south it had three, at equal distances. A third enclosure surrounded the temple, or holy place, and the altar of burnt offerings, forming what was called the court of the Hebrews. This was also square, having the wall on the outside surrounded by a flight of fourteen steps, which hid a considerable part of it; on the top a terrace of twelve cubits in breadth was carried completely round the whole. In this enclosure there was one gate on the east side, none on the west, but on the north and south sides four, at equal distances; and to each of them five steps ascended, in order to reach the level of the inner court. On the inside of each of these gates two spacious square chambers were raised in the form of a pavilion, thirty cubits wide, and forty high, each supported by columns of twelve cubits in circumference. The altar of burnt offerings, built of unhewn stones, was forty cubits high; and fifteen feet in height, with the ascent smooth and without steps. It was encircled with a low rail, dividing the court of the priests from that of the lay Israelites, none but the former being allowed to come within the enclosure. Herod had this temple dedicated with the greatest pomp, and presented it with trophies of his former victories.

In the midst of these magnificent works, however, this prince's mind was not diverted from its usual cruelty. His sister Salome prompted him to the murder of his two sons by Marianne, Alexander and Aristobulus, who had been educated at the imperial court, and were much admired by all who knew them. About this time also, urged by his wicked jealousy, he attempted to destroy the Saviour of the world, and 2000 innocent children perished on the occasion. He had the mortification soon after to discover, that Antipater had conspired against him, for which he had him tried and condemned for treason; but a more terrible calamity awaited him : he was seized with a loathsome and incurable disease, in which his pains were so intolerable, that his life became a burden. To the great joy of the Jews he died about five days after Antipater, having divided his dominions among his sons; Judea he gave to Archelaus, Galilee and Peræa to Herod Antipas, and made Philip tetrarch of Trachonitis, Ituræa, Batanea, and Paneas; he also left considerable legacies to his sister Salome and others of his relations. Aware that the Jews would rejoice at his death, he called together all the chiefs of them to Jericho, and ordered them to be shut up in the circus, leaving directions with Salome and her husband, to have them all butchered, as soon as he expired. 'By these means,' said he, 'I shall not only damp the people's joy, but secure a real mourning for my death!' These cruel orders, however, were not executed. Immediately on the tyrant's death Salome went to the Hippodrome, where the heads of the Jews were imprisoned, and dismissed them, telling them, that the king had no further oscasion for their attendance.

Tumults, seditions, and insurrections followed: Archelaus was opposed by his brethren, and obliged to appear before Augustus, to answer some complaints that were made against him; when the emperor, having heard both parties, assigned to Archelaus one-half of the kingdom with the title of ethnarch, or governor of a nation, and divided the remainder between Philip and Herod. For some years Archelaus continued to govern in peace; butat last, the Jews complaining of his tyranny, Augustus summoned him to his presence, and banished him to Vienne in Dauphiny.

Judea was thus reduced to a Roman province, and, being ordered to be taxed, Cyrenius, the governor of Syria, was sent to see the decree executed, which he did, and having sold the

palaces of Archelaus, and seized his treasure, rc-turned to Antioch. This new tax first sowed the seeds of dissension between the Romans and Jews. Always impatient of a foreign yoke, and knowing from their prophecies that the time was come for the appearance of their Messiah. whom they expected to be a great and powerful warrior, they thought they had only to take up arms and victory would crown their efforts. From this time, therefore, this infatuated people, while they rejected the true Messiah, were ready to follow every impostor, who chose to assume that character, and thus brought on with their spiritual, their temporal destruction likewise. About the sixteenth year of Christ Pontius Pilate was appointed governor; whose administration, according to Josephus, was one continued scene of venality, rapine, and tyranny. Such a governor was ill calculated to appease the ferments occasioned by the tax. Instead of this he inflamed them by introducing his standards with images, pictures, consecrated shields, &c., into their city; and at last attempting to drain the treasury of the temple, under pretence of bringing an aqueduct into Jerusalem. The most remarkable transaction of his government, however, was his condemnation of Jesus Christ, whom he ordered to be crucified at the instigation of the Jews; seven years after which he was removed : and in a short time Herod Agrippa, the grandson of Herod the Great, was made king by Caligula. He did not, however, long enjoy this honor; for having raised a persecution against the Christians, and blasphemously suffered himself to be styled a God by some deputies from Tyre and Sidon, he was miraculously struck in the bowels with a fatal disease, and died most miserably. On his death Judea was once more reduced to a Roman province, and had new governors appointed over it. About this time also Gessius Florus, the last and worst governor the Jews ever had, was sent into the coun-Josephus seems at a loss for words to try. describe his rapine and cruelty; indeed his whole behaviour was so profligate, that he was looked upon by the Jews rather as a bloody executioner than a magistrate. Many of the inhabitants sought an asylum abroad, while those who remained applied to Cestius Gallus, governor of Syria; beseeching him to pity their unhappy state. Florus, who was present, made a jest of them; and Cestius dismissed them with a general promise that the governor should conduct himself better. He then set about computing the number of Jews at that time in Jerusalem, by the number of lambs offered at the festival, in order to send an account of it to Nero. By his computation, they amounted to 2,556,000; though Josephus estimates them at 3,000,000.

In the year 67, A. D., began the fatal war with the Romans, which ended in the destruction of Jerusalem. It took place in consequence of the decision of a contest with the Syriaus concerning Cæsarea; the Jews maintaining that it belonged to them, because it had been built by Herod; and the Syrians asserting that it had always been reckoned a Greek city. Both parties took up arms, but Felix put an end to the contest for a time, by sending some of the chiefs

of each nation to Rome, to plead their eause before the emperor, and Nero decided it against the Jews. Upon this they flew in all places to arms; and, though they every where lost ground, yet from this fatal period their rage never abated. Nothing was heard of but robberies, murders, and every kind of cruelty: and eities and villages were filled with murdered vietims. The Jews spared neither Syrians nor Romans: and this led to the destruction of great numbers of their peaceful brethren; 20,000 Jews were massacred at Cæsarea, 50,000 at Alexandria, 2000 at Ptolemais, and 3500 at Jerusalem. A great number of assassins, in the mean time, having joined the factious in Jerusalem, beat the Romans out of Antonia, a fortress adjoining to the temple, and other strong places. The Romans were at last reduced to such straits, that they capitulated on the single condition that their lives should be spared; notwithstanding which they were all massacred by the furious zealots. This treachery was soon revenged on the Jews of Scythopolis. They had offered to assist in reducing their factious brethren; but, being suspected by the townsmen, were obliged to retire into a neighbouring wood, where, on the third night, they were murdered to the number of 13,000, and all their wealth carried off. The rebels then crossed the Jordan, and took the fortresses of Machærus and Cyprus; which last they razed to the ground, after having put all the Romans to the sword .-This brought Cestius Gallus, the Syrian governor, into Judea with all his forces; the Jews, however, partly by treachery and partly by force, overcame him and drove him out of the country.

Dreadful dissensions now prevailed among them, and many of the higher ranks, fearing the resentment of the Romans, left the city; while the Christians, remembering their Saviour's admonition, retired to Pella on the other side of Jordan, which the war did not reach. In the mean time Vespasian the Roman general, and soon afterwards emperor, left Greece, and, marching into Judea with a powerful army, ordered his son Titus to bring fresh forces from Alexandria; before he could arrive, however, the Jews had twice attempted to take Ascalon, but were repulsed on both occasions with the loss of 10,000 men. Early in the year 68 Vespasian entered Galilee at the head of 60,000 men, well armed and disciplined; he took and burned Gadara, and afterwards laid siege to Jotapa, which made so stout a resistance, that, when he took the place, he ordered all the Jews to be slain or carried into captivity: 40,000 perished on this occasion, and only 1200 were made prisoners, among whom was Josephus, the celebrated historian. Japha was taken next, after an obstinate resistance, the men being all massacred and the women and children carried away as captives. The Samaritans, who had collected together on Mount Gerazim, were a week after this put to the sword. Joppa was taken by storm, and 4000 Jews, who attempted to escape by their ships, were either drowned or slain. Tarriches, Tiberias, Gamala, Gischala, and Itabyr, were suecessively assaulted and carried. On the inhabitants of Gischala being inclined to surrender, a seditious Jew at the head of the faction, named John,

opposed it and overawed the whole city. On the sabbath day he entreated Titus to forbear hostilities till to-morrow, and he would then surrender; but instead of this he fled to Jerusalem with as many as would follow him. Being pursued by the Romans, 6000 of his men were killed, and 3000 women and children brought back prisoners to Titus.

The Jews were at this time divided into three parties : one which was for putting an end to the war by submission to the Romans; another, which breathed nothing but war, and obstinately set themselves against all amicable measures. But by far the most numerous and powerful party consisted of men of profligate character, who committed the most horrid and unnatural crimes under the mask of religion, affirming, that it was dishonorable to God to submit to Romans and heathens, and who bound themselves by a vow, that they would put down all foreign authority or perish in the attempt. These dissensions spread throughout all the country, and houses and families were so divided against each other, that, as our Saviour foretold, ' a man's foes were often those of his own household.' 'In short,' says Josephus, 'the zealots acted more like in-carnate devils than men.' The other parties suffered much more from them, it is said, than even from the Romans. They murdered all that opposed them in the adjacent country, and then entered Jerusalem, where they met with a stout resistance from Ananus, who had lately been high priest : a fierce engagement took place, and the zealots being driven into the inner enclosure of the temple, were closely besieged. On this John of Gischala, who had till now taken sides with the moderates, was sent to them with terms of peace; but, contrary to expectation, he persuaded them to hold out and call in the Idumeans: 20,000 of these therefore came to their relief and were admitted during a stormy night. The city immediately became the theatre of cruelties of every description, and 12,000 persons of respectable birth perished. At length, the Idumeans complaining of putting so many to death, the zealots crected a mock tribunal for the condemnation of their victims; but the judges having once acquitted a person, who was manifestly innocent, the zealots murdered him in the temple, and deposed the magistrates. They next massacred the common people to such an extent that numbers fled for refuge to the Romans, by whom they were instantly put to death. During these transactions Vespasian staid at Cæsarea, well knowing that the strength of the Jewish nation was rapidly wasting away. At last the zealots, having either killed or driven out of the city all the opposite party, began to contend with each other. One Simon, who had his head-quarters at Massada, formed a party against John, and retreated with the spoil into the fortress. In order to increase his party he promised liberty to the slaves, and proportionable encouragement to the freemen, who would join him; so that he was soon at the head of a large army. Unable to attack Jerusalem, he first invaded Idumea; and after a sharp engagement, in which the victory was doubtful, having corrupted the enemy's general, and having procured the army to be given up to him,

he got possession of the country. Here he committed such excesses, that the wretched inhabitants were obliged to seek shelter in Jerusalem, where John tyrannised in such a manner that the Idumeans revolted, killed a great number of his men, plundered his palace, and forced him to retire into the temple. In the mean time the people set fire to the city, and called a council, in which it was agreed to admit Simon with his troops to oppose John and the zealots. Simon's first attempt, however, was ineffectual, and he was obliged to besiege the zealots in the temple. The miseries of the city were now increased by the starting up of a third party, under the conduct of Eleazar, who seized on the court of the priests, and kept John confined within that of None were admitted into the the Israelites. avenues of the temple but those who came to offer sacrifices; and by these offerings he maintained himself and his men. John was thus hemmed in between two powerful enemies. He defended himself, however, with great resolution ; and when the city was invested by the Romans, pretending to come to an agreement with his rivals, he totally cut off or forced Eleazar's men to submit: so that the factions were again reduced to two. The Romans, in 72, began to advance towards the capital, destroying many thousands, and wasting the country as they went along; in 73 Titus invested the city, and immediately sent in offers of peace, which were rejected with contempt.

John now held the whole temple in his possession, together with the valley of Cedron; while Simon possessed the city, some parts of which John had so laid waste that they served for a field of battle, from which they jointly sallied against the common enemy, and to which they returned to renew their own hostilities. The Romans now drew nearer to the walls, having with great labor levelled all the ground as far as Bethara. In the mean time Titus sent Josephus to the besieged with offers of peace; but they were again rejected with indignation. Again he sent Nicanor and Josephus with fresh offers, when the former received a wound in his shoulder; upon which Titus resolved to begin the assault.

The Romans directed their engines against the city on the 14th April. The Jews had likewise machines upon the walls, which they had taken from Cestius, but they were so ignorant of the use of them, that they did little execution, till they were instructed by some Roman deserters : the Roman towers and machines made terrible navock. The least stones they threw were nearly 1 cwt.; and these they could send to the length of a quarter of a mile with incredible force. Titus had reared three towers fifty cubits high ; which, being plaited with iron, the Jews tried in vain to set fire to: they were at length forced to retire out of the reach of their arrows; and the battering rams were at full liberty to play against the wall. A breach was soon made, at which the Romans entered; and the Jews, forsaking this enclosure, retired within the next. This happened about the 28th of April. John defended the temple and the castle of Antonia, and Simon the rest of the city. Titus now drew close to the second wall, and applied his battering rams so furiously, that, after a feint of being willing to surrender, the Jews, who were in one of the towers, set it on fire, and threw themselves into the flames. This opened to the Romans an entrance into the second enclosure, when Titus, anxious to save the city, would not suffer any part of the wall to be demolished; so that his men were repulsed by Simon.

The famine, which was in the city, at length brought on a pestilence; and, as these two dreadful judgments increased, the rage of the factious became more violent. 'I should,' says Josephus 'undertake an impossible task were I to attempt a detail of all the cruelties of these impious wretches; it will be sufficient to say, that I do not think that any city, since the creation, ever suffered such dreadful calamities, or abounded with men so fertile in all kinds of wickedness." Titus, after causing his army to be drawn up, and provisions to be given to his soldiers in the sight of the Jews, again sent Josephus to exhort them not to plunge themselves into ineviable ruin; when this infatuated people not only received him with bitter invectives, but began to threaten his life. Numbers, however, were prevailed on to steal away privately to the Romans, who raised a strong wall round the city to prevent provisions from being brought in. Jerusalem was now filled with dead hodies, which lay rotting in heaps in the streets. The wretched soldiery, taken in the sallies, were cru-cified by order of Titus to terrify the rest, while the zealots gave it out, that they were such as had fled to him for protection. Many indeed who went over to the Romans were butchered by the soldiers from the idea that they had swallowed great quantities of gold; and, though Titus used all his authority, he could not entirely put a stop to this barbarous conduct. At the same time the faction within the city, making sport of the miseries of their starving brethren, and finding that they could not prevent the people from abandoning them, procured some vile pretenders to prophesy, to encourage the despairing survivors by predicting a speedy and miraculous deliverance.

It was during this scarcity of provision that a wretched mother was reduced to the extremity of killing and eating her own child. At the news of this event every one was horror-struck, the people gave themselves over as abandoned to the divine judgments, and Titus, hearing of it, vowed that the city should be razed to its very foundations. About this time he took the castle of Antonia, and, determining to hasten on the siege, caused the gates of the temple to be set on fire, at which the Jews were so terrified, that they suffered themselves to be devoured by the flames, without attempting to extinguish them.

The two factions having now plundered all the inhabitants, rich and poor, seized the treasury of the temple: they even appropriated the sacred oil, and drank the wine destined for the sacrifices. Nothing but the temple now remained, yet such an infatuation prevailed among them, that they still expected a miraculous deliverance, and the vile monster John secmed confident of its security; so that when Josephus was sent for the last time, to upbraid him for exposing that

S.

sacred place and the wretched remains of God's people to certain destruction, he replied, that he was defending the Lord's vineyard, which, he was certain, could not be taken by any human force. Thus himself condescended to speak to them, and endeavoured to persuade them to surrender; all, however, was in vain, and he was at last forced to proceed to those extremities which he earnestly wished to avoid.

On the 17th of July, Josephus observes, that the daily sacrifices ceased for the first time since their restoration by Judas Maccabæus, no proper person remaining to offer them. Titus upbraided the factious with this portentous circumstance, calling upon them to come out of the temple and fight on more proper ground; but, these remonstrances being of no avail, the Romans on the 28th set fire to the north gallery, which enclosed the outer court of the temple from the castle Antonia to the brook Cedron, a considerable portion of which the Jews had already burned. Thus they obtained an easy entrance into the outer court, and obliged the besieged to retreat to that of the priests. For six days Titus tried to beat down one of the galleries in that part, but it was so strong, that the force of his engines, united with the efforts of his troops in sapping, were unable to overthrow it; he next tried scaling, but was vigorously repulsed, and obliged to desist with the loss of some standards, and a considerable number of men. Finding that his desire of saving the building only led to the destruction of many lives, he now set fire to the gates, which, being plated with silver, burned all night, the meltal running down in the melting. The flames soon reached the porticoes and galleries, while the besieged did nothing to extinguish them, but looked on, uttering impotent curses against the Romans. On the 9th of August Titus gave orders to extinguish the fire; and assembled a council to deliberate and determine whether the remainder of the building should be saved or destroyed. Many were for its immediate destruction; but finding their general inflexibly bent on saving so noble an edifice, against which he said they could have no quarrel, they yielded, and the next day was fixed upon for a general assault. In the interval, the Jews having quarrelled with the Roman soldiers, or directed, as Josephus says, by the hand of Providence, one of the latter snatched a blazing firebrand, and, getting on the shoulders of his comrades, cast it through a window into one of the apartments, which surrounded the sanctuary, and instantly the whole north side up to the third story was in a blaze; this happened on the same day, and in the same month, in which the place had been formerly burned by Nebuchadnezzar. Titus, who had gone to rest for a little time, awaking at the noise, ran to give immediate orders for the fire to be extinguished. He called, entreated, threatened, and even caned his men; but they were so intent upon destroying all that was left, that he was not regarded. Finding all his endeavours vain, he entered the sanctuary, and most holy place, the remaining riches and grandeur of which surpassed, he said, all that had been told him. He saved the golden candlestick, the table of the show-bread, the altar of

incense, all of pure gold, and the book of the law, wrapped up in a rich golden tissue. On his leaving the place, the soldiers obliged those who staid behind to come out, and, setting it on fire, began to carry off the rich vessels, robes, platings of the gates, &c. A horrid massacre followed, in which neither age nor sex was spared; thousands perished by the flames, others by falling from the battlements. Among those destroyed were 6000 persons drawn thither by a false prophet, who had promised them on that very day a miraculous deliverance. The Romans carried their fury so far as to burn all the treasure-houses, though they were full of the rich furniture, plate, vestments, &c., which had been laid up in them for security; nothing in fine was left standing except two of the gates, and the court destined for the women.

The seditious in the mean time, under Simon and John of Gischala, found means to retire into the city, and sent to desire a parley with Titus. They were told, that, though they had been the cause of all this bloodshed, yet their lives should be spared, if they would lay down their arms and surrender; but to this they replied, that they had bound themselves by a solemn oath never to surrender; and only begged permission to retire to the mountains with their wives and children. This so provoked the Roman general, that he resolved none of them should be spared; and he immediately abandoned the city to the rage of the soldiers, who murdered all those that fell into their hands, while the factious, who were left, went and fortified themselves in the royal palace, where they put to death 8000 of their own countrymen.

The preparations for the attack of the upper city occupied Titus from the 20th of August to the 8th of September, on which day it was taken and set fire to, his men indiscriminately putting to the sword all the inhabitants, with the exception of those who were shut up in the court of the women. The youngest and most beautiful were reserved for Titus's triumph, and all above seventeen years of age were sent into Egypt, or into Syria and other provinces, to be employed in the public works and the theatres. There were 97,000 of these prisoners, besides 11,000 who were starved through neglect, or who starved themselves in despair. The total number that perished in this war is said to have amounted to 1,400,000, besides great numbers who perished in caves, woods, wildernesses, common sewers, &c. The two grand rebels were found, and reserved for the conqueror's triumph; John, being pinched with hunger, came out and obtained his life, but was condemned to perpetual imprisonment; but Simon, whose retreat was better sup-plied, held out till the end of October. These, with 700 of the handsomest captives, attended the triumphal chariot; after which, Simon having been dragged through the streets of Rome with a rope round his neck, and severely scourged, was put to death, and John was sent into confinement. The castle of Massada, where Eleazar was entrenched with a numerous garrison, held out for a long time against the Romans, who surrounded it with a high wall, and then set it on fire. The wind blew the flames so fiercely

against the Jews, that Eleazar in despair persuaded them to kill their wives and children, and afterwards to choose ten men to kill the rest; one of the survivors was then to kill the others and himself, after having set fire to the place. This was all accomplished, and when the Romans, the next day, were about to scale the walls, they were surprised at seeing no one on them, until two women came forth from an aqueduct, where they had concealed themselves, and informed them of the horrid catastrophe. Titus ordered his men to demolish every part of the city, and not to leave a vestige of its noble structures, except a piece of the western wall and three towers, as a monument to future ages of the desperate resistance of the Jews, the strength of the city, and the skill and valor of its conqueror.

Thus a complete termination was put to the Jewish worship, and the existence of the nation, nor have they been able since that time to gain any footing in Judea; but have been scattered, according to the predictions of their prophets, over the face of the whole earth, and become a by-word and a reproach among all nations. They still continue vainly to expect the coming of a Messiah, to deliver them from the wretched state into which they have fallen; and this hope has had so powerful an influence, that notwithstanding the many persecutions they have endured, both from Pagans, Mahommedans, and professed Christians, they have never been induced to mingle with any of the nations among which they have been scattered. In different ages they have suffered dreadful massacres. In this country formerly the life of a Jew, and the disposal of all his effects, were subject to the pleasure of the lord of the place where he lived. At the time of the crusades they were harassed by the most cruel exactions, and often treated with the utmost barbarity. The reigns of our Richard I. and John may be reckoned among the times of their greatest oppression. Popular prejudices ran so high against them, that in 1348, when a fatal distemper prevailed in many parts of Europe, they were accused of having poisoned the springs and wells, and a million and a half of them were cruelly massacred. Rather more than a century after this, 500,000 were driven out of Spain, and 150,000 from Portugal; Edward I. imitated this wicked example by expelling great numbers from this country. Since, however, arts and learning have revived in Europe, they have felt the benefit of that increased humanity, which has extended all over the globe; France, Holland, and other states, allow them the rights of citizenship; England and Prussia tolerate and protect them; and even the emperor of Austria has removed some restrictions under which they labored in his dominions. It is to be hoped that this humane treatment will continue and increase, until their prejudices against Chris-tianity will no longer find a support in the conduct of its professed disciples.

The attention of the friends of religion has will be f been much turned of late, especially in this antiquiti country, towards the amelioration of the condition of this people, and their conversion to and inter Christianity. Many exertions have been made records.

for this purpose, and a society has been for some years in operation, having this latter object especially in view; it is to be lamented, however, that as yet little progress has been made, and but few real conversions effected. The prophecies too, relative to this extraordinary nation, have been much investigated, to ascertain, by the assistance of unfolding events, what expectations may be justly formed with regard to them. Some Christians think that the Holy Scriptures predict their restoration to their own land, there to be converted to Christ, and thence to become missionaries for the conversion of the heathen world; while they expect a personal appearance of the Lord Jesus to reign over them, and to execute judgments upon the western, or Christian church, on account of its dreadful declension and corruptions. A few have asserted that they will fight their way to the Holy Land, and after exterminating the Mahommedans, who at present possess it, build their temple, and set up again their ancient worship. Others oppose both of these hypotheses, contending that the prophecies referred to in their support were almost all written previous to the Babylonian captivity, or at the time the Jews were captives, and therefore were fulfilled at the restoration, which took place in consequence of the decree of Cyrus, king of Persia; that not a vestige of the ten tribes of Israel seems to have been traced, and therefore they may be considered as lost; and that to suppose the restoration of the Jewish nation to their own land, and especially the re-establishment of their ancient worship, is utterly opposed to the nature of the kingdom of Christ, which he himself declares to be spiritual, and not of this world. They consider that the prophecies of the future glory and splendor of the church all relate to the spread of the gospel in the latter days, and the increase of believers in Christ of all nations, who are, according to the declarations of the New Testament, the saints, the true Israel of God; and, finally, that to suppose God's people should ever effect the triumph of their cause by war and bloodshed is directly contrary to the law of the Saviour, which forbids the use of the temporal sword, and allows no weapon but that of the Spirit, that is, the word of God, to be used in the advancement of his kingdom. They moreover contend, that these sentiments, professedly designed by their upholders to conciliate the Jews, are really calculated to strengthen their prejudices against the real doctrine of Christ, and to interpose still greater hindrances to their conversion.

The ceremonies and religious rites of this people should be taken from the law of Moses as found in the Scriptures; but they have added a multitude of absurd customs and traditions, most of them derived from their elders and rabbies, who have lived since the closing of the canon of the Old Testament, and written various commentaries upon it. In the Holy Scriptures, therefore, will be found the most genuine account of their antiquities; and the writings of their historian, Josephus, have added much that is curious and interesting, in illustration of those sacred records.

JEW'EL, n. s. JEW'EL-HOUSE, R. S.

Fr. joyaur ; Dut. jew-ealen ; Italian gioiello, from Latin gaudialis. JEW'ELLER, n. s. Any ornament of great value, used commonly of such as are adorned with precious stones; a term of fondness; an appellation of tender regard. Jewel-house is the place where regal ornaments are reposited. Jeweller, one who traffics in precious stones.

The bridel is in to the four yborne, And kept among his jewels lefe and dere : The hors vanisht, I not in what manere, Out of his sight.

Chaucer. The Squieres Tale. Amongst the rest a iewell rich he found,

That was a ruby of right perfect hew. Spenser. Faerie Queene.

Here, wear this jewel for me, 'tis my picture. Shakspeare.

They found him dead and cast into the streets, An empty casket, where the jewel, life,

By some damned hand was robbed and ta'en away. Id.

Bid farewell to your sisters.

-Ye jewels of our father, with washed eyes Id. King Lear. Cordelia leaves you. The king has made him master of the jewel-house. Shakspeare.

Jewels too, stones, rich and precious stones, Stolen by my daughter ! Id. Merchant of Venice.

But should I now to you relate

The strength and riches of their state ;

The pewder patches and the pins

The ribbons, jewels, and the rings ;

The lace, the paint, the warlike things,

That make up all their magazines. Cowley. These grains were as like little dice as if they had been made by a jeweller. Boyle.

The price of the market to a jeweller in his trade is one thing; but the intrinsick worth of a thing to a man of sense is another. L'Estrange.

The pleasure of the religious man is an easy and portable pleasure, such an one as he carries about in his bosom, without alarming either the eye or envy of the world : a man putting all his pleasures into this one, is like a traveller's putting all his goods into one South. jewel.

I will turn jeweller : I shall then deal in diamonds, Addison. and all sorts of rich stones.

Proud fame's imperial seat

With jewels blazed, magnificently great. Pope.

JEWEL. See DIAMOND, and RUBY. Jewels made a part of the ornaments with which the Jews, Greeks, and Romans, especially their ladies of distinction, adorned themselves. So prodigious was the extravagance of the Roman ladies, that Pliny the elder says he saw Lollia Paulina with an equipage of this kind amounting, according to Dr. Arbuthnot's calculation, to £322,916 13s. 4d. of our money. Precious stones, amongst the Romans and all the ancients, were much scarcer and consequently in higher esteem than they are amongst us, since a commerce has been opened with the Indies. The ancients did not know how to cut and polish them to much perfection; but colored stones were not scarce, and they cut them very well either hollow or in relief. When luxury had gained ground amongst them, the Romans hung pendants and pearls in their ears; and for this purpose the ears of both sexes were frequently bored.

JEWEL (John), a learned English writer and bishop, born in 1522, and educated at Oxford. In 1540 he proceeded A.B., became a noted tutor, and was soon after chosen rhetoric lecturer in his college. In February, 1544, he commenced A.M. He had early imbibed protestant princi-ples, and inculcated them to his pupils; but privately till the accession of kind Edward VI., in 1546, when he made a public declaration of his faith, and entered into a close friendship with Peter Martyr. In 1550 he took the degree of B. D., and preached before the university with great applause. Upon the accession of queen Mary, in 1553, he was one of the first who felt the rage of the storm then raised against the Reformation; for before any law was made, or order given by the queen, he was expelled Corpus Christi College by the fellows, by their own private authority; but he continued in Oxford till he was called upon to subscribe to some of the popish doctrines, under the severest penalties, to which he submitted. But this did not procure his safety; for he was obliged to fly, and, after encountering many difficulties, arrived at Frankfort, in the second year of queen Mary's reign, where he made a public recantation of his subscription to the popish doctrines. Thence he went to Strasburg, and afterwards to Zurich, where he resided with Peter Martyr. He returned to England in 1558, after Mary's death; and in 1559 was consecrated bishop of Salisbury. The university of Oxford, in 1565, conferred on him in his absence the degree of D. D. In this character he attended queen Elizabeth to Oxford in 1566, and presided at the disputations held before her on that occasion. He had greatly distinguished himself by a sermon preached at St. Paul's cross when he was made a bishop; in which he gave a public challenge to all the Roman Catholics in the world to produce but one clear testimony out of any father or famous writer, who flourished within 600 years after Christ, for any one of the articles which the Romanists maintain against the church of England; and, two years afterwards, he published his famous Apology for that church. But his watchful and laborious life impaired his health, and brought him quickly to the grave. He died at Monkton Farley in 1571, in the fiftieth year of his age. He wrote 1. A View of a seditious Bull sent into England by Pope Pius V. in 1569. 2. A Treatise on the Holy Scriptures. 3. An Exposition of St. Paul's two Epistles to the Thessalonians. 4. A Treatise on the Sacrament. 5. An Apology for the National Church. 6. Several sermons, controversial treatises, and other works. His admirable Apology was translated from the Latin by Anne, the second of the four learned daughters of Sir Anthony Coke, and mother of Sir Francis Bacon. It was published as it came from her pen, in 1564, with the approbation of the queen and the prelates. It was printed in Greek at Constantinople, under the direction of St. Cyril the patriarch. His Defence of it, against Harding and other popish divines, was in such esteem, that queen Elizabeth, king James I., king Charles I., and four successive archbishops, ordered it to be kept chained in all parish churches, for public use.

619

JEWEL-BLOCKS, in sea language, two small blocks suspended at the extremity of the main and fore top-sail-yards, by an eye-bolt driven from without into the middle of the yard-arm, parallel to its axis. Their use is to retain the upper part of the top-mast studdin_-sails beyoud the skirts of the top-sails, so that each of those sails may have its full force of action, which would be diminished by the encroachment of the other over its surface. The halliards, by which those studding-sails are hoisted, are accordingly passed through the jewel-blocks; whence, communicating with a block on the top-mast head, they lead downwards to the top or decks, where they may be conveniently hoisted. See SAIL.

JEWS-EARS, n. s. From its resemblance of the human ear.—Skinner. A fungus, tough and thin; and naturally, while growing, of a rumpled figure, like a flat and variously hollowed cup; from an inch to two inches in length, and about two-thirds of its length in breadth. Its sides in many places run into the hollow, so as to represent in it ridges like those of the human ear. It generally grows on the lower parts of the trunks of elder-trees decaying. The common people cure themselves of sore throats with a decoction of it in milk.

An herb called *jews-ear* groweth upon the lower parts of elder, and sometimes ashes : in warm water it swelleth, and openeth extremely. *Bacon.*

JEWS-HARP, n. s. A kind of musical instrument held between the teeth, which gives a sound by the motion of a broad spring of iron, which, being struck by the hand, plays against the breath.

JEWS-MALLOW, n. s. Lat. corchorus. Rauwolf says it is sown in great plenty about Aleppo as a pot-herb, the Jews boiling the leaves of this plant to eat it with their meat.

JEWS-STONE, n. s. The clavated spine of a very large egg-shaped sea-urchin, petrified by long lying in the earth. It is of a regular figure, oblong, and rounded, swelling in the middle, and gradually tapering; about three-quarters of an inch in length, and half an inch in diameter; ridged and furrowed alternately, in a longitudinal direction; and its color is a pale dusky gray, with a faint cast of dusky reddishness. It is found in Syria.

JEZIDES, among the Mahommedans, the name of a numerous sect inhabiting Turkey and Persia, so called from their head Jezid, an Arabian prince, who slew the sons of Ali, father-in-law to Mahomet; for which reason he is by true Mussulmans reckoned a parricide, and his followers heretics. There are about 20,000 Jezides in Turkey and Persia; who are of two families, black and white. The white are clad like Turks, and distinguished only by their shirts, which are not slit at the neck like those of others, but have a round hole to put the head through. This is in memory of a golden ring, or circle of light, which they say descended from heaven upon the neck of their cheq, the head of their religion, after his undergoing a fast of forty days. The black Jezides, though married, are the monks, or religious of the order; and these are called fakirs. The Turks

exact excessive taxes from the Jezides, who hate them as their mortal enemies, and are attached to Christians; being never circumcised but when they are compelled. They are extremely ignorant, never reading even the koran; and, though they make vows and pilgrimages, have no places of religious worship. It is said to be a point of their religion never to speak ill of the devil, lest he should resent the injury, if ever he should come to be in favor with God again, which they think possible. They bury their dead at the first place they come at, rejoicing as at a festival, and celebrating the entry of the deceased into heaven. They go in companies like the Arabians, and change their habitations every fifteen days. When they get wine, they drink it to excess.

JEZRAEL, or JEZREEL, a town in the north of Samaria, towards mount Carmel, on the borders of Galilee (Joshua xix.), said to be one of the towns of Issachar, where stood a palace of the kings of Israel; 1 Kings xxi. 18.

JEZREEL, a valley of Samaria (Judges vi. 17), situated north of the town, running from west to east ten miles, between two mountains; the one to the north commonly called Hermon, near mount Tabor; the other Gilboa. It is two miles broad.

JEZZAR PACHA, or the Butcher Pacha, a famous pacha of Seide and Acre, in modern times. He was born in Bosnia, in the early part of the last century, and originally named Ahmed. In his youth he sold himself to a trader, who took him to Egypt, where he was purchased by the noted Ali Bey, by whom he was promoted in a few years to the office of governor of Cairo. In 1773, when Ali became unfortunate, the emir Yusef confided to our hero the government of Berout, in Syria, in which post he betrayed the trust reposed in him; and Yusef, assisted by the sheik Dhaher and a Russian squadron, laid siege to Berout. Unable to resist these formidable foes, Jezzar surrendered himself into the hands of Dhaher, and went with him to Acre, whence he soon escaped. We now find the capitan pacha Hassan appointing him pacha of Acre and Syria. His zeal in this service was recompensed with new favors, and he was made a pacha of three tails, with the title of vizier. He largely extended the boundaries of his government, and, in spite of the efforts of the Turkish court to displace him, asserted and retained an independent authority as long as he lived. He was absolute master of this part of Syria at the period of the French invasion of Egypt; and with the aid of a naval force under Sir Sydney Smith, and of M. Phelippeaux, a French engineer, defended the city of St. Jean d'Acre against the reiterated attempts of Buonaparte. After a siege of sixty-one days, the conqueror of Italy and Egypt was obliged to relinquish his enterprise. He died at an advanced age, in 1804, leaving behind him a vast treasure.

IF, conjunction. Goth. ef; Belg. of; Sax. \mathfrak{F} ; literally the verb give : see the examples. Granting or allowing that; whether or not; suppose it be granted that.

For O thing, Sires ! saufly daro I sele, That frendes, everich, other must obeie, If they wol longe holden compagnie.

Absolute approbation, without any cautions, qualifi-Hooker. cations, ifs or ands. If that rebellion

Came like itself in base and abject routs ; I say, if damned commotion so appeared, In his true, native, and most proper shape. You, reverend father, and these noble lords, Shakspeare. Henry IV. Had not been there. If they have done this deed, my noble lord--If ! talk'st thou to me of ifs? Thou art a traitor. Shakspeare. His sword is all his argument, not his book,

Altho' no scholar he can act the cook, And will cut throats again if he be pay'd; In th' Irish shambles he first learned the trade. Marcell.

If e'er he be king I know Britain's doom

We must all to a stake or be converts to Rome. Id. Try but awhile if you be wise

The trial neither costs nor ties. Id.

Such mechanical circumstances, if I may so call them, were not necessary to the experiments. Boyle.

Uncertain if by augury, or chance ; But by this easy rise they all advance.

Dryden.

620

The province of the soul is large enough To fill up every cranny of your time,

And leave you much to answer, if one wretch Be damned by your neglect. 14.

This seeing of all things, because we can desire to see all things, Malbranche makes a proof that they are present to our minds ; and, if they be present, they can no ways be present but by the presence of God, who contains them all. Locke.

She doubts if two and two make four :

It can't-it may be-and it must;

To which of these must Alma trust?

Nay, further yet they make her go,

In doubting if she doubts or no. Prior.

All of them supposed the apostle to have allowed the Epicurean maxims to be good; if so be there Atterbury. were no resurrection.

Tisiphone, that oft hast heard my prayer, Assist, if Oedipus deserve thy care.

Pope's Statius.

If they,

Things of ignoble or of savage mood,

Endure and shrink not, we, of nobler clay,

May temper it to bear,-it is but for a day

Byron. Childe Harold.

IF, an island of France, in the department of the mouths of the Rhone, and late province of Provence; the most eastern of the three before the harbour of Marseilles: It is very well fortified, and its port one of the best in the Mediterranean.

IGLA, or IGLAWA, a river of Moravia, which rises in Bohemia, and crosses the circles of Znaym and Brunn, joining the Schwarza; after which the united stream falls into the Theya near Unterwisternitz.

IGLAU, a circle and town of Moravia, extends from the circle of Bruun, along the borders of that of Czaslau and Tabor, in Bohemia, to the south-west extremity of Moravia, where it meets the archduchy of Austria. The whole area is 1060 square miles; its population 151,000. It is mountainous, but has abundance of good pasture, and some arable land. A silver mine was once wrought, but is now relinquished.

The town is ancient, and situated in a hilly district near the river Iglau. It is fortified, and contains a large provincial school, six churches, and two convents. Here are manufactures of woollens, which are made of great fineness; the half, or more, is annually exported to Italy by way of Trieste. The trade in corn, hops, and hemp, is also considerable. Population 11,000: sixty-two miles south-east of Prague, and 122 south-east of Dresden.

IGLESIAS, a large town on the south-west coast of the island of Sardinia. It is a bishop's see and has a cathedral, with three convents and a small bay. Its trade is in olives, honey, and cheese. Population 6000: thirty-four miles west of Cagliari.

IGNATIA, in botany, a genus of the monogyma order and pentandria class of plants: CAL. five-toothed : cor. long; the fruit a unilocular There is but one plum, with many seeds. species. viz.

I. amara, a native of India. The fruit contains the seeds called St. Ignatius's beans. It grows in the Philippine Islands, and winds itself about the tallest trees to the top; it has large, ribbed, bitter leaves, a flower like that of the pomegranate, and a fruit larger than a melon. The fruit is covered with a thin, glossy, blackish, green, and marbled shell, under which is lodged another of a stony hardness; within this is contained a soft, yellow, bitterish pulp, in which lie the seeds or beans, to the number commonly of twenty-four, each covered with a silvery down. Koning relates, that a person by drinking a spirituous tincture of them was throw into strong convulsions; and Dr. Grim says, that a dram of the seed, in substance, occasioned for a time, a total deprivation of the senses.

IGNATIUS (St.), surnamed Theophrastus, one of the fathers of the church, was born in Syria, and said to be educated under the apostle John. He was also acquainted, we are told, with some of the other apostles, especially Peter and Paul. Being fully instructed in the doctrines of Christianity, he was ordained by St. John, bishop of Antioch, about A. D. 67. In this important post he continued above forty years, a zealous defender of the Christian religion, till A. D. 107, when Trajan, flushed with a victory which he had obtained over the Scythians and Daci, about the ninth year of his reign, came to Antioch, which he entered with the pomp of a triumph. Ignatius presented himself to the emperor; and, in a long discourse, vindicated his faith with freedom. He was in consequence cast into prison, and sentence passed upon him; that, being incurably superstitious, he should be carried bound to Rome, and there thrown to wild beasts. Arriving at Smyrna, he visited Polycarp, bishop of that place, and was himself visited by the pastors of the Asian churches round the country. In return he wrote letters to the churches of the Ephesians, Magnesians, and Trallians, for their instruction and establishment in the faith. He also wrote to the Chris621

tians at Rome, to acquaint them with his state, and passionate desire not to be hindered in the course of martyrdom, which he was now hastening to accomplish. His guard set sail with him for Troas, a noted city of Phrygia Minor, near the ruins of Troy, whither several churches sent messengers to him; and hence too he despatched epistles to the churches of Philadelphia and Smyrna; and, as Eusebius relates, to Polycarp, recommending to him the care of the church of Antioch. From Troas they sailed to Neapolis, in Macedonia; thence to Philippi; and, passing on foot through Macedonia and Epirus, they came to Epidaurum, in Dalmatia; where, again taking shipping, they sailed to Puteoli; whence, after a stay of twenty-four hours, a fair wind quickly carried them to the Roman port near Ostia, at the mouth of the Tiber, about sixteen miles from Rome. That his punishment might be the more public, the festival of the Saturnalia, and that part of it when they celebrated the Sigillaria, was pitched on for his execution; at which time it was the custom to entertain the people with the bloody conflicts of gladiators, and fighting with wild beasts. Accordingly, on the 13 kal. Jan. i. e. Dec. 20, he was brought out into the amphitheatre, and the lions, being let loose, quickly despatched him, leaving nothing but a few of his bones. These were gathered up by two deacons, who had been the companions of his journey; and, being transported to Antioch, were interred in the cemetery; whence, by order of the emperor Theodosius, they were removed with great solemnity to the Tycheon, a Pagan temple within the city, now consecrated to the memory of the martyr. St. Ignatius stands at the head of those Antinicene fathers, who defend the true divinity of Christ, whom he calls the Son of God and his eternal Word. He is also reckoned the champion of the episcopal order, as superior to that of priest and deacon. But the most important use of his writings respects the authenticity of the Holy Scriptures, which he frequently quotes and alludes to. Archbishop Usher's edition of his works, printed in 1647, is thought the best; yet there is a later edition extant at Amsterdam, where, besides the best notes, there are the dissertations of Usher and Pearson.

IGNATIUS'S BEAN. See IGNATIA.

IG'NEOUS, adj. IG'NIPOTENT, adj.

Lat. ignis, ignis potens, ignis-fatuus, ignis IG'NIS-FAT'UUS, n.s. et vomo. Of or per-IG'NITE, v.a. taining to fire; contain-IGNITION, n. s. IGNITI'BLE, adj. IGNIV'OMOUS, adj. IGNIVOMOUS, adj.

fire : ignis-fatuus, Will with the wisp, Jack with a lantern ; vulgar names for an electric or phosphoric light, seen at night in marshy and damp places: ignite, a chemical term: to kindle; to set on fire: ignition, the act of kindling: ignitible, inflammable; capable of being set on fire : ignivomous, vomiting fire.

That the fire burns by heat, leaves us still ignorant of the immediate way of igneous solutions.

Glanville's Scepsis. Such bodies only strike fire which have sulphur or Browne's Vulgar Errours. ignitible parts.

The laborant stirred the kindled nitre, that the ignition might be presently communicated. Boyle.

Those black circular lines we see on dishes, and other turned vessels of wood, are the effects of ignition, by the pressure of an edged stick upon the vessel turned nimbly in the lathe.

Take good firm chalk, ignite it in a crucible, and then powder it. Grew's Musæum. Vapours arising from putrified waters are usually

called ignes fatui. Newton's Opticks. Volcanos and ignivomous mountains are some of the

most terrible shocks of the globe. Derham. Vulcan is called the power ignipotent. Pope.

IGNIS FATUUS is a light, supposed to be of a phosphoric nature, appearing frequently in mines, marshy places, and near stagnating waters. It was formerly thought, and is still by the superstitious believed, to be ominous, and to presage death or misfortunes. People have been led by these lights into marshy places, where they have perished; whence its various names; as if it were an evil spirit who delighted in mischief. See CHEMISTRY and METEOR.

IGNITION is commonly restrained to that kind of burning which is not accompanied with flame, such as that of charcoal, cinders, metals, stones, and other solid substances. Vitrification, evaporation, dissipation, and all the other effects of ignition, depend on the presence of air. See COMBUSTION.

IGNOBLE, adj. Fr. ignoble; Lat. ignobi-IGNOBLY, adv. is. From in negative parti-cle, and nobilis, noble. Mean of birth; not of illustrious race : worthless ; not deserving honor ; used both of things and persons: ignobly, ignominiously; disgracefully.

The noble isle doth want her proper limbs ; Her royal stock graft with ignoble plants. Shakspeare.

To these, that sober race of men, whose lives Religious, titled them the sons of God,

Shall yield up all their virtue, all their fame

Milton's Paradise Lost. Ignobly! As when in tumults rise the ignoble crowd,

Mad are their notions, and their tongues are loud. Dryden.

Here, overmatched in fight, in heaps they lie ; There scattered o'er the fields ignobly fly.

Man ! know thyself ; all wisdom centres there ; To none man seems ignoble, but to man. Young.

The man we celebrate must find a tomb, And we that worship him ignoble graves.

Your first tears quenched by her, and your last sighs

Too often breathed out in a woman's hearing, When men have shrunk from the ignoble care Of watching the last hour of him who led them.

Byron.

IGNOMINIA, a species of punishment among the ancient Romans, whereby the offender suffered public shame, either by the prætor's edict, or by order of the censor. This punishment, besides the scandal, deprived the party of the privilege of bearing any offices, and almost all other liberties of a Roman citizen.

her liberties of a troad. IGNOMIN'IOUS, adj. IGNOMIN'IOUSLY, adv. IGNOMIN', n. s. Fr. ignominic, in ignominic, from in privative, and nomen name. honorable; used both of persons and things: ignominy, disgrace; infamy; dishonor.

Cowper.

They with pale fear surprised, Fled ignominious. Milton.

Strength from truth divided, and from just, Illaudable, nought merits but dispraise

And ignominy; yet to glory aspires,

Vain-glorious, and through infamy seeks fame. Id.

Cethegus, though a traitor to the state,

And tortured, 'scaped this ignominious fate. Id.

It is some allay to the infamy of him who died ignominiously to be buried privately. South.

Their generals have been received with honour after their defeat, yours with ignominy after conquest.

Addison.

They gave, and she transferred the curst advice, That monarchs should their iuward soul disguise ; By ignominious arts, for servile ends,

Should compliment their foes, and shun their friends. Prior.

Nor has this kingdom deserved to be sacrificed to one single, rapacious, obscure, ignominious projector. Swift.

IGNORA'MUS, n. s. IG'NORANCE, n. s. IG'NORANT, adj. & n.s. IG'NORANTLY, adv. IGNORE', v. a.

Lat. ignoro, from in privative, and nosco, noro, to know. French ignoratio, ig-norer. Ignoramus

is a word properly used by the grand inquest impanneled in the inquisition of causes criminal and public; and written upon the bill, whereby any crime is offered to their consideration, when they mislike their evidence as defective, or as too weak to make good the presentment: the effect of which word, so written, is that all farther enquiry upon that party, for that fault, is thereby stopped, and he delivered without farther answer. A foolish fellow; a vain uninstructed pretender; a low word : ignorance, want of knowledge in general, as to any particular subject, and dis-covered by external effect: ignorant, uninformed; unenlightened; unknown, undiscovered (in poetry); ignorantly made or done: an untaught person : ignore, to be ignorant of, not to know. Boyle endeavoured to introduce this word, but it has not been received, and is now applied only to a grand jury when they throw out a bill of indictment; and are said to ignore the bill.

So foolish was I and ignorant, I was as a beast. Psalm lxxiii.

For other thought and other dede also, Might never ben but soche as purveiance (Which maie not be disceved never mo) Hath feled, hiforne, withouten ignoraunce.

Chaucer. Troilus and Creseide.

If all the clergy were as learned as themselves are that most complain of ignorance in others, yet our book of prayer might remain the same. Hooker.

In such business

Action is eloquence, and the eyes of the ignorant More learned than the ears.

Shakspeare. Coriolanus. Ignorance is the curse of God,

Id.

Knowledge the wing wherewith we fly to heaven. Shakspeare.

Still banish your defenders, 'till at length Your ignorance deliver you,

As most abated captives, to some nation

That won you without blows.

IGU

If you know aught, which does behave my knowledge

Thereof to be informed, imprison't not

Id. Winter's Tale. In ignorant concealment. Thy letters have transported me beyond

This ignorant present time, and I feel now

The future in the instant. Id. Macbeth. His shipping,

Poor ignorant baubles, on our terrible seas

Like egg-shells moved. Shakspeare.

Let not judges be so ignorant of their own right, as to think there is not left to them, as a principal part

of their office, a wise application of laws.

Bacon's Essays.

Did I for this take pains to teach, Our zealous ignorants to preach ? Denham. O visions ill foreseen ! Better had I

Lived ignorant of future ! so had borne

My part of evil only. Milton's Paradise Lost. Philosophy would solidly be established, if men would more carefully distinguish those things that they know from those that they ignore. Boyle.

I ignored not the stricter interpretation, given by modern criticks to divers texts, by me alledged. Id.

He that doth not know those things which are of use for him to know, is but an ignorant man, whatover he may know besides. Tillotson.

The greatest and most cruel foes we have,

Are those whom you would ignorantly save.

Dryden.

Ignorant of guilt, I fear not shame. Id. Tell an ignoramus, in place and power, that he has a wit and an understanding above all the world, and he shall readily admit the commendation. Soutk.

If we see right, we see our woes;

Then what avails it to have eyes ?

From ignorance our comfort flows,

The only wretched are the wise ! Prior. It is in every body's power to pretend ignorance of the law. Sherlock.

Fools grant whate'er ambition craves,

Pope. And men once ignorant, are slaves. When a poet, an orator, or a painter has performed admirably, we sometimes mistake his blunders for beauties, and are so ignorantly fond as to copy after them. Watts.

Knowledge is not happiness, and science But an exchange of ignorance for that

Which is another kind of ignorance.

Byron.

IGNORANCE, or mistake, in law, a defect of will, whereby a person is excused from the guilt of a crime, when, intending to do a lawful act, he does that which is unlawful. For here, the deed and the will acting separately, there is not that conjunction between them which is necessary to form a criminal act. But this must be an ignorance or mistake of fact, and not an error in point of law. As if a man, intending to kill a thief or house-breaker in his own house, by mistake kills one of his own family, this is no criminal action: but if a man thinks he has a right to kill a person excommunicated or outlawed wherever he meets him, and does so, this is wilful murder. For a mistake in point of law, which every person of discretion not only may, but is bound and presumed to know, is, in criminal cases, no sort of defence. Ignorantia juris, quod quisque tenetur scire, neminem excusat, is as well the maxim of English law as it was of the Roman.

IGUARACU, a town in the province of Paraiba, Brasil, standing about two leagues from the sea. The woods that border the roads here are so thick as to be impassable to a man on foot, unless he carries in his hand a hatchet to cut his way. The town is partly situated upon a hill, and partly in the plain, where a rivulet runs, over which is a stone bridge. The place plainly denotes that it has enjoyed greater prosperity than at present: many houses are only of two stories. The streets are paved, but are much out of repair. It contains several churches and good shops, and about 800 inhabitants. The view from the principal church is said to be grand; and the only regular inn of which the country can boast is established here.

IHRE (John), a celebrated Swedish professor of rhetoric and politics, was born in March, 1707. On account of the early death of his father, a professor of theology at Lund, he was brought up by his grandfather, the archbishop of Upsal, and in 1730 travelled for improvement. On his return he was elected a member of the Academy of Sciences; and in 1757 public professor of poetry. In 1748 he was appointed professor of rhetoric and politics, an office which he discharged with great reputation for forty years. In 1756 he was raised to the rank of counsellor of the chancery. He died in 1780. His works are, Conspectus Prælectionum in Linguam Suecanam 1745; Lexicon Dialectorum, 1766; Glossarium Suio-Gothicum, 2 vols. folio, 1769. He wrote also on the old catalogue of the Suio-Gothic kings, and on the old West-Gothic laws.

JIB, the fore-mast sail of a ship, being a large stay-sail extended from the outer end of the bowsprit, prolonged by the jib-boom, towards the fore top-mast-head. See SAIL. The jib is a sail of great command with any side wind, but especially when the ship is close-hauled, cr has the wind upon her beam; and its effort in casting the ship, or turning her head to leeward, is very powerful and of great utility, particularly when the ship is working through a narrow channel.

JIBBEL AURESS, or AURAS, an extensive chain of mountains in North Africa, on the southern part of the province of Constantina, and territory of Algiers. It may be considered as one of the branches of the Atlas; and is about 120 miles in circuit, connecting itself with Mount Jurjura. It was called by Ptolemy, Audus, and, in the middle ages, Mons Aurasius. Various beautiful valleys intervene, and almost the whole of it is extremely fertile. The native tribes enjoy their own laws, and are independent, except in paying a certain tribute to the Algerine government, which is gathered every year by a flying camp. In proceeding to the southward they find higher and more rugged mountains, and a hardier race, who bid these authorities defiance. The most formidable tribe is that of the Neardee, who have their chief fortification on a high, rugged, and conical mountain. Within the last century, a princess of the name of Umbaany, emulating the heroines of old, led to battle in person several of these clans. A number of ancient ruins are spread over these mountains, and several rivers rise from them.

JIB-BOOM, in naval affairs, a boom run out

from the extremity of the bowsprit, parallel to its length, and serving to extend the bottom of the jib and the stay of the fore-top-gallant-mast. This boom, which is nothing more than a continuation of the bowsprit forward, to which it may be considered as a topmast, is usually attached to the bowsprit by means of two large boomirons, or by one boom-iron, and a cap on the outer end of the bowsprit; or, finally, by the cap without, and a strong lashing within, instead of a boom-iron, which is generally the method of securing it in small merchant ships. It may therefore be drawn in upon the bowsprit as occasion requires; which is usually practised when the ship enters a harbour, where it might very soon be broken or carried away, by the vessels which are moored therein, or passing by under sail.

JIDDA, DJIDDA, or DSJIDDA, a town of Arabia, on the Red Sea, situated, according to Bruce, in a very unwholesome, barren, and desert part of the country. From this disagreeable situation, it is probable that it would have been long ago abandoned, had it not been for its vicinity to Mecca, of which it may be considered as the port, and the vast annual influx of wealth occasioned by the India trade. The town itself receives but little advantage, for all the customs are sent to the sheriff of Mecca. 'The gold,' says Mr. Bruce, 'is returned in bags and boxes, and passes on as rapidly to the ships as the goods do to the market, and leaves as little profit behind. In the mean time provisions rise to a prodigions price, and this falls upon the townsmen, while all the profit of the traffic is in the hands of strangers; most of whom, after the market is over (which does not last six weeks), retire to Yemen and the adjacent countries, which abound in every sort of provision.' The port of Jidda is very extensive, and contains numberless shoals, small islands, and sunk rocks, but in the harbour itself ships may ride secure, whatever wind blows. The only danger is in coming in or going out. Jidda was surrounded with walls in 1540, by El Guri, sultan of Egypt, to protect it from the Portuguese; but these are now in a state of decay. The town is superior to that of Mocha; the houses are built of large blocks of madrepore; and, though the streets are narrow (which in this climate affords the advantage of their being shaded during the greatest part of the day), it is of imposing aspect in consequence of the hills which rise behind it. The entrance to the road it would be imprudent to attempt without a pilot; but, if signals be made, the pilots meet a ship at the proper dis-tance, and carry her to the anchorage, which is three miles from the town, in twelve fathoms of water. The landing place is in front of the vizier's palace; the custom-house likewise faces the sea, and is a lofty handsome building. The English are the principal European nation who carry on a trade here. When a vessel arrives, the first thing done is to have all the packages examined by the native government. Presents must then be made to the bashaw and other officers of government; for which purpose two or three articles of each part of the cargo are generally selected. The goods are now sold on credit, till

the returns are procured from Mecca, for which market they are bought. The imports consist almost exclusively of piece-goods from the coast of Coromandel; and a small quantity of spices, beetle-nut, opium, sugar, tin, and tobacco. Almost the only export is coffee; the returns are made in Spanish, Venetian, and German coins, and pearls. The duties are about 12 per cent. Long. 39° 15' E., lat. 21° 29' N.

JIG, n. s. & v. a. JIG-MAKER, n. s. JIG-MAKER, n. s. JIGGUMBOB, n. s. dance or tune: to dance carelessly or lightly, used in contempt: jigmaker, one who dances or plays merrily: jiggumbob, a trinket; a knick-knack; a slight contrivance in machinery.

When Cyrus had overcome the Lydians, that were a warlike nation, instead of their warlike musick, he appointed to them certain lascivieus lays and loose jigs; by which he so mollified and abated their courage, that they forgot their former ficreness.

Spenser on Irelaud. Your only jig-maker ! what should a man do but be merry ? Shakspeare. Hamlet.

As fiddlers still,

Though they be paid to be gone, yet needs will Thrust one more *iig* upon you. Donne.

Thrust one more jig upon you. Donne. Austerity shall know that you dare, in these jiggiven times, to countenance a legitimate poem.

Ben Jonson.

All the swains that there abide, With jigs and rural dance resort. Milton.

He rifled all his pokes and fobs

Of gimeracks, whins, and *jiggumbobs*. Hudibras. As for the *jigging* part and figures of dances, I count that little. Locke.

The muses blushed to see their friends exalting Those elegant delights of jig and vaulting. Fenton.

They wrote to her friends in the country, that she should dance a *jig* next October in Westminster Hall. Arbuthnot.

Another Phæbus, thy own Phæbus reigns,

Joys in my jigs and dances in my chains. Pope.

JILT, n. s., v.a. & v. n. Isl. gilia, from the verb gellen, to seduce; to entrap in an amour. Mr. Lye. Perhaps from giglot, by contraction; or gillet, or gillot, the diminutive of gill, the ludicrous name of a woman. Query from GULL. A woman who gives her lover hopes and deceives him; a name of contempt : jilt to practice amorous deceit.

Avoid both courts and camps,

Where dilatory fortune plays the jilt

With the brave, noble, honest, gallant man,

To throw herself away on fools.

Otway's Orphan.

Tell who loves you ; And who is *jilted* for another's sake.

Dryden.

Tell a man, passsionately in love, that he is *jilted*; bring witnesses of the falsehood of his mistress, and three kind words of hers shall invalidate all their testimonies. Locke.

She might have learned to cuckold, *jilt*, and sham, Had Covent Garden been at Surinam. Congreve.

When love was all an easy monarch's care,

Jilts ruled the state, and statesmen farces writ. Pope.

JING'LE, v. a. & n. s. See GINGLE. To clink or sound sharply.

What should the wars do with these jingling fools? Shakspeare.

With noises

Of roaring, shrieking, howling, jingling chains, We were awaked. Id. Tempest.

If you plant where savages are, do not only entertain them with triffes and *jingles*, but use them justly. Bacon's Essays.

Vulgar judges are nine parts in ten of all nations, who call conceits and *jingles* wit. Dryden.

The bells she *jingled*, and the whistle blew. Pope. What crouds of these, impenitently bold,

In sounds and jingling syllables grown old! Ic.

ILA, ILAY, or ISLAY, one of the Western Islee of Scotland, lying south-west of Jura. It is twenty-eight miles long from north to south, and eighteen broad from east to west. On the east side it is full of mountains covered with heath : on the south it is tolerably well cultivated. In some parts there is great plenty of limestone, and lead-mines are worked in three different places. The only harbours in Ila are at Lochdale and Bowmore. Here are several rivers and lakes well stored with trouts, eels, and salmon. In the centre is Loch Finlagan, about three miles in circuit, with the little isle of that name in the middle. Here the lords of the isles formerty resided in all the pomp of royalty; but the palaces and offices are now in ruins. Instead of a throne, Macdonald stood on a stone seven feet square, in which there was a hollow cut to receive his feet; here he was crowned and anointed by the bishop of Argyle and seven inferior priests, in the presence of the chieftains. This stone still exists. The ceremony (after the new lord had collected his kindred and vassals) was truly patriarchal. After putting on his armour, helmet, and sword, he took an oath to rule as his ancestors had done; to govern as a father would his children : his people, in return, swore that they would pay the same obedience to him as children would to their parent. The dominions of this potentate about 1586 con-sisted only of Ila, Jura, Knapdale, and Kintyre: so reduced were they from what they had been hefore the deprivation of the great earl of Ross in the reign of James III. Near this is another little isle, where he assembled his council, Ilan na Corlle, or the island of council; where thirteen judges constantly sat to decide differences among his subjects, and received for their trouble the eleventh part of the value of the affair tried before them. In the first island were buried the wives and children of the lords of the isles; but their own persons were deposited in the more sacred ground of Iona. On the shores of the lake are some marks of the quarters of his Carnauch and Gilli-glasses, i.e. the military of the isles: the first word signifying a strong man, the last, a grim-looking fellow. The former were light-armed, and fought with darts and daggers; the latter with sharp hatchets. These are the troops that Shakspeare alludes to, when he speaks of a Donald, who

From the Western Isles

Of Kernes and Gallow-glasses was supplied.

These lords had also a house and chapel at Laganon, on the south side of Loch-andaal: a strong castle on a rock in the sea, at Dunowaik, at the south-east end of the country; for they made this island their residence after their expul-

624

625

sion from that of Man, in 1304. There is a tradition, that while the Isle of Man was part of the kingdom of the Isles, the rents were paid in this country: those in silver were paid on a rock, still called Craig-a-nione, or the rock of the silver rent; the other, Craig-a-nairgid, or the rock of rents in kind. These lie opposite to each other, at the mouth of a harbour on the south side of this island. There are several forts built on the isles in fresh-water lakes, and divers caverns in different parts of the island, which have been used occasionally as places of strength.

It seems to have been long a seat of empire, probably jointly with the Isle of Man, as being most conveniently situated for the government of the rest of the Hebrides; for Crovan, the Norwegian, after his conquest of that island in 1066 retired and finished his days in Ila. On the retreat of the Danes it became the seat of the lords of the isles; and continued, after their power was broken, in the reign of James III. in their descendants the Macdonalds. It was in the possession of Sir James Macdonald in 1598, who gained the battle of Traii-dhruinard. His power gave umbrage to James VI., who directed the lord of Macleod, Cameron of Lochiel, and the Macneils of Barra, to support the Macleans in another invasion. The rival parties met near the hill of Benbigger, east of Killarrow; a fieree engagement ensued; the Macdonalds were defeated, and almost entirely cut off. Sir James escaped to Spain, but returned in 1620, was pardoned, received a pension, and died at Glasgow. But the king, irritated by the disturbances raised by private wars waged between these and other clans, resumed the grant made by his predecessor, and transferred it to Sir John Campbell of Calder, who held it on paying an annual feu-duty of £500 sterling. The island was granted to Sir John as a reward for his undertaking the conquest; but the family considered it as a dear acquisition.

ILCHESTER, or IVELCHESTER, a borough and market town of Somersetshire, seated on the right bank of the river Ivel, about 122 miles from London. It appears to have been strongly for-tified by the Romans, and at the time of the Norman conquest contained several churches. The foss-way retains its name, and passes through the principal street; and the pavement of the original ford, formed of flag-stones, may be seen on the west side of the bridge. Upon the bridge, which consists of two large arehes, and at its foot, are two dwelling-houses, formerly chapels. The town at present consists of four streets. It has a church, dedicated to St. Mary, with an octagonal tower of stone, fifty feet high; it has also a meeting-house for dissenters. The county court-house and new gaol are good buildings; and here is the county-gaol. A court is held here every Wednesday four weeks. It is a borough by prescription, and is governed by a bailiff and twelve capital burgesses, who, together with the inhabitants not receiving arms, return two members to parliament : the returning officer being the bailiff. Here is a good almshouse for sixteen poor women and a housekeeper.

ILDEFONSO (St.), a small town of Spain, in Vol., X1.

Segovia, owing its origin to the erection of the royal palace of La Granja. It stands on the north side of the mountain of Guadarama, and contains about 4300 inhabitants. Here are ducted on the government account, and at which are made the splendid mirrors sold at Madrid. The church contains a striking monument of Philip V. The palace takes its name from a granary which once stood upon the same spot, and which was purchased by Philip V. in 1721, from the Hieronymite friars. The exter-nal appearance is not magnificent, though the façade towards the gardens is neat. The interior contains a great number of paintings, statues, busts, &e., arranged in galleries. But the chief ornament here is the gardens. The soil was originally most unpromising and devoid of moisture ; but the elevations have been levelled, the cavities filled, and the scattered rills of the mountain collected, so as to water the gardens, and form a small river. The water-works are magnificent. The whole seems to have been planned on the model of Versailles. This is the highest royal residence in Europe, being at an elevation of 3800 feet above the sea. Forty miles north by west of Madrid, eight south-east of Segovia, and twenty-three north of the Escurial.

ILĚ, n. s. Corrupted from Fr. aisle. A walk or alley in a church or public building. Properly aisle.

Upward the columns shoot, the roofs ascend,

And arches widen, and long iles extend. Po

ILERAY, an island of Scotland, on the west coast of north Uist, separated from it and from the isle of Kirkbost by sands, which are overflowed at high water. It is three miles 'long, half a mile broad, and yields good crops of barley, besides pasture for cattle.

ILERDA, in ancient geography, the capital of a nation of Spain, called the Hergetes, situated on an eminence between the rivers Sicoris and Cinga. It was often besieged and taken, being exposed to the incursions from Gaul; and under Gallienus it was destroyed by the Germans. It is now called Lerida in Catalonia, on the Segra.

ILE'US, n. s. Lat.

An ileus, commonly called the twisting of the guts, is really either a circumvolution, or insertion of one part of the gut within the other. Arbuthnot.

I'LEX, n. s. Lat.

The *ilex*, or great scarlet oak, thrives well in England, is a hardy sort of tree, and easily raised of acorns. The Spaniards have a sort they call enzina ; the wood of which, when old, is finely chambletted, as if it were painted. *Mortimer*.

ITEX, the holm or holly, a genus of the tetragynia order, and tetrandria class of plants, natural order forty-third, dumosæ : CAL. quadridentated : cor. rotaceous; there is no style : SEED a monospermous berry. There are several species; but the most remarkable is the

I. aquifolium, or common holly. Of this there are many varieties with variegated leaves, which are propagated by the gardeners for sale, and, some years ago, were in great esteem, but at present are little regarded; the practice of filling gardens with shorn evergreens being abolished.

2 S

In the disposition of plantations of evergreen trees and shrubs, however, a few of the most lively colors have a good effect in winter, if properly disposed. The common holly grows naturally in woods and forests in many parts of England, where it rises from twenty to thirty feet, and sometimes more, but the ordinary height is not above twenty-five feet : the stem, by age, becomes large, and is covered with a gravish smooth bark; and those trees which are not lopped or browsed by eattle are commonly furnished with branches the greatest part of their length, forming a sort of cone; the branches are garnished with oblong oval leaves, of a lucid green on their upper surface, but are pale on their under, having a strong mid-rib; the edges are indented and waved, with sharp thorns terminating each of the points, so that some of the thorns are raised upward, and others are bent downward, and being very stiff they are troublesome to handle. The leaves are placed alternate on every side of the branches; and from the base of their foot-stalks come out the flowers in clusters, standing on very short foot-stalks; each of these sustain five, six, or more flowers. They are of a dirty white, and appear in May; but are succeeded by roundish berries, which turn to a beautiful red about Michaelmas, and continue on the trees, if not destroyed, till after Christmas. The common holly is a very beautiful tree in winter; therefore deserves a place in all plantatiens of evergreen trees and shrubs, where its shining leaves and red berries make a tine variety. It is propagated by seeds, which never come up the first year, but lie in the ground; therefore the berries should be buried in the ground one year, and then taken up and sown at Michaelmas, upon a bed exposed only to the morning sun; the following spring the plants will appear, which must be kept clean from weeds; and, if the spring prove dry, it will be of great service to the plants if they are watered once a week ; but too much moisture is very injurious to these plants when young. In this seed-bed the plants may remain two years, and then be transplanted in autumn, into beds about six inches asunder, where they may stand two years longer; during which time they must be constantly kept clean from weeds; and, if they nave thriven well, they will be strong enough to transplant where they are designed to remain; for, when they are transplanted at that age, they will grow to a larger size than those which are removed when they are much larger: but, if the ground is not ready to receive them, they should be transplanted into a nursery in rows two feet distant, and one foot asunder; where they may remain two years longer. If they are to be grafted with any of the variegated kinds, that should be performed after they have grown one year in the nursery; but the plants so grafted should continue two years after in the nursery, that they may make good shoots before they are removed ; though the plain ones should not stand longer than two years in the nursery, because, when they are older, they do not transplant so well. The best season for removing hollies is in autumn, especially in dry land : but, where the soil is cold and moist, they may be

626

transplanted with great safety in spring, if the plants are not too old, or have not stood long unremoved. Sheep in winter are fed with croppings of holly. Birds eat the berries. The bark fermented, and washed from the woody fibres, make the common bird-lime. The plant makes an impenetrable fence, and bears chopping, though it does not, in all respects, answer equally well with the hawthorn. The wood is used in veneering, and is sometimes stained black to imitate ebony. Handles for knives, and cogs for mill-wheels, are made of it.

ILFRACOMBE, a sea-port of Devonshire, with a spacious basin, formed by a fine pier projecting into the Bristol Channel. The high tides here allow large vessels to enter the harbour. This port employs a number of brigs and sloops, chiefly in carrying ore from Cornwall, coal from Wales, and corn to Bristol. A number of fishing skiffs belong to it. It is seated almost opposite Swansea, in Glamorganshire, and is forty-nine miles N. N. W. of Exeter, and 181 west by south of London.

ILHEOS, one of the four provinces of Brasil, which compose the captaincy of Bahia, bounded on the north by the province of Todos Santos; south by the river Grande, which separates it from Porto Seguro; east by the Atlantic; and west by the country of the Indians. It is fertile and well watered, producing considerable quantities of cotton, sugar, and Brasil wood.

ILHEOS, the capital of the foregoing province, is situated in a bay, the entrance of which is defended by a fort, which has a small garrison, and a governor. It has two convents of monks, with a college, which formerly belonged to the Jesuits. Ninety-three miles north from Porto Seguro, and 126 south-west of the bay of Todos Santos.

ILHEOS, a large river of Brasil, in the province of this name, which rises in the mountains of the interior, runs east, and enters the sea, forming at its mouth a beautiful port. There is an island of the same name situated at the mouth of this

river, in long. 39° 27' W., lat. 14° 37' S. ILIA, the daughter of Numitor, and mother of Romulus, the founder of Rome. See Nu-MITOR.

Relating to the lower IL'IAC, adj. IL'IAC-PAS'SION, n.s. bowels. Iliac-passion, a kind of nervous cholic, whose seat is the ilium, whereby that gut is twisted, or one part enters the cavity of the part immediately below or above; whence it is also called the volvulus, from volvo, to roll.

Those who die of the iliac passion have their bellies Floyer on the Humours. much swelled.

ILIAC REGION. See ANATOMY. ILIAD, 1210, from Ilium, an ancient epic poem, the finest of the works attributed to Ho-mer. The poet's design was to show the Greeks, who were divided into several states, how much it was their interest to preserve harmony among themselves; for which end he sets before them the calamities that befel their ancestors from the wrath of Achilles, and his misunderstanding with Agamemnon; and the advantages that afterwards accrued to them from their union. The Iliad is divided into twenty-four books or rhapsodies. See HOMER.

ILINISSA, a lofty peak of the western equatorial Andes, and one of the most picturesque of those which are seen from the city of Quito. The summit rises to the height of 17,238 feet above the level of the sea, and is divided into two points, which Humboldt thinks are the wrecks of a volcano. Ilinissa is in the parallel of Cotopaxi, and joins the summit of Ruminavi by the Alto de Tiopallo, which forms a transverse link, whence the waters run off towards both the Pacific and the Atlantic Oceans.

ILIUM, ILION, or ILIOS, in ancient geography, a name of Troy, most commonly used by the poets, and distinguished by the epithet Vetus, from that afterwards called Ilium Novum. See TROY.

ILIUM NOVUM is thought to be the Iliensium Pagus of Strabo. New or modern Ilium was a village near the sea, with a temple of Minerva, where Alexander, after the battle of Granicus, offered gifts, and named it a city, which he ordered to be enlarged. His orders were executed by Lysimachus, who encompassed it with a wall of forty stadia. It was afterwards adorned by the Romans, who granted it immunities as to their mother city.

ILK, adj. Sax. ealc. The same. It is still retained in Scotland, and denotes each; as, ilk ane cf you, every one of you. It also signifies, the same ; as, Macintosh of that ilk, denotes a gentleman whose surname and the title of his estate are the same; as, Macintosh of Macintosh.

Wo worthe, alas! that ilke dayes light On which I sawe him first with eyen twain. Chaucer. Troilus and Creseide.

Ther helpeth nought; all goth that ilke wey :

Than may I sain that alle thing mote dey. Id. The Knightes Tale.

Shepherds, should it not yshend Your roundels fresh, to hear a doleful verse Of Rosalind, who knows not Rosalind, That Colin made ? ilk can I you rehearse.

Spenser.

ILL, adj., n s., & adv. Is a contraction of the word evil : the substantive and adverb are used in composition to denote any bad quality. Bad as opposed to good, whether physical or moral; sick; disordered. See Evil. Ill, wickedness; misfortune; misery. Ill, not well; with pain or difficulty.

Who speketh for me now in my absence? Alas no wight; and that is all my care;

For, well wote I, as ill as I ye fare. Chaucer. Troilus and Creseide.

There some ill planet reigns;

I must be patient, 'till the Heavens look

With an aspect more favourable. Shakspeare. Of his own body he was ill, and gave

The clergy ill example. Id. Heury VIII.

Dangerous conjectures in ill-breeding minds. Id. Hamlet.

I have an *ill*-divining soul :

Methinks I see thee, now thou art below,

As one dead in the bottom of a tomb.

Shakspcare.

You wish me health in very happy season ; For I am on the sudden something ill. "d.

I was at her house the hour she appointed. -And you sped, sir ?

-Very ill-favouredly.

The examples

Of every minute's instance, present now

Have put us in these ill-besceming arms. Id.

Neither is it ill air only that maketh an ill seat ; but ili ways, ill markets, and ill neighbours.

Bacon's Essays.

H.

Some of an ill and melancholy nature, incline the company to be sad and ill-disposed; others, of a jovial nature, dispose them to be merry. Bacon.

Ill, to man's nature, as it stands perverted, hath a natural motion strongest in continuance. Id.

My colleague,

Being so ill affected with the gout,

Will not be able to be there in person.

Ben Jonson.

These are the product

Of those ill mated marriages thou sawest,

Where good with bad were matched. Milton. Thou desirest

The punishment all on thyself ! alas !

Bear thine own first ; ill able to sustain

His full wrath, whose thou feelest as yet least part, And my displeasure bear'st so ill. Id.

Hither, of ill joined sons and daughters born, First from the ancient world these giants came. Id. Your ill meaning politician lords,

Under pretence of bridal friends and guests,

Appointed to await me thirty spies,

Who, threatening cruel death, constrained the bride To wring from me and tell to them my secret. Id. Shall these e'er dare to contradict my will,

And think a prince o'the blood can e'er do ill Marvell.

Much better, when I find virtue in a fair lodging, than when J am bound to seek it in an ill favoured creature, like a pearl in a dunghill. Sidney.

Near to an old ill favoured castle they meant to perform their unknightly errand. Id.

The ungrateful treason of her ill chosen husband overthrows her, Id.

I have known two towns of the greatest consequence lost, by the governours falling ill in the time of the sieges. Temple.

Young men to imitate all ills are prone ;

But are compelled to avarice alone : For then in virtue's shape they follow vice.

Dryden.

Strong virtue, like strong nature, struggles still, Exerts itself, and then threws off the ill. LI

Ill bears the sex a youthful lover's fate,

When just approaching to the nuptial state. Id.

Lead back thy Saxons to their ancient Elbe :

I would restore the fruitful Kent, the gift Of Vortigern, or Hengist's ill bought aid.

Id. Ill at case, both she and all her train

The scorching sun had borne, and beating rain. Id. No look, no last adieu before he went ! In an ill boding hour to slaughter sent.

Id. Æneid.

Did you never taste delicious drink out of an ill looked vessel? L'Estrange.

Actions are pleasing or displeasing, either in themselves, or considered as a means to a greater and more desirable end : the eating of a well-seasoned dish, suiled to a man's palate, may move the mind, by the delight itself that accompanies the eating, without reference to any other erd; to which the con-sideration of the pleasure there is in health and strength may add a new gust, able to make us swallow an ill relished potion. Locke.

. .

Plain and rough nature, left to itself, is much better than an artificial ungratefulness, and such studied ways of being ill fashioned. Id.

Holding of *ill* tasted things in the mouth, will make a small salivation. Grew.

Our generals at present are such as are likely to make the best use of their numbers, without throwing them away on any *ill* concerted projects.

Addison on the War. I see thy sister's tears,

Thy father's anguish, and thy brother's death, In the pursuit of our ill fated loves. Addison.

We simple toasters take delight

To see our women's teeth look white,

And every saucy ill bred fellow Sneers at a mouth profoundly yellow. Prior.

The second daughter was a peevish, forward, ill conditioned creature as ever was. Arbuthnot.

A sir distinguished from his airy stand,

To bribe whose vigilance, Ægisthus told

A mighty sum of *ill* persuading gold. Pope. There motley images her fancy strike,

Figures ill paired, and similes unlike. Id. If a third but an ill favoured nose, the deep minkers would contrive to impute the cause to the prejudice of his education. Swift.

When desperate *ills* demand a speedy cure, Distrust is cowardice, and prudence folly.

Dr. Johnson's Irene.

Love, fame, ambition, avarice—'tis the same, Each idle—and all *ill*—and none the worst—

For all are meteors with a different name,

And Death the sable smoke where vanishes the flame. Byron. Childe Harold.

ILLAC'HRYMABLE, adj. Lat. illachrymabilis. Incapable of weeping.

ILLAPSE', n. s. Lat. *illapsus*. Gradual emission or entrance of one thing into another.

As a piece of iron red hot, by reason of the *illapse* of the fire into it, appears all over like a fire, so the souls of the blessed, by the *illapse* of the divine essence into them, shall be all over divine. Norris.

Sudden attack ; casual coming.

Life is oft preserved

By the bold swimmer in the swift illapse

Of accident disastrous. Thomson's Summer. To ILLA'QUEATE, v. a. Lat. illaqueo. To

entangle; to entrap; to ensnare. I am illaqueated, but not truly captivated into your

conclusion. More's Divine Dialogues. ¹LLAQUEA'TION, n. s. From illaqueate.

The act of catching or ensnaring.

The word in Matthew doth not only signify suspension, or pendulous *illaqueation*, but also suffocation.

Browne.

A snare ; any thing to catch another ; a noose. ILLATION, n. s. Lat. *illatio*. Inference ; conclusion drawn from premises.

Herein there seems to be a very erroneous illation from the indulgence of God unto Cain, concluding an immunity unto himself. - Browne.

Illation so orders the intermediate ideas as to discover what connection there is in each link of the chain, whereby the extremes are held together. Locke.

IL'LATIVE, *adj.* Lat. *illatus.* Relating to illation or conclusion.

In common discourse or writing such casual particles as for, because, manifest the act of reasoning as well as the *illative* particles then and therefore. *Watts*. ILLAU'DABLE, adj. Lat. illaudabilis. Unworthy of praise or commendation.

Strength from truth divided, and from just,

Illaudable, nought merits but dispraise. Milton.

ILLAU'DABLY, adv. From illaudable. Unworthily; without deserving praise.

It is natural for all people to form, not illaudably, too favourable a judgment of their own country. Broome.

ILLE ET VILAINE, a north-west department of France, including the north-east part of Brittany, and bounded partly by the English Channel and partly by the frontier line of other departments of Brittany. Its superficial extent is about 2750 square miles : its population 508,000. The surface is in general level, or intersected by small hills, and it is watered by the Ille, Vilaine, Meu, and Seiche; the small portion of coast which it has on the side of the English channel is bordered with a multitude of islets. Hardly half this department is in a state of cultivation, and the agriculture practised is of a very rude kind. The climate, however, is good, the pastures rich, and the breeding of cattle very successful. Flax is cultivated to a large extent, and affords materials for linen manufactures. Apples, pears, and various fruits are abundant, and the cyder and perry good, but the climate is not warm enough for the vine. The fisheries on the coast are also productive. The department is divided into the arrondissements of Rennes (the capital), St. Malo, Fougeres, Vitré, Redon, and Montfort.

ILLECEBRUM, in botany, a genus of the monogynia order, and pentandria class of plants: natural order tweifth, holoraceæ. CAL. pentaphyllous. and cartilaginous: COR. none: the stigma simple: CAPS. quinquevalved, and monospermous. There are several species, of which the most remarkable are

I. capitatum, and I. paronychia. Both have trailing stalks nearly two feet long, which spread on the ground, garnished with small leaves like those of knot grass. The heads of the flowers come out from the joints of the stalks, having neat silvery bractea surrounding them, which make a pretty appearance. Their flowers appear in June, and there is generally a succession of them for at least two months. When the autumn proves warm, they ripen their seeds in October. The seeds should be sown in a bed of light earth in the beginning of April: the plants come up in May, when they should be kept clean from weeds till they are fit to remove. Some should be planted in small pots, and the rest in a warm border, observing to water and shade them till they have taken new root. These plants are sometimes killed in severc winters; for which reason some of them should be planted in pots, that they may be sheltered.

ILLE'GAL, adj. Lat. in and legalis. Contrary to law.

No patent can oblige the subject against law, unless an *illegal* patent passed in one kingdom can bind another, and not itself. Swift.

ILLEGAL'ITY, n. s. From illegal. Contrariety to law.

He wished them to consider what votes they had passed, of the *illegality* of all those commissions, and

ILL of the unjustifiableness of all the proceedings by vir-Clarendon. the of them.

ILLE'GALLY, adv. From illegal. In a manner contrary to law.

ILLEGIBLE, adj. In and legibilis. From That cannot be read. Lat. lego.

The secretary poured the ink-box all over the writings, and so defaced them that they were made alto-Howel. gether illegible.

ILLEGIT'IMACY, n. s. From illegitimate. State of bastardy.

ILLEGIT'IMATE, adj. Lat. in and legiti-Unlawfully begotten; not begotten in mus. wedlock.

Grieve not at your state :

For all the world is illegitimate. Cleaveland.

Being illegitimate, I was deprived of that endearing tenderness and uncommon satisfaction, which a good man finds in the love and conversation of a parent.

Addison's Spectator.

ILLEGIT'IMATELY, adv. From illegitimate. Not begotten in wedlock.

ILLEGITIMATION, n. s. From illegitimate. The state of one not begotten in wedlock.

Richard III. had a resolution, out of his hatred to both of his brethren, to disable the issues, upon false and incompetent pretexts, the one of attainder, the other of illegitimation.

ILLER, a large river and circle of Suabia. The former rises in the Tyrol, passes by Kempten and Memmingen, and falls near Ulm into the Danube, which it renders navigable. Wood is floated down; and it forms, during the latter part of its course, the boundary between Bavaria and Wirtemberg.

The circle comprises the country to the south of the circle of the Upper Danube, but it underwent considerable changes in 1810 ; in 1815 also part of it, which had formerly belonged to Austria, was restored; and next year, on the final arrangement of the Bavarian provinces, the name of this circle was suppressed, and the part of it that remained to Bavaria was annexed to the circle of the Upper Danube.

ILLEV'IABLE, adj. Fr. lever. That cannot be levied or exacted.

He rectified the method of collecting his revenue, and removed obsolete and illeviable parts of charge.

Hale.

ILLFA'VORED, adj. Deformed.

O what a world of vile *illfavoured* faults Look handsome in three hundred pounds a-year ! Shakspeare.

ILLFA'VOREDLY, adv. With deformity. Roughly; ruggedly: in ludicrous language.

He shook him very illfavouredly for the time, raging chrough the very bowels of the country, and plundering all wheresoever he came. Howel.

ILLFA'VOREDNESS, n. s. Deformity.

ILLIB'ERAL, adj. Lat. illiberalis.

Not noble; not ingenuous.

The charity of most men is grown so cold, and their religion so illiberal. King Charles.

Not munificent; not generous; sparing.

Yet subsist they did, and well too: an argument that that earth did not deal out their nourishment with an oversparing or illiberal hand. Woodward.

ILLIBERAL'ITY, n. s. Lat. illiberalitas. From illiberal. Meanness of mind; parsimony; niggardness; want of munificence.

The illiberality of parents, in allowance towards their children, is an harmful error, and acquaints them with shifts. Bacon.

ILLIB'ERALLY, adv. From illiberal. Dis ingenuously; meanly.

One that has been bountiful only upon surprise or incogitancy, illiberally retracts. Decay of Piety.

ILLIC'IT, adj. Fr. illicite ; Latin illicitus. Unlawful; as, an illicit trade.

ILLICIUM m botany, a genus of the pentagynia order, and dodecandria class of plants: CAL. tetraphyllous, and deciduous : there are eight petals, and eight petaloid subulated nectaria. There are sixteen stamina with bifid antheræ: CAPS. are ovate, compressed, and monospermous. There are two species, viz.

I. anisatum, a native of the woods of China and Japan. It rises with an erect branched stem to the height of a cherry tree; and is covered with an ash colored bark, under which is another bark that is green, fleshy, somewhat mucous, and of an aromatic taste, combined with a small degree of astringency. The wood is hard and brittle; the pitch small in quantity, fungous, and of a green herbaceous color. The leaves resemble those of laurel; the flowers those of narcissus. These last generally stand single, are of a pale white, and consist of sixteen petals, which differ in their form. The extremity of the flower-stalk being continued into the germen or seed bud of the flower, forms eight conjoined capsules, or one deeply divided into eight parts. Of these capsules, some frequently decay; the rest enclose each a single seed, somewhat resembling that of palma christi, and which, when the hardish corticle that closely covers and involves it is broken, exhibits a kernel that is white, fleshy, soft, and of a vapid taste. The bonzes, or priests of China and Japan, persuade the inhabitants that the gods are delighted with this tree. Hence they generally place before their idols garlands and bundles made of the branches.

I. floridanum, with red flowers, and very odorous fruit, is a native of China.

To ILLI'GHTEN, v. a. In and lighten. To enlighten; to illuminate. A word, I believe, only in Raleigh.

Corporeal light cannot be, because then it would not pierce the air, nor diaphanous bodies; and yet every day we see the air illightened. Raleigh.

ILLIM'ITABLE, adj. Lat. in and limes. That cannot be bounded or limited.

Although in adoration of idols, unto the subtiler heads, the worship perhaps might be symbolical; ye was the idolatry direct in the people, whose credulity is illimitable, and who may be made believe that any thing is God. Browne.

With what an awful world-revolving power, Were first the unwieldy planets launched along The illimitable void ! Thomson's Summer.

ILLIM'ITABLY, adv. From illimitable. Without susceptibility of bounds.

ILLIMITED, adj. Fr. illimlé ; Lat. in and limes. Unbounded; interminable.

ILLIM'ITEDNESS, n. s. From illimited. Exemption from all bounds.

The absoluteness and *illimitedness* of his commission was generally much spoken of. *Clarendon*.

ILLINOIS, a river of the Illinois territory, formed by the junction of the Theakiki and Plein, in the north-west part of Indiana, North America. In the Illinois territory it pursues a southwesterly direction, and flows into the Mississippi, twenty-one miles above the Missouri. It is upwards of 400 yards wide at its mouth, and is about 400 miles long from its junction to the Mississippi, and is of easy navigation. It has a very gentle current, unbroken by falls or rapids, and passes through a fine country. The Plein, its northern head branch, interlocks with the Chicago, which flows into lake Michigan.

ILLINOIS, a state of North America, bounded north by the north-west territory, east by Indiana, south by the Ohio, which separates it from Kentucky, and west by the Mississippi ; 345 miles long from north to south, and 210 from east to west; containing about 52,000 square miles. In 1810 it was divided into two counties, and subdivided into twelve townships ; and contained 12,282 inhabitants, all free people, slavery not being admitted.

The counties, chief towns, and population, for the fore part of the year 1818 are thus exhibited :—

Counties.	Pop.	Chief Towns.
Bond	1382	Perrysville.
Crawford	2074	
Edwards	1948	Palmyra.
Franklin	600	
Gallatin	3256	
Jackson	1294	Brownsville.
Johnson	678	
Madison	5456	Edwardsville.
Monro	1358	Harrisonville.
Pope	1975	
Randolph	2939	Kaskaskia.
St. Clair	4519	Belleville.
Union	2482	
Washington	1707	
White	3539	Carmi.
Total	35,220	

By a more recent enumeration it appears that the population has exceeded the number required by the law of congress for the admission of this territory into the union as a state. See America, North.

Kaskaskia is the seat of government. The other most considerable towns are Shawneetown, Cahokia, Edwardsville, Brownsville, Belleville, and Carmi.

The Mississippi, Ohio, and Wabash, form about two thirds of the whole boundary of this district. The other most considerable rivers are the Illinois, Kaskaskia, Muddy, Saline, Little Wabash, Michilimackinack, Crow Meadow, Rainy, Vermilion, Mine, Spoon, Rocky, and Sangamoin.

The peninsula between the Mississippi and Illinois rivers has been surveyed as military bounty lands. Congress appropriated for this object 3,500,000 acres; and the surface actually surveyed amounts to an area about equal to 240 townships, each six miles square; equal to 8640 square miles, or 5,530,000 acres, nearly. It was necessary that the number surveyed should exceed the number appropriated, as the act of congress provides that the several portions granted shall be fit for cultivation. These lands are described as being very good.

The southern and middle parts of the territory are for the most part level. The banks of the Illinois and Kaskaskia, in some places, present a sublime and picturesque scenery. Several of their tributary streams have excavated for themselves deep and frightful gulfs, particularly those of the Kaskaskia, whose banks, near the junction of Big Hill Creek, present a perpendicular front of solid limestone 140 feet high. The north-western part of the territory is a hilly broken country, though there are no high mountains. The climate resembles that of Indiana and Ohio. The low and wet lands in the southern part are unhealthy.

The soil has been divided into six distinct kinds. 1. Bottom land, bearing a heavy growth of honey-locust, pecan, black-walnut, beach, sugar-maple, buckeye, pawpaw, grape-vines, &c. This land is of the first quality, and is found in greater or less quanties on all the con-siderable rivers. It is of inexhaustible fertility, and is annually cultivated without manure. 2. Newly formed land, found at the mouths and confluences of rivers, It produces sycamore, cotton-wood, water maple, water ash, elm, willow, oak, &c. There are many thousand acres of this land at the mouth of the Wabash, and at the confluence of the Ohio with the Mississippi. It is annually inundated, and is unhealthy. 3. Dry prairies, approaching the rivers and bordering on the bottom land, from thirty to 100 feet higher, and from one to ten miles wide. These prairies are destitute of trees, except where they are intersected by streams of water and occasional tracts of woodland. It has been estimated that as much as two-thirds of the whole territory consists of open prairie. The dry prairie has a black rich soil, well adapted to purposes of agriculture, and is covered with rank grass. 4. Wet prairie, found remote from streams, or at their sources. This is generally cold and unproductive, abounding with swamps and ponds, covered with tall coarse grass. 5. Land covered with timber, moderately hilly, well watered, and of a rich soil. 6. Hills, of a sterile soil and destitute of timber, or covered with stunted oaks and pines.

The prevailing forest tree in Illinois is oak, of which as many as thirteen or fourteen different species have been enumerated. Honey-locust, black-walnut, mulberry, plum, sugar-maple, black-locust, elm, bass-wood, beach, buckeye, hackberry, coffee-nut, sycamore, spice-wood, sassafras, black and white haws, crab-apple, wild cherry, cucumber, and pawpaw, are found in their congenial soils throughout the territory. White pine is found on the head branches of the Illinois.

Copper and lead are found in several parts of

the territory. Coal has been discovered in several places, on the Big Muddy in great quantities near Brownsville, on the Kaskaskia near the town of that name, near the town of Edwardsville, on the Illinois fifty miles above Illinois lake, and in other places. Salt water is found in several places sufficient to furnish immense quantities of salt. The famous salt works belonging to the United States are in the vicinity of Shawneetown. See SALINE. Iron ore has also been discovered.

The productions are corn in abundant crops, tobacco, flax, hemp, oats, potatoes, and some cotton in the southern parts. Wheat does well when properly managed, except on the bottoms, where the soil is too rich.

ILLIT'ERATE, adj. Lat. illiteratus. Unlettered; untaught; unlearned; unenlightened by science.

The duke was illiterate, yet had learned at court to supply his own defects, by the drawing unto him of the best instruments of experience. Wotton.

The illiterate writer, emperick like applies To minds discased unsafe chance remedies : The learned in schools, where knowledge first began Studies with care the anatomy of man; Sees virtue, vice, and passions in their cause, And fame from science, not from fortune draws.

Dryden. In the first ages of Christianity not only the learned and the wise, but the ignorant and illiterate embraced torments and death. Tillotson.

ILLIT'ERATENESS, n. s. From illiterate. Want of learning ; ignorance of science.

Many acquainted with chymistry but hy report, have, from the illiterateness and impostures of those that pretend skill in it, entertained an ill opinion of Boule. the art.

ILLIT'ERATURE, n. s. In and literature. Want of learning. A word not much used.

The more usual causes of this deprivation are, want of holy orders, illiterature, or inability for the discharge of that sacred function, and irreligion.

Ayliffe's Parergon.

ILL'NESS, n.s. From ill. Badness or inconvenience of any kind, natural or moral : sickness; wickedness.

Thou would be great ;

Art not without ambition ; but without

The illness should attend it. Shakspeare.

He that has his chains knocked off, and the prisondoors set open, is perfectly at liberty, though his prefcrence be determined to stay by the illness of the weather. Locke.

On the Lord's day which immediately preceded his illness, he had received the sacrament.

Atterbury. Since the account her majesty received of the insolent faction, during her late illness at Windsor, she hath been willing to see them deprived of power to do mischief. Swift.

ILLNA'TURE, n.s.) Ill and nature. Habitual malevolence; ILLNA'TURED, adj. want of humanity: habitually malevolent; wanting kindness or good will; mischievous.

The fondly studious of increase,

Rich foreign mold on their illnatured land Induce.

Philips. Illnature inclines a man to those actions that thwart and sour and disturb conversation, and consists of a

proneness to do ill turns, attended with a secret joy upon the sight of any mischief that befalls another, and of a nutter insensibility of any kindness done him. South.

These ill qualities denominate a person illnatured, they being such as make him grievous and uneasy to all whom he deals and associates himself with.

Stay, silly bird, the illnatured task refuse ; Nor he the bearer of unwelcome news.

Addison.

It might be one of those illnatured beings who are at enmity with mankind, and do therefore take pleasure in filling them with groundless terrors.

Atterbury.

Who can describe

Their affectation, pride, illnature, noise Proncness to change, even from the joy that pleased

Rowe's Ambitious Stepmother. 'em.

ILLOG'ICAL, adj. 7 Ill and logical. Ig-ILLOG'ICALLY, adv. 7 norant or negligent of the rules of reasoning.

One of the dissenters appeared to Dr. Sanderson so bold and illogical in the dispute, as forced him to say, he had never met with a man of more pertinacious confidence, and less abilities. Walton.

Reason cannot dispute and make an inference so utterly illogical. Decay of Piety.

ILLUDE', v.a. - Lat. illudo. To deceive; to mock; to impose on; to play upon; to torment by some contemptuous artifice of mockery.

Sometimes athwart, sometimes he strook him strait, And falsed oft his blow, t' illude him with such bait. Faerie Queene.

In vain we measure this amazing sphere,

While its circumference, scorning to be brought

Even into fanceed space, illudes our vanquished thought. Prior.

ILLUME', v.a.
ILLU'MINE, v. a.
ILLU'MINATE, V. a.
ILLUMINATION, n. S
ILLU'MINATIVE, adj
To a set a series of the set

Fr. illuminer ; Span. alumbrar; Lat. lumen and illumino, to en-[lighten. The primary idea is the communi-ILLU'MINATOR, n. s. \int cation of light: the

words are nearly synonymous: illumine, is a poetic variation of illuminate. To enlighten; to adorn with lamps; to enlighten with knowledge or grace; to adorn with pictures of gold and various colors, as in old missals; to illustrate: illumination is either the act of supplying light, or the effect of it : illuminative, having the power to give light : illuminator, the agent by whom light is shed on any subject.

Satan had no power to abuse the *illuminated* world Sandys' Travels. with his impostures.

Do thou vouchsafe, with thy love-kindling light, T' illuminate my dim and dulled eyn. Spenser.

Hymns and psalms are such kinds of prayer as are not conceived upon a sudden ; but framed by meditation beforehand, or by prophetical illumination aro inspired. Hooker.

When yon same star, that's westward from the pole, Had made his course, t' illumine that part of heaven, Where now it burns. Shakspeare. Hamlet.

The sun is but a body illightened, and an illumination created. Raleigh's History.

We have forms of prayer imploring God's aid and blessing for the illumination of our labours, and the turning them into good and holy uses. Bacon.

No painting can be seen in full perfection, but as all nature is *illuminated* by a single light. Wotton.

What makes itself and other things be seen, being accompanied by light, is called fire : what admits the illuminative action of fire, and is not seen, is called Digby on Bodies. air.

He made the stars, And set them in the firmament of heaven,

T' illuminate the earth and rule the night.

Milton.

To confirm his words, out flew Millions of flaming swords, drawn from the thighs Of mighty cherubims : the sudden blaze Far round illumined hell. ĺd.

What in me is dark, Illumine ! what is low, raise and support ! Id.

But he though blind of sight,

Despised and thought extinguished quite,

With inward cycs illuminated,

His fiery virtue roused

From under ashes into sudden flame.

Id. Samson Agonistes.

Flowers are strewed, and lamps in order placed, And windows with illuminations graced. Dryden.

When he illuminates the mind with supernatural light, he does not extinguish that which is natural. Locke.

No holy passion, no illumination, no inspiration, can be now a sufficient commission to warrant those attempts which contradict the common rules of peace. Sprat's Sermons.

Reason our guide, what can she more reply

Than that the sun illuminates the sky ;

'Than that night rises from his absent ray,

Prior. And his returning lustre kindles day?

Illuminators of manuscripts borrowed their title from the illumination which a bright genius giveth to his Felton. work.

To Cato, Virgil paid one honest line ; O let my country's friends illumine mine.

Pope.

My health is insufficient to amplify these remarks, and to illumine the several pages with variety of examples. Waits.

The mountain's brow

Illumed with fluid gold, his near approach Thomson's Summer. Betokens.

ILLUMINATI, Lat. i. e. enlightened, a name assumed by a secret society, said to be founded on the 1st of May 1776, by Dr. Adam Weishaupt, professor of canon law in the University of Ingoldstad. The avowed object of this order was, 'to diffuse from secret societies, as from so many centres, the light of science over the world; to propagate the purest principles of virtue; and to reinstate mankind in the happiness which they enjoyed during the golden age fabled by the poets.' Such a philanthropic object was doubtless well adapted to make a deep impression on the minds of ingenuous young men; and to such alone did Weishaupt at first address himself. But ' the real object,' we are assured by professor Robison and abbé Barruel, ' was, by clandestine arts to overturn every government and every religion; to bring the sciences of civil life into contempt; and to reduce mankind to that imaginary state of nature, when they lived independent of each other on the spontaneous productions of the earth.' Free masonry being in high reputation all over Europe, when Weishaupt first formed the plan of his society, he availed himself of its secrecy, to introduce his new order, of which he constituted himself general, after initiating some of his pupils, whom he

styled Areopagites, in its mysteries. And when report spread the news throughout Germany, of the institution of the order of Illuminées, it was generally considered as a mere college lodge, which could interest the students no longer than during the period of their studies. Weishaupt's character too, which at this time was respectable for morality, as well as erudition, prevented all suspicion of his harbouring any such dark designs as have since come to light. But it would far exceed the limits to which our work is restricted, to give even an outline of the nature and constitution of this extraordinary society; of its secrets and mysteries; of the deep dissimulation, consummate hypocrisy, and shocking impiety of its founder, and his associates; of their Jesuitical art in concealing their real objects, and their incredible industry and astonishing exertions in making converts; of the absolute despotism, and complete system of espionage, established throughout the order; of its different degrees of Novices, Minervals, Minor and Major Illuminées, Epopts or Priests, Regents, Magi, and Man-kings; of the Recruiters, or Insinuators, with their various subtle methods of insinuating into all characters and companies; the blind obedience exacted of the Novices; &c. &c. Such of our readers as wish to be fully informed of these matters, we must refer to the abbé Barruel's works, and to professor Robison's Proofs of a Conspiracy against all the Religions and Governments of Europe.

ILLUMINATING, a kind of miniature painting, anciently much practised for illustrating and adorning books. Besides the writers of books there were artists called illuminators, whose profession was to ornament and paint manuscripts. The writers first finished their part, and the illuminators embellished them with ornamented letters and paintings. We often find blanks left in MSS., for the illuminators, which were never filled up. Some of the ancient MSS. are gilt and burnished in a style superior to later times. Their colors were excellent, and their skill in preparing them must have been very great. The practice of introducing ornaments, drawings, emblematical figures, and even portraits, into MSS., is of great antiquity. Varro wrote the lives of 700 illustrious Romans, which he enriched with their portraits, as Pliny attests in his Natural History. Pomponius Atticus was the author of a work on the actions of the great men amongst the Romans, which he ornamented with their portraits. But these works have not been transmitted to posterity. There are, however, many precious documents remaining, which exhibit the advancement and decline of the arts in different ages and countries. These inestimable paintings and illuminations display the manners, eustoms, habits, ecclesiastical, civil, and military, weapons and instruments of war, utensils and architecture, of the ancients; and are of the greatest use in illustrating many important facts relative to the history of the times in which they were executed. A very ancient MS. of Genesis, which was in the Cotton library, and almost destroyed by a fire in 1731, contained 250 curious paintings in water colors: twenty-one fragments, which escaped the fire,

633

were engraved by the society of antiquaries of London. Several specimens of curious paintings also appear in Lambecius's catologue of the imperial library of Vienna, in which forty-eight drawings, of nearly equal antiquity with those in the Cotton library, are engraven; and several others may be found in various catalogues of the Italian libraries. The drawings in the Vatican copy of Virgil made in the fourth century, before the arts were entirely neglected, illustrate the different subjects treated of by the Roman poet. A miniature drawing is prefixed to each of the gospels brought over to England by St. Augustine in the sixth century, preserved in the library of Corpus Christi College, Cambridge: in the compartments of those drawings are depicted representations of several transactions in each gospel. Cædmon's Poetical Paraphrase of the book of Genesis, written in the eleventh century, which is preserved amongst F. Junius's MSS. in the Bodleian library, exhibits many specimens of utensils, weapons, instruments of music, and implements of husbandry used by the Anglo-Saxons. After the introduction of printing, this elegant art of illuminating gradually declined, and at length was quite neglected. On the whole, it may be observed, that, from the fifth to the tenth century, the miniature paintings in Greek MSS. are generally good, as are also some among those of Italy, England, and France. From the tenth to the middle of the fourteenth century they are commonly very bad, and may be considesed as so many monuments of the barbarity of those ages; towards the end of the fourteenth the paintings in MSS. were much improved; and, in the two succeeding centuries, many excellent illuminations were produced.

ILLUMINED, ILLUMINATI, in church history, a term anciently applied to such persons as had This name was occasioned received baptism. by a ceremony in the baptism of adults; which consisted in putting a lighted taper in the hand of the person baptised, as a symbol of the faith and grace he had received in the sacrament.

ILLUMINED, ILLUMINATI, is also the name of a sect of heretics, who sprang up in Spain about A. D. 1575, and were called by the Spaniards Almabrados. Their principal doctrines were, that by means of a sublime manner of prayer, to which they had attained, they entered into so perfect a state, that they had no occasion for ordinances, sacraments, or good works; and that they could give way, even to the vilest actions, without sin. The sect of Illumined was revived in France in 1634, and was soon after joined by the Guerinetes, or disciples of Peter Guerin; but they were so hotly pursued by Louis XIII., that they were soon destroyed. ILLU'SION, n. s. Fr. illusion; Lat. illusio.

Mockery : false show ; counterfeit appearance ; error

For prestes of the temple tellen this,---That dreines ben the revelacions Of goddes ; and alles well thei tell, iwis! That thei ben infernalle illusions.

Chaucer. Troilus and Crescide. That, distilled by magick flights,

hall raise such artificial sprights,

As, by the strength of their illusion, Shall draw him on to his confusion.

Shakspeare.

There wanted not some about him that would have persuaded him that all was but an illusion.

Bacon.

So oft they fell Into the same illusion ; not as man, O'er whom they triumphed.

Milton.

An excuse for uncharitableness, drawn from pretended inability, is of all others the most general prevailing illusion. Atterbury.

Many are the illusions by which the enemy endeavours to cheat men into security, and defeat their salvation. Rogers.

To dream once more I close my willing eyes,

Ye soft illusions, dear deceits, arise ! Pope.

We must use some illusion to render a pastoral delightful; and this consists in exposing the best side only of a shepherd's life, and in concealing its mise-Id. ries.

But, in the world's full light, those charming dreams,

Those fond illusions vanish. Thomson.

ILLU'SIVE, adj. Lat. illusus. Deceiving by false show.

The heathen bards, who idle fables drest,

Illusive dreams in mystic forms exprest.

Blackmore.

While the fond soul

Wrapt in gay visions of unreal bliss, Still paints the illusive form.

Thomson's Spring.

ILLU'SORY, adj. From Lat. in and luso-rius; Fr. illusoire. Deceiving; fraudulent.

Subtilty, in those who make profession to teach or defend truth, hath passed for a virtue : a virtue indeed, which, consisting for the most part in nothing but the fallacious and illusory use of obscure or deceitful terms, is only fit to make men more conceited in their ignorance. Locke.

ILLUS'TRATE, v. a.	Fr. illustrer ; Lat.
ILLUSTRA'TION, n. s.	j illustro; Span. es-

ILLUS'TRIOUSLY, adv.	plain; clear; eluci-
ILLUS'TRIOUSNESS, n. s.	date; to make ap-

o make apparent: illustration, an explanation or exposition: illustrative, having the quality of elucidating : illustrious, from Latin illustris, famous; renowned; noble, either in descent or by exploits; eminent; excellent.

The magnanimous and most illustrate king Cophetisa set eye upon the pernicious and induhitate beggar Zenelophon. Shakspeare.

Matter to me of glory ! whom their hate

Illustrates, when they see all regal power

Given to me to quell their pride. Milton.

Hell could no longer hold us in her bounds,

Nor this unvoyageable gulf obscure

Detain from following thy illustrious track.

Id. Paradise Lost. They play much upon the smile or illustrative argumentation, to induce their enthymemes unto the Browne. people.

Authors take up popular conceits, and from tradition unjustifiable, or false, illustrate matters of undeniable truth.

Things are many times delivered hieroglyphically, metaphorically, illustratively, and not with reference Id. to action.

Of every nation, each illustrious name, Such toys as those have cheated into fame.

Dryden.

Whoever looks about him will find many living *il-lustrations* of this emblem. *L'Estrange*.

Space and duration, being ideas that have something very abstruse and peculiar in their nature, the comparing them one with another may perhaps be of use for their *illustration*. Locke.

Thee she cnrolled her gartered knights among, Illustrating the noble list. Philips.

In other languages the most *illustrious* titles are derived from things sacred. South.

He dislained not to appear at festival entertainments, that he might more *illustriously* manifest his charity. Atterbury.

You, carrying with you all the world can boast, To all the world *illustriously* are lost. Pope.

It is often a difficult matter to *illustrate* gracefully the text of a sermon from the context, and to point out the connexion between them. *Blair's Sermons.*

That your illustrious lady admitted.

Byron. The Two Foscari.

ILLUSTRIOUS, ILLUSTRIS, was, in the Roman empire, a title of honor peculiar to people of a certain rank. It was first given to the most distinguished amongst the knights, who had a right to bear the latus clavus; afterwards, they were entitled illustrious who held the first rank among those called Monorati; viz., the præfecti prætorii, præfecti urbis, treasurers, comites, &c. There were, however, different degrees among the illustrious. There were illustres whom they called majores, and others called illustres minores : the præfectus prætorii was a degree below the master of the offices, though they were both illustres.

ILLYRIA, ILLYRICUM, or ILLYRIUM, in ancient geography, a country in Europe, extending from the Adriatic to Pannonia. Illyricum is the name used by Livy, Herodotus, and St. Paul. Its boundaries are variously assigned. Pliny makes it extend in length from the Arsia to the Drinius, thus including Liburnia on the west, and Dalraatia on the east; which is also the opinion of Ptolemy; who settles its limits from Meunt Scardus 22d the Upper Mæsia on the east, to Istria on the west. It was a Roman province, divided by Augustus into the Superior and Intertor, but of which the limits are left very indeterminate botn oy ancient historians and geographers. It now forms part of Croatia, Bosnia, Istria and Sclavonia.

ILLYRIA, a modern kingdom of South Europe, subject to Austria, comprehending Carinthia, Carniola, the vicinity of Trieste, Friuli, Cividal, Venetian Istria, a part of Croatia, and several islands in the gulf of Quarnero. It is bounded by Salzburg, Styria, Croatia, the Adriatic, the government of Venice, and the Tyrol. Most of this district has been long subject to Austria: 'he name of Illyria was given to it by Buonaparte in 1810, and it was retained by the Austrians, on newmodelling the territorial divisions, in 1816. It is called a kingdom, and consists of the two governments of Laibach and Trieste; the former inland, the latter maritime. These are subdivided into circles, the extent and population of which are as follow :— ILL

Circles.		Squa	are Miles.	Population.
Trieste 🍈			1 440	175,935

The chief towns are those that give name to the circles.

Austrian Illyria is mountainous; being intersected by the Carinthian and Julian Alps, including the rugged and lofty range called the Karst. These mountains are mostly covered with forests, and it has several other bare and unproductive tracts; but, on the other hand, there are a number of fertile valleys, enjoying a mild and warm climate. On the coast of the Adriatic, however, the bora, an impetuous wind severely felt in Croatia, is very destructive, and exhausts the soil. The principal rivers of Illyria are the Save, the Drave, the Laibach, and the Isonzo.

All the finer fruits of the south of Europe are produced here, and flax is cultivated in some districts; but the forests supply immense quantities of timber. Silk is also cultivated, and on the sea coast the fishing is extensive. The mineral kingdom is also rich. At Idria quicksilver and cinnabar are produced in large quantities : and copper and iron mines every where abound. Other mineral products are calamine, vitriol, alum, saltpetre, and pit-coal: on the coast bay salt is made. Olives, oil, timber, and the product of the mines, are the staple commodities. The pastures are in general good, and the rearing of cattle and sheep is carried on with success. The manufactures are various, but not on a large scale, and consist of linen, woollen, and silk; straw-plaiting, and hardware. The Austrian empire has no sea-ports except on the Adriatic, and Trieste and Fiume, the principal towns of Illyria, lie exactly in the road to the interior of the empire: the former is accordingly an entrepot for the trade of Germany, and the latter for that of Hungary.

This country remained under the dominion of Buonaparte, after the campaign of 1809, four years. The operations of the Austriaus and British for its recovery took place in the close of 1813.

ILLYRIAN ISLANDS. Under this name are sometimes comprised the islands in the Adriatic, lying along the coast of Dalmatia. The principal are Veglia, Cherso, Arbe, Pago, Isola, Grossa, Brazza, Lesina, Lissa, Curzola, Sabioncello, Meleda, and Lagosta. They all belong to the house of Austria.

634

N

ILLYRIUS (Matthias Flaccus, or Francowitz), one of the most learned divines of the Augsburg confession, born in Istria, anciently called Illyrica, in 1520. Ile is said to have been a man of extensive learning, and great zeal; but of a passionate temper. He studied under Luther and Melancthon; and published a great number of works. He also had the chief direction of the Centuriæ Magdeburgenses. He died in 1575.

ILMEN, a considerable lake of Russia, in the government of Novogorod : it is forty-eight miles long, and from twelve to eighteen wide, receiving various rivers. The Russians call it Osero-Ilmen.

ILMINSTER, a market town of Somersetshire, four miles north-west from Crewkerne, and 133 W.S.W. from London. This town is seated on the Ille; and, though low, is healthy, and was formerly a manufacturing town of some importance. It consists principally of two streets, one of which is a mile in length. The church is a handsome Gothic building, ornamented with a quadrangular tower in the centre, containing five bells and a clock. Within is a monument, erected in the beginning of the seventeenth century, to the memory of Nicholas Wadham and Dorothy his wife, the founders of Wadham College, Oxford. Here is a free grammar-school, endowed by them, with considerable property, now greatly improved, together with a good salary and a house for the head master and his assistant. Market on Saturday.

ILUS, in fabulous history, the fourth king of Troy, and son of Tros by Calirrhoe, father of Laomedon, and grandfather of Priam. He received the Palladium from Jupiter. See PALLA-DIUM.

I'M. Contracted from I am.

IM, is used commonly, in composition, for in before mute letters. What is im in Latin, when it is not negative, is often em in French; and our writers, as the Latin or French occurs to their minds, use im or em: formerly im was more common, and now em seems to prevail.

IM'AGE, n. s. & v.a. IM'AGERY, n. s. IMAG'INABLE, adj. IMAG'INANT, adj. IMAG'INARY, adj. IMAGINA'TION, n. s. IMAG'INATIVE, adj. IMAG'INE, v.a. IMAG'INER, n. s.

Fr. image, imaginable, imaginant, imaginatif; Latin imago; Span. imagén; Greek EIKWY. The root of all these words is image; any corporeal representation; a picture;

] a likeness; an idol; a copy; similitude in appearance; an idea or picture painted in the fancy: imagery, sensible representations; phantasms of the mind; show; appearance: imaginable, possible to be conceived : imaginant, forming ideas : imaginary, fancied ; visionary ; unreal ; existing only in imagination : imagination, a faculty of the mind by which ideal pictures are formed; the power of forming fanciful pictures, or representing absent things and beings to one's self and others ; conception ; contrivance ; a fanciful opinion : imaginative, fantastic; full of fancies or imaginations: imagine, to copy by fancy; scheme; contrive : imaginer, one who forms ideas.

Manasseh set the carved image in God's house.

Chronicles.

Thou hast seen all their vengeance, and all their imaginations against me. Lam. iii. 60.

Whose is this image and superscription ? Matt Whan that hire father slaine was on a night,

Unto Dianes temple goth she right

And hente the image in hire handles two,

Fro which image wold she never go.

Chaucer. The Frankeleines Tale.

His wordis ben so comfortabill, and comyth so in seson

That my wit is ovircome to make eny reson Contrary to counsaill, at myn ymagynocioune :

Wherfor I wol tel a Tale to your consolacioune.

Id. The Pardonere and Tapstere. He ne ete, dronke, ne slept, ne worde seide,

Imagining, aie, that she was unkinde;

For which, well nigh he wext out of his mind.

Id. Troilus and Creseide.

Of marble stone was cut

An altar carved with eunning imagery.

Faerie Queene.

Id.

The one is too like an image, and says nothing ; and the other too like a lady's oldest son, evermore talking. Shakspeare.

Thy brother I. Even like a stony image, cold and numb. Id. False sorrow's eye,

Which, for things true, weeps things imaginary. Id. The image of the jest

I'll shew you here at large. Id. Long mayest thou live,

To bear his image and renew his glories !

I have bewept a worthy husband's death,

And lived by looking on his images :

But now two mirrours of his princely semblance

Are cracked in pieces by malignant death. Id.

Princes have but their titles for their glories,

An outward honour for an inward toil;

And, for unfelt imaginations,

They often feel a world of restless cares. Id.

Deny to speak with me? They're sick, they're weary ?

They have travelled all night? Mere fetches ;

The images of revolt. Id. King Lear. This is the man should do the bloody deed :

The image of a wicked heinous fault

Lives in his eye, Id. King John. Look what notes and garments he doth give thee,

Bring them, I pray thee, with imagined speed. Shakspearc.

Present fears

Are less than horrible imaginings. Id. Fortune is nothing else than a power imaginary, to which the successes of human actions and endeavours were for their variety ascribed. Raleigh's History.

The juggler took upon him to know that such an one should point in such a place of a garter that was held up; and still he did it, by first telling the imaginer, and after bidding the actor think. Id.

We will enquire what the force of imagination is, either upon the body imaginant, or upon another body. Id.

Imagination I understand to be the representation of an individual thought. Imagination is of three kinds : joined with belief of that which is to come ; joined with memory of that which is past; and of things present, or as if they were present : for I comprehend in this imagination feigned and at pleasure, as if one should imagine such a man to be in the vestments of a pope, or to have wings. Id.

Lay fetters and restraints upon the imaginative and fantastick part, because our fancy is usually pleased with the entertainment of shadows and gauds.

Taylor's Rule of Holy Living

635

Things of the world fill the imaginative part with beauties and fantastick imagery. Taylor.

O whither shall I run, or which way fly

The sight of this so horrid spectacle,

Which erst my eyes beheld, and yet behold !

For dire imagination still pursues me. Milton. -; on his right

The radiant image of his glory sat,

Id. Paradise Lost. His only Son.

Our simple apprehension of corporeal objects, if present, is sense; if absent, imagination: when we would perceive a material object, our fancies present us with its idea. Glanville.

Sometimes despair darkens all her imaginations ; sometimes the active passion of love cheers and clears her invention. Sidney.

I fancyed pleasures, none but one who loves And doats as I did, can imagine like them.

Otway.

Id.

It is not imaginable that men will be brought to obey South. what they cannot esteem.

Men sunk into the greatest darkness imaginable, retain some sense and awe of a Deity. Tillotson.

The face of things a frightful image bears,

And present death in various forms appears.

Dryden's Æneid. wish there may be in this poem any instance of good imagery. Dryden.

How are immaterial substances to be imagined, which are such things whereof we can have no notion? Id.

When in those oratories might you see Rich carvings, portraitures, and imagery ;

Where every figure to the life expressed

The godhead's power. Id. Knight's Tale. He made us to his *image* all agree

That image is the soul, and that must be,

Or not the maker's image, or be free.

Still must I be upbraided with your line ; But your late brother did not prize me less,

Because I could not boast of images. Id.

We are apt to think that space, in itself, is actually boundless ; to which imagination, the idea of space, of itself, leads us. Locke.

What are our ideas of eternity and immensity but the repeated additions of certain ideas of imagined parts of duration and expansion, with the infinity of number, in which we can come to no end of addition ? Id.

The image of deity may be a proper object for that which is but the image of a religion. South.

The crowd indeed

Who kneel before the image, not the god, Worship the deity their hands have made.

Rowe's Ambitious Stepmother. Why wilt thou add to all the griefs I suffer, Imaginary ills and fancied tortures. Addison.

Honour's a fine imaginary notion

That draws in raw and inexperienced men

To real mischief, while they hunt a shadow. Id. What can thy imagery or sorrow mean : Secluded from the world, and all its care, Hast thou to grieve or joy, to hope or fear ? Prior.

Outcasts of mortal race ! can we conceive Image of aught delightful, soft, or great? Id.

His ear oft frighted with the imaged voice Of heaven, when first it thundered.

Id. All the visionary beauties of the prospect, the paint and imagery that attracted our senses, fade and disappear. Rogers.

It might be a mere dream which he saw; the imagery of a melancholick fancy, such as musing men mistake for a reality. Atterbury.

Fate some future bard shall join,

In sad similitude of griefs to mine,

Condemned whole years in absence to deplore, And *image* charms he must behold no more.

Pope. Id.

Where beams of warm imagination play, The memory's soft figure melt away.

When we speak of a figure of a thousand angles, we may have a clear idea of the number one thousand angles; but the image, or sensible idea, we cannot distinguish by fancy from the image of a figure that has nine hundred angles. Watts.

Imagination's fool and error's wretch Man makes a death which Nature never made. Young.

For this was thy fair image

Stampt on his soul in godlike lineaments? Porteus's Death.

Now my sere fancy " falls into the yellow Leaf,' and imagination droops her pinion, And the sad truth which hovers o'er my desk Turns what was once romantic to burlesque.

Byron. Don Juan.

IMAGE, in theology, the use and adoration of images have been long controverted. The first instance that occurs in any credible author, of images among Christians, is that recorded by Tertullian de Pudicitià, of certain cups, or chalices, on which was represented the parable of the good shepherd carrying the lost sheep on his shoulders: but this instance only proves, that the church at that time did not think emblematical figures unlawful ornaments of chalices. Another instance is taken from Eusebius, who says, that in his time there were to be seen two brass statues in the city of Paneas or Cæsarea Philippi; the one of a woman on her knees with her arms stretched out, the other of a man over against her with his hand extended to receive her: these statues were said to be the images of our Saviour and the woman whom he cured of an issue of blood. From the foot of the statue representing our Saviour, says the historian, sprung up an exotic plant, which, as soon as it grew to touch the border of his garment, was said to cure all sorts of distempers. Eusebius, however, vouches none of these things; nay, he supposes that the woman who erected this statue of our Saviour was a pagan, and ascribes it to a pagan custom. Philostorgius expressly says, that this statue was carefully preserved by the Christians, but that they paid no kind of worship to it, because it is not lawful for Christians to worship blass or any other matter. Justin Mart, Apol. ii. p. 44. Clem. Alex. Strom. 5, Strom. 1, and Protr. p. 46, Aug. de Civit. Dei. lib. vii. c. 5, and lib. iv. c. 32. Id. de Fide et Symb. c. 7, Lactant. lib. ii. c. 3, Tertull. Apol. c. 12, Arnob. lib. vi. p. 202. Tertullian, Clemens Alexandrinus, and Origen, were of opinion, that, by the second commandment, painting and engraving were unlawful to a Christian, styling them evil and wicked arts. Tert. de Idol. cap. 3, Clem. Alex. Admon. ad Gent. p. 41, Origen contra Celsum. lib. vi. p. 182. The use of images in churches, as ornaments, was first introduced by some Christians in Spain, in the beginning of the fourth century; but the practice was condemned as a dangerous innovation, in a council held at Eliberas in 305. Epiphanius, in a letter preserved by Jerome,

636

com. n. ep. 6, bears a strong testimony against images ; and he may be considered as one of the first Iconoclasts. The custom of admitting pictures of saints and martyrs into churches was rare in the end of the fourth century; but became common in the fifth. But they were still considered only as ornaments, and even in this view they met with very considerable opposition. In the following century the custom of thus adorning churches became almost universal, both in the east and west. Petavius expressly says, that no statues were yet allowed in the churches; because they bore too near a resemblance to the idols of the Gentiles. Towards the close of the fourth, or beginning of the fifth century, images, which were introduced by way of ornament, and then used as an aid to devotion, began to be actually worshipped. However, it continued to be the doctrine of the church in the sixth, and in the beginning of the seventh century, that images were to be used only as helps to devotion, and not as objects of worship. The worship of them was condemned in the strongest terms by Gregory the Great; as appears by two of his letters, written in 601. From this time to the beginning of the eighth century, there occurs no instance of any worship, given or allowed to be given to images by any council or assembly of bishops whatever. But they were commonly worshipped by the monks and populace in the beginning of the eighth century; insomuch, that in 726, when Leo published his famous edict, it had already spread into all the provinces subject to the empire. See Icono-CLASTÆ.

IMAGE, in optics, a figure in the form of any object, made by the rays of light issuing from the several points of it, and meeting in so many other points, either at the bottom of the eye, or on any other ground, or on any transparent medium, where there is no surface to reflect them. Thus we are said to see all objects by means of their images formed in the eye.

IMAGE, in rhetoric, also signifies a lively description of any thing in a discourse. Images in discourse are defined by Longinus to be, in general, any thoughts proper to produce expressions, and which present a kind of picture to the mind. But, in the more limited sense, images are such discourses as come from us, when, by a kind of enthusiasm, or an extraordinary emotion of the soul, we seem to see the things whereof we speak, and present them before the eye of those who hear us. These images, or pictures, are of great use, to give weight, magnificence, and strength, to a discourse. They warm and animate it; and, when managed with art, seem, as it were, to subdue the hearer, and put him in the power of the speaker.

IMAGO, in entomology, a name given by Linnæus to the third state of insects, when they appear in their proper shape and colors, and undergo no more transformation. See ENTO-MOLCGY.

IMAM, or IMAN, a minister in the Mahommedan church, answering to a parish priest among us. The word properly signifies a prelate, one who presides over others; but the Mussulmans frequently apply it to a person who has the care of a mosque, who is always there

637

first, and reads prayers to the people, which they repeat after him. The imam is to be clear of all gross sins, otherwise he may be deposed, and his dignity conferred on another. After an imam, however, has once been owned as such, he who denies that his authority comes immediately from God is accounted impious; he who does not obey him is a rebel. The imams have no outward mark of distinction; their habit is the same with that of the Turks in common, except that the turban is a little larger, and folded somewhat differently. Imam is also applied, by way of excellence, to the four chiefs or founders of the four principal sects among the Mahommedans. Thus Ali is the imam of the Persian sect. or sect of the Schiates; Abubeker the imam of the Sunnites, which is the sect followed by the Turks; Saphii, or Safiy, the imam of another sect, &c

IMAUS, in ancient geography, the largest mountain of Asia, and a part of Taurus; from which the whole of India extends into a vast plain, resembling Egypt. (Strabo, Pliny.) It extends through Scythia as far as to the Mare Glaciale, dividing it into Scythia intra Imaum, and Scythia extra Imaum (Ptolemy); and, stretching out along the north of India to the eastern ocean, separates it from Scythia. It had various names according to the different countries through which it extended.

IMBECILE', adj. & v. a. Fr. imbecule, IMBECIL'ITY, n. s Lat. imbecilis, in, sine, and baculo. Weak; feeble; wanting strength either of mind or body, generally used with relation to the former. This word is corruptly written embezzle; to weaken an estate or fortune by unjust appropriation.

These wicked wretches, these houndes of hel, (As I have told plaine in this sentence)

Were not content my dere love thus to quel; But yet they must embesile his presence,--

As I perceive by covert violence

They have him conveied to my displeasure

For here is lafte but naked sepulture.

Chaucer. Lament of Mary Magdelein. That way we are contented to prove, which, being the worse in itself, is notwithstanding now, by reason of common imbecility, the fitter and likelier to be brooked. Hooker.

Strength would be lord of imbecility,

And the rude son would strike his father dead.

Shakspeare.

Princes must in a special manner be guardians of pupils and widows, not suffering their persons to be oppressed, or their states *inbeciled*.

Taylor's Rule of Holy Living.

When man was fallen, and had abandoned his primitive innocence, a strange *imbecility* immediately seized and laid hold of him. *Woodward*.

IMBIBE', v. a. IMBIBE', v. a. IMBIBE', v. a. IMBIBIT'ION, n.s. Saturate, or soak. This sense, though unusual, perhaps unexampled, is necessary in English, unless the word imbue be adopted, which our writers seem not willing to receive. To admit into the mind. Imbiber, one who drinks. Imbibition, the act of sucking or drinking in.

Most powders grow more coherent by mixture of water than of oil; the reason is the congruity of bodies, which maketh a perfecter *imbibition* and incorporation. Bacan.

638

A pot of ashes will receive more hot water than cold, for as much as the warm water imbibeth more of Browne. the salt.

IMB

A drop of oil, let fall upon a sheet of white paper, that part of it, which, by the imbibition of the liquor, acquires a greater continuity and some transparency, will appear much darker than the rest ; many of the incident beams of light being now transmitted, that otherwise would be reflected. Boule.

It is not easy for the mind to put off those confused notions and prejudices it has imbibed from custom.

Loeke.

Metals, corroded with a little acid, turn into rust, which is an earth tasteless and indissolvable in water; and this earth, imbibed with more acid, becomes a me-Newton. tallick salt.

Those that have imbibed this error, have extended the influence of this belief to the whole gospel, which they will not allow to contain any thing but promises. Hammond.

The torrent merciless imbibes

Commissions, perquisites, and bribes. Swift.

Conversation with foreigners enlarges our minds, and sets them free from any prejudices we are ready to imbibe concerning them. Watts.

Illumined wide

The dewy-skirted clouds imbibe the sun. Thomson's Autumn.

IMBIT'TER, v. a. From bitter. To make bitter; figurately to deprive of pleasure; to make unhappy ; to exasperate.

Is there any thing that more imbitters the enjoyments of this life than shame? South.

Let them extinguish their passions which imbitter their lives, and deprive them of their share in the happiness of the community. Addison's Freeholder.

IMBOD'Y, v. a. & v. n. To invest with a body; to make corporeal; to incorporate, to condense, to enclose; to unite in a mass, or to coalesce.

I by vow am so imbodied yours,

That she which marries you must marry me.

Shakspeare.

The soul grows clotted by contagion,

Imbodies and imbrutes; 'till she quite lose The divine property of her first being. Milton. Never since created man

Met such imbodied force, as named with these, Could merit more than that small infantry

Id. Paradise Lost. Warred on by cranes.

Under their head imbodyed all in one. Milton. Though assiduity in the most fixed cogitation be no trouble to immaterialized spirits, yet is it more than our imbodied souls can bear without lassitude.

Glanville's Scepsis.

Then Clausus came, who led a num'rous band Of troops imbodied, from the Sabine land. Dryden. Æneas.

An opening cloud reveals

An heavenly form embodied, and arrayed

With robes of light. Dryden. The idea of white, which snow yielded yesterday, and another idea of white from another snow to-day, put together in your mind, imbody and run into one. Locke.

In those strata we shall meet with the same metal or mineral imbodied in stone, or lodged in coal, that clscwhere we found in marle. Woodward.

IMBOIL', v. n. From boil. To exestuate; to effervesce; to move with violent agitation, like hot liquor in a caldron. Not now in use.

With whose reproach and odious menace, The knight imboiling in his haughty heart, Knit all his forces, and 'gan soon embrace His grasping hold. Faerie Queene.

IMBOL'DEN, v. a. From bold. To raise to confidence ; to encourage. "Tis necessary he should die :

Nothing imboldens sin so much as mercy.

Shakspeure. I think myself in better plight for a lender than you are, the which hath something imboldened me to this unseasoned intrusion. Id.

I was the more emboldened, because I found I had a soul congenial to his. Druden.

Nor flight was left, nor hopes to force his way; Imboldened by despair, he stood at bay. Id.

Their virtues and superior genius imboldened them, in great exigencies of state, to attempt the service of their prince and country out of the common forms. Swift.

IMBO'SOM, v. a. From bosom. To hold on the bosom; to cover fondly with the folds of one's garment; to hide under any cover.

The Father infinite,

By whom in bliss imbosomed sat the Son. Milton.

Villages imbosomed soft in trees,

And spiry towns by surging columns marked. Thomson.

To admit to the heart, or to affection.

But glad desire, his late imbosomed guest, Yet but a babe, with milk of sight he nurst.

Sidney.

Who glad to imbosom his affection vile, Did all she might, more plainly to appear.

Faerie Queene.

IMBOUND', v. a. From bound. To enclose to shut in.

That sweet breath,

Which was imbounded in his beauteous clay.

Shakspeare.

Milton.

IMBOW', v. a. From bow. To arch IMBOW MENT, n. s. 5 to vault.

Prince Arthur gave a box of diamond sure, Imbowed with gold and gorgeous ornament.

Faerie Queene.

Imbowed windows be pretty retiring places for conference: they keep both the wind and sun off.

Bacon. The roof all open, not so much as any imbowment ncar any of the walls left. Id.

Let my due feet never fail,

To walk the studious cloister's pale,

And love the high imbowed roof,

With antick pillar massy proof.

IMBOW'ER, v.a. From bower. To cover with a bower; to shelter with trees.

Thick as autumnal leaves that strow the brooks In Valumbrosa, where the Etrurian shades

High over-arched imbower. Milton's Paradise Lost.

And stooping thence to Ham's embowering walks,

In spotless peace retired. Thomson.

IMBRANG'LE, v.a. To entargle. A low word.

With subtle cobweb cheats

They're catched in knotted law, like nets;

In which, when once they are imbrangled,

The more they stir, the more they're tangled.

Hudibras. IM'BRICATED, adj. From Lat. imbrex. Indented with concavities; bent and hollowed like a roof or gutter-tile.

IMBRICATED SHELLS, in natural history, are those which are elevated into transverse ridges, lying over one another at the base, in the manner of the tiles on a house-top. Also the name of a peculiar species of cordiformis, or heartshell, whose sides are remarkably ridged in this transverse manner, and at the same time so divided longitudinaily, by seven high ribs running from the apex to the edge, that the whole represents the roof of a house with the beams and rafters, before they are covered by the tiling.

IMBRICATION, n.s. Lat. imbrex. Concave indenture.

All is guarded with a well-made tegument, adorned with neat *imbrications*, and many other fineries.

Derham.

639

IMBROS, an island in the Grecian archipelago, situated east of Mount Athos, west of the peninsula of the Dardanelles, south of Samothracia, and north-east of Lemnos. N. lat. 40° 10', E. long. 23° 25'. It is not much visited by European travellers, and greatly resembles most of the other Greek islands, presenting the same aspect of fertility, the same delightful climate, and similar manners of the inhabitants. Imbros was anciently much larger than it is at present, but the inroads of the sea have by degrees reduced it to a surface the circumference of which is scarcely thirty miles. A porphyry rock forms the basis of the island, in several places appearing bare, and interrupting the vegetation of the soil; in some parts covered with sponges on the sea-coast, where it is carpeted with a great quantity of moss; while caper-bushes, asphodel, and other plants spontaneously take root in its interstices. In the beds of the torrents are found grouped together the agnus castus and the nerion; and here also are found jasper, and banks of yellow earth for dyeing, which the inhabitants export to Constantinople. This island is infested with several sorts of serpents, none of which, however, are venomous. Olives, wild peartrees, and kermesoaks, the acorns of which serve to fatten a great number of pigs, are the only trees that grow in Imbros. Its principal produce is corn, which is an article of exportation; in other respects it has little commerce, and the inhabitants are by no means industrious; as they have no good ports, they are seldom visited by foreign vessels. The whole island contains but five or six villages, and 1000 houses.

The English traveller, Sibthorpe, happening to land here, was very hospitably entertained by the Papas, at a panagia, or village festival. He was conducted to a hamlet surrounded by olive trees, where two priests were officiating in a rustic kind of chapel, in the presence of a great number of peasants. In these remote corners of the Greek commonwealth the distribution of provisions forms a part of every religious festival, as it did among the first Christians. The Englishman, having presented his offering, was considered as a member of the parish, and admitted to the sacred banquet. Five lambs, sacrificed in honor of the patron, whose festival they were celebrating, were cut in pieces and distributed among the men, women, and children, as were also other provisions, such as kourkous and The misitra, flummery, olives, and raisins.

priest then blessed the bread and the wine, and every man of the community presented himself, to receive from the hands of the pastor a small piece of the bread dipped in the wine. The women did not partake of this mystical distribution, probably on account of the wine, the use of which their habitual sobriety forbids to the Greek women. While eating the consecrated bread, every one made with his finger, the sign of a cross on his mouth. This ceremony passed with great simplicity, while happiness seemed to brighten the countenances of the rustic guests. There was only one of the priests, however, who showed any affability towards the stranger; the others were gloomy and silent.

IMBROWN, v. a. From brown. To make brown; to darken; to obscure; to cloud

Where the morning sun first warmly smote The open field, and where the unpierced shade Imbrowned the noontide bowers, Milton.

The foot grows black that was with dirt *imbrowned*, And in thy pocket gingling halfpence sound. Gay.

Another age shall see the golden ear Imbrown the slope, and nod on the parterre.

Pope. Imbrowned with native bronze, lo ! Henley stands. Id.

IMBRUE', v. a. From in and brue. To steep; to soak; to wet much or long. This seems indifferently written with *im* or *em*.

Thou mad'st many hearts to bleed

Of mighty victors, with wide wounds *embrued*, And by thy cruel darts to thee subdued. *Spenser*.

At me, as at a mark, his bow he drew,

Whose arrows in my blood their wings imbrue.

Sandys.

The merciless Turks, embrued with the Christian olood, were weary of slaughter, and began greedily to seek after the spoil. Knolles.

There streams a spring of blood so fast From those deep wounds, as all embrued the face Of that accursed catiff. Daniel's Civit War. Lucius pities the offenders,

That would *embrue* their hands in Cato's blood. Addison.

Lo! these hands in murder are *imbrued*, Those trembling feet by justice are pursued.

Prior.

Id

There, where two ways in equal parts divide, The direful monster from afar descried,

Two bleeding babes depending at her side;

Whose panting vitals, warm with life, she draws,

And in their hearts embrues her cruel claws. Pope. His virgin sword Ægysthus' veins imbrued;

The murderer fell, and blood atoned for blood.

A good man chuses rather to pass by a verbal injury than *imbrue* his hands in hlood. Clarissa.

To pour; to emit moisture. Obsolcte. Some bathed kisses, and did oft embrue

The sugared liquor through his melting lips. Faerie Queene.

IMBRUTE', v. a. & v. n. From brute. To degrade to brutality; to sink down to brutality. I, who erst contended

With gods to sit the highest, am now constrained Into a beast; and mix with bestial slipe,

This essence to incarnate and imbrute. Milton.

The soul grows clotted by contagion, Imbodies and *imbrutos*, 'till she quite lose 'The divine property of her first being.

Id.

IMBST, or UIMST, a town of the Austrian states, in the Tyrol, on the Inn. It has 2200 inhabitants, and is the chief place of a district, including the Upper Immerthal and the Vinstgau, with a population of 96,000. Imbst has acquired notoriety from the number of Canary birds reared in it for sale. The annual value of birds was formerly \pounds 4000. Eight miles southwest of Stambs, and nine S. S. E. of Ruetten.

IMBUE', v.a. Lat. imbuo. To tincture deep; to imbibe or soak with any liquor or die.

they satiate and soon fill,

Though pleasant, but thy words, with grace divine *Imbued*, bring to their sweetness no satiety.

Milton.

I would render this treatise intelligible to every rational man, however little versed in scholastick learning, among whom I expect it will have a fairer passage, than among those that are deeply *imbued* with other principles. Digby.⁴

Clothes which have once been thoroughly imbued with black, cannot well afterwards be dyed into lighter color. Boyle.

Where the mineral matter is great, so as to take the eye, the body appears imbued and tinctured with the color. Woodward.

To IMBURSE', v. a. Fr. bourse. To stock with money This should be emburse, from Fr. embourser.

IMIRETTA, a country of Asia, north of Persia, stretches along the southern limit of Caucasus, having the Black Sea on the west and Georgia on the east, and lies between the fortythird and forty-fourth degree of north latitude. The internal government is in a great measure independent; but, in 1784, Russia assumed a nominal supremacy here. Almost every family chooses for itself a habitation in the woody hills, or pleasant valleys, where they live in the most retired manner. The Imiretians are said to have deep sounding tones by which they understand and call each other on any important occasion ; and, on this signal being given, hundreds of people issue from places where no one could have supposed there had been a creature. They are chiefly of Georgian origin. The capital is Cotatis, on the left bank of the Phasis.

IMITABIL'ITY, n. s.
IM ITABLE, adj.
IM'ITATE, v.a.
IMITA'TION, n. s.
IM'ITATIVE, adL
IM'ITATOR, n. s.

Lat. imitabilis; Fr. imitable; Span. imitàr; Lat. imitor. The quality of being imitable: imitable, worthy or possible to be

imitated: imitate, to copy; endeavour to resemble; to counterfeit; to pursue the course of a composition with parallel images: imitation, the act of copying; the copy; a method of translation: imitative, inclined to copy or resemble; thus man is an imitative being: aiming at resemblance, as, painting is an imitative art; formed after some original: imitator, one that copies after or resembles another.

How could the most base men, and separate from all *imitable* qualities, attain to honour but by an observant slavish course ? Raleigh.

We imitate and practise to make swifter motions than any out of our muskets. Bacon.

As acts of parliament are not regarded by most imitable writers, I account the relation of them improper for history. Hayward. Despise wealth, and *imitate* a god. Cowley. This hand appeared a shining sword to wield, And that sustained an *imitated* shield.

Dryden's Æneid.

This temple, less in form, with equal grace,

Was imitative of the first in Thrace. Dryden. Imitators are but a servile kind of cattle, says the poet. Id.

Since a true knowledge of nature gives us pleasure, a lively *imitation* of it, either in poetry or painting, must produce a much greater; for both these arts are not only true *imitations* of nature, but of the best nature. Id.

In the way of *imitation*, the translator not only varies from the words and sense, but forsakes them as he sees occasion; and, taking only some general hints from the original, runs division on the groundwork. *Id.*

According to the multifariousness of this *imitability*, so are the possibilities of being. Norris.

For shame ! what, imitate an ode ? Gay.

The characters of men placed in lower stations of life, are more useful, as being *imitable* by greater numbers. Atterbury.

Several other arts *imitate* as well as Poetry; and an *imitation* of human manners and characters may be carried on in the humblest Prose, no less than in the more lofty Poetie strains. *Blair's Lectures.*

IMITATION, in music, admits of two different senses. Sound and motion are either capable of imitating themselves by a repetition of their own particular modes; or of imitating other objects of a nobler and more abstracted nature. Nothing perhaps is so purely mental, nothing so remote from external sense, as not to be imitable by music. 'Dramatic or theatrical music,' says Rousseau, 'contributes to imitation no less than painting or poetry: it is in this common principle that we must investigate both the origin and the final cause of all the fine arts. But this imitation is not equally extensive in all the imitative arts. Whatever the imagination can represent to itself is in the department of poetry. Painting, which does not present its pictures to the imagination immediately, but to external sense, and to one sense alone, paints only such objects as are discoverable by sight. Music might appear subjected to the same limits, with respect to the ear; yet it is capable of painting every thing, even such images as are objects of ocular perception alone : by a magic almost inconceivable it seems to transform the ears into eyes, and endow them with the double function of perceiving visible objects by the mediums of their own; and it is the greatest miracle of an art, which can only act by motion, that it can make that very motion represent absolute quiescence. Night, sleep, silence, solitude, are the noble efforts, the grand images, represented by a picturesque music. Though all nature should be asleep, he who contemplates her does not sleep; and the art of the musician consists in substituting, for this image of insensibility in the object, those emotions which its presence excites in the heart of the contemplator. He not only, continues Rousseau, 'ferments and agitates the ocean, animates the flame to conflagration, makes the fountain murmur in his harmony, calls the rattling shower from heaven, and swells the torrent to restless rage; but he paints the horrors of a boundless and frightful desert, involves the 641

subterraneous dungeon in tenfold gloom, soothes the tempest, tranquillises the disturbed elements, and from the orchestra diffuses a recent fragrance through imaginary groves; nay, he excites in the soul the same emotions which we feel from the immediate perception and full influence of these objects.' Imitation, in its technical sense, is a reiteration of the same air, or of one which is similar, in several parts where it is repeated by one after the other, either in unison, or at the distance of a fourth, a fifth, a third, or any other interval whatever. The imitation may be happily enough pursued, even though several notes should be changed; provided the same air may always be recognised, and that the composer does not deviate from the laws of proper modulation. Frequently, in order to render the imitation more sensible, it is preceded by a general rest, or by long notes, which seem to obliterate the impression formerly made by the air, till it is renewed with greater force and vivacity by the commencement of the imitation.

IMMAC'ULATE, adj. Fr. immaculé; Lat. immaculatus. Spotless, pure, undefiled, as applied to character; limpid, clear, not turbid, as applied to fluids.

To keep this commandment immaculate and blameless, was to teach the gospel of Christ. Hooker.

His words are bonds, his oaths are oracles; His love sincere, his thoughts immaculate.

Shakspeare.

Thou clear, immaculate, and silver fountain, From whence this stream, through muddy passages, Hath had his current and defiled himself. Id.

The king, whom catholicks count a saint-like and immaculate prince, was taken away in the flower of his age. Bacon.

Were but my soul as pure

From other guilts as that, Heaven did not hold One more immaculate. Denham's Sophy.

The world's infectious; few bring back at eve Young.

Immaculate, the manners of the morn. Hence chartered boroughs are such public plagues, Aud burghers, men immaculate perhaps

In all their private functions, once combined,

Become a loathsome body, only fit

For dissolution, hateful to the main. Cowper.

IMMAN'ACLE, v. a. From manacle. To fetter; to confine.

Thou can'st not touch the freedom of my mind With all thy charms, although this corporal rind

Thou hast immanacled. Milton. IMMANE', adj. Lat. immanis. Vast; pro-

digiously great. IM'MANENT, adj. Fr. immanent; Lat. in

and manco. Intrinsic; inherent; internal.

Judging the infinite essence by our narrow selves, we ascribe intellections, volitions, and such immanent actions, to that nature which hath nothing in common Glanville. with us.

What he wills and intends once, he willed and intended from all eternity; it being grossly contrary to the very first notions we have of the infinite perfections of the Divine Nature to state or suppose any new South. immanent act in God.

IMMAN'IFEST, adj. In and manifest. Not manifest; not plain. Not in use.

A time not much unlike that which was before time, immanifest and unknown. Browne's Vulgar Errours.

Bar-IMMAN'ITY, n. s. Lat. immanilas. barity; savageness. Vol. XI.

IMM

It was both impious and unnatural That such immanity and bloody strife Should reign among professors of one faith.

Shakspeare.

IMMAR'TIAL, adj. In and martial. Not warlike.

My powers are unfit,

Myself immartial. Chapman's Odyssey.

IMMASK', v. a. In and mask. To cover, to disguise.

I have cases of buckram for the nonce, to immask our noted outward garments.

Shakspearc. Henry IV.

IMMATE'RIAL, adj. Fr. immateriel ; Lat. in and materia. In-IMMATERIAL'ITY, n. s. IMMATE'RIALLY, adv. corporeal; distinct IMMATE'RIALISED, udj. from, or void of mat-IMMATE'RIALNESS, n. s. ter; unimportant; J without weight; im-IMMATE'RIATE, adj. pertinent; without relation. This sense has crept into the conversation and writings of many persons, but ought to be rejected. Immaterially, in a manner not depending upon matter: imma-terialised, incorporeal. The other words are synonymous.

Angels are spirits immaterial and intellectual, the glorious inhabitants of those sacred palaces, where there is nothing but light and immortality; no shadow of matter for tears, discontentments, griefs, and uncomfortable passions to work upon; but all joy, tranquility, and peace, even for ever and ever, do dwell. Hooker.

It is a virtue which may be called incorporeal and immateriate, whercof there be in nature but few.

Bacon.

After a long enquiry of things immerse in matter, I interpose some object which is immateriate, or less materiate; such as this of sounds. Id.

As then the soul a substance hath alone, Besides the body, in which she is confined ;

So hath she not a body of her own,

But is a spirit, and immaterial mind. Davies. Montanus, in his consultations, holds melancholy to be material or immaterial.

Burton's Anatomy of Melancholy.

Though assiduity in the most fixed cogitation be no trouble to immaterialized spirits, yet it is more than our embodied souls can bear without lassitude.

Glanville's Scepsis.

The visible species of things strike not our senses immaterially ; but, streaming in corporal rays, do carry with them the qualities of the object from whence they flow, and the medium through which they pass. Browne's Vulgar Errours.

No man that owns the existence of an infinite spirit can doubt the possibility of a finite spirit; that is, such a thing as is immaterial, and does not contain Tillotson. any principle of corruption.

When we know cogitation is the prime attribute of a spirit, we infer its immateriality, and thence its im-Watts. mortality.

Those immaterial fclicities we expect, suggest the necessity of preparing our appetites, without which Decay of Picty. heaven can be no heaven to us.

IMMATURE', adj. Lat. immaturus. Not IMMATURE'LY, adv. Carrived at fulness or Lat. immaturus. Not IMMATURE'NESS, n. s. completion; unripc; IMMATU'RITY, n. s. hasty; before the natural time; premature; a state short of perfection; incompleteness. Used generally in the figurative sense.

The land enterprize of Panama was an ill-measured and immature counsel, grounded upon a false account, that the passages were no better fortified than Drake Bacan. had left them.

We are pleased, and call not that death immature, if a man lives 'till seventy. Taylor.

The earth was formed, but in the womb as yct Of waters, embryon immature involved,

Appeared not. . Milton's Paradise Lost. I might reasonably expect a pardon from the ingenuous for faults committed in an immaturity of age and judgment. Glanville.

This is your time for faction and debate,

For partial favour, and permitted hate ;

Let now your immature dissension cease,

Sit quiet.

Dryden.

642

IMMEABIL'ITY, n. s. Lat. immeabilis. Want of power to pass. So it is used in the example; but it is rather incapability of affording passage.

From this phlegm proceed white cold tumours, viscidity, and consequently immeability of the juices. Arbuthnot.

IMMEAS'URABLE, adj. From in and That IMMEAS'URABLY, adv. § measure. cannot be measured; immense; indefinitely extensive; beyond all measure.

The Spaniards immeasurably bewail their dead.

Spenser.

Churches reared up to an height immeasurable, and adorned with far more beauty in their restoration than their founders before had given them. Hooker. From the shore

They viewed the vast immeasurable abyss,

Outrageous as a sea, dark, wasteful, wild. Milton. There ye shall be fed, and filled,

Immeasurably; all things shall be your prey. Id.

What a glorious shew are those beings entertained with, that can see such tremendous objects wandering through those immeasurable depths of ether !

Addison's Guardian. Nor friends are there, nor vessels to convey, Nor oars to cut the immeasurable way.

Pope's Odyssey.

IMMECHAN'ICAL, adj. In and mechanical. Not according to the laws of mechanics.

We have nothing to do to show any thing that is immeehanical, or not according to the established laws of nature. Cheyne.

Nothing will clear a head possessed with immeehanieal notions. Mead.

IMME'DIACY, n. s. Fr. immediat; Lat. IMME'DIATE, adj. in and medius. Next IMME'DIATENESS, n. s. unto; presently fol-

Iowing; without any interposing medium : this seems to be the primary and essential meaning. Not acting by second causes; instant; present with regard to time : immediacy, personal greatness; power of acting without dependance. This is a harsh word, and sense peculiar, I bebelieve, to Shakspeare : immediately is instantly, without the intervention of other cause or event: the substantive has a similar meaning.

He led our powers,

Bore the commission of my place and person, The which immediacy may well stand up,

And call itself your brother. Shakspeare. King Lear. Her father hath commanded her to slip

Away with Slender, and with him at Eaton

Immediately to marry. Shakspeare. Immediate are my needs, and my relief,

Must not be tost and turned to me in words But find supply immediate. Id. Timon.

It is much to be ascribed to the immediate will of God, who giveth and taketh away beauty at his plea-Abbot sure.

Death denounced that day,

Which he presumes already vain, and voia Because not yet inflicted, as he feared,

By some immediate stroke. Milton's Paradise Lost. Reason in man obscured, or not obeyed

Immediately inordinate desires

And upstart passions catch the government

From reason, and to servitude reduce

Man till then free.

Moses mentions the immediate causes of the deluge, the rains and the waters; and St. Peter mentions the more remote and fundamental causes, that constitution of the heavens .. Burnet.

God's acceptance of it, either immediately by himself, or mediately by the hands of the bishop, is that which vests the whole property of a thing in God. South.

But, she, howe'er, of victory sure,

Contemns the wreath too long delayed ;

And armed with more immediate power, Prior.

Calls cruel silence to her aid.

The news immediate to her mother brought, While, pierced with anxious thought, she pined away The lonely moments for Lavinia's fate.

Thomson. Autumn.

Id.

IMMED'ICABLE, adj. Lat. immedicabilis. Not to be healed; incurable; beyond the skill of a physician.

My griefs ferment and rage,

Nor less than wounds immedieable,

Rankle and fester, and gangrene

Milton's Agonistes. To black mortification.

IMMEM'ORABLE, adj. These words are IMMEMO'RIAL, adj. derived from in and memoria. Immemorable is not worth recollection; and immemorial, past the time of recollection: so ancient that they cannot be traced to their origin.

All the laws of this kingdom have some memorials in writing; yet all have not their original in writing; for some obtained their force by immemorial usage or custom. Hale.

By a long immemorial practice, and prescription of an aged thorough-paced hypocrisy, they come to believe that for a reality, which, at first practice of it, South. hey themselves knew to be a cheat.

IMMENSE', adj.	Fr. immense ; Lat.
IMMEN'SITY, n. s.	immensus ; Greek a-

IMMENSURABIL'ITY, n.s. μετρια. That which IMMEN'SURABLE, adj. cannot be limited, bounded, or measured; infinite: terms applicable to buildings and to the universe; applicable also to the attributes of Deity, which are beyond the grasp of finite understandings.

O goodness infinite ! goodness immense !

That all this good of evil shall produce ! Milton.

By the power we find in ourselves of repeating, as often as we will, any idea of space, we get the idea of immensity. Locke.

He that will consider the immensity of this fabrick, and the great variety that is to be found in this inconsiderable part of it which he has to do with, may think that in other mansions of it there may be other Loeke. and different intelligent beings.

As infinite duration hath no relation unto motion and time, so infinite or immense essence hath no relation unto body; but is a thing distinct from all corpo-real magnitude, which we mean when we speak of immensity, and of God as of an immense being.

Grew.

All these illustrious worlds,

And millions which the glass can ne'er descry, Lost in the wilds of vast immensity,

Blackmore's Creation. Are suns, are centers. We shall find that the void space of our system is immensely bigger than all its corporeal mass. Bentley.

How our hearts tremble at thy love immense ! In love immense, inviolably just. Young.

Lo from the dread immensity of space Returning, with accelerated course,

The rushing comet to the sun descends.

Id. Night Thoughts.

Meantime refracted from yon eastern cloud, Bestriding earth, the grand ethereal bow

Shoots out immense. IMMERGE, v. a. IMMERSE', v. a. & adj. Sink or cover deep; Lat. immergo. Subscription of the state to keep in a state of intellectual depression : immerse, buried; covered (not much in use): immersion, the act of putting a body below the surface of any fluid; the state of being overwhelmed or lost.

After long enquiry of things immerse in matter, I interpose some object which is in materiate or less materiate; such as this of sounds, that the intellect may become not partial. Bacon

He stood

More than a mile immersed within the wood ; At once the wind was laid. Druden.

It is a melancholy reflection that our country, which, in times of popery, was called the nation of saints, should now have less appearance of religion in it than any other neighbouring state or kingdom; whether they be such as continue still immersed in the errors of the church of Rome, or such as are recovered out of them. Addison's Freeholder.

Achilles's mother is said to have dipped him, when he was a child, in the river Styx, which made him invulnerable all over, excepting that part which the mother held in her hand during this immersion.

Id. Guardian.

They observed that they were immersed in their rocks, quarries, and mines, in the same manner as they are at this day found in all known parts of the world. Woodward.

Many persons, who, through the heat of their lusts and passions, through the contagion of ill example, or too deep an immersion in the affairs of life, swerve from the rules of their holy faith; yet would, upon extraordinary warnings, be brought to comply with them. Atterbury.

We are prone to engage ourselves with the business, the pleasures, and the amusements of this world : we give ourselves up too greedily to the pursuit, and immerse ourselves too deeply in the enjoyments of them. Id.

It is impossible to have a lively hope in another life, and yet be deeply immersed in the enjoyments of this. Id.

One half sate up, though numbed with the immersion, While t'other half were laid down in their place, At watch and watch. Byron. Don Juan.

IMMER'IT, n.s. Lat. immeritum. Want of worth; want of desert. This is a better word than demerit, which is now used in its stead.

When I receive your lines, and find their expressions of a passion, reason and my own immerit tell me it must not be for me. Suckling.

IMMETHOD'ICAL, adj. In and metho-IMMETHOD'ICALLY, adv. dical. Confused; without regularity or method.

M. Bayle compares the answering of an immethodical author to the hunting of a duck : when you have

him full in your sight, he gives you the slip, and cecomes invisible. Addison.

IM'MINENCE, n. s. Fr. imminent ; Lat. IM'MINENT, adj. Fr. imminens. Nearness Nearness of any ill or danger; threatening; impending, always used in an ill sense.

What dangers at any time are imminent, what evils hang over our heads, God doth know, and not we. Hooker.

I do not speak of flight, of fear, of death ;

But dare all imminence, that gods and men

Address their dangers in. Shakspeare. Three times to-day

You have defended me from imminent death. Id. These she applies for warnings and portents

Of evils imminent ; and on her knee

Hath begged, that I will stay at home to-day. Id. To them preached

Conversion and repentance, as to souls In prison, under judgments imminent.

Milton.

Men could not sail without imminent danger and inconveniences. Pope.

IM'MINGLE, v. a. From in and mingo, IMMISCIBIL'ITY, n. s. or miseeo. To mingle; to IMMIS'CIBLE, v. a. mix; unite : immiscible, that does not admit of being mingled.

Some of us, like thee, through stormy life Toiled, tempest-beaten, ere we could attain

This holy calm, this harmony of mind,

Where purity and peace immingle charms.

Thomson.

IMMINU'TION, n.s. From Lat. imminuo. Diminution ; decrease.

These revolutions are as exactly uniform as the earth's are, which could not be, were there any place for chance, and did not a Providence continually oversee and secure them from all alteration or imminution. Ray on the Creation.

IMMIS'SION, n. s. } Lat. immissio, immitto. IMMIT', v. n. } The act of sending in ; contrary to emission : to send in.

To IMMIX', v. a. In and mix. To mingle.

Samson, with these immixt, inevitably

Pulled down the same destruction on himself. Milton.

IMMIX'ABLE, adj. In and mix. Impossible to be mingled.

Fill a glass sphere with such liquors as may be clear, of the same color, and immixable. Wilkins.

IMMOBIL'ITY, n. s. Fr. immobilité ; from Lat. immobilis. Unmoveableness; want of motion; resistance to motion.

The course of fluids through the vascular solids must in time harden the fibres, and abolish many of the canals; from whence dryness, weakness, immobility, and debility of the vital force.

Arbuthnot on Aliments.

IMMOD'ERATE, anj. Lat. Fr. immoderé ; immoderatus. SFrom in privative, IMMODERATION, n. s.

and modus : excessive ; beyond a due measure ; in an excessive degree: want of moderation; excess.

Immoderately she weeps for Tybalt's death.

One means, very effectual for the preservation of health, is a quiet and cheerful mind, not afflicted with violent passions, or distracted with immoderate cares. Ray on the Creation.

2 T 2

Shakspeare.

The heat weakened more and more the arch of the earth, sucking out the moisture that was the cement of its parts, drying it immoderately, and chapping it. Burnet's Theory.

IMMOD'EST, adj. Fr. immodeste ; Span. § immodesta ; Lat. immo-IMMOD'ESTY, n. s. destus; sine modestiá. A term peculiarly applicable to the conduct of females; less in degree than impudent, but implying more culpability than indecent; a want of delicacy, chastity, or purity; and applicable, not merely to the disposition, but to the externals, as words, looks, attire, &c. : it has also been used to signify unreasonable, exorbitant, arrogant, but these terms belong to immoderate.

'Tis needful that the most immodest word Be looked upon and learned; which once attained,

Comes to no further use

Shahspeare. Than to be known and hated.

She railed at herself, that she should be so immodest to write to one that she knew would flout her.

Immodest deeds you hinder to be wrought ; But we proscribe the least immodest thought.

Dryden.

Immodest words admit of no defence, For want of decency is want of sense.

Roseommon.

It was a piece of immodesty. Pope.

IM'MOLATE, v. a. Fr. immoler ; Lat. IMMOLATION, n. s. Simmolo. To sacrifice ; to kill and offer in sacrifice: immolation implies either the act or the offering.

In the picture of the immolation of Isaac, or Abraham sacrificing his son, Isaac is described as a little Browne. boy.

These courtiers of applause being oftentimes reduced to live in want, these costly trifles so engrossing all that they can spare, that they frequently enough are forced to immolate their own desires to their vanity. Boyle.

Now immolate the tongues, and mix the wine,

Sacred to Neptune, and the powers divine. Pope. We make more barbarous immolations than the most savage heathens. Decay of Piety.

IMMO'MENT, adj. In and moment. Trifling; of no importance or value. A barbarous word.

I some lady-trifles have reserved, Immoment toys, things of such dignity As we greet modern friends withal.

Shakspeare.

IMMOR'AL, adj. From in privative, and IMMORAL'ITY, n. s. mos. Wanting regard to the laws of natural religion; practically vicious; dishonest; wanting virtue: acts op-posed to the laws of God, as theft, adultery, false witness, &c.

Such men are put into the commission of the peace who encourage the grossest immoralities, to whom all the bawds of the ward pay contribution. Swift.

'There's Epicurus

And Aristippus, a material crew ! Who to immoral courses would allure us; By theories quite practicable too.

Byron. Don Juan.

IMMOR'TAL, adj.	> Fr. immortalité;
IMMORTAL'ITY, n. s.	Lat. immortalis.
IMMOR'TALLY, adv.	(From <i>in</i> and <i>mor-</i>
IMMOR'TALISE, v. u. & v. n	J talis. Exempt

from death; being never to die; perpetual: immortalise, to make immortal; to exempt from oblivion; to become immortal, in this sense peculiar to Pope : immortally, for ever; without death, and without evil.

But that immortall light, which there doth shine, Is many thousand times more bright, more cleare More excellent, more glorious, more divine ; Through which to God all mortall actions here And even the thoughts of men, doe plaine appeare; For from the eternal truth it doth proceed, Thro' heavenly vertue which her beames doe breed.

Spenser. Hymnes. Though virtue vitall dyd vanishe away, Hir virtues inward remayn immortal, Eterne, and exempte from deathe and dekay, As fountaynes flowying with course contynuall.

G. Cavendish's Metricul Visions.

Drive them from Orleans, and be immortulized. Shakspeare.

Her body sleeps in Capulet's monument, And her immortal part with angels lives. Id.

Give me my robe, put on my crown ; I have Immortal longings in me. Id.

There is your crown,

And he that wears the crown immortally, Long guard it yours! Id. Henry IV. For mortal things desire their like to breed,

That so they may their kind immortalize. Davies. Only some twinkling stars remain beheld :

Then mortal made; yet, as one fainting dies,

Two other in its place succeeding rise ; And drooping stock with branches fresh immortalize.

Fletcher's Purple Island.

Quaff immortality, and joy. Milton. Nine times the space that measures day and night

To mortal men, he with his horrid crew

Lay vanquished, rolling in the fiery gulf,

Confounded though immortal. Id. Paradise Lost.

The Paphian queen,

With gored hand, and veil so rudely torn,

Like terror did among the immortals breed,

Taught by her wound that goddesses may bleed.

Waller. What pity 'tis that he cannot wallow immortally in his sensual pleasures ! Bentley.

Fix the year precise,

When British bards begin t' immortalize. Pope.

When we know cogitation is the prime attribute of a spirit, we infer its immateriality, and thence its Watts. immortality.

But not the pomp that royalty displays, Nor all the imperial pride of lofty Troy, Nor virtue's triumph of immortal praise,

Could rouse the languor of the lingering boy. Beattie.

But here, here in this goblet is his title

To immortality,-the immortal grape

From which he [Bacchus] first expressed the soul, and gave

To gladden that of man, as some atonement For the victorious mischiefs he had done. Byron. Sardanapalus.

 IMMOVE'ABLE, adj.
 Lat. in and moveo.

 IMMOVE'ABLY, adv.
 Not ableto be forced

 from its place; not liable to be carried away; rcal in law; unshaken; unaffected.

His name was Talus, made of iron mould, Immoveable, resistlesse, without end.

Spenser. Faerie Queene.

From beds of raging fire, to starve in ice Their soft ethereal warmth, and there to pine

Immoveable, infixed, and frozen round, Periods of time, thence hurried back to fire.

Milton. Paradise Lost.

We shall not question his removing the earth, when he finds an immoveable hase to place his engine upon. Browne.

How much happier is he, who, centrating on himself, remains immovable, and smiles at the madness of the dance about him ! Dryden.

How revered is the face of this tall pile,

Whose ancient pillars rear their marble heads

To bear aloft its arch'd and pond'rous roof, By its own weight made stedfast and immoveable.

Congreve.

645

Immovably firm to their duty, when they could have no prospect of reward. Atterbury.

IMMU'NITY, n. s. Fr. immunité ; Lat. immunitas; Span. immunidad; Ital. immunita, vacuus à munere. Freedom; exemption; privilege; discharge from obligation.

Simon sent to Demetrius, to the end he should give the land an immunity, because all that Tryphon did was to spoil. 1 Mac. xiii. 34.

Of things harmless whatsoever there is, which the whole church doth observe, to argue for any man's immunity from observing the same, it were a point of most insolent madness. Hooker.

Common apprehensions entertain the antidotal condition of Ireland, conceiving only in that land an immunity from venamous creatures. Browne.

Granting great immunities to the commons, they prevailed so far as to cause Palladius to be proclaimed successor. Sidney.

IMMURE', v. a. & n. s. Old Fr. emurer ; Lat. in and muris. To enclose with walls; to confine; to shut up or imprison. Immure, a wall; an enclosure.

Lysimachus immured it with a wall. Sandys. Pity, you ancient stones, these tender babes,

Whom envy hath immured within your walls !

Shakspeare.

One of these three contains her heavenly picture ; And shall I think in silver she's immured ! Id. Their vow is made

To ransack Troy ; within whose strong immures

The ravished Helen, Menelaus' queen, With wanton Paris sleeps.

Id. At the first descent on shore he was not immured with a wooden vessel, but he did countenance the Wotton. landing in his long-boat.

IMMU'SICAL, adj. In and musical. Inharmonious: wanting proportion of sound.

All sounds are either musical, which are ever equal, or immusical, which are ever unequal, as the voice in speaking, and whisperings. Bacon.

We consider the immusical note of all swans we ever beheld or heard of. Browne.

IMMUTABIL/ITY, n.s. Fr. ummutabilité ; Lat. Simmutabile. IMMU'TABLY, adv. Ex-

emption from change; invariableness: unaltera-ble; ever the same. Immutability can only be predicated of the Deity, and is one of his essential attributes.

By two immutable things, in which it was impossible for God to lyc, we have a strong consolation.

Heb. vi.

The immutability of God they strive unto, by work-Hooker. ing after one and the same manner. God made thee perfect, not immutable. Milton.

So without least impulse or shadow of fate,

Or aught by me immutably foreseen,

IMM

They trespass, author to themselves in all Both what they see and what they chuse. Id. Paradise Lost.

His love is like his essence, immutably eternal.

Boyle.

Thy threat'nings, Lord, as thine, thou mayst revoke;

But if immutable and fixed they stand,

Continue still thyself to give the stroke,

And let not foreign foes oppress thy land. Dryden.

IMOLA, a populous district of Italy, in the department of Reno. The number of its citizens was, in 1801, reckoned 116,728.

IMOLA, a city of Italy, in the province of Romagna, capital of the above district, anciently Forum Cornelii. By a former division of the Italian republic, it was included in the department of the Amone. It is seated on an island formed by the Santerno; is strongly fortified with walls, turrets, and ditches; and has an ancient castle, with a cathedral and twelve churches. On the 11th of February, 1797, a rebellion was quelled in this town, and the papal army defeated by the French, under Buonaparte, assisted by the legion of Lombardy. The town is a bishop's see, and its streets are neat, containing several buildings worth the attention of the traveller. Imola has produced several men of note, the most distinguished of whom were Giovanni da Imola, professor of jurisprudence at Bologna, and Giovanni Tartagno, his son. Its academy was once of considerable repute, particularly about 1566; and the poetry of Zappi, one of its members, retains a high character. Population 8400. Eighteen miles south-east of Bologna, and forty N. N. E. of Florence.

IMP, n. s. & v.a. Welsh, imp, a shoot, impio, to engraft. A son; the offspring; a progeny; a subaltern devil. Imp, to lengthen or enlarge with any thing adscititious : it was originally a term used by falconers, who repair a hawk's wing with adscititious feathers.

Of feeble trees ther comen wretched impes.

Chaucer. Prologue to the Monkes Talc.

Such we deny not to be the imps and limbs of Satan. Hooker.

If then we shall shake off our slavish yoke, Imp out our drooping country's broken wings.

Shakspearc. A lad of life, an imp of fame. Id. Henry V.

Help, ye tart satyrists to imp my rage

With all the scorpions that should whip this age. Cleaveland.

New rebellions raise

Their hydra heads, and the false north displays Her broken league to imp her serpent's wings

Milton.

With cord and canvass from rich Hamburgh sent, His navy's molted wings he imps once more.

Dryden.

New creatures rise,

A moving mass at first and short of thighs;

'Till shooting out with legs, and imped with wings, The grubs proceed to bees with pointed stings. Id.

As soon as you can hear his knell,

This god on earth turns d-l in hell;

And, lo! his ministers of state,

Transformed to imps, his levce wait. Swift

To IMPACT', v. a. Lat. impactus. To drive close or hard.

They are angular; but of what particular figure is not easy to determine, because of their being *impacted* so thick and confusedly together.

Woodward on Fossils.

To IMPAINT', v. a. In and paint. To paint; to decorate with colors. Not in use.

Never did insurrection want

Such water-colors to impaint his cause. Shakspeare.

IMPAIR' v. a., v. n. & n. s.) Fr. empirer;

IMPAIR'MENT, n. s. Lat. pejor. To make worse; to diminish; to injure; lessen in quantity, value, or excellence: to be lessened or worn out. Impair, diminution; decrease; not used. Impairment, injury.

Flesh may impair, quoth he, but reason can repair. Faerie Queene.

To change any such law, must needs, with the common sort, *impair* and weaken the force of those grounds whereby all laws are made effectual.

Hooker.

Objects divine

Must needs impair and weary human sense.

Milton. That soon refreshed him wearied, and repaired What hunger, if aught hunger had impaired, Or thirst. Milton's Paradise Regained.

A loadstone, kept in undue position, that is, not lying on the meridian, or with its poles inverted, receives in longer time *impair* in activity and exchange of faces, and is more powerfully preserved by site than dust of steel. Brownee.

His posterity, at this distance, and after so perpetual *impairment*, cannot but condemn the poverty of Adam's conception, that thought to obscure himself from his Creator in the shade of the garden.

Browne's Vulgar Errours.

Nor was the work *impaired* by storms alone, But felt the approaches of too warm a sun. *Pope*.

In years he seemed, but not impaired by years.

To IMPALE, in heraldry, is to conjoin two coats of arms pale-wise. Women impale their coats of arms with those of their husbands. See HERALDRY, Plate III.

HERALDRY, Plate III. IMPAL/PABLE, *adj.* Fr. *impalpable*. In and palpable. Not to be perceived by touch.

If beaten into an *impalpable* powder, when poured out, it will emulate a liquor, by reason that the smallness of the parts do make them easy to be put into motion. Boyle.

IMPAR'ADISE, v. a. Italian, *imparadisare*. To put in a place or state resembling paradise in felicity.

All my souls be

Imparadised in you, in whom alone

I understand, and grow, and see. Donne. Thus these two

Imparadised in one another's arms,

The happier Eden, shall enjoy their fill

Of bliss on bliss. Milton's Paradise Lost. This imparadised neighbourhood made Zelmane's soul cleave unto her, both through the ivory case of her body, and the apparel which did overcloud it.

Sidney.

IMPARTTY, n. s. Lat *impur*. Inequality; disproportion; oddness; indivisibility into equal parts.

Some bodies are hard, some soft : the hardness is caused chiefly by the jejuneness of the spirits, and their *imparity* with the tangible parts. Bacon. Browne's Vulgar Errours.

IMPARK', v. a. In and park. To enclose with, or for a park ; to sever from a common.

IMPART', v. a. Latin impertire. To IMPART'IBLE, adj. S grant; to give; to make known by words or tokens; to communicate; to grant as to a partaker. Impartible, communicable: this word is elegant, although used by few writers.

But, when sweets words their ioyning sweet disparted

To th'eare a dainty musique they imparted.

Spenser. Britain's Ida.

Gentle lady,

When first I did impart my love to you, I freely told you all the wealth I had

Ran in my veins.

Shakspeare. Merchant of Venice.

As in confession the revealing is for the ease of a man's heart, so secret men come to the knowledge of many things, while men rather discharge than *impart* their minds. Bacon.

To give just form to every regiment ;

Imparting to each part due strength and 'stablishment. Fletcher's Purple Island.

The same body may be conceived to be more or less *impartible* than it is active or heavy. Digby.

Thou to me thy thoughts

Wast wont, I mine to thee was wont to impart.

Milton.

High state and honours to others impart, But give me your heart. Dryden.

Thy form benign, O goddess, wear,

Thy milder influence impart ;

Thy philosophic train be there

To soften not to wound my heart.

Gray. Ode to Adversity.

IMPAR'TIAL, adj. IMPARTIAL'ITY, n. s. in and partes. Equit-IMPAR'TIALY, adv. able; free from regard to party; indifferent; disinterested; equal in the distribution of justice; just: impartially, with unbiassed judgment; honestly; justly; without favor or preference of one to another.

Such pardon therefore as I give my folly, Take to thy wicked deed; which when thou seest Impartial, self severe, inexorable, Thou wilt renounce thy seeking.

Milton. Samson Agonistes.

Success I hope, and fate I cannot fear: Alive or dead, I shall deserve a name; Jove is *impartial*, and to both the same.

Dryden

Since the Scripture promises eternal happiness and pardon of sin, upon the sole condition of faith and sincere obedience, it is evident, that he only can plead a title to such a pardon, whose conscience impartially tells him that he has performed the required condition. South.

Nay, I have listened

Impartially to thee-why not to them. Byron. Sardanapalus.

IMPAS'SABLE, *adj.* In and passable. Not to be passed; not admitting passage; impervious.

There are in America many high and *impassable* mountains, which are very rich. Raleigh. Impassable, impervious; let us try, To found a path from hell to that new world.

Milton.

647

IMPASS'IBLE, adj. IMPASSIBIL'ITY, n. s. IMPASS'IBLENTES, n. s. IMPAS'SIVE, adj. IMPA'TIENCE, n. s. IMPA'TIENT, adj. IMPA'TIENTLY, adv.

Fr. impassibilite; Lat. in and patior, impatientia. Exemption from suffering: insusceptible of injury from external causes : impassive

has the same meaning: impatience, rage and fretfulness under suffering; vehemence of temper; eagerness: impatient, vehemently agitated by some painful passion; hot; hasty; ardently desirous.

Impatient is he that wol not be taught.

Chaucer. The Persones Tale. All the power of his wits has given way to his impatience. Shakspeare. King Lear.

To be *impatient* at the death of a person, concerning whom it was certain he must die, is to mourn because thy friend was not born an angel.

Taylor's Rule of Holy Living. He considered one thing so impatiently, that he would not admit any thing else to be worth consideration. Clarcadon.

Yet hard for gods, and too unequal work we find, Against unequal arms to fight in pain,

Against unpained, impassive, from which evil

Ruin must needs ensue. Milton's Paradise Lost. The experiment I resolved to make was upon thought, and not rashness or impatience. Temple.

The tortured savage turns around,

And flings about his foam, impatient of the wound. Druden.

She told him what those empty phantoms were, Forms without bodies, and *impassive* air.

Id. Æneid.

Secure of death, I should contemn thy dart, Though naked, and *impassible* depart. Dryden.

The headstrong beast

Rushes along impatient of the course;

Nor hears the rider's call; nor feels the rein.

Rowe's Royal Convert. The impatient man will not give himself time to be informed of the matter that lies before him.

Addison's Spectator.

If the upper soul check what is consented to by the will, in compliance with the flesh, and can then hope that, after a few years of sensuality, that rebellious servant should be eternally cast off, drop into a perpetual *impassible* nothing, take a long progress into a land where all things are forgotten, this would be some colour. Hammond.

Fame, impatient of extremes, decays

Not more by envy than excess of praise. Pope. Pale suns, unfelt at distance, roll away;

And on the impassive ice the lightnings play. Id.

How shamcless a partiality is it, thus to reserve all the sensualities of this world, and yet cry out for the *impassibleness* of the next? Decay of Picty.

IMPAS'TED, *adj.* In and paste. Concreted as into paste.

Horribly trickt

With blood of fathers, mothers, daughters, sons, Baked and *impasted* with the parching fires.

Shakspeare.

IMPATIENS, touch-me-not, a genus of the monogania order, syngenesia class of plants; natural order twenty-fourth, corydales: CAL diphyllous: COR. pentapetalous and irregular, with a hooded nectarium: CAPS. superior and quinquevalved.

I. balsamina, or balsam, is a native of India. It has a fibrous root, an upright, thick, succulent stalk, branching all around a foot and a half or two feet high; with long, spear-shaped, sawed leaves, the upper ones alternate; and from the joints of the stalk and branches clusters of short foot-stalks, each sustaining one large irregular flower, of different colors in the varieties; flowering from June or July till September. This species requires artificial warmth. The seeds will indeed grow in the full ground, but rarely before May; and more freely then, if covered with a hand-glass, &c. But the plants raised by artificial heat will flower five or six weeks sooner than those raised in the natural ground. The seeds ought therefore always to be sowed on a hot-bed in March or April, and the plants continued therein till June; and, if the frames be deep, they will then be drawn up to the length of two or three feet; after which they may be planted in pots, which must likewise be continued in the hot-bed till the plants have taken fresh root.

I. noli-me-tangere, or common yellow balsamine, is a native of Britain, but is cultivated in many gardens for curiosity. It has a fibrous root, an upright jointed, succulent, stalk, about eighteen inches high, with alternate oval leaves; and, from the axillas of the stalks, long, slender, branching foot-stalks, each sustaining many yellow flowers; succeeded by taper capsules, that burst open, and dart forth their seeds with great velocity, whence its name. It is very hardy, and will grow freely from the seeds in any common border.

IMPAT'RONISE, v. a. Fr. impatroniser, in and patronise. To gain to one's self the power of any seigniory. This word is not usual.

The ambition of the French king was to impatronize himself of the dutchy. Bacon's Henry VII.

IMPAWN', v. a. In and pawn. To impignorate; to pawn; to give as a pledge; to pledge.

Go to the king, and let there be impawned

Some surety for a safe return again.

Shahspeare. Henry IV.

Many now in health

Shall drop their blood, in approbation

Of what your reverence shall invite us to; Therefore take heed how you *impawn* our person, How you awake our sleeping sword of war.

Shakspeare.

IMPEACH', v. a. & n. s.
IMPEACH'ABLE, adj.
IMPEACH'ER, n. s.
IMPEACH'MENT, H. S.
IMPEDE', v. a.
IMPED'IMENT, n. s.

Fr. empccher; Lat. impedio, impeto. To hinder; to accuse by public authority: impeach, hindrance; impe-

diment: impeachable, accusable; chargeable with criminality: impeachment, a public accusaton; an obstruction or hindrance, but this latter sense is obsolete: impediment is used for opposition, obstruction, or hindrance: impede, to hinder.

They bring one that was deaf, and had in impediment in his spec h. Mark vii. 32.

Each door he opened without any breach ; There was no bar to stop, nor foe him to impeach.

Spenser. What impediments there are to hinder it, and

which were the speediest way to remove them. Hooker.

But for my tears,

The moist impediments unto my speech,

I had forestalled this dear and deep rebuke. Shakspeare.

The king, provoked to it by the queen, Devised impeachments to imprison him.

Id. Richard III.

648

Why, what an intricate impeach is this ! If here you housed him, here he would have been ;

If he were mad, he would not plead so coldly.

Shakspeare.

And soon

In order, quit of all impediment ; Instant without disturb they took alarm

And onward move embattled.

Milton. Paradise Lost. The minds of beasts grudge not at their bodies comfort, nor are their senses letted from enjoying their objects : we have the *impediments* of honour, and the torments of conscience. Sidney.

Had God omitted by positive laws to give religion to the world, the wisdom of his providence had been Grew. impeachable.

They were both impeached by a house of commons. Addison.

Great dissentions were kindled between the nobles and commons on account of Coriolanus, whom the latter had impeached. Swift.

The consequences of Coriolanus's impeachment had like to have been fatal to their state. Id.

All the forces are mustered to impede its passage. Decay of Piety.

Suspicion is a heavy armour, and

With its own weight impedes more than it protects. Byron.

IMPEARL,' v. a. In and pearl. To form in resemblance of pearls; to decorate as with pearls.

Innumerable as the stars of night,

Or stars of morning, dewdrops, which the sun Impearls on every leaf, and every flower. Milton.

IMPEC'CABLE, adj.) Fr. impeccable, im-IMPECCABIL'ITY, n. s. § peccabilité ; Lat. in and pecco. Exempt from the possibility of sinning: strictly applicable to the deity alone.

That man pretends he never commits any act prohibited by the word of God, and then that were a rare charm to render him impeccable, or that is the means of consecrating every sin of his.

Hammond on Fundamentals. Infallibility and impeccability are two of his attributes. Pope.

To drive IMPEL, v. a. 2 Lat. impello. IMPEL'LENT, n. s. Son towards a point; to urge forwards; to press on: impellent, an impulsive power; a power that drives forward.

How such a variety of motions should be regularly managed, in such a wilderness of passages, by mere blind impellents and material conveyances, I have not Glanville. the least conjecture.

So Mirrah's mind, impelled on either side,

Takes every bent, but cannot long abide. Druden. The surge impelled me on a craggy coast. Pope. Propitious gales

Attend thy voyage, and impel thy sails.

Id. Odysscy.

IMP

Such the perfect hand

That poised impels and rules the steady whole. Thomson.

And was of yor

Patron or tyrant as the changing mood

Of petty power impelled, of those who wore The wreath which Dante's brow alone had worn before. Byron, Childe Harold.

IMPEND' v.n. Latin impendeo. To (hang over; to be at hand; IMPEN'DENT, adj. IMPEN'DENCE, n. s. fo press nearly; a state IMPEN'DING, part. for near approach : in its figurative meaning, generally used in an ill sense.

Good sometimes is not safe to be attempted, by reason of the impendence of a greater sensible evil

Hale

If the evil feared or *impendent* he a greater sensible evil than the good, it over-rules the appetite to aversation. Id.

Dreadful in arms, on Landen's glorious plain Place Ormond's duke : impendent in the air Let this keen sabre, comet-like appear. Prior.

No story I unfold of publick woes,

Nor bear advices of impending foes.

Pope's Odyssey.

Destruction sure over all your heads impends; Prpe. Ulysses comes, and death his steps attends.

The forest deepens round,

And more gigantic still the impending trees

Stretch their extravagant arms athwart the gloom. Armstrong.

Nought

Could urge the prince thy kinsman to require Thus much from thee, but some impending danger. Byron. Sardanapalus.

IMPENETRABIL'ITY, n.s.

Fr. impenetrabilite ; Lat. in and

IMPEN'ETRABLY, adv. penetro. The quality of not being pierceable or entered by external force : impervious ; insusceptible of intellectual impression; not to be reformed or moved; with hardness to a degree incapable of impression; not to be wrought upon by entreaty.

It is the most impenetrable cur That ever kept with men. -Let him alone ;

IMPEN'ETRABLE, adj.

I'll follow him no more with bootless prayers.

Shakspeare.

Some will never believe a proposition in divinity, if any thing can be said against it : they will be credulous in all affairs of life, but impenetrable by a ser-Taylor. mon of the gospel.

Three of adamantine rock, Impenetrable, impaled with circling fire Yet unconsumed. Milton's Paradise Lost.

Deep into some thick covert would I run, Impenetrable to the stars or sun. Dryden.

All bodies, so far as experience reaches, are either hard, or may be hardened; and we have no other evidence of universal impenetrability, besides a large experience, without an experimental exception.

Newton's Opticks.

Blunt the sense, and fit it for a skull Of solid proof, impenetrably dull. Pope.

O might I here

In solitude like savage, in some glade Obscured, where highest woods impenetrable To star or sun-light, spread their umbrage broad Byron. And brown as evening.

-649

IMPEN'ITENCY, n.s. IMPEN'ITENCE, n. s. IMPEN'ITENT, adj. IMPEN'ITENT, adj.

IMPENTENCE, *n. s.* IMPENTENCE, *adj.* IMPENTITENCE, *adj.* IMPENTITENCE, *adv.* duracy; want of represe for crimes; disregard of God's threaten-

morse for crimes; disregard of God's threatenings against sin: negligent of the duty of repentance; without sorrow for evil doings.

Our Lord in anger hath granted some impenitent mcn's request; as, on the other side, the apostle's suit he hath of favour and mercy not granted. Hooker.

a

They died Impenitent, and left a race behind

Like to themselves.

Where one man ever comes to repent, a thousand end their days in final *impenitence*. South.

He will advance from one degree of wickedness and *impenitence* to another, 'till at last he becomes hardened without remorse. Rogers.

When the reward of penitents, and punishment of impenitents, is once assented to as true, 'tis impossible but the mind of man should wish for the one, and have dislike to the other. Itamnond.

What crowds of these, impenitently bold,

In sounds and jingling syllables grown old, Still run on poets !

Pope.

Milton.

IMPEN'NOUS, *adj.* Latin *in* and *penna*. Wanting wings. This word is convenient, but, I think, not used.

It is generally received an earwigg hath no wings, and is reckoned amongst *impennous* insects; but he that shall, with a needle, put aside the short and sheathy cases on their back, may draw forth two wings, larger than in many flies, Broune.

IM'PERATE, adj. IMPER'ATIVE, adj. IMPER'ATIVELY, adv. Fr. imperatif; Lat. imperatus. Done voluntarily; done by the direction of the mind. Imperative, commanding, expressive of command.

Those natural and involuntary actings are not done by deliberation, yet they are done by the energy of the soul and instrumentality of the spirits, as well as those *imperate* acts, wherein we see the empire of the soul. Hale.

The verb is formed in a different manner, to signify the intention of commanding, forbidding, allowing, disallowing, intreating; which likewise, from the principal use of it, is called the *imperative* mood.

Clarke's Latin Grammar.

The IMPERATIVE is one of the moods of a verb, used when we would command, intreat, or advise. In the Latin and Greek languages this mood has a peculiar termination to distinguish it, doce or doceto, teach; lege or legito, read, &cc., and not only so, but the termination varies, according as we address one or more persons, as audi and audite; areitw, areitwy, areitwoav, &cc.

IMPERATOR, Latin, i. e. commander, in Roman antiquity, a tide of honor conferred on v.ctorious generals by their armies, and afterwards confirmed by the senate. Though originally no more than a military title in the republican armies, yet upon the degeneracy of the Roman republic, and assumption of the supreme power by Cæsar and Augustus, it was used to express the most unlimited despotism, and a rank superior to that of king. Hence the origin of emperor.

IMPERATORIA, masterwort, a genus of the digynia order, and pentandria class of plants: natural order forty-fifth, umbellatæ. The fruit is roundish, compressed in the middle, gibbous, and surrounded with a border; the petals are inflexoemarginated. There is only one species, viz.

I. ostruthium, a native of the Austrian and Styrian Alps and other mountainous places of Italy. Lightfoot informs us, that he found it in several places on the banks of the Clyde in Scotland; but whether it be indigenous is uncer-tain. The root is as thick as a man's thumb, running in the ground; it is fleshy, aromatic, and has a strong acrid taste, biting the tongue like pellitory of Spain; the leaves arise immediately from the root ; they have long foot-stalks, dividing into three very short ones at the top, each sustaining a trilobate leaf, indented on the border. The foot-stalks are deeply channelled, and, when broken, emit a rank odor. The flower-stalks rise about two feet high, dividing into two or three branches, each terminated by a pretty large umber of white flowers, whose petals are split; these are succeeded by oval compressed seeds, or by parting the roots in autumn. It thrives best in a shady situation. The root has a flower similar to that of angelica, and is esteemed a good sudorific.

IMPERCEP'TIBLE, adj. IMPERCEP'TIBLE, adj. MPFRCEP'TIBLY, adv. be discovered or perceived ; small ; subtle ; quick or slow, so as to elude observation : the quality of eluding observation.

Some things are in their nature *imperceptible* by our sense; yea, and the more refined parts of material existence, which, by reason of their subtilty, escape our perception. Hale.

Many excellent things there are in nature, which, by reason of their subtility and *imperceptibleness* to us, are not so much as within any of our faculties to apprehend. *Id.*

In the sudden changes of his subject with almost imperceptible connections, the Theban poet is his master. Dryden.

Upon reading of a fable we are made to believe we advise ourselves : the moral insinuates itself *imperceptibly*, we are taught by surprize, and become wiser and better unawares. Addison.

IMPER'FECT, adj. IMPER'FECTION, n.s. IMPER'FECTLY, adv. Tot absolutely finished; frail; not entirely good. Imperfection, is either physical or moral defect; a failure. Imperfectly, not thoroughly finished or rendered complete.

For, certes, Jesu Crist is entirely all good; in him is not *imperfection*; and therefore he forgeveth all parfitly, or elles never a dele.

Chaucer. The Persones Tale.

Laws, as all other things human, are many times full of *imperfection*; and that which is supposed behoveful unto men, proveth oftentimes most pernicious. *Hooker*.

Something he left *imperfect* in the state, Which, since his coming forth, is thought of, Which brought the kingdom so much fear and danger, That his return was most required. Shakspeare. IMP

Opinion is a light, vain, crude, and *imperfect* thing, settled in the imagination; but never arriving at the understanding, there to obtain the tincture of reason. Ben Jonson.

A marcor is either *imperfect*, tending to a greater withering, which is curable; or perfect, that is, an entire wasting of the body, excluding all cure.

Harvey on Consumptions.

His creating hand

Nothing imperfect or deficient left

Of all that he created, much less man

Or aught that might his happy state secure, Secure from outward force.

Milton's Paradise Lost.

The ancients were *imperfect* in the doctrine of meteors, by their ignorance of gunpowder and fireworks.

Browne. The still-born sounds upon the palate hung,

And died imperfect on the faltering tongue.

Dryden.

Imperfections would not be half so much taken notice of, if vanity did not make proclamation of them. $L^2Estrange.$

As obscure and *imperfect* ideas often involve our reason, so do dubious words puzzle men. Locke.

Should sinking nations summon you away,

Maria's love might justify your stay ;

Imperfectly the many vows are paid,

Which for your safety to the gods were made.

Stepney.

The world is more apt to censure than applaud, and himself fuller of *imperfections* than virtues. Addison's Spectutor.

That his taste for the true pathetic was imperfect, too manifestly appears, from the general tenor of his translations, as well as tragedies. Beattie.

IMPERFECT TENSE, in grammar, a tense that denotes some preterite case, or denotes the thing to be at that time present, and not quite finished; as scribebam, I was writing.

IMPER'FORABLE, *adj.* Lat. *in* and *pcr*-IMPER'FORATE, *adj. foro.* Not to be bored or pierced through ; without an orifice.

Sometimes children are born *imperforate*; in which case a small puncture, dressed with a tent, effects the cure. Sharp.

IMPE'RIAL, adj. IMPE'RIALIST, n s. IMPE'RIOUSLY, ady. IMPE'RIOUSLY, adv. IMPE'RIOUSLY, s. no.
Imperialist, one belonging to an emperor. Imperious, tyrannical; haughty; arrogant; powerful; overbearing. Imperiously, in an insolent or arrogant manner. Imperiousness, the air of command or authority.

If it be your proud will

To show the power of your imperious eyes.

Spenser.

The imperialists imputed the cause of so shameful a flight unto the Venetians. Knolles's History.

This *imperious* man will work us all From princes into pages.

Shakspeare. Henry VIII. My due from the is this imperial crown, Which, as immediate from thy place and blood, Derives itself to me. Id. Henry IV. IMP

Who's there, that knocketh so imperiously ?

Shakspeare.

The' imperial flower his neck with pearl attires; The lily high, her silver grogram rears.

Fletcher's Purple Island.

Who can abide, that, against their own doctors, six whole books should, by their fatherhoods of Trent, be under pain of a curse *imperiously* obtruded upon God and his church? Hall.

On such day

As Heaven's great year brings forth, the' empyreal host

Of angels, by imperial summons called,

Innumerable before the' Almighty's throne

Forthwith from all the ends of Heaven appeared,

Under their hierarchs, in order bright.

Milton's Paradise Lost.

So would he use his *imperiousness*, that we had a delightful fear and awe, which made us loth to lose our hopes. Sidney.

He is an *imperious* dictator of the principles of vice, and impatient of all contradiction. More.

A man, by a vast and *imperious* mind, and a heart large as the sand upon the sea shore, could command all the knowledge of nature and art. *Tillotson*.

The main body of the marching foe

Against the' imperial palace is designed.

Dryden.

How much I suffered, and how long I strove Against the' assaults of this *imperious* love! Id.

Imperiousness and severity is but an ill way of treating men, who have reason of their own to guide them. Locke.

It is not to insult and domineer, to look disdainfully, and revile *imperiously*, that procures an esteem from any one. South,

The sage transported at the approaching hour, Imperiously thrice thundered on the floor! Garth.

O death! I stretch my view; what visions rise! What triumphs! toils *imperial*! arts divine. Young.

And beauteous Greece ;

And the great queen of earth, imperial Rome. Dyer's Ruins of Rome.

Italy !

Time, which hath wronged thee with ten thousand rents

Of thine imperial garment, shall deny,

And hath denied, to every other sky,

Spirits which soar from ruin. Byron. Childe Harold. What? thus suspected—with the sword slung o'er us

But by a single hair, and that still wavering

To be blown down by his imperious breath,

Which spared us-why, I know not.

Id. Sardanapalus.

IMPERIAL DIET. See DIET.

IMPERIALI (John Baptist), a celebrated physician, of a noble family, born at Vicenza, in 1568. He was professor of philosophy and physic at Padua; and composed several esteemed works in prose and verse, particularly Exercitationes Exoticæ; Venet. 1640; 4to. He died in 1623.

IMPER'ISHABLE, *adj.* Fr. *imperissable*; Lat. *in* and *perco*. In and perish. Not to be destroyed.

We find this our empyreal form

Incapable of mortal injury,

Imperishable; and, though pierced with wound, Soon closing, and by native vigour healed. Milton.

The high, the mountain majesty of worth Should be, and shall, survivor of its woe, And from its immortality look forth In the sun's face, like yonder Alpine snow,-Imperishably pure, beyond all things below. Byron. Childe Harold.

IMPER'SONAL, adj. Fr. impersonal; Lat. IMPER'SONALLY, adv. impersonalis. Not varied according to the persons.

Impersonals be declined throughout all moods and tenses : a verb impersonal hath no nominative case be-Accidence. fore it.

IMPERSONAL VERBS, in Latin grammar, are verbs to which the nominative of any certain person cannot be prefixed; or verbs destitute of the two first and principal persons, as decet, oportet, &c. The impersonal verbs of the active voice end in t, and those of the passive in tur; they are conjugated through the third person singular of almost all the tenses and moods: they want the imperative, instead of which the present of the subjunctive is used; as pæniteat, pugnetur, &c.

IMPERSUA'SIBLE, adj. Lat. in and persuasibilis. Not to be moved by persuasion.

Every pious person ought to be a Noah, a preacher of righteousness; and if it be his fortune to have as impersuasible an auditory, if he cannot avert the deluge, it will yet deliver his own soul, if he cannot Decay of Piety. benefit other men's.

IMPERTINENCE, n. s.) Fr. imperument, from Lat. in and IMPER'TINENT, adj. & n.s. furthermore f which belongs not That IMPER'TINENTLY. to the present, or has no present weight ; trifling ; importunate; meddling: impertinence, folly; intrusion : impertinent, a triffer, or intruder : impertinently, troublesomely; officiously; intrusively.

The law of angels we cannot judge altogether impertinent unto the affairs of the church of God.

Hooker. O, matter and impertinency mixt, Reason and madness !

Shakspeare. Kiny Lear.

Some, though they lead a single life, yet their thoughts do end with themselves, and account future times impertinences. Bacon.

It will be said I handle an art no way suitable to my employments or fortune, and so stand charged with intrusion and impertinency

Wotton's Architecture.

I have had joy given me as preposterously, and as impertinently, as they give it to men who marry where Suckling. they do not love.

The contemplation of things that are impertinent to us, and do not concern us, are but a more specious Tillotson. idleness.

Governours would have enough to do to trouble their heads with the politicks of every meddling L'Estrange. officious impertinent.

I envy your felicity, delivered from the gilded impertinences of life, to enjoy the moments of a solid Evelun. contentment.

Why will any man be so impertinently officious as to tell me all this is only fancy? If it is a dream, let me Addison. enjoy it.

Nothing is more easy than to represent as impertinencies any parts of learning, that have no immediate relation to the happiness or convenience of mankind. Id.

There are many subtle impertinencies learnt in the schools, and many painful trifles, even among the mathematical theorems and problems. Watts.

IMP

Adieu for him

The dull engagements of the bustling world ! Adicu the sick impertinence of praise ! Akenside.

IMPERTRANSIBIL'ITY, n. s. Lat. in and pertranseo. Impossibility to be passed through.

I willingly declined those many ingenious reasons given by others; as of the impertransibility of eternity, and impossibility therein to attain to the present limit of antecedent ages. Hale.

IMPER'VIOUS, adj.) Lat. impervius, from IMPER'VIOUSNESS, n. s. § in per via. Impassable; impenetrable; inaccessible; the state of not admitting any passage.

Let the difficulty of passing back

Stay his return, perhaps, over this gulf

Impassable, impervious ; let us try

To found a path from hell to that new world.

Milton.

We may thence discern of how close a texture glass is, since so very thin a film proved so impervious to the air, that it was forced to break the glass to free Boule. itself.

The cause of reflection is not the impinging of light on the solid or impervious parts of bodies.

Newton's Opticks.

A great many vessels are, in this state, impervious Arbuthnot. by the fluids.

From the damp earth impervious vapours rise, Increase the darkness, and involve the skies. Pope.

IMPETIG'INOUS, adj. From Lat. impetigo. Scurfy; covered with small scabs.

IM'PETRABLE, adj. Fr. impetror, Impetror, Possible to She obtained by en-IM PETRATION, n. s. treaty: to obtain by solicitation: the act of obtaining by prayer.

The blessed sacrament is the mystery of the death of Christ, and the application of his blood, which was shed for the remission of sins, and is the great means of impetration, and the meritorious cause of it.

Taylor.

IMPETUOS'ITY, n. s. Fr. impetus. Vio-Slent; forcible; vehe-IMPET'UOUSLY, adv. IMPET'UOUSNESS, n. s. sionate: fury; vehe-IM'PETUS, n. s.

mence of passion: impetus, violent effort; or violent tendency to any point : applicable to mer. and things.

I will set upon Aguecheek a notable report of valour, and drive the gentleman into a most hideous opinion of his rage, skill, fury, and impetuosity.

Shakspeare. Twelfth Night. The mind gives not only licence, but incitation to the other passions, to take their freest range, and act Decay of Piety. with the utmost impetuosity.

I wish all words of rage might vanish in that breath that utters them; that, as they resemble the wind in fury and impetuousness, so they might in transientness. Id.

The whole intrigue was contrived by the duke, and so vielently pursued by his spirit and impetuosity. Clarcndon.

Down rushed the rain

Impetaous, and continued till the earth

Milton. No more was seen. They view the windings of the heary Nar;

Through rocks and woods impetuously he glides While froth and foam the fretting surface hides.

Addison.

The king, 'tis true, is noble, but impetuous. Rowe. Why did not they continue their descent 'till they were continuous to the sun, whither both mutual attraction and impetus carried them? Bentley's Sermons.

Blind and impetuous in its fond pursuits, Leaves the grey-headed reason far behind.

Thomson.

To check the' impetuous all-involving tide

Of human woes, how impotent thy strife !

High o'er thy mounds devouring surges ride,

Nor reck thy baffled toils, or lavished life. Beattie. Judgment of Puris.

IMPIERCE'ABLE, adj. In and pierce. Impenetrable; not to be pierced.

Exceeding rage inflamed the furious beast ; For never felt his impierceable breast So wondrous force from hand of living wight.

Spenser. IMPI'ETY, n. s. Fr. impicté ; Lat. impictas. IM'PIOUS, adj. Irreverence towards the M'PIOUSLY, adv. Supreme Being; an act of wickedness, expressive of irreligion: in this sense it has a plural. Impious, wicked; ungodly; profane.

That Scripture standeth not the church of God in any stead to direct, but may be let pass as needless to be consulted with, we judge it prophane, impious, and irreligious to think. Hooker.

If they die unprovided, no more is the king guilty of those impieties for which they are now visited. Shabeneare

	Snukspeare.
Can Juno such <i>impieties</i> approve?	Denham.
Cease then this impious rage.	Milton.
Then lowd Anchemalus he laid in due	

Then lewd Auchemolus he laid in dust, Who stained his stepdame's bed with impious lust.

Dryden.

Shame and reproach is generally the portion of the impious and irreligious. South.

When vice prevails, and impious men bear sway, The post of honour is a private station. Addison.

The Roman wit, who impiously divides

His hero and his gods to different sides,

Granville. I would condemn.

They, impious, dared to prey On herds devoted to the god of day. Pope.

We have a melancholy prospect of the state of our religion; such amazing impieties can be equalled by nothing, but by those cities consumed of old by fire.

Swift.

O ye cold-hearted frozen formalists ! On such a theme, 'tis impious to be calm. Young.

'Twas not enough By subtle fraud to snatch a single life !

Puny impiety! Porteus's Death.

Alas! thou sinnest now, my Cain ; thy words Sound impious in mine ears. Byron.

IMPIG'NORATE, v.a. Lat. in and pig-IMPIGNORATION, n. s. Snus. To pawn or pledge : the act of pawning, or putting in pledge.

To IMPINGE', v. n. Lat. impingo. To fall against; to strike against; to clash with.

Things are reserved in the memory by some corporeal exuviæ and material images, which, having impinged on the common sense, rebound thence into some vacant cells of the brain. Glanville.

The cause of reflection is not the impinging of light on the solid or impervious parts of bodies. Newton's Opticks.

IMPING'UATE, v. a. Lat. in and pinguis. To fatten; to make fat.

652

Frictions also do more fill and impinguate the body than exercise ; for that in frictions the inward parts are at rest. Bacon.

IMPLACABIL/ITY, n. s. Lat. in placabilis. Lat. in and Not) to be pacified; IMPLA'CABLY, adv. inexorable; malicious: implacability, unappeaseable malice: implacably is used once by Dryden in a kind of mixed sense of a tyrant's love.

His incensement is so implacable, that satisfaction can be none but by pangs of death. Shakspeare.

I see thou art implacable, more deaf To prayers than winds and seas. Milton.

I love,

And 'tis below my greatness to disown it : Love thee *implacably*, yet hate thee too. Dryden.

The French are the most implacable and the most dangerous enemies of the British nation. Addison.

Vain thought! to hide them from the general scorn That haunts and dogs them like an injured ghost Implacable. Blair's Grave.

IMPLANT,' v. a. IMPLANT, v. a. Lat. in and planto. IMPLANTA'TION, n. s. To infix; to insert; to place; to engraft; to settle: to set, or sow : the act of setting or planting.

See, Father! what first fruits on earth are sprung From thy implanted grace in man.

Milton. Paradise Lost.

How can you him unworthy then decree, In whose chief part your worths implanted be?

Sidney.

No need of public sanctions this to bind, Which Nature has implanted in the mind.

Dryden. God, having endowed man with faculties of knowing, was no more obliged to implant those innate notions in his mind, than that, having given him reason, hands, and materials, he should build him bridges. Locke.

There grew to the outside of the arytenoides another cartilage, capable of motion by the help of some muscles that were *implanted* in it. Ray.

IMPLA'USIBLE, adj. In and plausible. Not specious; not likely to seduce or persuade.

Nothing can better improve political school-boys than the art of making plausible or implausible harangues against the very opinion for which they resolve to determine. Swift.

IM'PLEMENT, n. s. Lat. impleo. Some-IMPLE'TION, n. s. thing that fills up va-cancy or supplies wants; tools of manufacture; vessels of a kitchen: impletion, the act of filling,

or the state of being full. Unto life many implements are necessary; more, if we seek such a life as hath in it joy, comfort, delight,

and pleasure. Hooker. Theophrastus conceiveth, upon a plentiful impletion,

there may succeed a disruption of the matrix. Browne.

Wood hath coined seventeen thousand pounds, and nath his tools and implements to coin six times as much. Swift.

Proud Esculapius' son

Where are thy boasted implements of art

And all thy well crammed magazines of health? Blair's Grave.

IM'PLEX, adj. implexus, implico. Intri-Fr. impliquer; Lat. IM'PLICATE, v. a. IMPLICATION, n. s.) cate; entangled: opposed

to simple: to embarrass; to involve; to infold and perplex : implication, an inference, not expressed; an involution, or entanglement.

The ingredients of saltpetro do so mutually *implicate* and hinder each other, that the concrete acts but very languidly. Boyle.

Three principal causes of firmness are the grossness, the quiet contact, and the *implication* of the component parts. Id.

Though civil causes, according to some men, are of less moment than criminal, yet the doctors are, by implication, of a different opinion. Ayliffe's Parergon.

Every poem is either simple or *implex*: it is called simple when there is no change of fortune in it; *implex* when the fortune of the chief actor changes from bad \Im good, or from good to bad. Spectator.

IMPLIC'IT, adj. Fr. implicite; Lat. im-IMPLIC'ITLY, adv. § plicitus. Entangled; enfolded; but this sense is rare: inferred, not expressed; entire; resting upon another; connected with another over which that which is connected to it has no power; trusting without reserve or examination: implicitly, with unreserved confidence or obedience.

There be false peaces or unities, when the peace is grounded but upon an *implicit* ignorance; for all colours will agree in the dark. Bacon.

No longer by implicit faith we err,

Whilst every man's his own interpreter. Derham. My blushing muse with conscious fear retires,

And whom they like implicitly admires. Roscommon.

In the first establishments of speech there was an *implicit* compact, founded upon common consent, that such and such words should be signs, whereby they would express their thoughts one to another. South.

We implicitly follow in the track in which they lead us, and comfort ourselves with this poor reflection, that we shall fare as well as those that go before us. Rogers.

Learn not to dispute the methods of his providence; but humbly and *implicitly* to acquiesce in and adore them. Atterbury.

The divine inspection into the affairs of the world doth necessarily follow from the nature and being of God; and he that denies this, doth *implicitly* deny his existence: he may acknowledge what he will with his mouth but in his heart he hath said there is no God. Bentley.

In his woolly ficece I cling *implicit*.

The humble shrub,

And bush with frizzled hair implicit. Thomson.

Pope.

Bliss ! sublunary bliss ! proud words and vain ! Implicit treason to divine decree ! Young.

No knife had curbed the rambling sprays, No hand had wove the *implicit* maze. Beattie.

We have the *implicit* order of the Guinta

To await their coming here, and join them in Their office. Byron. The Two Foscari.

IMPLORE', v. a. & n. s. Fr. implorer; IMPLO'RER, n. s. Lat. imploro. To call upon in supplication; to solicit; to ask or reg: the act of begging or intreaty: implorer, solicitor; a petitioner.

Urged sore

With piercing words and pitiful implore,

Him hasty to arise. Faerie Queenc. Do not say 'tis superstition, that

I kneel, and then implore her blessing.

Shakspeare. Winter's Tale. Mere implorers of unboly suits,

Breathing, like sanctified and pious,

The better to beguile. Id. Hamlet.

They ship their oars, and crown with wine The holy goblet to the powers divine, *Imploring* all the gods that reign above.

Pope's Odyssey.

Fain to *implore* the aid of Flattery's screen, Even from thyself thy loathsome heart to hide. Beattie. Minstrel.

IMPLY', v. a. Fr. *impliquer*; Lat. *implico*. To unfold; to cover; to entangle. Not in use. To involve or comprise as a consequence or concomitant.

His courage stout,

Striving to loose the knot that fast him ties, Himself in straighter bends too rash *implies*.

Faerie Queene.

Id.

And Phœbus flying so most shameful sight, His blushing face in foggy cloud *implies*. Id. That it was in use among the Greeks, the word triclinium *implieth*. Browne's Vulgar Errours.

Bows the strength of brawny arms imply,

Emblems of valour, and of victory. Dryden. Where a malicious act is proved, a malicious intention is implied. Sherlock.

IMPOI'SON, v. a. Fr. empoisonner. It might be written empoison. To corrupt with poison; to kill with poison; but this is rare.

One doth not know

How much an ill word doth impoison liking. Shakspeare.

A man by his own arms *impoisoned*, And with his charity slain.

IMPO'LARILY, *adv.* In and polar. Not according to the direction of the poles. Little used.

Being *impolarily* adjoined into a more vigorous loadstone, it will, in a short time, exchange its poles.

IMPOL/ITICALLY, adv.~	In and politic.
IMPOL'ITICLY, adv.	(Imprudent; in-
	discreet; void of
IMPOL'ITIC, adj.	art or forecast.

He that exhorteth to beware of an enemy's policy, doth not give counsel to be *impolitick*; but rather to use all prudent foresight and circumspection, lest our simplicity be overreached by cunning slights. *Hooker*.

IMPON'DEROUS, *adj.* In and ponderous. Void of perceptible weight.

It produces visible and real effects by imponderous and invisible emissions. Browne's Vulgar Errours.

IMPOROS'ITY, n. s. In and porous. IMPO'ROUS, adj. Absence of interstices; compactness: close of texture; com-

pletely solid. The porosity or *imporosity* betwixt the tangible parts, and the greatness or smallness of the pores.

Bacon.

It has its earthly and salinous parts so exactly resolved, that its body is left *imporous*, and not discreted by atomical terminations.

Browne's Vulgar Errours.

If atoms should descend plump down with equal velocity, being all perfectly solid and *imporous*, they would never the one overtake the other.

Ray on the Creation.

IMPOR'T, v. a. & n. s. Impor'table, adj. Impor'tance, n. s. Impor'tant, adj. Impor'tation, n. s. Impor'ters, a. s. Impor'tless, adj.

Fr. importer; Lat. importo. To carry into any country from abroad; to imply; to produce a consequence; to be of moment, weight or consequence: import and importance, moment; tendency; consequence; importunity; but this is only used by Shakspeare. Any thing imported from abroad is called an import: important, of weight or consequence: importation, the act of bringing from abroad : importer, the agent by whom imports are made: importless, trifling; of no moment. Importable is accented by Spenser on the first syllable, and signifies insupportable; not to be endured.

God for his manace him so sore smote, * * * * * * * * * * * * *

Thatte his peines weren importable.

Chaucer. The Monkes Tale. Both at once him charge on either side,

With hideous strekes and importable power,

That forced him his ground to traverse wide,

And wisely watch to ward that deadly stour. Faerie Qaeene.

He fiercely at him flew,

And with *important* outrage him assailed; Who soon prepared to field, his sword forth drew, And him with equal valour countervailed. Id.

Himself not only comprehended all our necessities, but in such sort also framed every petition as might most naturally serve for many; and doth, though not always require, yet always *import* a multitude of speakers together. Hooker.

The name of discipline *importeth* not as they would fain have it construed; but the self same thing it signifieth, which the name of doctrine doth. Id.

Something he left imperfect in the state,

Which since his coming forth is thought of, which *Imports* the kingdom so much fear and danger,

That his return was most required. Shakspeare. Maria writ

The letter at Sir Toby's great *importance*; In recompence whereof he hath married her.

Id.

Great France

My mourning and *important* tears hath pitied. Id. What occasion of *import*

Hath all so long detained you from your wife ? Id.

It had been pity you should have been put together with so mortal a purpose, as then each bore, upon importance of so slight a nature. Id.

We less expect

That matter needless, of importless burthen, Divide thy lips.

Her length of sickness, with what else more serious

Importeth thee to know, this bears.

A notable passion of wonder appeared in them; but the wisest beholder, that knew no more but seeing, could not say if the *importance* were joy or sorrow.

Id. Winter's Tale.

Id.

Id.

This question we now asked, *imported*, as that we thought this land a land of magicians. Bacon.

Let the heat be such as may keep the metal perpetually molten; for that above all *importeth* to the work. Id.

Number in armies *importeth* not much, where the people is of weak courage. *Id.*

The king's reasonable profit should not be neglected upon *importation* and exportation. Id.

This superadds treachery to the crime : 'tis the falsifying the most important trust. Decay of Piety.

It may import us in this calm to hearken more than we have done to the storms that are now raising abroad. Taylor. This to attain, whether heaven move, or carth, Imports not, if thou reckon right. Milton.

O then, what interest shall I make

To save my last important stake, When the most just have cause to quake?

re cause to quake r

Roscommon. Add to the former observations made about vegetables a third of the same import made in mineral substances. Boyle.

If I endure it, what imports it you? Dryden. Some business of import that triumph wears

You seem to go with. Dryden and Lee's Oedipus. The great important end that God designs religion for, the government of mankind, sufficiently shews the necessity of its being rooted deep in the heart, and put beyond the danger of being torn up hy any ordinary violence. South.

These mines fill the country with greater numbers of people than it would be able to bear, without the *importation* of corn from foreign parts.

Addison.

The emperor has forbidden the *importation* of their manufactures into any part of the empire.

Id. on Italy.

When there is any dispute, the judge ought to appoint the sum according to the eloquence and ability of the advocate, and iu proportion to the import of the cause. Ayliffe.

Examine how the fashionable practice of the world can be reconciled to the *important* doctrine of our religion. Rogers.

For Elis I would sail with utmost speed,

T' import twelve mares, which there luxurious feed. Pope,

Thy own importance know,

Nor bound thy narrow views to things below. Id. It is impossible to limit the quantity that shall be brought in, especially if the *importers* of it have so sure a market as the Exchequer. Swift.

Of what seems

A trifle, a mere nothing by itself, In some nice situations turns the scale

Of Fate, and rules the most important actions.

Thomson.

Joy is an import ; joy is an exchange ;

Joy flies monopolists; it calls for two : ,

Rich fruit ! Heaven planted ! never plucked by one. Young.

It is of *importance* to observe, that, whatever is easy and agreeable to the organs of speech, always sounds grateful to the ear. Blair's Lectures.

Drink and be mad then, 'tis your country bids; Gloriously drunk obey the' important call :

Her cause demands the assistance of your throats, Ye all can swallow, and she asks no more. Couper.

Now shall this rule be allowed to every science, and not to the most *important* of all sciences—the science of life and manners? Beattie.

The good old gentleman had been detained By winds and waves, and some *important* captures;

And, in the hope of more at sea remained, Although a squall or two had damped his raptures.

Byron. Don Juan.

IMPOR'TUNATE, adj. IMPOR'TUNATENESS, n. s. IMPOR'TUNATELY, adv. IMPORTUNE', v. a. & adj. IMPORTUNE'LY, adv. IMPORTUNE'LY, a. s.

Fr. importuner; Latin importunus. Unseasonable solicitations; incessant petition. Importune, to teaze;

harass; or molest. Importune, constantly recurring; troublesome; vexatious; unseasonable; coming at a wrong time. Importunely, troublesomely; incessantly. Importunity, incessant solicitation.

IMP

And for he n'ill be *importune* Unto no wight, ne onerous, Nor of hire godesse covetous.

Chaucer. Romannt of the Rose. And the' armies of their creatures all, and some Do serve to them, and with *importune* might

War against us the vassals of their will. Spenser. But the sage wizard telles (as she has redd)

That it importunes death and doleful diery hedd. Id. Faerie Queenc.

If fortuned, whilest she stifly strove,

And the wide sea importuned long space

With shrilling shrickes Proteus abrode did rove,

Along the fiery waves driving his finny drove. Id. The palmer bent his ear unto the noise,

To weet who called so *importunely*:

Again he heard a more efforced voice,

That bade him come in haste.

Overcome with the *importunity* of his wife, a woman of a haughty spirit, he altered his former purpose. Knolles.

Against all sense you do importune her. Shakspeare.

I was in debt to my *importunate* business, but he would not hear my excuse. Id.

Henry, king of England, needed not to have bestowed such great sums, nor so to have busied himself with *importune* and incessant labour, to compass my death and ruin, if I had been a feigned person.

Bacon's Henry VII.

Id.

If he espied any lewd gaiety in his fellow-servants, his master should straightways know it, and not rest free from *importuning*, until the fellow had put away his fault. *Carew*.

Their pertinacity is such, that when you drive them out of one form, they assume another; and are so *importunately* troublesome, as makes many think it impossible to be freed from them. Duppa.

The constitutions that the apostles made concerning deacons and widows, are, with much *importunity*, but very *importunely* urged by the disciplinarians.

Sanderson.

Thrice I deluded her, and turned to sport Herimportunity. Milton's Agonistes.

No fair to thine

Equivalent, or second ' which compelled Me thus, though *importune* perhaps, to come

And gaze and worship thee. Milton. The same airs which some eutertain with most

delightful transports to others are importune. Glanville's Scepsis.

The bloom of heauty other years demands,

Nor will be gathered by such withered hands; You importune it with a false desire. Dryden.

Every one hath experimented this troublesome intrusion of some frisking ideas, which thus *importune* the understanding, and hinder it from being employed. Locke.

A rule restrains the most *importunate* appetites of our nature. Rogers.

We have been obliged to hire troops from several princes of the empire, whose ministers and residents here perpetually *importuned* the court with unreasonable demands. Swift.

IMPOSE', v. a. & n. s.	Fr. imposer, impo-
IMPOSE'ABLE, adj.	sition, imposte, impos-
IMPO'SER, n. s.	teur. Lat. in and
IMPOSITION, n. s.	pono. Imposition, to
IM'POST, n. s.	Slay on as a burden;
IM'POSTS, n. s.	a penalty: 10 enjoin as
IMPOS'TOR, n. s.	a duty; to fix on, or
Toon and the	1 1 1 1 1 1 1 1

IMPOS'TURE, n. s. J impute to; to obtrude fallaciously; to deceive, when used with on: among printers, to put the pages on the stone,

and fit on the chase in order to carry the form s to press. Impose, a command or injunction. Imposeable, to be laid as obligatory on any one. Imposer, one who enjoins. Imposition, the act of laying any thing on another; of annexing; injunction; constraint; oppression; cheat; imposture; a supernumerary exercise enjoined on scholars as a punishment. Impost, a tax; a toll; a custom paid: in architecture, that part of a pillar, in vaults and arches, on which the weight of the whole building lieth. Impostor, one who cheats by a fictitious character. Imposture, a fraud, cheat, or deception, committed by giving to persons or things a false character.

It shall not be lawful to impose toll upon them.

Ezra vii.

Yet greatly did the Beast repine at those Straunge hands, whose like till then he never bore, Ne ever any durst till then *impose*.

Spenser's Faeric Queene. There was a thorough way made by the sword for the *imposing* of the laws upon them. Id. on Ireland.

What good or evil is there under the sun, what action correspondent or repugnant unto the law which God hath *imposed* upon his creatures, but in or **upon** it God doth work, according to the law which himself hath eternally purposed to keep. *Hooker*.

According to your ladyship's impose

I am thus early come. Shakspeare. If a son do fall into a lewd action, the imputation, by your rule, should be imposed upon his father. Id.

The first *imposition* of names was grounded, among all nations, upon future good hope conceived of children. *Canidea*.

Taxes and *imposts* upon merchants do seldom good to the king's revenue; for that that he wins in the hundred, he loseth in the shire. Bacon.

From imposition of strict laws, to free

Acceptance of large grace ; from servile fear

To filial ; works of law, to works of faith. Milton.

This cannot be allowed, except we impute that unto the first cause which we *impose* not on the second; or, what we deny unto nature, we impute unto nativity itself. Browne.

The universities' sufferings might be manifested to all nations, and the *imposers* of these oaths might repent. Walton.

Thou on the deep imposest nobler laws,

And by that justice hast removed the cause. Waller.

The *imposition* of the name is grounded only upon the predominancy of that element, whose name is ascribed to it. Boyle.

Physicians and philosephers have suffered themselves to be so far *imposed upon* as to publish chymical experiments which they never tried. Id.

Christianity hath hardly *imposed* any other laws upon us, but what are enacted in our natures, or are agreeable to the prime and fundamental laws of it.

Tillotson.

'To tyrants others have their country sold, Imposing foreign lords for foreign gold.

Dryden's Æneid.

Impose but your commands.

This hour shall bring you twenty thousand hands. Dryden,

It was neither *imposed* on me, nor so much as the subject given me by any man. Id.

Our poet thinks not fit

To impose upon you what he writes for wit. Id. The constraint of receiving and holding opinions by authority was rightly called imposition. Locke.

He that thinks the name centaur stands for some

real being, imposes on himself, and mistakes words for things. Id.

We know how successful the late usurper was, while his army believed him real in his zeal against kingship; but when they found out the *imposture*, upon his aspiring to the same himself, he was presently deserted, and never able to crown his usurped greatness with that title. South.

Shame and pain, poverty and sickness, yea death and hell itself, are but the trophies of those fatal conquests got by that grand *impostor*, the devil, over the deluded sons of men. *Id.*

They were not simply *imposeable* on any particular man, farther than he was a member of some church. Hammond.

The second part of confirmation is the prayer or benediction of the bishop, made more solemn by the *imposition* of hands. Id.

On impious realms and barbarous kings impose Thy plagues, and curse them with such ills as those. Pope.

A greater load has been laid on us than we have been able to bear, and the grossest *impositions* have been submitted to, in order to forward the dangerous designs of a faction. Swift.

Let it not be made, contrary to its own nature, the occasion of strife, a narrow spirit, and unreasonable *impositions* on the mind and practice. Watts.

Form new legends,

And fill the world with follies and *impostures*. Irene.

Fit for the model of a statuary,

A race of mere impostors, when all's done.

Byron. Don Juan.

I see the colour comes

Back to your cheek: Heaven send you strength to bear

What more may be imposed ! Id. The Two Foscari.

IMPOSITION OF HANDS, a religious ceremony, by which a bishop lays his haud or hands on the head of a person, in ordination, confirmation, or in uttering a blessing. This practice is also frequently observed by dissenters at the ordination of their ministers, when all the ministers present place their hands on the head of him whom they are ordaining, while one of them prays for a blessing on him and on his future labors. It is also used by some dissenting churches on the the reception of each member, and as a mode of invoking the blessing and Spirit of God, grounded on Heb. vi. 2. They are not, however, agreed as to the propriety of this ceremony; nor do they consider it as an essential part of ordination. Imposition of hands was a Jewish ceremony, introduced not by any divine authority, but by custom; it being the practice among those people, whenever they prayed to God, for any person to lay their hands on his head. Our Saviour observed the same custom, both when he conferred his blessing on children, and when he cured the sick; adding prayer to the cere-mony. The apostles likewise laid hands on those upon whom they bestowed the Holy Ghost. The Jewish priests observed the same custom when any one was received into their body. And the apostles themselves underwent the imposition of hands afresh when they entered upon any new undertaking. In the ancient church, imposition of hands was even practised on persons when they married, which custom the Abyssinians still observe.

IMPOS'SIBLE, adj.) Fr. impossible; Lat. IMPOSTBIL'ITY, n. s. ; impossibilis. Not to be done or attained; impracticable; the state of being not feasible; that which is beyond our power.

With men this is *impossible*; but with God all things are possible. Mat. xix. 26.

It was impossible that the state should continue quiet. 2 Mac.

Of hir delite, or joies, one of the lest

Were impossible to my wit to saie.

Chaucer. Troilus and Creseide.

For, trusteth wel, it is impossible

That any clerk wol speken good of wives,

(But-if it be of holy seintes lives)

Ne of none other woman never the mo.

Id. Prologue to the Wif of Bathcs Tale. Though men do, without offence, wish daily that the affairs, which with evil success are past, might have failen out much better; yet to pray that they may have been any other than they are, this being a manifest impossibility in itself, the rules of religion do not permit. Hooker.

Admit all these *impossibilities* and great absurdities to be possible and convenient. Whitgifte.

Let the mutinous winds

Strike the proud cedars 'gainst the fiery sun,

Murdering impossibility, to make

What cannot be, slight work.

Difficult it is, but not impossible. Chillingworth. Impossibilities! oh no, there's none,

Could I bring thy heart captive home. Cowley.

Simple Philoclea, it is the *impossibility* that doth torment me; for unlawful desires are punished after the effect of enjoying, but *impossible* desires in the desire itself. Sidney.

It is *impossible* the mind should be stopped any where in its progress in this space, how far soever it extends its thoughts. Locke.

We cannot believe it *impossible* to God to make a creature with more ways to convey into the understanding the notice of corporeal things than five. *Id.*

Those who assert the *inpossibility* of space existing without matter, must make body infinite. Id.

I my thoughts deceive

With hope of things impossible to find. Walsh. They confound difficulty with impossibility. South.

When we see a man with like passions and weakness with ourselves going before us in the paths of duty, it confutes all lazy pretences of *impossibility*. Rogers.

'Twere *impossible* for any enterprise to be lawful, if that which should legitimate it is subsequent to it.

Decay of Piety.

Shakspeare.

Is it not recommended to those who study to excel in any art or science, that they form themselves after the most perfect models, even although it be morally *impossible* for them ever to attain the perfection of these models? *Beattie.*

IMPOSSIBILITY is either physical or moral. Moral impossibility is when any thing, in its own nature, is possible, but yet is attended with such difficulties, as that, all things considered, it appears impossible. Thus it is morally impossible that a man should throw the same number with three dice 100 times successively. Physical impossibility is that which is contrary to the law of nature, and which, therefore, cannot by any means or method within our conception possibly be accomplished.

IMPOST, in law, is particularly applied to that tax which the crown receives for merchandises imported into any port or haven. IMPOSTHUMATE, v. n. & This seems IMPOSTHUMA'TION, n. s. [v. a. to have been IMPOST'HUME, n. s.

ruption from impostem, as South writes it; and impostem to have been written erroneously for apostem, Gr. $\dot{\alpha}\pi\dot{\delta}\eta\mu\alpha$, an abscess.—Johnson. These are old medicinal words now out of use. To form an abscess or cyst, containing purulent matter: the act of forming an abscess, or the state in which it is formed.

Now rotten diseases, ruptures, catarrhs, and bladders full of imposthumes, make preposterous discove-Shakspeare.

He that maketh the wound bleed inwards, endangereth malign ulcers and pernicious imposthumations. Bacon's Essays.

Humours of tongues imposthumed purged with shame are mended.

Fletcher. The Purple Island.

Fumes cannot transude through the bag of an imposthume. Harvey.

An error in the judgment is like an impostem in the head, which is always noisome, and frequently mortal. South.

The bruise imposthumated, and afterwards turned to a stinking ulcer, which made every body shy to come near her. Arbuthnot.

They would not fly that surgeon, whose lancet threatens none but the imposthumated parts.

Decay of Piety.

Fr. impotent ; Lat. IM'POTENCE, n. s. impotens; in and po-IM'POTENCY, n. s. fens. Weak; feeble; disabled by nature or IM'POTENT, adj. IM'POTENTLY, adv. disease in body or mind; without power of restraint; without power of propagation. Impotently, powerlessly; feebly.

In those porches lay a great multitude of impotent folk, of blind, halt, and withered. John v. 3.

There sat a certain man, impotent in his feet, being a cripple from his mother's womb, who never had walked. Acts xiv.

But impotence with her owne wilfull hands One of Maleger's cursed darts did take,

So ryved her trembling hart, and wicked end did make. Spenser's Facrie Queene.

We that are strong must bear the imbecility of the impotent, and not please ourselves. Hooker.

I have learned that fearful commenting

Is leden servitor to dull delay :

Delay leads impotent and pale-faced beggary. Shakspeare.

Yet wealth is impotent

To gain dominion, or to keep it gainea. Milton.

Will he, so wise, let loose at once his ire, Belike through impotence, or unaware, To give his enemies their wish, and end Thom in his anger, whom his anger saves To punish endless? Id.

The impotent poor might be relieved, and the idle forced to labour. Temple.

With jealous eyes at distance she had seen, Whispering with Jove, the silver-footed queen; Then impotent of tongue, her silence broke, Thus turbulent in rattling tone she spoke.

Yet all combined,

Drydon.

Your beauty and my impotence of mind. Id. He told beau Prim, who is thought impotent, that his mistress would not have Fim, because he is a sloven, and committed a rape. Tatler, VOL. XI.

IMP Although in dreadful whirls he hung, High on the broken wave,

I knew thou wert not slow to hear,

Nor impotent to save. Addison's Spectator.

God is a friend and a father, whose care supplies our wants, and defends our impotence, and from whose compassion in Christ we hope for eternal glory hereafter. Rogers.

Weakness, or the impotence of exercising animal motion, attends fevers. Arbuthnot.

This is not a restraint or impotency, but the royal prerogative of the most absolute king of kings; that he wills to do nothing but what he can ; and that he can do nothing which is repugnant to his divine good-Bentley.

Dulness with obscenity must prove

As hateful sure, as impotence in love.

To a mind resolved and wise

There is an impotence in misery

Which makes me smile, when all its shafts are in me. Young's Revenge.

Pope.

IMPOTENCE, in moral agency. Divines and philosophers distinguish two sorts of impotency; natural and moral. The first is a want of some physical principle, necessary to an action; or where a being is absolutely defective, or not free and at liberty to act; the second imports a want of will, and sometimes only a great difficulty; as a strong habit to the contrary, a violent passion, &c.

IMPOTENCE is a canonical disability, to avoid marriage in the spiritual court. The marriage is not void ab initio, but voidable only by sentence of separation during the life of the parties.

IMPOUND', v. a. To enclose as in a pound ; to confine or shut up in a penfold.

England

Hath taken and impounded as a stray

The king. Shakspeare. Henry V. The great care was rather how to impound the rebels, that none of them might escape, than that any doubt was made to vanquish them. Bacon.

Seeing him wander about, I took him up for a stray, and impounded him, with intention to restore him to the right owner. Dryden.

IMPOW'ER. See Empower.

IMPRAC'TICABLE, adj. ? Fr. impractica-IMPRAC'TICABLENESS, n. s. ble; in and practicable; Gr. πραγμα. Not to be performed; untractable; unmanageable; stubborn: an impossibility.

And yet this tough impracticable heart

Is governed by a dainty-fingered girl.

Rowe's Jane Shore.

Had there not been still remaining bodies, the legitimate offsprings of the antediluvian earth, 'twould have been an extravagant and impracticable undertaking to have gone about to determine any thing concerning it. Woodward.

To preach up the necessity of that which our experience tells us is utterly impracticable, were to affright mankind with the terrible prospect of universal damnation. Rogers.

I do not know a greater mark of an able minister than that of rightly adapting the several faculties of men, nor is any thing more to be lamented than the impracticableness of doing this. Swift.

IM'PRECATE, v. a. Lat. imprecor, impre-catio. To call for a Fr. imprecation; IMPRECATION, n. s. IM'PRECATORY, adj. curse, or any evil, on onc's self or others : an imprecation is a prayer, always used in a bad sense; a wish for cvil.

My mother shall the horrid furies raise

With imprecations. Chapman's Odyssey. Sir John Hotham, uncursed by any imprecation of mine, paid his own and his eldest son's heads.

King.

With *imprecations* thus he filled the air, And angry Neptune heard the unrighteous prayer.

Pope.

No light, save yon faint gleam, which shews me walls

Which never echoed but to sorrow's sounds,

The sigh of long imprisonment, the step

Of feet on which the iron clanked, the groan

Of death, the imprecation of despair.

Byron. The Two Foscari.

IMPREGN, 'v.a. French, im-IMPREGNATE, v.a. & adj. Fregnable; Lat. IMPREGNATION, n. s. in, pre, and old Lat. geno. To fill with any matter or quality; to fill with young; to make pregnant or prolific: impregnation, the act of making prolific; that with which any thing is impregnated; saturation; impregnate, impregnated.

They ought to refer matters unto counsellors, which is the first begetting or *impregnation*; but when they are elaborate in the womb of their counsel, and grow ripe to be brought forth, then they take the matter back into their own hands. Bacon.

In her ears the sound

Yet rung of his persuasive words, impregned

With reason, to her seeming. Milton. Hermaphrodites, although they include the parts of both sexes, cannot *impregnate* themselves.

Browne.

With native earth their blood the monsters mixed; The blood, endued with animating heat,

Did in the *impregnate* earth new sons beget. Dryden. What could implant in the body such peculiar im-

pregnations, as should have such power? Derham. Christianity is of so prolific a nature, so apt to impregnate the hearts and lives of its proselytes, that it is hard to imagine that any branch should want a due fertility. Decay of Piety.

The unfruitful rock itself, impregned by thee, Forms lucid stones. Thomson.

That man is of a temper too severe :

Hard, but as lofty as the rock, and free

From all the taints of common earth-while I

Am softer clay, impregnated with flowers.

Byron. Sardanapalus.

IMPREG'NABLE, adj. Fr. imprenable; IMPREG'NABLY, adv. S Lat. non-prehendus. Not to be stormed or taken; unshaken; unmoved; invincible : impregnably, defended in such manner as to defy external force.

A castle strongly seated on a high rock, joineth by an isthmus to the land, and is *impregnably* fortified. Sandys.

Hast thou not him, and all Which he calls his, inclosed with a wall Of strength impregnable? Id.

Let us be backed with God, and with the seas, Which he hath given for fence *impregnable*, And with their helps alone defend ourselves.

Shakspeare. There the capitol thou see'st,

Above the rest lifting his stately head

On the Tarpeian rock, her citadel

Impregnable. Milton. Two giants kept themselves in a castle, seated upon the top of a rock, impregnable, because there was no coming to it but by one narrow path, where one man's force was able to keep down an army. Sidney.

The man's affection remains wholly unconcerned and imprograble; just like a rock, which, being plied continually by the waves, still throws them back again, but is not at all moved. South.

IMPREJU'DICATE, adj. Lat. in præ and judico. Unprejudiced; not prepossessed; impartial.

The solid reason of one man with *imprejudicate* apprchensions, begets as firm a belief as the authority or aggregated testimony of many hundreds. Browne.

IMPREPARA'TION, n. s. In and preparation. Unpreparedness; want of preparation.

Impreparation and unreadiness when they find in us, they turn it to the soothing up of themselves. Hooker.

IMPRESS, v. a. & n. s. IMPRES'SION, n. s. IMPRES'SIBLE, adj. IMPRES'SURE, n. s. IMPRES'SURE, n. s.

vice; now generally written press: impress is a mark made by pressure; effect of one substance on another; mark of distinction; device; seizure: impression, act of pressing; effect of pressure; image in the mind; efficacious agency or influence; effect of a military attack; an edition of a work: impressible, that may be impressed; soft; tender: impressure, the mark, dent, or impression.

Eke other sain, that through *impressions*, As if a wight hath fast a thing in minde, That thereof cometh soche avisions: And other sain, as thei in bokes finde, That after times of the yere, by kinde, Men dreme. Chaueer. Troilus and Creseide.

And of hire loke, in him there gan to quicken So grete desire and suche affection, That in his hertes hottom, gan to sticken Of her his fixe and depe *impressioun*. Id.

And with meeke service and much suit did lav Continuall siege unto her gentle hart ; Which, being whylome launcht with lovely dart, More eath was new *impression* to receive However she her paynd with womanish art To hide her wound that none might it perceive. Spenser. Faerie Queene.

But nothing might relent her hasty flight; So deepe the deadly feare of that foule swaine Was eart *impressed* in her gentle spright.

So foul and ugly, that exceeding fear Their visages *imprest*, when they approached near Spenser.

Lean but upon a rush,

The cicatrice and capable impressure

Thy palm some moments keeps. Shakspearc.

Ajax was here the voluntary, and you as under an impress. Id.

Why such impress of shipwrights, whose sore task Does not divide the Sunday from the week? Id.

Your ships are not well manned ;

Your mariners are muleteers, reapers, people Ingrossed by swift *impress*.

Id., Antony and Cleopatra.

His age has charms in it, his title more, To pluck the common bosoms on his side, And turn our *imprest* launces in our eyes,

Which do command them. Id. King Lear.

Like to a chaos, or unlicked hear-whelp, That carries no *impression* like the dam.

Shakspears,

This weak *impress* of love is as a figure Trenched in ice, which with an hour's heat Dissolves to water.

Id. Two Gentlemen of Verona. Macbeth shall never vanquished be, until Great Birnam-wood to Dunsinane's high hill Shall come against him.

-That will never be :

Who can impress the forest, bid the tree

Unfix his earth-bound root ? Id. Macbeth.

To be distracted with many opinions, makes men to be of the last *impression*, and full of change.

Bacon.

Id.

659

His spear a spit, a pot-lid broad his shield,

Whose smoky plain a chalked *impresse* filled; A bag sure sealed: his word, much better than spilled. Fletcher. The Purple Island.

When God from earth formed Adam in the East, He his own image on the clay imprest. Denham.

Ormond should contribute all he could for the making those levies of men, and for *impressing* of ships. *Clarendon*.

The king had made him high sheriff of Sussex, that he might the better make *impression* upon that county.

To describe emblazoned shields,

Impresses quaint, caparisons, and steeds,

Bases, and tinsels, trappings. Milton. For ten impressions, which his works have had in so many years, at present a hundred books are scarcely purchased once a twelvemonth. Dryden.

The conquering chief his foot imprest

On the strong neck of that destructive beast. Id. Sensation is such an *impression* or motion, made in some part of the body, as produces some perception in the understanding. Locke.

God, surveying the works of the creation, leaves us this general *impress* or character upon them, that they were exceeding good. South.

They having taken the *impresses* of the inside of these shells with that exquisite niceness, as to express even the finest lineaments of them. Woodward.

Were the officers of religion stript of all the external decencies, they would not make a due *impression* on the mind. Atterbury.

We take care to *improve* in our frugality and diligence; virtues which become us, particularly in times of war. Id.

Universal gravitation is above all mechanism, and proceeds from a divine energy and *impression*.

Bentley.

The false representations of the kingdom's enemies had made some *impression* in the mind of the successor. Swift.

We should dwell upon the arguments, and *impress* the motives of persuasion upon our own hearts, 'till we feel the force of them. Watts.

While passions glow, the heart like heated steel Takes each *impression*, and is worked at pleasure.

Young.

All vastness produces the *impression* of sublimity. It is to be remarked, however, that space, extended in length, makes not so strong an *impression* as height or depth. Blair's Lectures.

That has a noble sound ; but 'tis a sound, A music most *impressive*, but too transient : The mind is much but is not all.

Build is much but is not all.

Byron. The Two Foscari. It shows

The impression of his former instances ;

If they were from his heart, he may be thankful; If not 'twill punish his hypocrisy. Byron.

IMPRESSING OF SEAMEN. The power of impressing seamen for the sca-service by the king's

commission, has been a matter of great dispute, and submitted to with great reluctance. Sir Michael Foster attempts to prove, that the practice of impressing, and granting powers to the admiralty for that purpose, is of very ancient date, and has been uniformly continued by a regular series of precedents to the present time: whence he concludes it to be part of the common law. The difficulty arises hence, that no statute has expressly declared this power to be in the crown, though many of them strongly imply it. The stat. 2 Ric. II., c. 4., speaks of mariners being arrested and retained for the king's service, as of a thing well known, and practised without dispute; and provides a remedy against their running away. By a later statute, if any waterman, who uses the river Thames, shall hide himself during the execution of any commission of pressing for the king's service, he is liable to heavy penalties. By another (5 Eliz. c. 5) no fisherman shall be taken by the queen's commission to serve as a mariner; but the commission shall be first brought to two justices of the peace, inhabiting near the sea coast where the mariners are to be taken, to the intent that the justices may choose out and return such a number of able-bodied men, as in the commission are contained, to serve her majesty. And by others, especial protections are allowed to seamen, in particular circumstances, to prevent them from being impressed. Ferrymen are also said to be privileged from being impressed at common All which do most evidently imply a law. power of impressing to reside somewhere; and if any where, it must, from the spirit of our constitution, as well as from the frequent mention of the king's commission, reside in the crown alone. This method of manning the navy can be considered as only defensible from public necessity, to which all private considerations must give way. The following persons are exempted from being impressed: apprentices for three years; the master, mate, and carpenter, and one man for every 100 tons of vessels employed in the coal trade; all under eighteen years of age and above fiftyfive; foreigners in merchant-ships and privateers; landmen betaking themselves to sea for two years; seamen in the Greenland fishery, and harpooners employed during the interval of the fishing season in the coal trade, and giving security to go to the fishing next season. In cases of threatened or actual invasion of a colony, or other unforeseen necessity, commanders of ships of war there may, with consent of the governor and council of the colony, press seamen, to make up their usual complement. Such seamen to be discharged, if they require it, when the service is performed. Captains refusing their discharge to pay the penalty of £50.

INPRESSION is applied to the species of objects which are supposed to make some mark on the senses, the mind, and the memory. The Peripatetics assert, that bodies emit species resembling them, which are conveyed to the common sensorium, and they are rendered intelligible by the active intellect; and, when thus spiritualised, are called expressions, or express species, as being expressed from others.

IMPRIMATUR, a Latin verb, signifying, 2 U 2 Let it be printed, much used on English books printed in the sixteenth and seventeenth centuries, and introducing copies of warrants for their publication, signed by the lord chancellor or other public officer: or when

Some learned decree [would say] ' Tis right,' And *imprimatur* ushered it to light.

The pope still exercises an authority of this kind on bulls circulated amongst catholics. See INDEX.

IMPRINT', v. a. Fr. imprimer. To mark on any substance; to fix on the mind and memory.

There is a kind of conveying of effectual and *imprinting* passages, amongst compliments, which is of singular use. Bacon.

One of the same scal, *imprinted* upon pieces of wax of different colours.

Holder's Elements of Specch.

We have al. hose ideas in our understandings which we can make the objects of our thoughts, without the help of those sensible qualities which first *imprinted* lhem. Locke.

Retention is the power to revive again in our minds those ideas, which, after *imprinting*, have disappeared. Id.

By familiar acquaintance he has got the ideas of those two different things distinctly *imprinted* on his mind. Id.

When we set before our eyes a round globe, the idea *imprinted* in our mind is of a flat circle, variously shadowed. Id.

Having surveyed the image of God in the soul of rian, we are not to omit those characters of majesty that God *imprinted* upon the body. South.

She amidst his spacious meadows flows ;

Inclines her urn upon his fattened lands,

And sees his numerous herds imprint her sands. Prior.

IMPRIS'ON, v. a. Fr. emprisonner. To IMPRIS'ONMENT, u. s. Shut up; to conline; to

keep from liberty: confinement; clausure. He imprisoned was in chains remediless;

For that Hippolytus' rent corse he did redress. Spenser.

His sinews waxen weak and raw fhrough long *imprisonment* and hard constraint.

Id.

Now we are in the street, he first of all, Improvidently proud, creeps to the wall; And so imprisoned and hemmed in by me, Sells for a little state his liberty. Donne. At length the flame breaks from the' imprisoning

With horrid noise, tearing the limber mould;

While down, in liquid tears, the broken vapours rolled. Fletcher's Purple Island. The prince who saw his long imprisonment

Now end in never ending liberty;

To meet the victim from his castle went. Id. Which shall I first bewail,

Thy bondage or lost sight?

Thou art become, O worst imprisonment !

The dungeon of thyself. Milton's Agonistics. Try to imprison the resistless wind ;

So swift is guilt, so hard to be confined.

Dryden.

From retentive cage When sullen Philomel escapes, her notes She varies, and of past *inprisonment* Sweetly complains. Phillips.

Count Serini, still close prisoner in this eastle, lost his senses by his long *imprisonment* and afflictions. Addison. It is not improbable, that all the virtual heat in the juices of vegetables, metals, and minerals, may be owing to the action of the *imprisoned* rays. *Cheyne*.

If a man *imprisons* himself in his closet, and cmploys reason to find out the nature of the corporeal world, without experiments, he will frame a scheme of chimeras. Watts.

It is well if they don't fix the brand of heresy on the man who is leading them out of their long *imprisonment*, and loosing the fetters of their souls.

Id. on the Mind.

Both the same to me : the after Freedom as is the first *imprisonment*.

Byron. The Two Foscari.

IMPRISONMENT, in law. No person is to be imprisoned but as the law directs, either by the command or order of a court of record, or by lawful warrant; or the king's process, on which one may be lawfully detained. Where the law gives power to imprison, in such case it is justifiable, provided he that does it in pursuance of a statute, exactly pursues the statute in the manner of doing it; for otherwise it will be deemed false imprisonment, and of consequence is unjustifiable. Every warrant for commitment for imprisoning a person, ought to run, ' till delivered by due course of law,' and not 'until farther order;' which has been held illegal: and thus it also is, where one is imprisoned on a warrant not mentioning any cause for which he is committed.

Every confinement of the person is an imprisonment, whether it be in a common prison or in a private house, or in the stocks, or even by forcibly detaining one in the public streets. Unlawful, or false imprisonment, consists in such confinement or detention without sufficient authority: which authority may arise either from some process from the courts of justice; or from some warrant from a legal power to commit, under his hand and seal, and expressing the cause of such commitment; or from some other special cause warranted, for the necessity of the thing, either by common law or act of parliament; such as the arresting of a felon by a private person without warrant, the impressing of mariners for the public service, or the apprehending of waggoners for misbehaviour in the public highways. False imprisonment also may arise by executing a lawful warrant or process at an unlawful time, as on a Sunday; or in a place privileged from arrests, as in the verge of the king's court. The remedy is of two sorts; the one removing the injury, the other making satisfaction for it. The satisfactory remedy for this injury of false imprisonment, is by an action of trespass vi et armis, usually called an action of false imprisonment: which is generally, and almost unavoidably, accompanied with a charge of assault and battery also; and therein the party shall recover damages for the injuries he has received; and also the defendant is, as for all other injuries committed with force, vi et armis, liable to pay a fine to the king for the violation of the public peace.

IMPROBABIL'ITY, n. s. IMPROB'ABLE, adj. IMPROB'ABLE, adj. IMPROB'ABLY, adv. IM'PROBATE, v. a. IMPROBATE, v. a. IMPROBATION, n. s. Fr. improbable; Int in and probo. That which is unlikely, incredible, or difficult to be

proved : in a manner not approved. Not to approve, improbate ; act of disallowing, improbation; which words are not commonly used.

Aristotle tells us, if a drop of wine be put into ten thousand measures of water, the wine, being overpowered, will be turned into water : he speaks very improbably. Boyle.

As to the improbabilities of a spirit appearing, I beldly answer him, that a heroic poet is not tied to the bare representation of what is true, or exceeding probable. Dryden.

This account of party-patches will appear improbable to those who live at a distance from the fashionable world. Addison.

The difficulty and the improbability of attempting this successfully is great. Hammond.

It warns the reader to expect nothing but truth, and consequently every appearance of fiction in the sequel must produce a bad effect, and bear the mark of improbability. Beattie.

IMPROB'ITY, n. s. Lat. improbitas, improbus. Want of honesty; dishonesty; baseness.

He was perhaps excommunicable, yea, and cast out for notorious improbity. Hooker.

We halance the improbity of the one with the improbity of the other. L'Estrange.

IMPROLIF'ICATE, v. a. In and prolific. To impregnate; to fecundate. A word not used.

A difficulty in eggs is how the sperm of the cock improlificates, and makes the oval conception fruitful. Browne.

IMPROP'ER, adj. Fr. impropre ; Lat. im-IMPROP'ERLY, adv. proprius. Not well adapt-IMPROPRI'ETY, n. s. ed; unqualified; unfit; inaccurate; wrong: incongruously; out of order or place.

They assuring me of their assistance in correcting my fault where I spoke improperly, I was encouraged. Dryden.

He disappeared, was rarified;

For 'tis improper speech to say he died :

He was exhaled.

Improperly we measure life by breath : Such do not truly live who merit death.

Id. Juvenal.

Id.

As every science requires a peculiar genius, so likewise there is a genius peculiarly improper for every Burnet.

Many gross improprieties, however authorised by practice, ought to be discarded. Swift.

I have heard private tutors complain, that they were obliged to have recourse to flattery or bribery to engage the attention of their pupil; and I need not observe how improper it is to set the example of such practices before children. Beattie.

IMPRO'PRIATE, v. a. IMPROPRIATION, n. s. IMPRO'PRIATOR, n. s. IMPRO'PRIATOR, n. s. putting of the possessions of the church in lay hands, is called impropriation ; and impropriator is a layman that has such possession.

For the pardon of the rest, the king thought it not fit it should pass by parliament; the better, being matter of grace, to impropriate the thanks to himself.

Bacon's Henry VII. Having an impropriation in his estate, he took a course to dispose of it for the augmentation of the vicarage. Spelman.

Mrs. Gulston, being possessed of the impropriate parsonage of Bardwell in Suffolk, did procure from the king leave to annex the same to the vicarage. 12.

Where the vicar leases his glebe, the tenant must pay the great tythes to the rector or impropriator.

Ayliffe's Parergon.

An impropriation is properly so called when 'the church land is in the hands of a layman; and an appropriation is when it is in the hands of a bishop, college, or religious house, though sometimes these terms are confounded. Id.

IMPROS'PEROUS, adj. ? In and prosper-IMPROS'PEROUSLY, adv. Sous. Unhappy; unfortunate; unsuccessful.

This experiment has been but very improsperously attempted. Boyle.

Seven revolting years are wholly run, Since the improsperous voyage we begun.

Dryden.

This method is in the design probable, how improsperous soever the wickedness of men hath rendered the success of it. Hammond.

Our pride seduces us at once into the guilt of bold, and punishment of improsperous rebels.

Decay of Piety.

ו IMPROV'ABLE, adj. ך
IMPROV'ABLENESS, n. s.
IMPROV'ABLY, adv.
IMPROVE', v. n. & v. a.
IMPROVE'MENT, n. s.
IMPROV'ER, n. s.

Fr. improuver ; Lat. in and probus, quasi probum fa-cere.—Skinner. To approach, or ad-) vance any thing or

being, nearer to perfection; to make attainment in goodness : improvable, capable of being made better: improvably, in a manner that admits of amelioration : improvement, melioration ; alteration for the better ; progress ; instruction ; edification : improver, any person or thing that con-duces to this progress. There is an old meaning to improve, viz. to disprove; but this is obsolete.

Though the prophet Jeremy was unjustly accused, yet doth that improve any thing that I have said ?

Whitgifte.

I love not to improve the honour of the living by impairing that of the dead. Denham.

They were the greatest improvers of those qualifications with which courts used to be adorned.

Clarendon.

Man is accommodated with moral principles, improvable by the exercise of his faculties.

Hale's Origin of Mankind.

Adventures in knowledge are laudable, and the essays of weaker heads afford improvable hints unto better. Browne.

They have it by tradition from their mothers Which they improve each day, and grow more exqui-

site ! Otway's Athcist. Some virtues tend to the preservation of health,

and others to the improvement and security of estates. Tillotson.

The first started ideas have been examined, and many effectually confuted by the late improvers of this way. Locke.

Animals are not improvable beyond their proper genius : a dog will never learn to mew, nor a cat to bark. Grew.

I look upon your city as the best place of improvement; from the school we go to the university, but from the universities to London. South.

There is a design of publishing a history of architecture, with its several improvements and decays.

Addison.

The parts of Sinon, Camilla, and some few others, are improvements on the Greek poet.

I have a fine spread of improvable lands, and am already planting woods and draining marshes.

Id. Spectator

We take care to improve in our frugality and diligence; virtues which become us, particularly in times of war. Atterbury.

Homer is like a skilful improver, who places a beautiful statue so as to answer several vistas. Pope.

Heaven seems improved with a superior ray,

And the bright arch reflects a double day. Id.

We have stock enough, and that too of so improvable a nature, that it is capable of infinite advance-Decay of Piety. ment.

Virtue, our present peace, our future prize,

Man's unprecarious natural estate

Improveable at will, in virtue lies

Young. Its tenure sure ; its income is divine.

The few that pray at all pray oft amiss ; And seeking grace to' improve the prize they hold Would urge a wiser suit, than asking more.

Cowper.

For this was all thy caution ?

For this thy painful labours at the glass, To' improve those charms, and keep them in repair, For which the spoiler thanks thee not ?

Blair's Grave.

Who can tell what happy, what glorious effects might be produced, were an equal proportion of industry applied to the regulations of the passions and the strengthening and improving the reasonable Beattie. powers.

Glowing, and circumfused in speechless love, Their full divinity inadequate

That feeling to express, or to improve,

The gods become as mortals, and man's fate

Has moments like their brightest.

Byron. Childe Harold.

I am not prepared to sacrifice or to hazard the fruits of centuries of experience, of centuries of struggles, and of more than one century of liberty as perfect as ever blessed any country upon the earth, for visionary schemes of ideal perfectibility, or doubtful experiments, even of possible improvement.

Canning.

IMPROVI'DED, adj. IMPROV'IDENCE, n. s. IMPROV'IDENT, adj. IMPROV'IDENTLY, adv. IMPROVIS'ION, n.S. MPROVISATO'RE, n. S.

Fr. imprevu; Lat. improvisus. Unforeseen; unexpected: improvidence, want of caution; want of forethought : impro-

IMPROVIS'ATRICE, n. s.) vident, wanting care to provide : improvidently, without care or forethought; improvisatore and improvisatrice, extemporaneous composers, or speakers, in prose or poetry.

She suborned hath

This crafty messenger with letters vain,

To work new woe, and improvided scath,

By breaking off the band betwixt us twain.

Spenser.

Improvident soldiers, had your watch been good, This sudden mischief never could have fallen.

Shakspeare.

Now we are in the street, he first of all, Improvidently proud, creeps to the wall; And so imprisoned and hemmed in by me, Donne. Sells for a little state his liberty.

When men well have fed, the blood being warm, Then are they most improvident of harm. Daniel.

I shall conclude this digression, and return to the time when that brisk and improvident resolution was taken. Clarendon.

Men would escape floods by running up to mountains; and, though some might perish through improvidence, many would escape. Hale.

This were an improvident revenge in the young ones. whereby they must destroy themselves. Browne.

Her improvision would be justly accusable. Id. The improvidence of my neighbour must not make

me inhuman. L'Estrange. Of this I'm sure at least there's no servility

In mine irregularity of chime,

Which rings what's uppermost of new or hoary, Just as I feel the improvisatore.

Byron. Don Juan.

IMPRU'DENCE, n. s. Lat. in and prudens. Fr. imprudence: IMPRU'DENT, adj. Want of prudence; indiscretion; negligence: inattention to interest.

There is no such imprudent person as he that neglects God and his soul. Tillotson.

IM'PUDENCE, n. s.	French, <i>impudence</i> ;
IM'PUDENCY, n. s.	(Latin, impudentia, in
IM'PUDENT, adj.	and pudens. Immo-
IM'PUDENTLY, adv.	desty; shamelessness:
unchaste; rude; saucy.	• •

Impuden' is he that, for his pride, hath no shame Chaucer. The Persones Tale. of his sinnes.

At once assail With open mouths, and impudently rail. Sandys.

That when the haughty Titanesse beheld, All were she fraught with pride and impudence ; Yet with the sight thereof was almost queld.

Spenser. Faerie Queene. I ne'er heard yet

That any of these bolder vices wanted

Less impudence to gainsay what they did,

Than to perform it first.

Shakspeare. Winter's Tale. It is not a confident brow, nor the throng of words that come with such more than impudent sawciness from you, can thruse me from a level consideration. Id. Henry IV.

Why should soft Fabius impudently bear Names gained by conquest in the Gallic war? Why lays he claim to Hercules his strain,

Yet dares be base, effeminate, and vain? Dryden. When we behold an angel, not to fear,

Id. Spanish Fryar. Is to be impudent.

IMPUGN, v.a. Fr. impugner ; Lat. im-IMPUGN'ER, n. s.) pugno. To attack or assault by law or argument.

Of a strange nature is the suit you follow; Yet in such rule, that the Venetian law Cannot impugn you.

Shakspeare. Merchant of Venice. St. Hierom reporteth, that he saw one of these in his time; but the truth hereof I will not rashly impugn, or over boldly affirm. Peacham on Drawing.

I cannot think myself engaged to discourse of lots; as to their nature, use, and allowableness; and that not only in matters of moment and business, but also of recreation, which is impugned by some, though bet-South. ter defended by others.

IMPU'ISSANCE, n.s. Fr. Impotence; inability; weakness; feebleness.

As he would not trust Ferdinando and Maximilian for supports of war, so the impuissance of the one, and the double proceeding of the other, lay fair for him Bacon. for occasions to accept of peace.

IM'PULSE, n. s. IMPUL'SION, n. s. IMPUL'SIVE, adj. Fr. impulsion; Lat. im-pulsus, from in and pello. Communicated force; the effect of one body acting upon another; influence acting on the mind ; idea impressed : impulsion, the agency of body in motion upon body;

influence acting on the mind : impulsive, having the power of impulse.

The motion in the minute parts of any solid body passeth without sound; far that sound that is heard sometimes is produced only by the breaking of the air, and not by the *impulsion* of the air. Bacon.

To the *impulsion* there is requisite the force of the body that moveth, and the resistance of the body that is moved; and if the body he too great it yieldeth too little; and if it be too small it resisteth too little. *Id. Natural History.*

Nature and duty bind him to obedience; But, those being placed in a lower sphere, His fierce ambition, like the highest mover, Has hurried with a strong *impulsive* motion Against their proper course. Deuhan's Sophy. But thou didst plead

Divine *impulsion*, prompting how thou mightest Find some occasion to infest our foes.

Milton's Agonistes.

These were my natural *impulses* for the undertaking; but there was an accidental motive, which was full as forcible. Dryden.

Mean time, by Jove's impulse, Mezentius armed, Succeeded Turnus. Id.

Moses saw the bush burn without heing consumed, and beard a voice out of it: this was something besides finding an *impulse* upon his mind to go to Pharaoh, that he might bring his brethren out of Egypt. Locke.

Bodies produce ideas in us manifestly by *impulse*. Id. What is the fountain, or *impulsive* cause, of this pre-

vention of sin? It is perfectly free grace. South. If these little *impulses* set the great wheels of devotion on work, the largeness and height of that shall not at all he prejudiced by the smallness of its occasion. Id.

Like two great rocks against the raging tide,

Unmoved the two united chiefs abide,

Sustain the' *impulse*, and receive the war. Prior. Poor men! poor papers! we and they

Do some impulsive force obey,

And are but played with, do not play.

Bodies, from the *impulse* of a fluid, can only gravitate in proportion to their surfaces, and not according to their quantity of matter, which is contrary to experience. *Cheyne.*

But they were not aware that there are things Which make revenge a virtue by reflection, And not an *impulse* of mere anger.

Byron. Doge of Venice.

Id.

The *impulse* once given may be too impetuous to be controlled, and, intending only to change the guidance of the machine, they may hurry it and themselves to irretrievable destruction. *Canning*.

IMPU'NITY, n.s. Fr. impunté; Lat. impunitas. Freedom from punishment; exemption from punishment.

In the condition of subjects they will gladly continue, as long as they may be protected and justly governed, without oppression on the one side or impunity on the other. Davies.

A general *impunity* would confirm them; for the vulgar will never believe that there is a crime where they see no penalty. Addison.

Men, potent in the commonwealth, will employ their ill-gotten influence towards procuring *impunity*, or extorting undue favours, for themselves or dependants. *Atterbury*.

IMPURE', adj. IMPURE'LY, adv. IMPURE'LY, adv. IMPURE'NESS, n. s. IMPURE'NESS, n. s. IMPURE'NESS, n. s. IMPURE'LY, n. s. IMPURE'LY, adj. IMPURE'LY, adj. IMPURE'LY, adj. IMPURE'LY, adj. IMPURE'LY, adj. IMPURE'LY, adj. IMPURE'LY, adv. IMPURE feculent admixture: defiled with guilt: whatever is contrary to sanctity or purity, either in persons or things.

He daily did apply himselfe to donne All dewfull service, voide of thoughts *impure* Ne any paines ne perill did he shonne.

Spenser. Faerie Qucene.

If black scandal, or foul-faced reproach, Attend the sequel of your imposition, Your meer enforcement shall acquittance me From all the *impure* blots and stains thereof. Shakspeare.

No more can *impure* man retain and move In that pure region of a worthy love, Than earthly substance cau unforced aspire, And leave his nature to converse with fire.

Donne.

Hypocrites austerely talk,

Condemning as *impure* what God has made Pure, and commands to some, leaves free to all. *Milton.*

One could not devise a more proper hell for an impure spirit, than that which Plato has touched upon. Addison.

Foul impurities reigned among the monkish clergy. Atterbury.

Cleanse the alimentary duct by vomiting, and clysters, the *impurities* of which will be carried into the blood. Arbuthmot.

IMPURITY, in the law of Moses, is any legal defilement. Of these there were several sorts. Some were voluntary, as the touching a dead body, or any animal that died of itself, or any creature that was esteemed unclean; or the touching things holy, by one who was not clean. or was not a priest; the touching one who had a leprosy, or who was polluted by a dead carcase, &c. Sometimes these impurities were involuntary; as when any one inadvertently touched bones, or a sepulchre, or any thing polluted; or fell into such diseases as pollute, as the leprosy, &c. The beds, clothes, and moveables which had touched any thing unclean, contracted also a kind of impurity, and, in some cases, communicated it to others. These legal pollutions wero generally removed by bathing, and lasted no longer than the evening. The persons polluted immersed themselves in water, and either had their clothes on when they did so, or washed their clothes separately. Other pollutions continued seven days, as that which was contracted by touching a dead body. That of women in their monthly courses lasted till this was over with them; that of women after child-birth lasted forty days after the birth of a boy, and fifty after that of a girl. Others lasted till the person was cured. Many of these pollutions were explated by sacrifices; and others by water mixed with the ashes of a red heifer, sacrificed on the great day of explation. When the leper was cured he went to the temple, and offered two birds, one of which was killed, and the other set at liberty. He who had touched a dead body, or had been present at a funeral, was to be purified with the water of expiation, upon pain of death. A woman after child-birth offered a turtle and a lamb for her expiation; or, if poor, two turtles, or two young pigeons. Those impurities, which are accurately described in the law of Moses, were only figures of those

more important impurities, the sins and iniquities committed against God or our fellow creatures. The saints and prophets of the Old Testament were sensible of this; and our Saviour has strongly inculcated, that, not outward and corporeal pollutions, but such inward pollutions as the violations of justice, truth, and charity, defile the soul, and render it polluted in the sight of God.

To IMPU'RPLE, v.a. Fr. empourprer. From purple. To make red; to color as with purple.

Now in loose garlands, thick thrown off the bright Pavement, that like a sea of jasper shone, Impurpled with celestial roses smiled. Milton.

IMPU'TABLE, adj. IMPU'TABLENESS, n. s. IMPUTA'TION, n. S. IMPU'TATIVE, adj. " IMPUTE', v.a. IMPU'TER, n. s.

Fr. imputer ; Latin imputo. Chargeable upon any one; that of which one may be accused : imputable-) ness, the quality of

664

being imputable : imputation, attribution of any thing, but generally of ill; censure; reproach; hint : impute, to charge upon or accuse; sometimes to attribute good; to reckon to one what is not strictly his own.

It was imputed to him for righteousness.

Romans iv. 22. Whatsoever happens they also the least feel that scourge of vulgar imputation, which notwithstanding Hooker. they deserve.

Trust to me, Ulysses,

Our imputation shall be oddly poised

In this wild action.

Shakspeare. Troilus and Cressida. If a son that is sent by his father about merchandise do fall into some lewd action, the imputation of his wickedness, by your rule, should be imposed upon his father. Shakspeare.

Antonio is a good man.

-Have you heard any imputation to the contrary ?

-No, no; my meaning is to have you understand the that he is sufficient. *Id. Merchant of Venice.* me that he is sufficient.

If 1 had a suit to master Shallow, I would humour his men with the imputation of being near their master. Shakspeare.

Men in their innovations should follow the example of time, which innovateth but quietly, and by degrees scarce to be perceived ; for otherwise whatsoever is new and unlooked for, even mends some, and impairs others; and he that is holpen takes it for a fortune, and thanks the time; and he that is hurt for a wrong, imputeth it to the author. Bacon's Essays.

Thy merit

Imputed shall absolve them who renounce

Their own both righteous and unrighteous deeds. Milton.

To use intellections and volitions in the infinite essence, as an hypothesis is allowable, but a rigorous imputation is derogatory to him, and arrogant in us.

Glanville's Scepsis.

I made it by your persuasion, to satisfy those who imputed it to folly. Temple. Impute your dangers to our ignorance.

Druden.

I have formerly said that I could distinguish your writings from those of any others : 'tis now time to clear myselt from any imputation of self-conceit on that subject. Id.

This obscurity cannot be imputed to want of language in so great a master of style. Locke.

"Tis necessary to the imputableness of an action, that Norris.

That first sort of foolishness is imputable to them. South.

Let us be careful to guard ourselves against these groundless imputations of our enemies, and to rise above them. Addison.

If the wife departs from her husband, through any default of his, as on the account of cruelty, then he shall be compelled to allow her alimony ; for the law deems her to be a dutiful wife as long as the fault lies at his door, and she is in no wise imputable.

Ayliffe.

Neither do I reflect upon the memory of his late majesty, whom I entirely acquit of any imputation upon this matter. Swift.

I have read a book imputed to lord Bathurst, called a dissertation on parties. Id.

Nor you, ye proud, impute to these the fault,

If memory o'er their tomb no trophies raise,

Where thro' the long-drawn aisle and fretted vault. The pealing anthem swells the note of praise.

Gray's Elegy.

IN, prep. Lat. in. Noting the place where any thing is present; not without.

In school of love are all things taught we see ; There learned this maid of arms the ireful guise.

Fairfax.

Is this place here not sufficient strong To guard us in? Daniel's Civil War.

And what they pleased to do with the young khan In heaven, I know not, nor pretend to guess.

Byron.

Noting the state or thing present at any time. In Armorike, that called is Bretaigne,

Ther was a knight, that loved and did his peine To serve a ladie in his beste wise.

Chaucer. The Frankeleines Tale.

The other is only by error and misconceit named the ordinance of Jesus Christ : no one proof is yet brought forth, whereby it may clearly appear to be so Hooker. in very deed.

Like one of two contending in a prize,

That thinks he hath done well in people's eyes. Shakspeare.

Sir Edmund Courtney, and the haughty prelate, With many more confederates, are in arms. Id.

Danger before, and in, and after the act,

You needs must grant is great.

Daniel's Civil War.

However it be in knowledge, I may truly say it is of no use at all in probabilities; for the assent there, being to be determined by the preponderancy, after a due weighing of all the proofs on both sides, nothing is so unfit to assist the mind in that as syllogism.

Locke.

God hath made our eternal and temporal interests, in most cases, very consistent. Smalridge's Sermons.

None was so little in their friendships, or so much in that of those whom they had most abused.

Dunciad.

Noting the time.

When we would consider eternity a parte ante, what do we but, beginning from ourselves and the present time we are in, repeat in our minds the ideas of years or ages past? Locks.

Noting power.

To feed men's souls, quoth he, is not in man.

Hubberd's Tale.

Noting proportion.

Let usury in general be reduced to five in the hundred, and let that rate be proclaimed to be free and current. Bacon.

I cannot but lament the common course, which, at least, nine in ten of those who enter into the ministry are obliged to enter. Swift.

According to.

In all likelihood I brought all my limbs out of the bed, which, 'tis probable, he has not done off the breach. Collicr.

Concerning.

I only consider what he, who is allowed to have carried this argument farthest, has said in it. Locke. For the sake of. A solemn phrase.

Now, in the names of all the gods at once,

Upon what meat does this our Cæsar feed, That he is grown so great?

Shakspeare. Julius Casar. In the name of the people,

And in the power of us the tribunes, we

Banish him our city. Id. Coriolanus. Now, in the name of honour, Sir, I beg you

That I may see your father's death revenged. Dryden.

Noting cause.

King Henry, be thy title right or wrong, Lord Clifford vows to fight in thy defence.

Shakspeare.

In that. Because.

Some things they do in that they are men ; in that they are wise men, and christian men, some things some things in that they are men misled, and blinded with error. Hooker.

He cannot brook such disgrace well, as he shall run into; in that it is a thing of his own search.

Shakspeare.

In as much. Since; seeing that.

Those things are done voluntarily by us, which other creatures do naturally, in as much as we might stay our doing of them if we would. Hooker.

IN, adv.

Within some place; not out. I fear me, you'll be in 'till then. Shakspeare. Now painter, shew us in the blocks and dye

The counsellors of all this villany. Marvell.

How infamous is the false, fraudulent, and unconscionable person : especially if he be arrived at that consummate and robust degree of falsehood as to play in and out, and shew tricks with oaths, the sacredest bonds which the conscience of man can be bound with. South.

Engaged to any affair.

We know the worst can come ; 'tis thought upon : We cannot shift being in, we must go on. Daniel.

These pragmatical flies value themselves for being in at every thing, and are found at last to be just good for nothing. L'Estrange.

Placed in some state.

Poor rogues talk of court news,

Who loses and who wins ; who's in, who's out. Shakspeare.

Must never patriot then declaim at gin, Unless, good man, he has been fairly in? Pope.

Noting immediate entrance.

Go to thy fellows; bid them cover the table, serve in the meat, and we will come in to dinner. Shahspeare.

He's too big to go in there : what shall I do?

-Let me see't; I'll in, I'll in : follow your friend's advice.

I'll in. Id. Merry Wives of Windsor. Into any place.

Next fill the hole with its own earth again, And trample with thy feet, and tread it in.

Dryden.

is it not more eligible to come in with a smooth gale, that to be tossed at sea with a storm ? Collier. In the said cavity lies loose the shell of some sort

of bivalve larger than could be introduced in at those holes. Woodward. .

Close; home.

The posture of left-handed fencers is so different from that of the right handed, that you run upon their swords if you push forward; and they are in with you, if you offer to fall back without keeping your guard. Tatler.

In has commonly in composition a negative or privative sense, as in the Latin; so active denotes that which acts, inactive that which does not act. In before r is changed into r; as irregular: before l into l; as illative: and into mbefore some other consonants, as, improbable.

INA, in biography, one of the most illustrious princes in the Saxon heptarchy, succeeded to the throne of Wessex in 689, and began his reign by endeavouring to extend his dominions by force of arms. He invaded Kent, but was induced, by a large subsidy, to desist from his enterprise. He soon after obtained possession of Cornwall and Somersetshire, which he an-nexed to his kingdom, treating the vanquished with a degree of humanity but little practised by the Saxon conquerors. By his code of laws he is placed at the head of the Saxon kings as a legislator; and, though disturbed by occasional insurrections at home, his long reign of thirtyseven years may be regarded as one of the most prosperous of the heptarchy. In the decline of life he made a pilgrimage to Rome, and, after his return, retired to a cloister where he died.

INABIL'ITY, n. s. In and ability. Impuissance; impotence; want of power.

If no natural nor casual inability cross their desires, they, always delighting to inure themselves with actions most beneficial to others, cannot but gather great experience, and through experience the more wisdom. Hooker.

Neither ignorance nor inability can be pretended : and what plea can we offer to divine justice to prevent condemnation ? Rogers.

INAB'STINENCE, n. s. In and abstinence. Intemperance; want of power to abstain; prevalence of appetite.

Diseases dire ; of which a monstrous crew Before thee shall appear, that thou may'st know What misery the inabstincnce of Evo Shall bring on man. Milton.

INACCES'SIBLE, adj. Fr. inaccessible; in and accessible. Not to be reached; not to be approached.

Whate'er you are,

That in this desert inaccessible,

Under the shade of melancholy boughs, Lose and neglect the creeping hours of time.

Shakspeare.

Many other hidden parts of nature, even of a far lower form, are inaccessible to us. Hale.

And by proof we feel

Our power sufficient to disturb his heaven,

And with perpetual inroads to alarm,

Though inaccessible, his fatal throne :

Which, if not victory. is yet revenge.

Milton. Paradisc Lost.

There shall we see the ends and uses of these things, which here were either too subtile for us to penetrate, or too remote and inaccessible for us to Ray. come to any distant view of.

This part, which is so noble, is not altogether inaccessible ; and that an easy way may be found to it, 'tis to consider nature and to copy her. Dryden.

Ye, to whom the tops

Of mountains inaccessible are haunts,

And earth's and ocean's caves familiar things-

Byron. Manfred. I call upon you.

INAC'CURACY, n. s. In and accurate. INAC'CURATE, adj. Want of exactness; not accurate; used sometimes of persons, but more frequently of performances.

A sentiment which is expressed in accurate language, and in a period, clearly, neatly, and well arranged, always makes a stronger impression on tho mind, than one that is expressed inaccurately, or in a feeble or embarassed manner. Murray.

INACTION, n. s. Fr. macrone, and ago. Cessation from INAC'TIVELY, adv. for forbearance of labor; INACTIV'ITY, n.s. not busy; idle; indolent; sluggish : without motion ; in a state of rest ; sluggishness.

In seasons of perfect freedom, mark how your son spends his time; whether he inactively loiters it away, when left to his own inclination. Lucke.

A doctrine which manifestly tends to discourage the endeavours of men, to introduce a lazy inactivity, and neglect of the ordinary means of grace.

Rogers.

The times and amusements past are not more like a dream to me, than those which are present : I lie in a refreshing kind of inaction. Pope.

Virtue, concealed within our breast,

Is inactivity at best. Swift.

INAD'EQUATE, adj. 🧨 Lat. in and ada-INAD'EQUATELY, adv. § quo. Not equal to the purpose; defective; falling below the proportion; not completely.

These pores they may either exactly fill, or but inadequately. Boyle.

Remorse for vice

Not paid, or paid inadequate in price,

What farther means can reason now direct ? Dryden.

Inadequate ideas are such, which are but a partial or incomplete representation of these archetypes to which they are referred. Locke.

INADVER'TENCE, n. s.	r. inducer tence;
INADVER'TENCY, n. s. La	at. in and adver-
	ns. Careless-
INADVER'TENTLY, adv.) ne	ss; negligence;

act or effect of inattention.

From an habitual heedless inadvertency, men are so intent upon the presen that they mind nothing else. L'Estrange.

There is a difference between them, as between inadvertency and deliberation, between surprise and set purpose. South.

The productions of a great genius, with many lapses and inadvertencies, are infinitely preferable to the works of an inferior kind of author, which are scrupulously exact. Addison.

Aristotle mentions Telegonus as the son of Circe and Ulysses, who afterwards slew his father with the bone of a fish inadvertently. Broome.

Worthy persons, if inadvertently drawn into a deviation, will endeavour instantly to recover their lost ground. Clarissa.

An inadvertent step may crush the snail That crawls at evening in the public path,

But he that has humanity, forewarned,

Will tread aside and let the reptile live. Cowper.

INA'LIENABLE, adj. In and alienable. That cannot be alienated, or granted to another.

INAL'IMENTAL, adj. In and alimental. Affording no nourishment.

Dulcoration importeth a degree to nourishment; and the making of things inalimental to become alimental, may be an experiment of great profit for making new victual. Bacon.

INAMIS'SIBLE, adj. Fr. inammissible ; Lat. in and amissum. Not to be lost.

These advantages are inan	nissible. Hammond.
INANE', adj.	Fr. inanimé, inani-
INAN'IMATE, v.a. & adj.	tion; Lat. inanis, in-
	> animatus. Empty;
	void; either in body
	or mind; want of ful-

ness in the vessels of the animal: inanimate, void of life; without animation; to animate or quicken; not now used in this sense : inanity, emptiness; void of space: inanition, deficiency in the vessels of any animal body.

The spirits of animate bodies are all in some degree kindled; but inanimate bodies have spirits no whit inflamed. Bacon.

There's a kind of world remaining still, Though she which did inanimate and fill The world be gone; yet in this last long night Her ghost doth walk, that is, a glimmering light. Donne.

This opinion excludes all such inanity, and admits no vacuities but so little ones as no body whatever can come to, but will be bigger than they, and must touch the corporal parts which those vacuities divide. Digby on Bodies.

The golden goddess, present at the prayer,

Well knew he meant the' inanimated fair,

And gave the sign of granting. Dryden.

We sometimes speak of place in the great inane, beyond the confines of the world. Locke.

Weakness which attends fevers proceeds from too great fulness in the beginning, and too great inanition in the latter end of the disease. Arbuthnot on Diet.

All the ideas of sensible qualities are not inherent in the inanimate bodies; but are the effects of their motion upon our nerves. Bentley.

Both require the constant influence of a principle different from that which governs the inanimated part Cheyne. of the universe.

From roofs when Verrio's colours fall,

And leave inanimate the naked wall,

Still in thy song should vanquished France appear. Pope.

Could it be pride?

Or modesty, or absence, or inanity?

Byron. Don Juan.

INAP'PETENCY, n.s. Lat. in and appetentia. Want of appetite.

INAP'PLICABLE, adj. Lat. in and applico. INAPPLICABLL'ITY, n. s. Not adapted to a

INAPPLICABIL'ITY, n. s. Not adapted to a INAPPLICATION, n. s. Sparticular use; unfit for the purpose: inapplication, indolence or negligence.

INAR'ABLE, adj. Lat. in and aro. Incapable of tillage.

INARCHING, in gardening. See GRAFTING. INARTIC'ULATE, adj.) Fr. inarticulé; INARCHING, adj. Fr. marticu-INARTIC'ULATE, adj. Lat. in and articu-listingt ut-INARTIC'ULATELY, adv. Lat. in and articu-INARTIC'ULATENESS, n. s. Jus. Indistinct ut-

terance; confusion of sounds; want of clearness in pronunciation.

3

INA Observe what inarticulate sounds resemble any of the particular letters.

Wilkins's Mathematical Magic.

By the harmony of words we elevate the mind to a sense of devotion; as our solemn musick, which is inarticulate poesy, doth in churches. Dryden.

INARTIFIC'IAL, adj. Lat. in, artem, facio. INARTIFIC'IALLY, adv. Contrary to, or without art; natural.

This lofty humour is clumsily and inartificially managed, when it is effected by those of a self-denying profession. Collier.

I have ranked this among the effects; and it may be thought inartificial to make it the cause also.

Decay of Piety.

INATTENTION, n. s. Fr. un Fr. inattention; attentus. INATTEN'TIVELY, adv. Disregard; neglect; heedlessness: without care: in an indifferent manner.

Persons keep out of the reach of the reproofs of the ministry, or hear with such inattention or contempt as renders them of little effect. Rogers.

We see a strange inattention to this most important prospect. Id.

Novel lays attract our ravished ears ;

But old, the mind with inattention hears. Pope.

If we indulge the frequent roving of passions, we shall procure an unsteady and inattentive habit.

Watts.

What prodigies can power divine perform More grand than it produces year by year And all in sight of inattentive man? Cowper.

INAU'DIBLE, adj. In and audible. Not to be heard; void of sound.

Let's take the instant by the forward top ; For we are old, and on our quickest decrees The' inaudible and noiseless foot of time Steals, ere we can effect them. Shakspeare.

INAU'GURATE, v.a.) Lat. inauguro. To INAUGURA'TION, n. s. | consecrate, or invest with a new office by solemn rites; to begin with

good omens. The royal olive was solemnly sworn, at his inauguration, to observe these things inviolable. Howel.

At his regal inauguration his old father resigned the kingdom to him. Browne's Vulgar Errours.

And after the manner which the Roman Catholic church before time hath observed in anointing and inaugurating kings, we will anoint and inaugurate him. Milton. Prose Works.

Those beginnings of years were propitious to him, as if kings did chuse remarkable days to inaugurate their favours, that they may appear acts as well of the time as of the will. Wotton.

INAURA'TION, n.s. Lat. inauro. The art of gilding or covering with gold.

The Romans had the art of gilding after our manner; but some sort of their inauration, or gilding, must have been much dearer than ours.

Arbuthnot on Coins.

INAUSPI'CIOUS, adj. In and auspicious. Ill-omened; unlucky; unfortunate.

Oh here

I will set up my overlasting rest; And shake the yoke of inauspicious stars From this world-wearied flesh. Shukspeare. Though Heaven's inauspicious eye Ley black on love's nativity,

Her eye a strong appeal can give ; Beauty, smiles, and love shall live.

Crashaw.

The stars feel not the diseases their inauspicious influence produces. Boyle.

With inauspicious love a wretched swain Pursued the fairest nymph of all the plain ; She plunged him hopeless in a deep despair.

Dryden.

INBE'ING, n.s. In and being. Inherence; inseparableness.

When we say the bowl is round, the boy is witty, these are proper or inherent modes; for they have a sort of inbeing in the substance itself, and do not arise from the addition of any other substance to it.

Watts. IN'BORN, adj. In and born. Innate; implanted by nature.

Led by sense of good,

Inborn to all, I sought my needful food.

Dryden.

All passions being inborn within us, we are almost equally judges of them. Id.

Some Carolina, to Heaven's dictates true, Thy inborn worth with conscious eyes shall see And slight the imperial diadem for thee.

Addison.

Monarch of the climes,

And those who dwell in them ; for, near or far,

Our inborn spirits have a tint of thee,

Even as our outward aspects ;- thou dost rise,

And shine, and set in glory, Fare thee well!

Byron. Manfred.

INBRE'ATHED, adj. In and breathe. Inspired; infused by inspiration.

Blest pair of Syrcns, pledges of Heaven's joy, Sphere-born harmonious sisters Voice and Verse,

Wed your divine sounds, and mixt power employ, Dead things with inbreathed sense, able to pierce.

Milton.

I'NBRED, adj. In and bred. Produced within; hatched or generated within.

My inbred enemy

Forth issued. Milton's Paradise Lost. A man thinks better of his children than they deserve; but there is an impulse of tenderness, and there must be some esteem for the setting of that inbred affection at work. L'Estrange.

But he unmoved contemns their idle threat ; And inbred worth doth boasting valour slight

Dryden.

INCA, or YNCA, an appellation anciently given by the native Peruvians to the kings of that country, and the princes of their blood. Pedro de Cieca, in his Chronicles of Peru, gives the origin of the incas: that country had been for a long time the theatre of all sorts of crimes, war, and dissensions, till at last two brothers appeared, one of whom was called Mango Capac, of whom the Peruvians relate many wonders. He built the city of Cusco, made laws, established order and harmony by his wise regulations; and he and his descendants took the name of inca, which signifies king or great lord. These incas became so powerful, that they rendered themselves masters of all the country from Chili to Quito, and from the Maul on the south to the Augasmago on the north, these two rivers forming the bounds of their empire, which extended above 1300 leagues in length. This they enjoyed till the divisions

between Huascar and Atabalipa; at which time the Spaniards made themselves masters of the country, and destroyed the empire of the incas in 1533.

INCAGE', v.a. In and cage. To coop up; to shut up; to confine in a cage, or any narrow space.

And yet incaged in so small a verge,

Thy waste is no whit lesser than thy lord's.

Shakspeare.

It made my imprisonment a pleasure,

Ay, such a pleasure as incaged birds Id. Henry VI. Conceive.

Concerve. INCALES'CENCE, n. s. Lann the state of growing warm, warmth; incipient heat.

Averroes restrained his hilarity, making no more thercof than Seneca commendeth, and was allowable in Cato; that is, a sober incalescence, and regulated es-Browne. tuation from wine.

The oil preserves the ends of the bones from incalescency, which they, being solid bodies, would necessarily contract from a swift motion. Ray.

Fr. incantation;

INCANTA'TION, n. s. Fr. incantation ; INCAN'TATORY, adj. Lat. incanto. A charm INCAN'TATORY, adj. uttered by singing; enchantment: incantatory, dealing by enchantment; magical.

My antient incantations are too weak,

Shakspeare. Henry VI. And hell too strong. By Adam's heakening to his wife, mankind, by that her incantation, became the subject of labour, sorrow, and death. Raleigh.

The great wonders of witches, their carrying in the air, and transforming themselves into other bodies, as reported to be wrought, not by incantations or ceremonics, but by anointing themselves all over, move a man to think that these fables are the effects of imagination; for ointments, if laid on any thing thick, by stopping of the pores, shut in the vapours, and send them to the head extremely. Bacon's Natural History.

The name of a city being discovered unto their enemies, their penates and patronal gods might be called forth by charms and incantations. Browne.

Fortune-tellers, jugglers, geomancers, and the like incantatory impostors, daily delude them. Id.

The nuptial rites his outrage strait attends ;

The dower desired is his transfigured friends : The incantation backward she repeats,

Inverts her rod, and what she did, defeats.

Garth.

The commands which our religion hath imposed on its followers are not like the absurd ceremonies of pagan idolatry, that might look like incantations and magick, but had no tendency to make mankind the Bentley. happier.

INCAN'TON, v.a. In and canton. To unite to or into a canton or separate community.

When the cantons of Bern and Zurich proposed the incorporating Geneva in the cantons, the Roman Catholies, fearing the protestant interest, proposed the incantoning of Constance as a counterpoise.

Addison on Italy.

INCAPABIL'ITY, n. s. INCA'PABLENESS, n. s. INCA'PABLE, adj. INCAPA'CIOUS, udj. INCAPA'CIOUSNESS, n. S. INCAPACITATE, V. a. INCAPACITY, n. S.

Fr. incapable, incapacité; Lat. in and Want of capax. power or want of room; unable to comprehend, learn, J or understand : in-

ability either in law or fact; in body or mind:

in conversation, a man is said to be incapable of falsehood : incapacious, narrow ; not containing sufficient space : incapacitate, to make weak ; to disable or disqualify : incapacity, a state of inability either corporeal or mental.

Incapable and shallow innocents !

You cannot guess who caused your father's death. Shakspeare.

Is not your father grown incapable

Of reasonable affairs? Is he not stupid

Id. Winter's Tale. With age? You have nothing to urge but a kind of incapability in yourself to the service. Suckling.

Wilmot, when he saw Goring put in the command. thought himself incapable of reparation. Clarendon.

Since now we used in a since now we used in a since now we used in a since a s Since now we find this our empyreal form

It chiefly proceedeth from natural incapacity, and Browne's Vulgar Errours. genial indisposition.

Souls that are made little and incapacious, cannot enlarge their thoughts to take in any great compass of Burnet. times or things.

Admonition he imputes either to envy, or else ignorance and incapacity of estimating his worth.

Government of the Tongue. The inactivity of the soul is its incapacity to be

moved with any thing common. Arbuthnot. Monstrosity could not incapacitate from marriage. Id.

Their lands are almost entirely taken from them, and they are rendered incapable of purchasing any more. Swift.

Nothing of consequence should be left to be done in the last incapacitating hours of life. Claris.

Is it true, as Rousseau asserts, that this language [French], on account of the incessant monotony of the pronunciation, is incapable of harmony. Beattie.

INCARCERA'TION, n. s.) Lat. incarcero. § To INCAR'CERATE, v. u. imprison; confine.

Contagion may be propagated by bodies, that easily incurcerate the infected air; as woollen clothes.

Harvey.

INCARN', v. a. & v. n. INCAR'NADINE, v. a. INCAR'NATE, v. a. & adj. Lat. in and carne. To cover with flesh; to breed flesh : in-INCARNA'TION, n. s. INCAR'NATIVE, n. s.

carnadine, to dye red : incarnate, to clothe with flesh; to embody: incarnation, the act of as-suming a body; the state of breeding flesh: incarnative, a medicine promotive of granulation.

For thee, through wicked entencion, The yere of the incarnacion, A thousande and two hundred yere Five and fifte, ferther ne nere Broughten a boke with sorie grace To yeven ensample in common place. Chaucer. Romaunt of the Rose.

Undoubtedly even the nature of God itself, in the person of the son, is incarnate, and hath taken to it-Hooker. self flesh.

We must beware we exclude not the nature of God from incarnation, and so make the son of God incar-Id. nate not to be very God.

Will all great Neptune's ocean wash this blood Clean from my hand ? No, this my hand will rather The multitudinous sea incarnadine,

Shakopeare. Macbeth. Making the green one red.

INC

A most wise sufficient means of redemption and salvation, by the satisfactory death and obedience of the incarnate son of God, Jesus Christ, God blessed Sanderson. for ever.

Upon the Annunciation, or our Lady-day, meditate on the incarnation of our blessed Saviour. Taylor's Guide to Devotion.

I, who erst contended With gods to sit the highest, am now constrained

Into a beast, and mix with bestial slime, Milton. This essence to incarnate and imbrute.

The slough came off, and the ulcer happily incarned. Wiseman.

The flesh will soon arise in that cut of the bone, make exfoliation of what is necessary, and incarn it.

The pulsation under the cicatrix proceeded from the too lax incarnation of the wound. Id.

I deterged the abscess, and incarned by the com-Id. Surgery. mon incarnative.

But he's possest,

Incarnate with a thousand imps. Swift. They,

Like to incarnate Molochs, feed on ours Until 'tis time to give them to the tombs, Which they have made so populous. Byron.

INCARNATION, in theology, signifies the act whereby the Son of God assumed the human nature; or the mystery by which Jesus Christ, the eternal Word, was made man to accomplish the work of our salvation. The era first used among Christians, whence they numbered their years, is the time of the incarnation, that is, of Christ's conception. This era was first established by Dionysius Exiguus, about the beginning of the sixth century, till which time the era of Dioclesian had been in use. Some time after this it was considered that the years of a man's life were not numbered from the time of his conception, but from that of his birth; which occasioned them to postpone the beginning of this era for a year, retaining the cycle of Dionysius entire in every thing else. See CHRONO-LOGY. At Rome they reckon the years from the birth of Christ on the 25th of December, which custom has obtained from the year 1431. In several other countries they also reckon from the incarnation, but differ as to the day of the incarnation, fixing it, after the primitive manner, not to the day of the birth, but conception of our Saviour. The Florentines retain the day of the birth, and begin their year from Christmas.

INCASE', v. a. In and case. To cover; to inclose; to inwrap.

Rich plates of gold the folding doors inease, Pope's Odyssey.

The pillars silver.

Lat. in and cautus. INCAU'TIOUS, adj. INCAU'TIOUSLY, adv.) Unwary ; negligent ; heedless; indiscreet.

His rhetorical expressions may easily captivate any Keill against Burnet. incantious reader.

A species of palsy invades such as incautiously expose themselves to the morning air. Arbuthnot.

INCEN'DIARY, n.s.	Fr. incendiaire,
IN'CENSE, n. s., v. a. & v. n.	encens; Latin,
INCEN'SEMENT, n. s.	inceado, incen-
INCEN'SION, n. s.	Sdiarius, incensum.
INCEN'SOR, n. s.	One who sets
INCENSORY, n. s.	houses or towns
INCENTIVE, n. s. & adj	on fire ; one who

inflames factions, or promotes quarrels : incense also has a literal and figurative meaning : perfumes exhaled by fire, in honor of deity: to perfume; to enkindle to rage; to inflame with anger; to make furious; to exasperate: incensement, rage or fury (an old word): incension, (also out of use), the act of kindling; the state of being on fire: incensor, an inflamer of passions : incensory, the vessel in which incense is burnt and offered, more commonly called a censer: incentive, that which kindles or provokes; incitement; motive; used either as a spur to good or ill : exerting; encouraging.

> Upon such sacrifices, my Cordelia, The gods themselves throw incense.

Shakspeare. King Lear.

The world, too saucy with the gods,

Incenses them to send destruction.

Id. Julius Cæsar.

If 'gainst yourself you be incensed, we'll put you, Like one that means his proper harm, in manacles. Shakspeare.

He is attended with a desp'rate train;

And what they may incense him to, being apt

To have his car abused, wisdom bids fear. Id.

Tractable obedience is a slave

To each incensed will. Id. Henry VIII. His incensement at this moment is so implacable,

that satisfaction can be none but by pangs of death. Id.

Senna loseth its windiness by decoction, and subtile or windy spirits are taken off by incension or evaporation. Bacon.

Many priests were impetuous and importunate incensors of the rage. Hayward.

Their unreasonable severity was not the least incentive, that blew up into those flames the sparks of discontent. King Charles.

Nor could any order be obtained impartially to examine impudent incendiaries. Id.

Foul idolatries, and other faults,

Heaped to the popular sum, will so incense

God as to leave them. Milton's Paradise Lost.

Congruity of opinions, to our natural constitution, is one great incentive to their reception.

Glanville's Scepsis.

How could my pious son thy power incense? Or what, alas ! is vanquished Troy's offence?

Incendiaries of figure and distinction, who are the inventors and publishers of gross falsehoods, cannot be regarded but with the utmost detestation.

Addison.

It encourages speculative persons, with all the incentives of place, profit, and preferment. Id.

Numa the rites of strict religion knew ;

Prior. On every altar laid the incense duo.

Competency is the most incentive to industry : too little makes men desperate, and too much careless.

Decay of Piety.

His pure thoughts were borne,

Like fumes of sacred incense, o'er the clouds, And wafted thence, on angels' wings, through ways Of light, to the bright source of all. Congreve.

Even the wisdom of God hath not suggested more pressing motives, more powerful incentives to charity, than these, that we shall be judged by it at the last dreadful day. Atterbury.

Several cities of Greece drove them out as incendiaries, and pests of commonweals. Bentley. The breezy call of incense-breathing morn,

The swallow twittering from her straw-built shed,

Dryden.

The cock's shrill clarion, or the echoing horn,

No more shall rouse them from their loncly bed. Gray's Elegy.

Vainly his incense soars, his victim bleeds ; Foor child of Doubt and Death, whose hope is built Byron. Childe Harold. on reeds.

INCENDIARY, in law. A bare attempt to set fire to another's dwelling-house, or out-houses, barn, or stable, unless it absolutely burns, does not fall within the description of incendit et combussit. But the burning and consuming of any part is sufficient; though the fire be afterwards extinguished. It must also be a malicious burning; otherwise it is only a trespass. This crime is called arson. Among the ancients in-cendiaries were burnt. The punishment of arson was death by the ancient Saxon laws and Gothic constitutions; and, in the reign of Edward I., incendiaries were burnt to death. The stat. 8 Hen. VI., c. 6, made the wilful burning of houses, under special circumstances, high treason; but it was reduced to felony by the general acts of Edward VI. and Mary I. This offence was denied the benefit of clergy by 21 Hen. VIII. c. 1, which statute was repealed by 1 Edw. VI. c. 12; and arson was held to be ousted of clergy, with respect to the principal, by inference from the stat. 4 and 5 P. & M. c. 4, which expressly denied it to the accessory; though now it is expressly denied to the principal also, by 9 Geo. I. c. 22. See Arson.

INCENSE, OF FRANKINCENSE, a dry resinous rich perfume, with which the Pagans and Roman Catholics perfume their temples, altars, &c. The word comes from the Latin incensum q. d. burnt. The burning of incense made part of the daily service of the ancient Jewish church. The priests drew lots to know who should offer it: the destined person took a large silver dish, in which was a censer full of incense; and, being accompanied by another priest carrying some live coals from the altar, went into the temple. There, in order to give notice to the people, they struck upon an instrument of brass placed between the temple and the altar; and, being returned to the altar, he who brought the fire left it there, and went away. Then the offerer of the incense waited till the burning of the holocaust; immediately upon which he set fire to the incense. The quantity of incense offered each day was half a pound in the morning, and as much at night. One reason of this continual burning of incense might be, that the effluvia of the multitude of victims continually offered up might have inspired the worshippers rather with disgust and aversion, than awe and reverence, had it not been overpowered by the fragrance of those perfumes.

INCEP'TION, n. s. Lat. inceptio, inceptivus. INCEP'TIVE, adj. The beginning: one who) is in his rudiments. INCEP'TOR, n. s.

The inception of putrefaction hath in it a maturation. Bacon.

An inceptive and desitive proposition, as, the fogs vanish as the sun rises; but the fogs have not yet bcgun to vanish, therefore the sun is not yet risen.

Locke.

INCEPTIVE, a word used by Dr. Willis to express such moments, or first principles, which, though of no magnitude themselves, are yet capable of producing such as are. Thus a point has no magnitude itself, but is inceptive of a line which it produces by its motion. So a line, though it have no breadth, is yet inceptive of breadth; that is, it is capable, by its motion, of producing a surface which has breadth, &c.

INCER'TITUDE, n. s. Fr. incertitude ; Lat.

incertitudo. Uncertainty; doubtfulness. INCES'SANT, adj. Lat. in and cessans. INCES'SANTLY, adv. Unceasing; without intermission; continual; uninterrupted.

Mercie shall I purchase by incessant crying ; The mercies of our Lorde, er, shall I syng.

Chaucer. The Remedie of Love. Both his hands most filthy feculent,

Above the water were on high extent,

And fained to wash themselves incessantly.

Faerie Queene.

The incessant weeping of my wife, Shakspeare. Forced me to seek delays.

Who reads

Incessantly, and to his reading brings not A spirit and judgment equal or superior.

Milton.

If by prayer

Incessant I could hope to change the will Of him who all things can, I would not cease To weary him with my assiduous cries. Id.

The Christians, who carried their religion through so many persecutions, were incessantly comforting one another with the example and history of our Saviour and his apostles. Addison.

In form, a herald of the king she flies From peer to peer, and thus incessant cries.

Pope.

The sun has lost his rage ; his downward orb Shoots nothing now but animating warmth And vital lustre, that, with various ray, Lights up the clouds, those beauteous robes of heaven, Incessant, rolled into romantic shapes Thomson.

The dream of waking fancy. Fr. inceste ; Lat. inces-IN'CEST, n. s. INCEST, n. s. INCEST'UOUS, adj. INCEST'UOUSLY, adv. Criminal connexion of persons within prohibited degrees of affinity : incestuous, guilty of unnatural cohabitation : incestuously, in an unnatural manner.

Is't not a kind of incest to take life From thine own sister's shame? Shakspeare.

Hide me, thou bloody hand, Thou perjure, thou simular of virtue,

That art incestuous. Id. King Lear. If weakness may excuse,

What murderer, what traitor, parrieide, Incestuous, sacrilegious, but may plead it? Milton. Paradise Lost.

When boys shall take their sisters for their mate, And practise incest between seven and eight.

Marves.

Macareus and Canace, son and daughter to Æolus, god of the winds, loved each other incestuously.

Dryden.

Ere you reach to this incestuous love, You must divine and human rights remove.

Id.

He who entered in the first act, a young man like Pericles, prince of Tyre, must not be in danger in the fifth act of committing incest with his daughter.

Id. Dufresnoy.

We may easily guess with what impatience the world would have heard an incestuous Herod discoursing of chastity. South.

INCEST, by the rules of the church, was formerly most absurdly extended even to the seventh degree; but it is now restricted to the third or fourth. Most nations look on incest with horror, In the history of Persia and Egypt excepted. the aucient kings of those countries we meet with instances of brothers marrying their sisters, because they thought it too mean to join in alliance with their own subjects, and still more so to marry into any foreign family. Vortigern, king of South Britain, equalled or rather exceeded them in wickedness, by marrying his own daughter. The late queen of Portugal was mar-ried to her uncle, and the prince of Brasil, the son of that incestuous marriage, was wedded to But they had dispensations for these his aunt. marriages from his holiness!

INCEST, SPIRITUAL, is an ideal crime committed between persons who have a spiritual alliance by means of baptism or confirmation. This ridiculous fancy was made use of, as an instrument of great tyranny, in times when the power of the pope was unlimited, even queens being sometimes divorced upon this pretence.

INCEST, SPIRITUAL, is also understood of a vicar, or other beneficiary, who enjoys both the mother and daughter; that is, holds two benefices, one whereof depends upon the collation of the other. Such spiritual incest renders both the one and the other of these benefices vacant.

IN'CHIPIN, n. S. INCH'MEAT, n. s.

e and the other of Sax. Ince, tuncia, A measure of length supposed equal to three grains

of barley laid end to end : the twelfth part of a foot; a proverbial name for a small quantity; a nice point of time : inch, to drive by inches ; to give sparingly: inched, containing inches in length or breadth : inchipin, some of the inside of a deer: inchmeal, a piece an inch long.

Beldame, I think, we watched you at an inch.

Shakspeare.

The plebeians have got your fellow tribune ;

They'll give him death by inches. Id. Coriolanus. Poor Tom, proud of heart to ride on a bay trotting Id. King Lear. horse over four inched bridges.

All the' infections that the sun sucks up

From bogs, fens, flats, on Prospero fall, and make him

By inchmeal a disease ! Id. Tempest. As in lasting, so in length is man,

Contracted to an inch, who was a span. Donne.

A foot is the sixth part of the stature of a man, a span one eighth of it, and a thumb's breadth or inch one seventy-second. Holder on Time.

Valiant they say, but very popular; He gets too far into the soldiers graces,

And inches out my master. Dryden's Cleomencs. Is it so desirable a condition to consume by inches, and lose one's blood by drops? Collier.

The sun should never miss, in all his race,

Of time one minute, or one inch of space.

Blackmore. The commons were growing by degrees into power and property, gaining ground upon the patricians inch by inch. Swift.

Life's little stage is a small eminence,

Inch-high the grave above. Young's Night Thoughts.

INCH, an island considered part of the county of Donegal, Ireland. It is in the bay

INCHBALD (Mrs. Elizabeth), was the daughter of Mr. J. Simpson, a farmer of Stanningfield, in Suffolk, where she was born in the year 1756. She came to London on the death of her father, and when only sixteen years of age, with a view to obtain a theatrical engagement; where attracting the attention of Mr. Inchbald, then a performer of some note, they married, and she accompanied her husband on several professional tours. After his death she made her debut October 3rd, 1780, at Covent Garden, as Bellario in the play of Philaster. Here she continued about eight years, and from those personal attractions which she retained to a late period, united with considerable natural talents, she was very popular. Retiring from the stage, in 1789, she devoted herself to those literary labors for which she is equally known. Her works consist of A Mogul Tale, a farce, 1784; I'll tell you what, a comedy; Appearance is against them, and the Widow's Vow, farces, 1786; The Child of Nature, a dramatic piece: The Midnight Hour, a farce ; Such Things are, a play, 1788; The Married Man, a comedy, 1789; Next door Neighbours, a comedy; and, A Simple Story, a novel, in four 12mo. vols. in 1791: Every one has his Fault, a comedy, 1793; Wedding Day, a comedy, 1794; Nature and Art, a novel, in two vols. 12mo., 1796 ; Wives as they were, and Maids as they are, a comedy, 1797; Lover's Vows; a play from the German of Kot-zebue, 1798; Wise Man of the East, a comedy, 1799; and to Marry and not to Marry, 1805. She also edited the British Theatre, with biographical and critical remarks, in 25 vols. 12mo., during the period from 1806 to 1809; a similar collection of popular farces, in seven vols. 12mo., and The Modern Theatre, in ten vols. 1809. She died at Kensington, August 1st, 1821, in her sixty-sixth year, having preserved throughout life an unblemished reputation.

INCII-COLM, or Columba, the isle of Columba; an island in the frith of Forth, famous for its monastery. This monastery was founded in 1123, by Alexander I., on the following occasion : In passing the frith of Forth he was overtaken with a violent storm, which drove him to this island, where he met with the most hospitable reception from a poor hermit, then residing here in the chapel of St. Columba, who, for the three days that the king continued there tempest bound, entertained him with the milk of his cow, and a few shell-fish. The king, from the sense of the danger he had escaped, and in gratitude to the saint to whom he attributed his safety, vowed some token of respect; and accordingly founded here a monastery of Augustines, and dedicated it to St. Columba. Allan de Mortimer lord Aberdour, who attended Edward III. in his Scottish expedition, bestowed half of those lands on the monks of this island for the privilege of a family burial place in their church. The buildings made in consequence of the piety of Alexander were very considerable. There are still to be seen a large square tower belonging to the church, the

ruins of the church, and of several other buildings. The wealth of this place in the time of Edward III. proved so strong a temptation to his fleet, then lying in the Forth, that the English landed, and spared not even the furniture more immediately consecrated to divine worship. But, in a storm which instantly followed, many of them perished; those who escaped vowed to make ample recompense to the injured saint. The tempest ceased ; and they made the promised atonement. The Danish monument, figured by Sir Robert Sibbald, lies on the south-east side of the building on a rising ground. It is of a rigid form, and the surface ornamented with scale-like figures. At each end is the representation of a human head.

INCH-EFFRAY, Gael. i. e. the isle of masses, an ancient abbey of Perthshire, now in ruins, seated on a rising ground, formerly sur-rounded by the water of the Po, and belonging to the earl of Kinnoul. It was endowed with many privileges by David I. and Alexander III. Mauritius, abbot of Inch-Effray, was at the battle of Bannockburn. The property of this ancient abbey, and six or seven acres of ground adjacent, constitute lord Kinnoul patron of twelve parishes that were formerly attached to it.

INCH-GARVIE, a small island in the frith of Forth, near Queensferry. It was anciently for-'ified, and after the alarm occasioned by the appearance of Paul Jones and his squadron in the frith in 1779, its fortifications were repaired, and four iron guns, twenty pounders, mounted upor them, and furnished with 100 rounds of ammunition each. An artillery man resides upon it, to take care of the stores. nition each.

INCH-KEITH, a small island in the frith ot Forth, half way between Leith and Kinghorn. Its name was derived from the gallant Keith, who so greatly signalised himself by his valor in 1010, in the battle of Barry, in Angus, against the Danes; after which he received in reward the barony of Keith in Lothian, and this little isle. In 1549 the English fleet, sent by Edward VI. to assist the lords of the congregation against the queen dowager, landed, and began to fortify this island, of the importance of which they grew sensible, after their neglect of securing the port of Leith so lately in their power. They left here five companies to cover the workmen under the command of Cotterel; but their operations were soon interrupted by M. Desse, general of the French auxiliaries, who took the place, after a gallant defence on the part of the English. The Scots kept possession for some years ; but at last the fortifications were destroyed by act of parliament, to prevent it from being of any use to the former.

IN'CHOATE, v. a. & adj. To begin or un-INCHO'ATIVE, udj. dertake: the commencement of any work.

It discerneth of four kinds of causes ; forces, frauds, crimes various of stellionate, and the inchoations or middle acts towards crimes capital, not actually perpetrated. Bacon.

It is neither a substance perfect, nor a substance inchoate, or in the way of norfection.

Ralcigh's History.

672

The setting on foot some of those arts in those parts would be looked upon as the first inchoation of them, which yet would be but their reviving.

Hale's Origin of Manhind.

INCHOFEN, or INCHOFER (Melchior, a learned Jesuit, born at Vienna in 1584. After studying the law, he joined the Jesuits in 1607. He taught philosophy and mathematics at Mes-sina, and published The Blessed Virgin Mary's Letter to the people of Messina proved to be genuine : folio, 1630. This work excited great disturbances. Complaints were preferred against him before the congregation of the Index at Rome, on account of this publication. IIe immediately repaired to the city, vindicated himself, and was allowed to reprint his work, with a small alteration in the title. He wrote several other works, particularly a satire on the Jesuits : and died at Milan, in 1648.

INCIDE,' v.a. IN'CIDENCE, n. s. IN'CIDENCY, n. s. IN'CIDENT, adj. & n. s. > cident, casually: in-INCIDEN'TAL, adj. INCIDEN'TALLY, adv. IN'CIDENTLY, adv.

Lat. incido, to cut; incido, to fall; Fr. incidence. To cut: incidental, accidental; casual; unexpected; J apt to happen: inci-

dental, not intended; not necessary to the chief purpose: incidently, occasionally; by the bye.

As the ordinary course of common affairs is disposed of by general laws, so likewise men's rarer ineident necessities and utilities should be with special equity considered. Hooker.

In mirrours there is the like angle of incidence, from the object of the glass, and from the glass to the eye. Bacon.

It was incidently moved amongst the judges what should be done for the king himself, who was attainted; but resolved that the crown takes away defects. Id. Henry VII.

His wisdom will fall into it as an incident to the point of lawfulness. Id. Holy War.

These general rules are but occasionally and incidentally mentioned in Scripture, rather to manifest unto us a former, than to lay upon us a new obligation. Sanderson.

The satisfaction you received from those incidental Milton. discourses which we have wandered into. I treat either purposely or incidentally of colors.

Boyle.

No person, no ineident in the play, but must be of use to carry on the main design. Dryden.

He enjoys his happy state most when he communicates it, and receives a more vigorous joy from the reflexion than from the direct incidency of his happiness. Norris.

Constancy is such a firmness of friendship as overlooks all those failures of kindness, that through passion, incident to human nature, a man may be guilty South. of.

The direction with which one body strikes upon another, and the angle made by that line, and the plane struck upon, is called the angle of ineidence. In the occursions of two moving bodies, their ineidence is said to be perpendicular or oblique, as their directions or lines of motion make a straight line or an oblique angle at the point of contact. Quiney.

I would note in children not only their articulate answers, but likewise smiles and frowns upon incident occasions. Wotton.

In equal ineidences there is a considerable inequality of refractions, whether it be that some of the in-

The permanent whiteness argues, that in like incidences of the rays there is no such separation of the Newton. emerging rays.

By some, religious duties scarce appear to be regarded at all, and by others only as an incidental business, to be done when they have nothing else to Rogers. do.

The menses are promoted by all saponaceous substances, which incide the mucus in the first passages. Arbuthnot.

In a complex proposition the predicate or subject is sometimes made complex by the pronouns who, which, whose, whom, &c., which make another proposition : as, every man, who is pious, shall be saved. Here the whole proposition is called the primary or chief, and the additional proposition is called an incidental proposition. Watts.

To one who has read the second book of Virgil, Voltaire's Massacre of St. Bartholomew will appear very triffing. It is uninteresting and void of incident; the horrors of it arise upon reflection. Reattie.

INCIDENT, in a poem, is an episode, or particular action joined to the principal action, or de-The poet ought always to make pending on it. choice of such incidents as are susceptible of ornament suitable to the nature of his poem. A variety of incidents well conducted is the beauty of an heroic poem, which ought always to take in a certain number of incidents to suspend the catastrophe that would otherwise break out too soon.

INCIDENT, in law, is a thing appertaining to, or following another, that is more worthy or principal. A court baron is inseparably incident to a manor; and a court of pie-poudre to a fair.

INCIDENT DILIGENCE, in Scots law, a warrant granted by a lord ordinary in the court of session, for citing witnesses to prove any point, or for the production of any writing necessary for preparing the cause for a final determination, or before it goes to a general proof.

Fr. incineration;

INCIN'ERATE, v. a. Fr. incineration; INCINERA'TION, n. s. Lat. in and cineres. To burn to ashes: the act of consuming by fire to ashes.

By baking, without melting, the heat indurateth, then maketh fragile; lastly, it doth incinerate and Bacon. calcinate.

Fire burneth wood, making it first luminous, then black and brittle, and lastly broken and incinerate.

Id.

These dregs are soon incinerated and calcined into such salts which produce coughs.

Harvey on Consumptions. I observed in the fixt salt of urine, brought by dcpuration to be very white, a taste not unlike common salt, and very differing from the caustick lixiviate

taste of other salts made by incineration. Boyle. INCIRCUMSPEC'TION, n. s. In and cir-

cumspection. Want of caution; want of heed. An unexpected way of delusion, whereby he more

easily lcd away the incircumspection of their belief. Browne.

INCISED', adj. INCIS'ION, n. s. INCIS'ION, n. s. INCIS'IVF, adj. Even structure and the second secon) a surgical term; division of viscosities by medicine : INCI'SURF., n. s. Vol. XI.

incisive, having the quality of cutting or dividing : incisor, a cutter; the teeth in the fore part of the mouth : incisure, a cut; an aperture.

Let us make incision for your love,

To prove whose blood is reddest, his or mine. Shakspeare.

God help thee, shallow man : God make incision in thee, thou art raw. Id. As You Like It.

Abstersion is a scouring off, or incision of viscous humours, and making them fluid, and cutting between them and the part; as in nitrous water, which scourcth linen. Bacon.

The colour of many corpuscles will cohere by being precipitated together, and be destroyed by the effusion of very piercing and incisive liquors. Boyle.

The reception of one is as different from the admission of the other, as when the earth falls open under the incisions of the plough, and when it gapes to drink in the dew of heaven, or the refreshments of a shower. South.

Wiseman.

I brought the incised lips together. A small incision knife is more handy than a larger Sharp's Surgery. for opening the bag.

In some creatures it is wide, in some narrow, in some with a deep incisure up into the head, for the better catching and holding of prey, and comminuting of hard food. Derham,

INCITA'TION, n. s.	Lat. incito, incitatio.
INCITE', v.a.	Incitement; incentive;
INCITE MENT, n. s.	motive: impulse: the

act of inciting; the power of inciting; to stir up; to animate; to urge on : incitement, motive; impulse; cause of action.

A marvel it were, if a man of great capacity, having such incitements to make him desirous of all furtherances unto his cause, could espy in the whole scripture of God nothing which might breed at the least a prohable opinion of likelihood, that divine authority was the same way inclinable. Hooker.

How many now in health Shall drop their blood, in approbation Of what your reverence shall incite us to?

Shakspear .

No blown ambition doth our arms incite ; But love, dear love, and our aged father's right. Id.

Antiochus, when he incited Prusias to join in war, set before him the greatness of the Romans, comparing it to a fire, that took and spread from kingdom to kingdom. Bacon.

Hartlib seems sent hither by some good providence, to be the occasion and incitement of great good to this Milton. island.

What if the sun

Be centre to the world, and other stars,

By his attractive virtue and their own

Incited, dance about him various rounds.

Id. Paradise Lost.

Dr. Ridley defines magnetical attraction to be a natural incitation and disposition conforming unto contiguity, an union of one magnetical body unto Browne's Vulgar Errours. another.

The multitude of objects do proportionably multiply both the possibilities and incitations.

Government of the Tongue.

If thou must reform the stubborn times,

From the long records of distant age

Dorive incitements to renew thy rage.

Pope's Statius.

Nature and common reason, in all difficulties, where prudence or courage are required, do rather incite us to fly for assistance to a single person than a Swift. multitude.

2 X

The mind gives not only licence, but incitation to the other passions to act with the utmost impetuosity. Decay of Piety.

Fr. incivil; Lat. in and INCIV'IL, adj. INCIVIL'ITY, n. s. 5 civis. Want of courtesy : rude; unpolished.

Abstain from dissolute langhter, uncomely jests, loud talking and jeering, which, in civil account, are called indecencies and incivilities. Taylor.

He does offend against that reverence which is due to the common apprehensions of mankind, whether true or not, which is the greatest incivility. Tillotson.

Swell, curled waves, high as Jove's roof;

Your incivility doth shew,

That innocence is tempest proof. L'Estrange. Old Song.

INCLEDON (Benjamin Charles), a late eminent vocalist, was born at St. Keveram, in Cornwall, in 1764, his father being a member of the faculty. The fine tones of his voice, and his early taste for music, induced his parents to article him to the celebrated Jackson of Exeter cathedral until he had attained his fifteenth year. He then took an opportunity to quit Exeter abruptly, and entered as a common sailor on board the Formidable, a ninety-eight gun ship, commanded by captain Cleland. He remained in the navy about five years; where his vocal abilities attracting the notice of his officers, especially of lord Mulgrave (then captain Phipps), and admirals Pigott and Hervey, he was advised to try his fortune on the stage; and they gave him letters of recommendation to both Sheridan and Colman. He, however, made his first appearance before an audience in Collins's Southampton Company, in 1783, as Alphonso, in the Castle of Andalusia. At Bath, the following year, he was introduced to the acquaintance of Rauzzini, who gave him the great benefit of his instructions. October, 1790, he first appeared in London, at Covent Garden theatre, and played with great success the character of Dermot, in O'Keefe's farce of the Poor Soldier. Justice was now amply awarded him by the public; and a high degree of popularity attended him, till the infirmities of his advancing years, and an irregular mode of life, compelled him to retire. His voice, a rich tenor of extraordinary power and sweetness, embraced a compass of about fourteen notes in the natural, and ten notes in falsetto; The his intonation also was singularly correct. better sort of the old English ballad was his forte, of which Stevens's Storm, and Gay's Blackeyed Susan, were amongst his best specimens. Shield wrote many airs expressly for him. He died at Worcester 11th of February, 1826, and was buried at Hampstead.

INCLEM'ENCY, n. s. Lat. in and turner Unmerciful; cruel; severe ; rough ; unpitying : it is used more frequently of things than men.

Teach us further by what means to shun The' inclement seasons, rain, ice, hail, and snow. Milton.

And, though by tempests of the prize bereft, In heaven's inclemency some case we find : Our focs we vanquished by our valour left.

Druden.

I stand

Naked, defenceless, on a foreign laud : Propitious to my wants, a vest supply To guard the wretched from the' inclement sky.

Pope.

INCLI'NABLE, adj. Lat. manna, Hav-INCLI'NATORY, adj. Sing a propension of INCLI'NATORILY, adv. will; favorably dis-INCLI'NATORY, adj.

674

INCLINE', v. n. & v. a.) posed; willing; tending by disposition : with to. Inclination, tendency towards any point; natural aptness; propension of mind; disposition or desire; love; affection; regard; disposition: used with to, for the tendency of the magnetic needle to east or west. In pharmacy, the act by which a clear liquor is poured off from some fæces or sediment by only stooping the vessel, which is also called decantation. Inclinatory, and inclinatorily, obliquely; with inclination to one side or the other : incline, to tend; to lean; to give tendency or direction to any place or state; to attend; to bend; to incurvate.

Their hearts inclined to follow Abimelech.

Judges. Her house inclineth unto death, and her paths unto Proverbs ii. 18. the dead.

A marvel it were, if a man of capacity could espy in the whole scripture nothing which might breed a probable opinion that divine authority was the same way inclinable. Hooker.

The gall and bitterness of certain men's writings, who spared him little, made him, for their sakes, the less inclinable to that truth which he himself should have honored. Id.

Doth his majesty

Incline to it, or no?

-He seems indifferent :

Or rather swaying more upon our part.

Shakspeare.

Bid him

Report the features of Octavia, her years,

Her inclination. Id. Antony and Cleopatra. The king was wonderfully disquieted, when he found that the prince was totally aliened from all thoughts of, or inclination to, the marriage.

Clarendon.

The timely dew of sleep, Now falling with soft slumberous weight, inclines Our eye-lids. Milton.

But that from us aught should ascend to heaven

So prevalent, as to concern the mind

Of God high-blest, or to incline his will,

Hard to belief may seem, yet this will prayer. Id. Desire,

Inclinable now grown to touch or taste,

Solicited her longing eye.

Whether they be refrigerated inclinatorily, or somewhat equinoxially, that is, toward the eastern or western points, they discover some verticity.

Browne's Vulgar Errours.

If that inclinatory virtue be destroyed by a touch from the contrary pole, that end which before was clevated will then decline. Id.

We have had few knowing painters, because of the little inclination which princes have for painting.

Dryden.

Id.

With due respect my body I inclined,

Id. As to some being of superior kind. A mere inclination to a thing is not properly a willing of that thing; and yet, in matters of duty, men frequently reckon it for such : for otherwise how should

they so often plead and rest in the honest and well inclined disposition of their minds, when they are justly charged with an actual non-performance of the South. law '

The two rays, being equally refracted, have the same inclination to one another after refraction which they had before; that is, the inclination of half a degree answering to the sun's diameter. Newton.

If such a crust naturally fell, then it was more likely and inclinable to fall this thousand years than the last; but if the crust was always gradually nearer and nearer to falling, that plainly evinces that it had not endured Bentley. eternally.

With him went Doubt, staggering with steps unsure; That every way and neither way inclined.

Fletcher's Purple Island. Still to this place

My heart inclines, still hither turn my eyes ; Rowe.

Though most of the thick woods are grubbed up since the promontory has been cultivated, there are still many spots of it which show the natural inclina-Addison. tion of the soil leans that way.

Thus far both armies to Belinda yield ; Now to the baron fate inclines the field. Pope.

A towering structure to the palace joined ; To this his steps the thoughtful prince inclined. Id

Her very smile was haughty, though so sweet

Her very nod was not an inclination ;

There was a self-will even in her small feet,

As though they were quite conscious of her station. Byron. Don Juan.

INCLIP', v. a. In and clip. To grasp; to enclose; to surround.

Whate'er the ocean pales, or sky inclips,

Is thine, if thou wilt ha't.

Shakspeare. Antony and Cleopatra.

INCLOIS'TER, v.a. In and cloister. To shut up in a cloister.

INCLOUD, v.a. In and cloud. To darken; to obscure.

In their thick breaths,

Rank of gross diet, shall we be inclouded,

And forced to drink their vapour. Shakspeare.

Clusif. INCLUDE,' v. a. Lat. includo; Fr. in-To enclose or INCLU'SIVE, adj. INCLU'SIVELY, adv. Shut in; to comprise, comprehend, or contain in the sum or number : inclusively is the thing mentioned reckoned into the account.

O, would that the inclusive verge

Of golden metal, that must round my brow,

Were red-hot steel, to sear me to the brain !

Shakspeare.

This desire being recommended to her majesty, it liked her to include the same within one intire lease. Bacon.

Thus much shall serve for the several periods or growth of the common law, until the time of Edward I. inclusively. Hale.

For now and since first break of dawn, the Fiend Mere serpent in appearance forth was come, And on his quest, where likeliest he might find The only two of mankind, but in them The whole included race his purposed prey.

Milton's Paradise Lost.

All articulation is made within the mouth, from the throat to the lips inclusively ; and is differenced partly by the organs used in it, and partly by the manner and degree of articulating. Holder.

The marvellous fable includes whatever is supernatural, and especially the machines of the gods.

Pope.

Instead of enquiring whether he be a man of virtue, the question is only whether he be a whig or a tory ; under which terms all good and ill qualities are included. Swift.

I'll search where every virtue dwells.

From courts inclusive down to cells. ľď INCOAG'ULABLE, adj. In and coagulable.

Incapable of concretion. INCOEXISTENCE, n. s. In and coexis-tence. The quality of not existing together; non-association of existence. An unusual word.

Another more incurable part of ignorance, which sets us more remote from a certain knowledge of the coexistence or incoexistence of different ideas in the same subject, is, that there is no discoverable connexion between any secondary quality and those primary qualities it depends on. Locke.

INCOG', adv. Lat. incognitus. A state INCOG'NITO, adv. of concealment; unknown; in private.

But if you'r rough, and use him like a dog,

Depend upon it, he'll remain incog. Addison. 'Twas long ago

Some gods came down incognito. Prior. INCOG'ITANCY, n. s. ? Lat. incogitantia.

§ In and cogito. Want INCOG ITATIVE, adj. of thought; wanting the power of thought.

Next to the stupid and meerly vegetable state of incogitancy, we may rank partial and piece-meal consideration. Decay of Piety.

One man's fancies are laws to succeeders, who afterwards misname all unobsequiousness to their incogitancy presumption. Boyle.

Purely material beings, as clippings of our beards, and sensible, thinking, perceiving beings, such as we find ourselves, we will call cogitative and incogitative beings. Lucke.

INCOHE'RENCE, n. s.	Lat. i	n and	CO-
	haro.		
Incone'rent, adj.	cohesion	; loc	se-
INCOHE'RENTLY, adv.			
parts; want of connexion; in			
dependence of one part upo	n anothe	r: inco	he-

rent, loose ; inconsistent ; inconsequential. If plaister be beaten into an impalpable powder, when poured out it will emulate a liquor, by reason that the smallness and incoherence of the parts do both make them easy to be put into motion, and makes the pores they intercept so small, that they interrupt not the unity or continuity of the mass. Boyle.

I find that laying the intermediate ideas naked, in their due order, shows the incoherence of the argumentations better than syllogisms. Locke.

Incoherences in matter, and suppositions without proofs, put handsomely together, are apt to pass for strong reason. Id

We have instances of perception whilst we are asleep, and retain the memory of them ; but how extravagant and incoherent are they, and how little conformable to the perfection of a rational being ! Id.

Had the strata of stone become solid, but the matter whereof they consist continued lax and incoherent, they had consequently been as pervious as those of marle or gravel. Woodward.

The character of Eurylochus is the imitation of a person confounded with fears, speaking irrationally and incoherently. Broome.

INCOLU'MITY, n.s. Lat. incolumitas. Safe'y; security. A word very little in use.

The parliament is necessary to assert and preserve the national rights of a people, with the incolumity and welfare of a country Howel.

INCOMBUSTIBIL/ITY, n. s.) Lathn in-INCOMBUS'TIBLE, adj. combustus. The quality INCOMBUS'TIBLENESS, n. s. of resisting fire so that it cannot consume : incombustible, not to be consumed by fire.

INC

It agrees in this common quality ascribed unto both, of being incombustible, and not consumable by fire.

Wilkins. The stone in the Appennines is remarkable for its shining quality, and the amianthus for its incombustibility. Ray.

INCOMBUSTIBLE CLOTH. See ASBESTOS. M. Magellan informs us that the Romans enclosed dead bodies in cloth of this kind. In 1756 or 1757 he tells us, that he saw in the Vatican a large piece of asbestos cloth, found in a stone tomb, with the ashes of a Roman, as appeared by the epitaph. The under-librarian, to show that it was incombustible, lighted a candle, and let some drops of wax fall on the cloth, which he set on fire with a candle in his presence, without any detriment to the cloth. Its texture was coarse, but much softer than he could have expected.

IN'COME, n. s. In and come. Revenue; produce of any thing.

No fields afford

So large an income to the village lord.

Dryden.

Thou who repinest at the plenty of thy neighbour, and the greatness of his incomes, consider what are frequently the dismal consequences of all this.

South.

St. Gaul has scarce any lands belonging to it, and little or no income but what arises from its trade ; the great support of this little state is its linen manufacture. Addison on Italy.

Notwithstanding the large incomes annexed to some few of her preferments, this church hath in the whole little to subsist on. Atterbury.

None can say that this was not good advice, The only mischief was, it came too late ; Of all experience 'tis the usual price ; A sort of income tax, laid on by fate.

Byron. Don Juan.

INCOMMENSURABIL'ITY, n. s. Latin, INCOMMEN'SURABLE, adj. 5 INCOMMEN'SURATE, adj. men-

sura. The state of one thing with respect to another, when they cannot be compared by any common measure: not to be reduced to any measure common to both ; not to be measured together, such as that the proportion of one to the other can be told,

The diagonal line and side of a quadrate, which, to our apprehension, are incommensurate, are yet commensurable to the infinite comprehension of the divine intellect. More.

As all other measures of time are reducible to these three; so we labour to reduce these three, though strictly of themselves incommensurate to one another, for civil use, measuring the greater by the less. Holder on Time.

If the year comprehend days, it is but as any greater space of time may be said to comprehend a less, though the less space be incommensurate to the greater. Id.

Our disputations about vacuum or space, incommensurable quantities, the infinite divisibility of matter, and eternal duration, will lead us to see the weakness cf our nature. Watts.

INCOMMENSURABLE, in geometry, is used where two lines, when compared to each other, have no common measure, how small soever, that will exactly measure them both. And, in general, two quantities are said to be incommensurable when no third quantity can be found that is an aliquot part of both.

INCOMMENSURABLE NUMBERS are such as have no common divisor that will divide them both equally.

INCOM'MODATE, v. a.	Lat. incommo-
INCOMMODE', v. a.	dus. To be in-
INCOMMO'DIOUS, adj.	convenient to;
INCOMMO'DIOUSLY, adv.	(to embarrass;
INCOMMO'DIOUSNESS, n. s.	to hinder: in-
INCOMMOD'ITY, n. s.	commodious,

vexatious without much mischief : incommodity, trouble ; inconvenience.

Declare your opinion, what incommodity you have conceived to be in the common law, which I would have thought most free from all such dislike.

Spenser's State of Ireland.

Things of general benefit, for in this world what is so perfect that no inconvenience doth ever follow it? may by some accident be incommodious to a few.

Hooker.

If iron can be incorporated with fint or stone, without over great charge, or other incommodity, the cheapness doth make the compound stuff profitable.

Bacon. A gnat, planted upon the horn of a bull, begged the bull's pardon ; but rather than incommode ye, says he, I'll remove. L'Estrange.

Men's intentions in speaking are to be understood, without frequent explanations and incommodious interruptions. Locke.

Diseases, disorders, and the incommodiousness of external nature, are inconsistent with happiness.

Burnet.

By considering the region and the winds, one might so cast the rooms, which shall most need fire, that he should little fear the incommodity of smoak.

Wotton's Architecture.

Although they sometimes molest and incommode the inhabitants, yet the agent, whereby both the one and the other is effected, is of that indispensable necessity to the earth and to mankind, that they could not subsist without it. Woodward.

INCOMMUNICABIL'ITY, n. s.~	Latin, in
INCOMMU'NICABLE, adj.	privative,
	and com-
	munico

Not impartible; not to be made the property of more than one; not to be expressed. uttered, or told : incommunicating, having no intercourse.

They cannot ask more than I can give, may I but reserve to myself the incommunicable jewel of my King Charles. conscience.

To annihilate is both in reason, and by the consent of divines, as incommunicably the effect of a power divine, and above nature, as is creation itself.

Hakewill on Providence.

The judgments and administrations of common justice are preserved from that confusion that would ensue, if the administration was by several incommunicating hands, or by provincial establishments.

Hale's Common Law.

Light without darkness is the incommunicable claim of him that dwells in light inaccessible. Glanville.

It was agreed on both sides, that there was one supreme excellency, which was incommunicable to any creature. Stillingfleet.

Neither did he treat them with these peculiarities of favor ic the extraordinary discoveries of the gospel only, but also of those incommunicable revelations of the diving love, in reference to their own personal South. interest in it.

INCOMPACT, adj. In and compacted. Not INCOMPAC'TED, adj. Sjoined; not cohering.

Salt, say they, is the basis of solidity and permanency in compound bodies, without which the other four elements might be variously blended, but would remain incompacted. Boyle.

INCOM'PARABLE, adj.) Lat. in, com-INCOM'PARABLY, adv. § paro, and comparabilis. Excellent beyond compare, or competition; done in a manner beyond all praise.

A founder it had, whom I think incomparably the wisest man that ever the French church did enjoy, since the hour it enjoyed him. Hooker.

A most incomparable man, breathed as it were To an untirable and continuate goodness.

Shakspeare. Her words do shew her wit incomparable. Id. Now this mask

Was cried incomparable, and the ensuing night Made it a fool and beggar. Id. Henry VIII.

My heart would not suffer me to omit any occasion, whereby I might make the incomparable Pamela see how much extraordinary devotion I bore to her service. Sidney.

If I could leave this argument of your incomparable beauty, I might turn to one which would equally oppress me with its greatness. Dryden.

Self-preservation will oblige a man voluntarily to undergo any less evil, to secure himself but from the probability of an evil incomparably greater.

South.

There are the heads of Antoninus Pius, the Faustinas, and Marcus Aurelius, all incomparably well Addison on Italy. cut.

INCOMPAS'SIONATE, adj. In and com-

INCOMPATIBLL'ITY, n.s. INCOMPATIBLL'ITY, n.s. INCOMPATIBLE, adj. INCOMPATIBLY, adv.

petibility. Inconsistent with something else; such as cannot subsist or cannot be possessed together with something else : it is followed by with, sometimes with to; a state or manner which is inconsistent with something else.

Fortune and love have ever been so incompatible, that it is no wonder, madam, if, having had so much of the one for you, I have ever found so little of the other for myself. Suckling.

The reason of the stress rests not upon the incompetibility of excess of one infinitude above another either in intension or extension; but the incompetibility of any multitude to be infinite. Hale.

The repugnancy of infinitude is equally incompetible to continued or successive motion, and depends upon the incompossibility of things successive with infinitude. Id.

We know those colours which have a friendship with each other, and those which are incompatible, by mixing together those colours of which we would Dryden. make trial.

Sense I have proved to be incompatible with mere bodies, even those of the most compound and cla-Bentley. borate textures.

May not the outward expressions of love in many good Christians he greater to some other object than to God ? Or is this incompetible with the sincerity of the love of God. Hammond.

INCOM'PETENCY, n. s. Fr. incompe-Stence; Lat. in INCOM'PETENT, adj.) and competo. In-INCOM'PETENTLY, adv. ability; want of qualification : not suitable; inadequate. In the civil law it denotes a defect of right to do any thing.

Richard III. had a resolution, out of hatred to his brethren, to disable their issues, upon false and incompetent pretexts, the one of attainder, the other of illegitimation. Bucon.

Our not being able to discern the motion of a shadow of a dial-plate, or that of the index upon a clock, ought to make us sensible of the incompetency of our eyes to discern some motions of natural bodics incomparably slower than these. Boule.

I thank you for the commission you have given me : how I have acquitted myself of it must be left to the opinion of the world, in spight of any protestation which I can enter against the present age, as incompetent or corrupt judges. Dryden.

Laymen, with equal advantages of parts, are not the most incompetent judges of sacred things. Id.

Every speck does not blind a man, nor does every infirmity make one unable to discern, or incompetent to reprove, the grosser faults of others

Government of the Tonque.

An equal attraction on all sides of all matter is just equal to no attraction at all; and by this means all the motion in the universe must proceed from external impulse alone, which is an incompetent cause for the formation of a world. Bentley.

INCOMPLETE, adj. Lat. in and com-INCOMPLETE'NESS, n. s.) pletus. These words denote an imperfect unfinished state.

It pleaseth him in mercy to account himself incomplete, and maimed without us. Hooker.

The incompleteness of our seraphick lover's happiness, in his fruitions, proceeds not from their want of satisfactoriness, but of an intire possession. Boyle.

In incomplete ideas we are apt to impose on ourselves, and wrangle with others, especially where they have particular and familiar names. Locke.

INCOMPLI'ANCE, n. s. Untractableness; obstinacy; refusal of compliance.

Self-conceit produces previshness and incompliance of humour in things lawful and indifferent. Tillotson.

Consider the vast disproportion between the worst inconveniences that can attend our incompliance with men, and the eternal displeasure of an offended God. Rogers.

INCOMPOSED,' adj. In and composed. Disturbed; discomposed; disordered. Not much used.

Somewhat incomposed they are in their trimming, and extraordinary tender of their young ones.

Howel.

Thus Satan; and him the Anarch old, With faltering speech and visage incomposed,

Answered. I know thee stranger who thou art.

INCOMPOSSIBIL/ITY, n. s. } Latin, in, con, possum. Quality of being not possible but by the negation or destruction of something: inconsistency with something.

Though the repugnancy of infinitude be equally incompetible to continued or successive motion, and depends upon the incompossibility of the very nature of things successive or extensive with infinitude, yet that incompossibility is more conspicuous in discrete quantity, that ariseth from individuals already actually Hale's Origin of Mankind. distinguished.

INCOMPREHENSIBIL'ITY, n.s.

INCOMPREHEN'SIBLE, adi. INCOMPREHEN'SIBLENESS, n. s.

INCOMPREHEN'SIBLY, adv. J sibilité; Lat. in, con, prehendo. That which cannot be taken hold of or conceived in the mind: an old sense of these words, now out of use was, not to be contained : in this sense incomprehensible is used by Hooker.

Presence every where is the sequel of an infinite and *incomprehensible* substance; for what can be every where but that which can no where be comprehended ? Hooker.

Hew incomprehensibly glorious is the light that is in thee, since one glimpse of this created light, gave so lively a glory to all thy workmanship ! Bp. Hall. Stars that seem to roli

Spaces incomprehensible.

Milton.

And last of all that unutterable incomprehensible mystery of two natures united into one person, and again of one and the same nature diffused into a triple personality. South's Sermons.

I conclude that for any one to deny or reject the mysteries of our religion as impossible, because of the imcomprehensibleness of them, is upon all true principles, both of divinity and philosophy, utterly inconsequent and irrational.

The laws of vegetation and propagation are the arbitrary pleasure of God, and may vary in manners incomprehensible to our imaginations. Bentley.

His precepts tend to the improving and perfecting the most valuable part of us, and annexing incomprehensible rewards as an eternal weight of glory.

Hammond.

I might argue from God's incomprehensibleness : if we could believe nothing but what we have ideas of, it would be impossible for us to believe God is incomprehensible. Watts.

thensible. INCOMPRESS'IBLE, adj. } Lat. 1 pressus. Lat. in, con, Not capable of being compressed into less space.

Hardness is the reason why water is incompressible, when the air lodged in it is exhausted. Cheyne.

INCONCUR'RING, adj. Lat. in, con, curro. Not concurring.

They derive effects not only from inconcurring causes, but things devoid of efficiency. Browne.

INCONCEAL'ABLE, adj. Lat. in con celo. Not to be hid; not to be kept secret.

The inconcealable imperfections of ourselves will hourly prompt us our corruption, and loudly tell us we are sons of earth. Browne.

INCONCEIV'ABLE, adj. Latin, conceptus. Latin, in and Not

to be conceived : INCONCEP'TIBLE, adj. in a manner or degree beyond human comprehension: inconceptible is obsolete, it has a similar meaning.

It is inconceptible how any such man, that hath stood the shock of an eternal duration without corruption, should after be corrupted. Hale.

It is inconceivable to me, that a spiritual substance should represent an extended figure. Locke.

Does that man take a rational course to preserve himself, who refuses the endurance of those lesser troubles, to secure himself from a condition inconceivably more miserable ? South.

How two ethers can be diffused through all space, one of which acts upon the other, and by consequence is reacted upon, without retarding, shattering, dispersing, and confounding one another's motions, is inconceivable. Newton's Opticks.

Such are Christ's promises, divine inconceivable promises: a bliss to be enjoyed to all eternity, and that by way of return for a weak obedience of sor ? few years. Hammond.

They fall into a contrary extreme, and would persuade us, that the attributes of God are all alike inconceivable to us as they are in themselves, and can be known no way except by analogy. Bolingbroke.

INCONCLU'DENT, adj. Lat. cludo. Lat. in and con-Inferring INCONCLU'SIVELY, adv. Inconcelusiveness, n. s. Inconcelusiveness, n. s. determination of the mind : to reason inconclusively is without any such evidence as determines the understanding: inconclusiveness, want of rational cogency.

A man, unskilful in syllogism, at first hearing, could perceive the weakness and inconclusiveness of a long, artificial, and plausible discourse, wherewith some others, better skilled in syllogism, have been misled.

Locke.

R

The depositions of witnesses themselves, as being false, various, contrariant, single, inconcludent.

Ayliffe's Parergon.

INCONCOCT', adj. Lat. in and communication of the digested is these INCONCOCTIED, adj. Unripened; immature; INCONCOCTION, n. s. Not fully digested: these words are nearly useless.

The middle action, which produceth such imperfect bodies, is fitly called inquination, or inconcoction, which is a kind of putrefaction.

Bacon's Natural History.

While the body, to be converted and altered, is too strong for the efficient that should convert it, it is all that while crude and inconcoct ; and the process is to be called cruidity and inconcoction. Bacen.

I understand, remember, and reason better in my riper years, than when I was a child, and had my organical parts less digested and inconcocted. Hale.

INCON'DITE, adj. Lat. incorditus. Irregular; rude; unpolished.

Now sportive youth

Carol incondite rhimes with suiting Lotes,

Phillips. And quaver inharmonious.

INCONDIT'IONAL, adj. Lat Lat. in and con-Without exception, limitation, or stipulation; not restrained by conditions; absolute.

From that which is but crue in a qualified sense, an inconditional and absolute verity is inferred.

Browne.

They ascribe to God, in relation to every man, an eternal, unchangeable, and inconditionate decree of Boyle. election or reprobation.

INCONFOR'MITY, n.s. Lat. in, cum, forma. In and conformity. Incompliance with the practice of others.

We have thought their opinion to be, that utter inconformity with the church of Rome was not an extremity whereunto we should be drawn for a time, but the very mediocrity itself, wherein they meant we should ever continue. Hooker.

INCONFU'SION, n. s. Lat. in and eonfusus. In and confusion. Distinctness. Not used.

The cause of the confusion in sounds, and the inconfusion in species visible, is, for that the sight worketh in right lines, and so there can be no coincidence in the eye; but sounds that move in oblique and

incom-

prehen-

e the other. INCONGRUENCE, n. s. Ifr. incongruità; Ital. incongruità; Latin incongruo. Incon'gruous, adj. Want of adapta-INCON'GRUOUSLY, adv.

tion : incongruity, unsuitableness; absurdity; want of agreement with something else; want of symmetry; not fitting to the kind or occasion.

This werke who so shal se, or yrede,

Of incongruite doe me not impeche.

Chaucer. Remedie of Love. She, whom after what form soe'er we see,

Is discord and rude incongruity;

She, she is dead, she's dead.

Humidity is but relative, and depends upon the congruity or incongruence of the component particles of the liquor to the pores of the bodies it touches. Boyle.

The fathers make use of this acknowledgment of the incongruity of images to the Deity, from thence to prove the incongruity of the worship of them.

Stillingfleet.

Donne.

Wiser heathens condemned the worship of God as incongruous to a divine nature, and a disparagement to the deity. Id.

To avoid absurdities and incongrutties, is the same law established for both arts : the painter is not to paint a cloud at the bottom of a picture, nor the poet to place what is proper to the end in the beginning of a poem. Dryden.

INCONNEX'EDLY, adv. In and connex. Lat. in and connecto, to bind together. Without any connexion or dependence. Little used.

Others ascribed hercto, as a cause, what perhaps Browne. but casually or inconnexedly succeeds.

٠

6.

.

In and con-INCON'SCIONABLE, [adj.] scionable. Lat. in and conscius. Void of the sense of good and evil; without influence of conscience. Not used.

So inconscionable are these common people, and so little feeling have they of God, or their own souls' good. Spenser.

INCON'SEQUENCE, n. s.) Lat. in and Sconsequor; Fr. Incon'sequent, adj. inconsequence. Want of just inference in reasoning; without suitable conclusions.

The ground he assumes is unsound, and his illation from thence deduced inconsequent. Hakewill.

Men rest not in false apprehensions without absurd and inconsequent deductions from fallacious foundations, and misapprehended mediums, erecting conclusions no way inferrible from their premises. Browne's Vulgar Errours.

This he bestows the name of many fallacies upon ; and runs on with shewing the inconsequence of it, as though he did in earnest believe it were an impertinent answer. Stillingfleet.

And yet as absurd, as fallacious, and inconsequent as this way of discoursing is, it is one of the chief foundations of the doctrine of merit, and consequently of the religion of too great a part of the world.

South's Sermons. Latin in and consideratio.

notice; trifling;

of little value;

of

Unworthy

INCONSID'ERABLE, adj.) INCONSID'ERABLENESS, n. s. Inconsid'erate, adj. INCONSID'ERATELY, adv.

INCONSID'ERATENESS, n. s.

J small in INCONSIDERA'TION, n.s importance : inconsiderate, from inconsideratus, careless; inadvertent; inattentive: want of thought; negligence; inattention: used both of persons and things.

The king, transported with just wrath, inconsiderately fighting and precipitating the charge, before his whole numbers came up, was slain in the pursuit. Bacon.

When thy inconsiderate hand

Flings ope this casement with my trembling name, Then think this name alive, and that thou thus Donne. In it offendest my genius.

S. Gregory reckons uncleanness to be the parent of blindness of mind, inconsideration, precipitancy or gid-Taylor. diness in actions, and self-love.

I am an inconsiderable fellow, and know nothing. Denham.

If you lament it,

That which now looks like justice will be thought Id. Sophy. An inconsiderate rashness.

He who laid down his life for the redemption of the transgressions, which were under the first Testament, cannot be so inconsiderate of our frailties.

Decay of Piety.

Lat. in and consto.

Not compatible

If men do know and believe that there is such a being as God, not to demean ourselves towards him as becomes our relation to him is great stupidity and Tillotson. inconsiderateness.

The most inconsiderable of creatures may at some time or other come to revenge itself upon the greatest. L'Estrange.

From the consideration of our smallness and inconsiderableness, in respect of the greatness and splendor of heavenly bodies, let us with the holy psalmist raise up our hearts. Ray on the Creation.

Joseph was delighted with Mariamne's conversation, and endeavoured with all his art to set out the excess of Herod's passion for her; but, when he still found her cold and incredulous, he inconsiderately told her the private orders he left behind. Addison.

It is a very unhappy token of our corruption, that there should be any so inconsiderate among us as to Id. Freeholder. sacrifice morality to politicks.

May not planets and comets perform their motions more freely, and with less resistance, in this ethereal medium, than in any fluid which fills all space adequately without leaving any pores, and by consequence is much denser than quicksilver or gold ? And may not its resistance be so small as to be inconsiderable ? Newton.

Let no sin appear small or inconsiderable by which an almighty God is offended, and eternal salvation endangered. Rogers.

If we were under any real fear of the papists, it would be hard to think us so stupid not to be equally apprehensive with others, since we are likely to be the greatest sufferers; but we look upon them to be altogether as inconsiderable as the women and children. Swift.

INCONSIS'TING, adj. INCONSIS'TENCE, n. s. Swith: inconsistency, INCONSIS'TENCY, n. s. INCONSIS'TENT, adj. Such opposition as Inconsis'TENTLY, adv. Sthat one proposition

infers the negation of the other; such contrariety that both cannot be together; absurdity; incongruity : inconsistent, unsuitable ; unsteady ; changeable; contrary; with self-contradiction.

Finding no kind of compliance, but sharp protestations against the demands, as inconsistent with conscience, justice, or religion, the conference broke off. Clarendon.

The persons and actions of a farce are all unnatural, and the manners false; that is, inconsisting with the characters of mankind. Dryden's Dufresnoy.

The idea of an infinite space or duration is very obscure and confused, because it is made up of two parts very different, if not inconsistent. Locke.

INC

There is a perfect inconsistency between that which is of debt, and that which is of free gift. South.

Mutability of temper, and inconsistency with ourselves, is the greatest weakness of human nature.

Addison.

Compositions of this nature, when thus restrained, shew that wisdom and virtue are far from being inconsistent with politeness and good humour.

Id. Freeholder. If a man would register all his opinions upon love, politics, religion, and learning, what a bundle of inconsistencies and contradictions would appear at last. Swift.

When inconsistent with a greater good, Reason commands to cast the less away.

Dr. Johnson's Irene.

INCON'SOLABLE, adj. Fr. inconsolable; Lat. in and consolor. Not to be comforted; sorrowful beyond susceptibility of comfort.

Her women will represent to me that she is inconsolable, by reason of my unkindness. Addison.

They take pleasure in an obstinate grief, in rendering themselves inconsolable. Fiddes's Sermon.

INCON'SONANCY, n.s. Lat. in and consono. Disagreement with itself.

INCONSPIC'UOUS, adj. Lat. in and con-spicio. In and conspicuous. Indiscernible; not perceptible by the sight.

When an excellent experimenter had taken pains in accurately filling up a tube of mercury, we found that yet there remained store of inconspicuous bubbles. Boyle.

INCON'STANCY, n. s. Fr. inconstant; INCON'STANT, adj. Lat. in and consto. INCON'STANT, adj. Unsteadiness; mutability; diversity. Inconstant, wavering; not firm in resolution; various of inclination; wanting perseverance; applicable to persons.

Your inconstance is your confusion.

Chaucer. The Sompnoures Tale. I have suffered more for their sakes, more than the villaiuous inconstancy of man is able to bear.

Shakspeare.

O swear not by the moon, th' inconstant moon, That monthly changes in her circled orb,

Lest that thy love prove likewise variable. Id. Be made the mark

For all the people's hate, the princess' curses, And his son's rage, or the old king's inconstancy. Denham.

I do not think it a mark of inconstancy to accommodate our measures, as we do the course which we steer at sea, to the winds and storms of the political horizon. Milton's Prose Works.

Inconstant Sylvia, when yet

I had not found him counterfeit,

One morning (I remember well)

Tyed in this silver chain and bell,

Gave it to me, nay, and I know

What he said then ; I'm sure I do. Marvell. He is so naturally inconstant, that I marvel his soul finds not some way to kill his body. Sidney.

O Virtue you affect, inconstancy you practise.

Otway's Orphan.

Trust not a man, we are by nature false,

Dissembling, subtile, cruel, and inconstant. Id. Where Unpreparedness is encountred with unexpected Force, Weakness with Violence, Inconstancy with Importunity, there Destruction must needs be not the effect of chance but nature, and by the dosest connexion of causes unavoidable.

Irresolution on the schemes of life which offer to our choice and inconstancy in pursuing them are the greatest causes of all our unhappiness. Addison.

As much inconstancy and confusion is there in their mixtures or combinations; for it is rare to find any of them pure and unmixt. Woodward.

Inconstant, blind, Deserting friends at need, and duped by foes. Thomson.

I hate inconstancy-I loathe, detest,

Abhor, condemn, abjure, the mortal made Of such quicksilver clay, that in his breast

No permanent foundation can be laid.

Byron. Don Juan.

INCONSU'MABLE, adj. Lat. in and conwasted, spent, or brought to an end : not to be destroyed by fire.

Before I give any answer to this objection of pretended inconsumptible lights, I would gladly see the effect undoubtedly proved. Digby on Bodies.

By art were weaved napkins, shirts, and coats, inconsumable by fire, and wherein they burnt the Lodies of kings. Browne.

INCONTES'TABLE, adj.) Fr. incontestable ; Lat. in and INCONTES'TABLY, adv. contestor. Not to be disputed, debated, or controverted : clear beyond all doubt.

Our own being furnishes us with an evident and incontestable proof of a Deity; and I believe no body can avoid the cogency of it, who will carefully attend to it. Locke.

INCONTIGUOUS, adj. Lat. in and contigo. In and contiguous. Not touching each other; not joined together.

They seemed part of small bracelets, consisting of equally little incontiguous beads. Boyle.

INCON'TINENCE, n. s. Lat. m and con-tineo. Inability to INCON'TINENT, adj. frestrain the pas-sions : unchaste ; INCON'TIMENTLY, adv.

indulging unlawful pleasures: an old meaning of incontinent and incontinently is, shunning delay; immediately.

Men shall be lovers of their own selves, faise accusers, incontinent, fierce. 2 Tim. iii, 3.

They ran towards the far rebounded noise,

To weet what wight so loudly did lament ;

Unto the place they came incontinent.

Spenser. Faerie Queene Dispersed all their troupe incontinent,

And sent them home to tell a pitcous tale

Of their vaine prowesse turned to their proper bale. Id.

He says he will return incontinent.

Shakspeare. The cognizance of her incontinency

Is this; she hath bought the name of whore thus dearly. Id.

In these degrees have they made a pair of stairs to marriage, which they will climb incontinent, or else be incontinent before marriage. Id.

Come, mourn with me for what I do lament,

And put on sullen black incontinent.

Id. Richard II.

The cause of this war is no other than that we will not incontinently submit ourselves to our neighbours. Hayward.

But beauty, like the fair Hesperian tree, Laden with blooming gold, had need the guard Of dragon-watch with uninchanted eye, To save her blossoms, and defend her fruit From the rash hand of boild incontinence. Milton. This is my defence :

I pleased myself, I shunned incontinence, And, urged by strong desires, indulged my sense.

Druden.

The words sine veste Dianam agree better with Livia, who had the fame of chastity, than with either of the Julias, who were both noted of incontinency. Id.

Incontinently I left Madrid, and have been dogged and waylaid through several nations.

Arbuthnot and Pope.

INCONTINENCE, in medicine, signifies an inability in any of the organs to retain what should not be discharged without the concurrence of the will. It is most frequently used with regard to a diabetes, or an involuntary discharge of urine. See MEDICINE.

INCONTROVER'TIBLE, adj. ? Lat. in. INCONTROVER'TIBLY, adv. S controverto. Indisputable; to a degree beyond controversy or dispute.

The Hebrew is incontrovertibly the primitive and surest text to rely upon; and, to preserve the same uncorrupt, there hath been used the highest caution humanity could invent. Browne's Vulgar Errours.

When any tenet is generally received and adopted as an incontrovertible principle, we seldom look back to the arguments upon which it was first established.

Johnson's Rambler,

INCONVE'NIENCE, n. s. Venient; Lat. in venient; Lat. in S and convenio. Unfitness; inex-INCONVE'NIENT, adj. INCONVE'NIENTLY, adv. pedience; cause of uneasiness; disadvantage: inconvenient, unfit; incommodious; unseason-

able ; not agreeing either in time, place, or occasion. Seying the manyfolde inconvenience

Falling by unbrydled prosperite

Whiche is not tempered with moral prudence,

Moved I am, bothe by right and equite,

To youthe's wele somwhat for to endite.

Chaucer. Prologue to the Remedie of Love.

They lean to their own customs, though they be more unjust, and more inconvenient for the common people. Spenser on Ireland.

We are not to look that the church should change her publick laws, although it chance that for some particular men the same he found inconvenient, especially when there may be other remedy against particular inconveniences. Hooker.

They plead against the inconveniences, not the unlawfulness of popish apparel; and against the inconvenience, not the unlawfulness of ceremonies in burial. Id.

There is a place upon the top of mount Athos above all clouds of rain, or other inconvenience. Raleigh's History.

Man is liable to a great many inconveniences every moment, and is continually unsecure even of life itself. Tillotson.

The inconvenience of old age makes him incapable of corporal pleasures. Druden.

Would not quickness of sensation be an inconvenience to an animal, that must lie still where chance has once placed it? Locke.

He knows that to be inconvenient, which we falsely think convenient for us. Smalridge.

Consider the disproportion between the worst inconveniences that stand in compliance with men, and the eternal displeasure of God. Rogers.

We are freed from many inconveniences, and we enjoy several advantages. Atterbury.

The things of another world, being distant, operate but faintly upon us; to remedy this inconveniency, we must frequently revolve their certainty and importance.

Id.

The next amusement mortgages our fields ; Slight inconvenience prisons hardly frown,

From hateful time if prisons set us free. Young. Another inconvenience attending private education is the suppressing of the principle of emulation, without which, it rarely happens that a boy prosecutes his studies with alacrity or success. Beattie.

This country, with its eyes open to all the inconveniences of the connexion, but with its memory full of all its benefits, and with all the feelings belonging to them, renewed solemnly the previously existing obligations. Canning.

INCONVER'SABLE, adj. Lat. in and con-versor. In and conversable. Incommunicative; ill-qualified by temper for conversation; unsocial.

He is a person very inconversable. More.

INCONVER'TIBLE, adj. Lat. in and converto. In and convertible. Not transmutable; incapable of change.

It entereth not the veins, but taketh leave of the permeant parts, and accompanieth the inconvertible portion unto the siege.

INCONVIN'CIBLE, adj. Lat. in and con-inconvirue, adv. vincor. Not to be convinced; incapable of conviction.

It is injurious unto knowledge obstinately and inconvincibly to side with any one. Browne.

INCO'NY, adj. Perhaps from in and conn, to know. Unlearned ; artless. This sense is uncertain. In Scotland it denotes mischie-vously unlucky: as, he's an *incony* fellow. This seems to be the meaning of Shakspeare.

O' my troth, most sweet jests, most incony vulgar wit.

When it comes so smoothly off.

Shakspeare.

5	
INCOR'PORAL, adj.) Fr. incor-
INCORPORAL'ITY, n. s.	porel; Lat.
INCOR'PORALLY, adv.	in and cor-
INCOR'PORATE, v. a., v. n. & adj.	pus. These
INCORPORATION, n. s.	Swords have
INCORPO'REAL, adj.	opposite
INCORPO'REALLY, adv.	meanings :
INCORPORE'ITY, n. s.	incorporal,
INCORPSE', v. a.	incorpora-

lity, incorporally, signify immaterial; distinct from matter, as do also incorporeal, incorporeally; incorporate is to mingle into a mass; to conjoin as one body; to form into a corporation; to unite, associate, embody: incorporeity is immateriality : incorpse, to unite in one body; in the former words in is used as a privative, in the latter it has the force of increase or addition.

The apostle affirmeth plainly of all men Christian, that be they Jews or Gentiles, bond or free, they are all incorporated into one company, they all make but one body. Hooker

In him we actually are, by our actual incorporation into that society which hath him for their head.

Villainous thoughts, Roderigo, when these mutualties so marshal the way, hard at hand comes the master and main exercise, the incorporate conclusion.

Shakspeare. Othello.

Who the swelling clouds in bladders ties, To mollify the stubborn clods with rain,

And scattered dust incorporate again ? Sandus. By your leaves, you shall not stay alone

'Till holy church incorporate two in one.

Upon my knees

I charm you, by that great vow

Which did incorporate and make us one. Id. It is Casca, one incorporate

To our attempts. Id. Julius Cæsar. Your most grave belly was deliberate,

Not rash, like his accusers, and thus answered :

True is it, my incorporate friends, quoth he,

That I receive the general food at first,

Which you do live upon. Id. Coriolanus. Why do'st thou bend thine eye on vacancy, And with the incorporal air doest hold discourse ?

Shakspeare.

He grew unto his seat,

As he had been incorpsed and demy-natured

Id. Hamlet. With the brave horse. Moses forebore to speak of angels, and things invisible and incorporate. Raleigh.

It is a virtue which may be called incorporeal and immateriate, whereof there be in nature but few.

Bacon.

Id.

Id.

Shakspeare.

682

Hearing striketh the spirits more immediately than the other senses, and more incorporeally than the smelling. Id.

Make proof of the incorporation of iron with flint; for if it can be incorporated without over great charge, the cheapness of the flint doth make the compound stuff profitable. Id.

This, with some little additional, may further the intrinsick incorporation. Id. Natural History.

The same is incorporated with a majority, and nameth burgesses to parliament. Carew. Death and I

Are found eternal, and incorporate hoth. Milton. Thy soul

In real darkness of the body dwells,

Shut out from outward light,

T' incorporate with gloomy night.

Thus incorporeal spirits to smallest forms

Reduced their shapes immense.

Courtesy, that seemed incorporated in his heart, would not be persuaded by danger to offer any offence. Sidney.

It is not universally true, that acid salts and oils will not incorporate or mingle. Boyle.

Sense and perception must necessarily proceed from some incorporeal substance within us. Bentley.

The idolaters, who worshipped their images as gods, supposed some spirit to be incorporated therein, and so to make together with it a person fit to receive a worship. Stillingfleet.

All this learning is ignoble and mechanical among them, and the Confutian only essential and incorporate in their government. Temple.

It finds the mind unprepossessed with any former notions, and so easily gains upon the assent, grows up with it, and incorporates into it. South.

The Romans did not subdue a country to put the inhabitants to fire and sword, but to incorporate them into their own community. Addison's Freeholder.

Incorporated minds will always feel some inclination towards exterior acts, ritual observances.

Johnson. Rambler.

INCORPORATIONS, or trades, in the polity of the Royal boroughs of Scotland, are societies of tradesmen or artists, incorporated by royal charter, and endowed with certain exclusive privileges, agreeably to the nature of their respective professions. Their number varies in the different roya: boroughs, and they have more or less share in the government of their respective burghs according to the constitution of each. See Corpo-RATION.

INCORRECT', adj. INCORRECT'LY, adv. INCORRECT'NESS, n.s. INCOR'RIGIBLE, adj. INCOR'RIGIBLENESS, n. s. INCOR'RIGIBLY, adv.

Lat. in and corrigo. That which is faulty or cannot be corrected; inaccurate; full of J faults : incorrigi-

ble, applied to persons who cannot be reformed or amended, and to things which cannot be improved: incorrigibleness, hopeless depravity: incorrigibly, wicked beyond the possibility of reform.

Some men appear incorrigibly mad.

They cleanliness and company renounce.

Roscommon. What we call penitence becomes a sad attestation of our incorrigibleness. Decay of Piety.

Provoked by these incorrigible fools,

I left declaiming in pedantick schools. Dryden. What are their thoughts of things, but variety of incorrigible error? L'Estrange.

I would not have chiding used, much less blows, 'till obstinacy and incorrigibleness make it absolutely necessary. Locke.

Whilst we are incorrigible, God may in vengeauce continue to chastise us with the judgment of war. Smalridge.

The piece you think is incorrect : why take it ;

I'm all submission; what you'd have it, make it.

Pope.

The most violent party-men are such as have discovered least sense of religion or morality; and when such are laid aside, as shall be found incorrigible, it will be no difficulty to reconcile the rest. Swift.

INCORRUPT,' adj. I'r. incorruptible : INCORRUP'TED, adj. Lat. in and cor-INCORRUPTIBIL'ITY, n. s. { ruptus. Pure in INCORRUP'TIBLE, adj. conduct and prin-INCORRUP'TION, n. s. ciples; free from J depravity : incor-INCORRUPT'NESS, n. s.

ruptibility, insusceptibleness of corruption or decay: incorruptible, not admitting decay; pure: incorruptness, purity of manners; honesty; integrity. A mind above the power of bribes is incorruptible.

So also is the resurrection of the dead : it is sown in corruption, it is raised in incorruption. 1 Cor.

Philo, in his book of the world's incorruptibility, alledgeth the verses of a Greek tragick poet.

Hakewill.

Sin, that first

Distempered all things, and, of incorrupt,

Milton's Paradise Lost Corrupted. In such abundance lies our choice,

As leaves a great store of fruit untouched,

Still hanging incorruptible.

Probity of mind, integrity, and incorrutpness of manners, is preferable to fine parts and subtile specu-Woodward. lations.

Our bodies shall be changed into incorruptible and immortal substances, our souls he entertained with the most ravishing objects, and both continue happy Wake. throughout all eternity.

INCORRUPTIBILES, INCORRUPTIBLES, in ecclesiastical history, the name of a sect which sprang out of the Eutychians. Their distinguishing tenet was, that the body of Jesus Christ was

Id.

incorruptible; by which they meant, that after, and from the time wherein he was formed in the womb of his holy mother, he was not susceptible of any change or alteration; not even of any natural and innocent passions, as of hunger, thirst, &c.; so that he eat without any occasion before his death, as well as after his resurrection. And hence they took their name.

And hence they took that InCRAS'SATE, v. a. INCRAS'SATE, v. a. INCRAS'ATIVE, n. s. INCRAS'SATIVE, n. s. The act of thickening, and the state of growing thick, are called incrassation: incrassate, to make thick: incrassative, having the quality of thickening.

The two latter indicate restringents to stanch, and *incrassatives* to thicken the blood. Harvey.

Nothing doth conglaciate but water; for the determination of quicksilver is fixation, that of milk coagulation, and that of oil incrassation. Browne.

If the cork be too light to sink under the surface, the body of water may be attenuated with spirits of wine; if too heavy, it may be *incrassated* with salt. *Id. Vulgar Errours.*

Acids dissolve or attenuate; alcalies precipitate or incrassate. Newton's Opticks.

Acids, such as are austere, as unripe fruits, produce too great a stricture of the fibres, *inerassate* and coagulate the fluids; from whence pains and rheumatism. *Arbuthnot*.

INCREASE', v. n., v. u., & n. s. Lat. in INCREA'SER, n. s. and cresco. To grow more in number, or greater in bulk; to advance in quantity or value, or in any quality capable of being more or less; to be fertile; to make more or greater: increase, augmentation; addition to the original stock; produce; generation; progeny; the state of waxing or growing

full orbed : increaser, he who increases. Take thou no usury of him nor *increase*. Levit. Hear and observe to do it, that it may be well with thee, and that ye may *increase* mightily.

Dent. vi. 3. He hath increased in Judah mourning and lamentation.

I will increase the famine. Ezek. v. 16.

I will increase them with men like a flock.

Id. xxxvi. Profane and vain babbling will *increase* unto more ungodliness. 2 *Tim.* ii, 16.

Hye thee from this slaughter-house,

Lest thou *increase* the number of the dead. Shakspeare.

Into her womb convey sterility;

Dry up in her the organs of increase,

And from her derogate body never spring a babe. Id.

Seeds, hair, nails, hedges, and herbs, will grow soonest, if set or cut in the *increase* of the moon. Bacon's Natural History.

Upon his shield a palm-tree still increased,

Though many weights its rising arms depressed : His word was, ' Rising most, hy being most oppressed.' *Fletcher's Purple Island.*

As Hesiod sings, spread waters o'er thy field, And a most just and glad *increase* 'twill yield.

Denham. Our maker bids increase; who bids abstain But our destroyer, foe to God and man? Milton.

Fishes are more numerous or increasing than beasts

or birds, as appears by their numerous spawn. Hale. It serves to *increase* that treasuro, or to preserve it. Temple.

683

From fifty to threeseore he loses not much in fancy; and judgment, the effect of observation, still increases. Dryden.

For three years he lived with large *increase* In arms of honour, and esteemed in peace.

In arms of honour, and esteemed in peace. Id. Those grains which grew produced an increase beyond expectation. Mortimer's Husbandry.

Henry, in knots, involved his Emma's name Upon this tree; and, as the tender mark,

Grew with the year and widened with the bark: Venus had heard the virgin's soft address,

That as the wound the passion might increase.

Prior.

Since the desire is infinite, nothing but the absolute and *increased* Infinite can adequately fill it. *Cheyne*.

Him young Thoasa bore the bright increase Of Phorcys. Pope's Odyssey.

Hail, bards triumphant ! born in happier days, Whose honours with increase of ages grow,

As streams roll down, enlarging as they flow. Pope.

Methinks they both, as we recede from them, Appear to join the innumerable stars

Which are around us, and as we move on Increase their myriads. Byron's Cain.

INCREDIBIL'ITY, n. s. INCRED'IBLE, adj. INCRED'IBLENESS, n. s. INCRED'IBLY, adv. INCRED'LITY, n. s. INCRED'ULOUS, adj. INCRED'ULOUS, adj. INCRED'ULOUS, adj.

INCRED'ULOUSNESS, n.s.) of being not to be believed. Incredulity, hardness of belief; refusal of credit to testimony; the state or disposition of unbelief.

The ship Argo, that there might want no *incredible* thing in this fable, spoke to them. Raleigh.

He was more large in the description of paradise, to take away all scruple from the *incredulity* of future ages. Id.

I am not altogether *incredulous* but there may be such candles as are made of salamander's wood, bemg a kind of mineral which whiteneth in the burning, and consumeth not. Bacon.

Yet God has wrought things as *ineredible* For his people of old : what hinders now?

Milton's Samson Agonistes.

For objects of *incredibility*, none are so removed from all appearance of truth as those of Corneille's Andromede. Dryden.

Presenting things impossible to view,

They wander through incredible to true.

Granville.

INCRE'MABLE, *adj.* Lat. *in* and *cremo*. Not consumable by fire.

If from the skin of the salamander these incremable pieces are composed. Browne's Vulgar Errours.

IN'CREMENT, n. s. Lat. incrementum. The act of growing greater; increase or produce.

Divers conceptions are concerning the Nile's increment, or inundation. Browne's Vulgar Errours. The orchard loves to wave

With Winter winds : the loosened roots then drink Large increment, earnest of happy years. Phillips.

This stratum is expanded at top, serving as the seminary that furnisheth matter for the formation and *increment* of animal and vegetable bodies.

Woodward.

IN'CREPATE, v.a. Lat. increpo, incre-INCREPA'TION, n.s. patio. To chide: reprehension.

Hammond.

INCRUST', v. a. INCRUST', v. a. INCRUST'ATTON, n. s. Fr. incruster; Latin incrusto. To cover with An additional coat adhering to the internal matter; a covering; something superinduced.

The finer part of the wood will be turned into air, and the grosser stick baked and *incrustate* upon the sides of the vessel. Bacon.

Having such a prodigious stock of marble, their chapels are laid over with such a rich variety of *incrustations* as cannot be found in any other part.

Addison on Italy. Some rivers bring forth spars, and other mineral matter so as to cover and *incrust* the stones.

Woodward.

Any of these sun-like bodies in the centres of the several vortices, are so *incrustated* and weakened as to be carried about in the vortex of the true sun.

Cheyne.

Save but our army, and let Jove *incrust* Swords, pikes, and guns, with everlasting rust.

Pope. The shield was purchased by Woodward, who incrusted it with a new rust. Arbuthnot and Pope.

How was my heart *incrust ed* by the world; O how self-fettered was my grov'ling soul. Young.

IN'CUBATE, v. n. INCUBATION, n. s. IN'CUBUS, n. s. hatch them. Incubus, the night-mare.

Women may now go safely up and down;

In every bush, and under every tree,

Ther is none other Incubus but he

And he ne will don hem no dishonour.

Chaucer. The Wif of Bathes Tale. Whether that vitality was by incubation, or how else, is only known to God. Raleigh.

Birds have eggs enough at first conceived in them to serve them, allowing such a proportion for every year as will serve for one or two *incubations*. Ray.

The incubus is an inflation of the membranes of the stomach, which hinders the motion of the diaphragma, lungs, and pulse, with a sense of a weight oppressing the breast, F/loyer,

As the white of an egg, by *incubation*, so can the serum by the action of the fibres be attenuated.

Arbuthnot.

When the whole tribe of birds by *incubation*, produce their young, it is a wonderful deviation, that some few families should do it in a more novercal way. Derham.

INCUBUS, or Night Mare, is a disease consisting in oppression of the breast, so very violent, that the patient cannot speak or even breathe. The Greeks call it $\epsilon \phi i a \lambda \tau \eta c_s q$. d. leaper, or one that rusheth on a person. In this disease the senses are not quite lost, but drowned and astonished, as is the understanding and imagination; so that the patient seems to think some huge weight thrown on him, ready to strangle him. Children are very liable to this distemper; so are corpulent people, and men of much study and application of mind, by reason the stomach in all these finds some difficulty in digestion.

INCUL'CATE, v. a. Jincul'cate, n. s.

Fr. inculquer; Lat. inculco. To impress by frequent admonitious; to enforce by repetition. Inculcation, repeated admonition.

Manifest truth may deserve sometimes to be inculcated, because we are too apt to forget it. Atterbury.

Homer continually inculcates morality and piety to the gods. Broome's Notes to Pope's Odyssey.

His teachers would have known what peculiar precepts and examples it was most expedient to *inculcate* upon him. Beattie.

INCULT', adj. Fr. incultus; Lat. inculte. Uncultivated; untilled.

Her forests huge,

Incult, robust and tall, by Nature's hand Planted of old. Thomson's Autumn.

INCUL'PABLE, adj. } Latin inculpabilis. INCUL'PABLY, adv. SNot deserving blame: not in a responsible manner.

As to errors or infirmities, the frailty of man's condition has invincibly, and therefore *inculpably*, exposed him. South.

Ignorance, so far as it may he resolved into natural inability, is, as to men at least, *inculpable*, and consequently not the object of scorn, but pity. *Id*.

INCUM'BENCY, n.s. Latin, incumbo. INCUM'BENT, adj. & n.s. The act of lying upon another; the state of keeping a benefice. Incumbent, resting; lying upon; imposed as a duty; obligatory. Incumbent, the present possessor of an ecclesiastical benefice.

Then with expanded wings he steers his flight Aloft, *incumbent* on the dusky air,

That felt unusual weight. Milton's Paradise Lost.

The ascending parcels of air, having now little more than the weight of the *incumbent* water to surmount, were able both so to expand themselves as to fill up that part of the pipe which they pervaded, and, by pressing every way against the sides of it, to lift upwards with them what water they found above them. Boyle.

With wings expanded wide ourselves we'll rear, And fly incumbent on the dusky air. Dryden.

There is a double duty incumbent upon us in the exercise of our powers. L'Estrange.

Thus, if we think and act, we shall shew ourselves duly mindful not only of the advantages we receive from thence, but of the obligations also which are *incumbent* upon us. Atterburg.

In many places the whole ecclesiastical dues are in lay hands, and the *incumbent* lieth at the mercy of his patron. Swift.

These fines are only to be paid to the bishop, during his *incumbency* in the same see. Id.

Man is the destined prey of pestilence,

And o'er his guilty domes

She draws a close incumbent cloud of death. Thomson.

While full of death, and fierce with ten-fold frost The long long night, *incumbent* o'er their heads, Falls horrible. Id.

Here the rebel giants lye;

And, when to move the *incumbent* load they try, Ascending vapours on the day prevail. Addison.

But though there were only one nation, one family, or one person, upon the earth, certain duties would

or one person, upon the earth, certain duties would be incumbent on that nation, family or person. Beattie.

An INCUMBENT, or minister, resident on his benefice, is so called, because he does, or at least ought to, bend his whole study to discharge the cure of his church. INCUM'BER, v. a. Fr. encombrer. To embarrass. See Encumber.

My cause is called, and that long looked-for day Is still encumbered with some new delay. Dryden.

INCUR', v. u. Lat. incurro ; Span. in-INCUR'SION, n. s. Currir ; Ital. incorrere. To

INCUR'SION, *n. s.* (*currir*; Ital. *incorrere*. To become liable to blame or punishment; to press on the senses: incursion, a hostile attack; invasion, without conquest; inroad; ravage.

Spain is very weak at home, or very slow to move, when they suffered a small fleet of English to make an hostile invasion, or *incursion*, upon their havens and roads. Bacon.

The motions of the minute parts of bodies are invisible, and *incur* not to the eye; but yet they are to be deprehended by experience. Id.

I have incurred displeasure from inferiors for giving way to the faults of others. Hayward.

They, not obeying,

10,

521

Incurred, what could they less ? the penalty ;

And, manifold in sin, deserved to fall. Milton. So judge thou still, presumptuous! 'till the wrath, Which thou *incurrest* by flying, meet thy flight Sevenfold, and scourge that wisdom back to hell.

Id.

Now the Parthian king hath gathered all his host Against the Scythian, whose *incursions* wild Have wasted Sogdiana. Id.

Sternly he pronounced

The rigid interdiction, which resounds

Yet dreadful in mine ear, though in my choice Not to incur. Id. Puradise Lost.

The mind of man, even in spirituals, acts with corporeal dependance; and so is he helped or hindered in its operations, according to the different quality of external objects that *incur into* the senses. South.

Sins of daily *incursion*, and such as human frailty is unavoidably liable to. *Id*.

They had a full persuasive that not to do it were to desert God, and consequently to *incur* damnation. Id.

The incursions of the Goths disordered the affairs of the Roman empire. Arbuthnot on Coins.

To imitate the fictions and sentiments of Spenser can *insur* no reproach; for allegory is perhaps one of the most pleasing vehicles of instruction.

Johnson's Rambler. Fr. incurabilité ;

INCURABIL'ITY, n. s. Incu'rable, adj. Incu'rableness, n. s. Incu'rabley, adv.

Latin *in* and *curo*. Impossibility of cure : remediless ; not to be removed

Incu'rious, *adj.* **J** not to be removed by medicine: these words are used principally with reference to bodily disease; but also in a figurative sense, as descriptive of any state which is beyond remedy.: incurious is negligent; inattentive.

If I bide here, life can I not sustain; If I go hence my peines be *incurable*: Where him to finde, I knowe no place certain; And thus I ne wote, of these things twain, Whiche I maie take, and which I maie refuse; My hert is wounded, heron to think or muse. *Chaucer. Lament of Mary Magdaleine.*

Pause not; for the present time's so sick, That present medicine must be ministered, Or overthrow *incurable* ensues. Shahspeare. Stop the rage betime,

Before the wound do grow incurable ;

For being green, there is great hope of help. Id.

We'll instantly open a door to the manner of a proper and improper consumption, together with the

reason of the *incurability* of the former, and facile cure of the other. Hurvey.

No man withholds thee, nothing from thy hand Fear I incurable; bring up thy van;

My heels are fettered, but my fist is free.

Milton. Samson Agonistes. We cannot know it is or is not, being incurably ignorant. Locke.

A schirrus is not absolutely *incurable*, because it has been known that fresh pasture has cured it in cattle. *Arbuthnot*.

The Creator did not bestow so much skill upon his creatures, to be looked upon with a carcless *incurious* cyc. Derham.

He seldom at the park appeared ;

Yet, not incurious, was inclined

To know the converse of mankind. Swift. If idiots and lunaticks cannot he found, incurables may be taken into the hospital. Id.

But ah! what woes remain ! life rolls apace And that *incurable* disease old age,

In youthful bodies more severely felt,

More steruly active, shakes their blasted prime.

Armstrong.

INCURVA'TION, n. s. 7	Lat. incurvo. The	
INCUR'VATE, v.a.	act of bending ; the	
	state of being bent;	
flexion of the body in token of reverence: to		
crook : a change from a straight line.		

One part moving while the other rests, one would think, should cause an *incurvation* in the line.

Glanville.

The incurvity of a dolphin must be taken not really, but in appearance, when they leap above water, and suddenly shoot down again : strait bodies, in a sudden motion, pretruded obliquely downward, appear crooked. Browne.

He made use of acts of worship which God hath appropriated; as *incurvation*, and sacrifice.

Stillingflect.

Sir Isaac Newton has shewn, by several experiments of rays passing by the edges of bodies, that they are *incurvated* by the action of these bodies.

Cheyne.

IN'DAGATE, v. a. INDAGA'TION, n. a. INDAGA'TON, n. s. INDAGA'TON, n. s. indagator, an examiner.

Part hath been discovered by himself, and some by human indagation. Browne's Vulgar Errours.

The number of the elements of bodies requires to be searched into by such skilful *indagators* of nature. Boyle.

Paracelsus directs us, in the *indagation* of colours, to have an eye principally upon salts. Boyle.

INDART', v. a. In and dart. To dart in; to strike in.

I'll look to like, if looking liking move ;

But no more deep will I indart mine eye,

Than your consent gives strength to make it fly.

INDEBT, v. a. Lat. in and debeo. To

INDERT'ED, *adj.* **;** put into debt; to oblige or put under obligation : indebted, obliged by something received ; bound to restitution ; having incurred a debt. It has *to* before the person to whom the debt is due, and *for* before the thing received.

Forgive us our sins, for we forgive every one that is *indebted* to us. Luke xi. 4.

If the course of politick affairs cannot in any good course go forward without fit instruments, and that

Shakspeare.

which fitteth them be their virtues, let polity acknowledge itself indebted to religion, godliness being the chiefest top and well-spring of all true virtues, even Hooker. as God is of all things.

He for himself

Indebted and undone, has nought to bring.

Milton.

Let us represent to our souls the love and beneficence for which we daily stand indebted to God. Rogers.

Few consider how much we are indebted to government, because few can represent how wretched mankind would be without it. Atterbury. This blest alliance may

Th' indebted nation bounteously repay.

Granville.

We are wholly indebted for them to our ancestors. Swift.

Thy forehead wrapt in clouds,

A leafless branch thy sceptre, and thy throne,

A sliding car indebted to no wheels. Cowper. For the most valuable comforts of life we are in-

debted to the social and benevolent attentions of one another. Beattie.

Friends fail-slaves fly-and all betray-and more Than all the most indebted-but a heart

That loves without self-love. 'Tis here-now prove it. Byron.

INDE'CENCY, n. s. INDE'CENT, adj.

Fr. indecence; Lat. in and decet. Any thing unbecoming;

INDE'CENTLY, adv. any thing contrary to good manners; something wrong, but scarcely criminal: unfit to be seen or heard.

If on they rushed, repulse

Repcated, and indecent overthrow

Doubled, would render them yet more despised, And to their foes a laughter.

Milton's Paradise Lost.

Characters, where obscene words were proper in their mouths, but very indecent to be heard. Dryden.

He will in vain endeavour to reform indecency in his pupil, which he allows in himself. Locke.

Till these men can prove these things, ordered by our church, to be either intrinsically unlawful or indecent, the use of them, as established amongst us, is South. necessary.

And it is abominable, because it abounds in filthy Beattie. and indecent images.

INDECID'UOUS, adj. Lat. in, de, cado In and deciduous. Not falling; not shed. Used of trees that do not shed their leaves in winter.

We find the statue of the sun framed with rays about the head, which were the indeciduous and unshaken locks of Apollo. Browne.

INDECLI'NABLE, adj. Fr. indeclinable; Not varied by terminations. Lat. indeclinabilis.

Pondo is an indeclinable word, and when it is joined to numbers it signifies libra. Arbuthnot.

INDEC'OROUS, adj. Lat. in, decus, inde-INDECO'RUM, n. s. Scorus. Conduct unsuitable, unsemly, and improper: unbecoming.

What can be more indecorous than for a creature to violate the commands, and trample upon the authority, of that awful Excellence to whom he owes his life ? Norris.

The soft address, the castigated grace,

Are indecorums in the modern maid. Young.

Belg. inde dædt; Teut. INDEED', adv. inder that, i.e. that is truly. See DEED. In reality; in truth : used emphatically to express

Some, who have not deserved judgment of death, have been for their goods' sake caught up and carried streight to the bough : a thing indeed very pitiful and Spenser. horrible.

Though such assemblies he had indeed for Religion's sake, hurtful nevertheless they may prove as well in regard of their fitness to serve the turn of hereticks, and such as privily will venture to instil their poison Hooker. into new minds.

Then didst thou utter, I am yours for ever, 'Tis grace indeed. Shakspeare.

Against these forces were prepared to the number of near one hundred ships; not so great of bulk indeed, but of a more nimble motion. Bacon.

I said I thought it was confederacy between the juggler and the two servants; tho' indeed I had no reason so to think. Id.

Borrows in mean affairs his subjects' pains ;

But things of weight and consequence indeed, Himself doth in his chamber them debate.

Davies.

Yet loving indeed, and therefore constant.

Sidney.

This limitation, indeed, of our author will save those the labour who would look for Adam's heir among the race of brutes; but will very little contribute to the discovery of one next heir amongst men. Locke.

Such sons of Abraham, how highly soever they may have the luck to be thought of, are far from being Israelites indeed. South.

There is indeed no great pleasure in visiting these magazines of war, after one has seen two or three of them. Addison.

There is nothing in the world more generally dreaded, and yet less to be feared, than death : indeed, for those unhappy men whose hopes terminate in this life, no wonder if the prospect of another Wake. seems terrible and amazing.

When young indeed

In full content, we sometimes nobly rest,

Unanxious for ourselves.

Young.

Milton.

It is indeed true that habits of long acquaintance Beattie will sometimes overcome dislike.

Indeed a certain fair and fairy one Of the best class, and better than her class.

Byron. Don Juan.

I dread it, indeed, but upon far other grounds; 1 dread it from a consciousness of the tremendous power Great Britain possesses of pushing hostilities in which she may be engaged to consequences which I shudder to contemplate. Canning.

Spanish and INDEFAT'IGABLE, adj.) § French, indefati-INDEFAT'IGABLY, adv. gable; Lat. in and defatigo. Unwearied; not exhausted with labor; diligent: without intermission, and without tiring.

Who shall spread his airy flight,

Unborne with indefatigable wings,

Over the vast abrupt.

A man indefatigably zealous in the service of the church and state, and whose writings have highly Dryden. deserved of both.

The ambitious person must rise early and sit up late, and pursue his design with a constant indefatigable attendance : he must be infinitely patient and servile. South.

INDEFECTIBIL'ITY, n. s. (Lat. in and *i* defectus. The INDEFEC'TIBLE, adj. quality of suffering no decay, decline, or defect : unfailing; constant.

INDÉFEI'SIBLE, adj. Fr. indefaisable. Not to be cut off; not to be vacated; irrevocable.

So indefeisible is our estate in those joys, that, if we do not sell it in reversion, we shall, when once invested, be beyond the possibility of ill husbandry. Decay of Piety.

INDEFEN'SIBLE, adj. Lat. in and defensus. That cannot be defended or maintained.

As they extend the rule of consulting Scripture to all the actions of common life, even so far as to the taking up of a straw, so it is altogether false or inde-Sanderson, fensible.

sible. INDEF'INITE, adj. Fr. maejan, , indefinite; Lat. indefi-Not determined or limited; undecided; large beyond human comprehension, although not absolutely without limits: quantity not limited or defined.

We observe that custom, whereunto St. Paul alludeth, and whereof the fathers of the church in their writings make often mention, to shew indefinitely what was done; but not universally to bind for ever all prayers unto one only fashion of utterance. Hooker.

Though a position should be wholly rejected, yet that negative is more pregnant of direction than an indefinite; as ashes are more generative than dust.

Bacon's Essays.

Her advancement was left indefinite ; but thus, that it should be as great as ever any former queen Bacon. of England bad.

They arise to a strange and prodigious multitude, if not indefinitude, by their various positions, combinations, and conjunctions. Hale.

We conceive no more than the letter beareth; that is, four times, or indefinitely more than thrice.

Browne.

Tragedy and picture are more narrowly circumscribed by place and time than the epick poem ; and the time of this last is left indefinite. Dryden.

If the word be indefinitely extended, that is, so far as no human intellect can fancy any bounds of it, then Ray. what we see must be the least part.

Though it is not infinite, it may be indefinite; though it is not boundless in itself, it may be so to Spectator. human comprehension.

A duty to which all are indefinitely obliged, upon some occasions, by the expressed command of God. Smalridge.

INDELIB'ERATE, ulj. Fr. mutuer. Unpremeditated; done without consideration.

Actions proceeding from blandishments, or sweet persuasions, if they be indeliberated, as in children, who want the use of reason, are not presently free Bramhall. actions.

The love of God better can consist with the indeliberate commissions of many sins, than with an allowed Government of the Tongue. persistance in any one.

INDEL'IBLE, adj. Fr. indelebile; Lat. indelebilis. Not to be blotted out or effaced; not to be annulled.

Wilful perpetration of unworthy actions brands with indelible characters the name and memory.

King Charles.

They are indued with indelible power from above to feed, to govern this household, and to consecrate pastors and stewards of it to the world's end. Sprat.

Thy heedless sleeve will drink the coloured oil, And spot indelible thy pocket soil. Gay's Trivia.

INDEL'ICACY, n. s. Latin in and deliciæ; INDEL'ICATE, adj. Shence delicatus. Want of decency; coarseness of appearance or manner : inelegant. See DELICACY.

Your papers would be chargeable with worse than indelicacy, they would be immoral, did you treat detestable uncleanness as you rally an impertinent selflove. Addison.

INDEMNIFICA'TION, n. s.	Fr. indem-
INDEM'NIFY, v. a.	nité ; Ital. in-
	demnita; in,

and Lat. damno. Security against loss; reimbursement of penalty or loss, and security from punishment: to preserve from injury.

I will use all means, both of amnesty and indemnity, which may most fully remove all fears, and bury all jealousies in forgetfulness. King Charles.

Insolent signifies rude and haughty, indemnify to keep safe. Wutts.

Just laws, to be sure, and admirable equity, if a stranger is to collect a mob which is to set half Manchester on fire; and the burnt half is to come upon the other half for indemnity, while the stranger goes off unquestioned, by the stage ! Canning.

INDENT', v. a., v. n. & n. s. Fr. aenic, Ital. indentare; "INDENTA'TION, n. s.

INDENT'URE, n. s. Latin in and dens; a tooth. To mark any thing with inequalities like a row of teeth; to cut in and out; to make a wave or undulate. Indent, from the method of cutting counterparts of a contract together, that, laid on each other, they may fit, and any want of conformity may discover a fraud; to contract; to bargain; to make a compact. Indent, inequality ; incisure. Indentation, waving in any figure. Indenture, a covenant, so named because the counterparts are indented or cut one by the other; a contract of which there is a counterpart.

In Hall's chronicle much good matter is quite marred with indenture English.

Ascham's Schoolmaster.

Trent shall not wind with such a deep indent. To rob me of so rich a bottom here. Shakspeare.

Shall we buy treason, and indent with fears, When they have lost and forfeited themselves?

Id.

About his neck

A green and gilded snake had wreathed itself, Who with her head, nimble in threats, approached

The opening of his mouth ; but suddenly,

Seeing Orlando, unlinked itself,

And with indented glides did slip away

Into a bush. Id. As You Like It. He descends into the solemnity of a pact and cove-

nant, and has indented with us. Decay of Piety. Trent, who, like some earth-born giant, spreads

His thirty arms along the indented meads. Milton. The scrpent then, not with indented wave, Prone on the ground, as since; but on his rear Circular base of rising folds, that towered Fold above fold, a surging maze !

Id.

The margins do not terminate in a straight line, but are indented, each indentation being continued in a small ridge, to the indentation that answers it on the opposite margin. Woodward.

The margins on each side do not terminate in a straight line, but are indented. Id.

The critick to his grief will find

How firmly these indentures bind. Swift.

INDEPEN'DENCE, n. s. French indepen-INDEPEN'DENCY, n. s. French indepen-dance; in, and INDEPEN'DENT, adj. & n. s. Latin, dependeo. INDEPEN'DENTLY, adv. Freedom; ex-

emption from control: not depending; not supported by any other; not relying on another; not controlled. It is used with on, of, or from, the object; of which on seems most proper, since we say to depend on, and consequently dependent on; not relating to any thing else as its superior. Independent, one who holds that every congregation is a complete church, subject, in religious matters, to no superior authority. Independently, without reference to other things or subjects.

We shall, in our sermons, take occasion to justify such passages in our liturgy as have been unjustly quarrelled at by presbyterians, independents, or other puritan sectaries. Sanderson.

Dispose lights and shadows, without finishing every thing independently the one of the other. Dryden.

Since all princes of independent governments are in a state of nature, the world never was without men in Locke. that state.

Creation must needs infer providence, and God's making the world irrefragably proves that he governs it too; or that a being of dependent nature remains nevertheless independent upon him in that respect.

South.

Id.

Dreams may give us some idea of the great excellency of a human soul, and some intimations of its independency on matter. Addison.

A very famous independent minister was head of a college in those times. Id. Spectator.

The town of St. Gaul is a protestant republick, independent of the abbot, and under the protection of the cantons. Addison.

The consideration of our understanding, which is an incorporeal substance independent from matter; and the contemplation of our own bodies, which have all the stamps and characters of excellent contrivance; these alone do very easily guide us to the wise Author of all things. Bentley.

Let fortune do her worst, whatever she makes us lose, as long as she never makes us lose our honesty and our independence. Pope.

Give me, I cried, enough for mc,

My bread and independency :

So bought an annual rent or two,

And lived just as you see I do.

Hail! Independence, hail! Heaven's next best gift To that of life and an immortal soul !

Thomson's Liberty. I praise you much, ye meek and patient pair, For ye are worthy; chusing rather far

A dry but independent crust, hard earned.

And eaten with a sigh, than to endure

The rugged frowns and insolent rebuffs

Of knaves in office.

Cowper. He was as independent-aye, much more Than those who were not paid for independence.

Byron. Don Juan.

The house of Braganza was placed at the head of an independent monarchy at the instance and by the friendship of Great Britain. Canning.

INDEPENDENCY. Under the term BISHOP we have stated at considerable length the chief arguments in favor of the episcopal form of church government. It will be fair to add a more detailed statement of the principal arguments of the Independents in favor of their plan. In support of it, they observe, that the word εκκλησια, translated church, is always used in Scripture to signify either a single congregation, or the place where a single congregation meets. Thus that unlawful assembly at Ephesus, brought together against Paul by the craftsmen, is called $\epsilon \kappa \kappa \lambda \eta \sigma \iota a$, a church. Acts xix. 32, 39, 41. The word, however, is generally applied to a more sacred use; but still it signifies either the body assembling, or the place in which it assembles. The whole body of the disciples at Corinth is called the church, and spoken of as coming together into one place. 1 Cor. xiv. 23. The place into which they came together has been likewise thought to be called a church. See 1 Cor. xi. 18, 20. Wherever there were more congregations than one there were likewise more churches than one. See 1 Cor. xi. 18. The whole nation of Israel'is indeed called a church, but it was no more than a single congregation; for it had but one place of public worship, viz. first the tabernacle, and afterwards the temple. The Catholic church of Christ, his holy nation and kingdom, is also a single congregation, having one place of worship, viz. heaven, where all the members assemble by faith and hold communion; and in which, when they shall all be fully gathered together, they will in fact be one glorious assembly. We find it called 'the general assembly and church of the first-born, whose names are written in heaven.' The Independent can find no other description of a church in the New Testament; not a trace of a diocese or presbytery consisting of several congregations all subject to one jurisdiction. The number of disciples in Jerusalem was certainly great before they were dispersed by the persecution; yet they are never mentioned as forming distinct assemblies, but as one assembly meeting with its elders in one place; sometimes in the temple, sometimes in Solomon's porch, and sometimes in an upper room. After the dispersion the disciples who fled from Jerusalem, as they could no longer assemble in one place, are never called a church by themselves, or one church, but the churches of Judea, Samaria, and Galilee (Acts ix. 31, Gal. i. 22). Whence the Independents conclude that in Jerusalem the words church and congregation were of the same import; and if such was the case there, where the gospel was first preached, we may reasonably expect to find it so in other places. Thus, when Paul on his journey calls the elders of the church of Ephesus to Miletus, he speaks to them as the joint overseers of a single congregation. See Acts xx. 28. Had the church at Ephesus consisted of different congregations, united under such a jurisdiction as that of a modern presbytery, it would have been natural to say 'Take heed to yourselves, and to the flocks over which the Holy Ghost hath made you overseers:' but this is a way of speaking of which the Independents find not an instance in the whole New Testament.

The sacred writers, when speaking of all the Christians in a nation or province, never call them the church of such a nation or province, but the churches of Galatia (Gal. i. 2), of Macedonia (2 Cor. viii. 1), and of Asia (1 Cor. xvi. 10). On the other hand, when speaking of the disciples in a city or town, who might ordinarily assemble in one place, they uniformly call them a church; saying the church of Antioch, the church at Corinth, the church of Ephesus, and the like.

In each of these churches or congregations there were elders or presbyters, and deacons; and in every church there seem to have been more than one elder, in some many, who 'labored in word and doctrine.' Thus we read (Acts xiv. 23) of Paul and Barnabas ordaining elders in every church; and (Acts xx. 17) of a company of elders in the church of Ephesus, who were exhorted to 'feed the flock, and to take heed to themselves, and to all the flock over which the Holy Ghost had made them overseers :' but of such elders as are to be tound in modern Presbyterian churches, who neither teach, nor are apt to teach, the Independents find no vestige in the Scriptures, nor in the earliest writers of the Christian church. The rule or government of this presbytery or eldership in a church is not their own, but Christ's. They are not lords over God's heritage, nor can they pretend to more power over the disciples than the apostles had. But when the administration of the apostles in the church of Jerusalem, and other churches where they acted as elders, is enquired into by an Independent, it does not appear to him that they did any thing of common concern to the church, without the consent of the multitude: nay, it seems they thought it necessary to judge and determine in discipline in presence of the whole church (Acts vi. 1, 6; xv. 22; 1 Cor. v. 3, 4, 5).

Excommunication and absolution were in the power of the church at Corinth, and not of the elders, as distinguished from the congregation (1 Cor. v., 2 Cor. ii.) The apostle indeed speaks of his delivering some unto Satan (1 Tim. i. 20), but it is by no means clear that he did it by himself, and not after the manner pointed at, 1 Cor. v. 4, 5; even as it does not appear, from his saying, in one epistle, that the gift was given unto Timothy by the putting on of his hands, that this was not done in the presbytery of a church, as in the other epistle we find it actually was. The trying and judging of false apostles was a matter of the first importance: but it was done by elders with the flock at Ephesus (Rev. ii. 2; Acts xx. 28-30); which flock did in the days of Ignatius all partake of the Lord's supper, and pray together in one place. Even the power of binding and loosing, or the power of the keys, as it has been called, was by our Saviour conferred not upon a particular order of disciples, but upon the church. See Matt. xviii. 15, 16, 17, 18. It is not said, if he shall neglect to hear the one or two, tell it to the elders of the church; far less can it be meant that the offended person should tell the cause of his offence to all the disciples in a presbytery or diocese consisting of many congregations : but he is required

to tell it to that particular church or congregation to which they both belong; and the sentence of that assembly, pronounced by its elders, is in a very solemn manner declared to be final, from which there lies no appeal to any jurisdiction on earth.

With respect to the constituting of elders in any church or congregation, the Independent reasons as follows. The officers of Christ's appointment are either ordinary and permanent in the church, or they were extraordinary and peculiar to the planting of Christianity. The extraordinary officers were employed in laying the plan of the gospel churches, and in publishing the New Testament revelation. Such were the apostles, the chosen witnesses of our Saviour's resurrection; such were the prophets inspired by the Holy Ghost for explaining infallibly the Old Testament by the things written in the New ; and such were the evangelists, the apostle's ministers. These can be succeeded by none in that which was peculiar to them, because their work was completed by themselves. But they are succeeded in all that was not peculiar to them by elders and deacons, the only two ordinary and permanent orders of ministers in the church. We have already seen that it belongs to the office of the elder to feed the flock of Christ; and the only question to be settled is, how men are ordinarily called to that office; for about the office of the deacon there is little or no dispute. No man now can pretend to be so called of God to the ministry of the word as the apostles and other inspired elders were, whom he chose to be the publishers of his revealed truth, and to whose mission he bore witness in an extraordinary manner.

But what the apostles were to those who had the divine oracles from their mouths, that their writings are to us: and therefore, as no man can lawfully pretend a call from God to make any addition to those writings, so neither can any man pretend to be lawfully called to the ministry of the word already written, but in the manner which that word directs. Now there is nothing of which the New Testament speaks more clearly than of the characters of those who should exercise the office of elders in the church, and of the actual exercise of that office. The former are graphically drawn in the epistles to Timothy and Titus; and the latter is minutely described in Paul's discourse to the Ephesian elders, in Peter's exhortation to elders, and our Lord's commission to those ministers with whom he promised to be always present even unto the end of the world. It is not competent for any man or bedy of men to add to, or diminish from, the description of a gospel minister given in these places, so as to insist upon the necessity of any qualification which is not there mentioned, or to dispense with any qualification as needless which is there required. Neither has Jesus Christ, the only legislator to the church, given to any ministers or people any power or right whatsoever to call, send, elect, or ordain, to that office, any person who is not qualified according to the description given in his law. Let a man have hands laid upon him by such as could prove an uninterrupted descent by imposition of hands

Vol. XI.

from the apostles; let him be set apart to that office by a company of ministers themselves the most conformable to the scripture character, and let him be chosen by the most holy people on earth; yet, if he answer not the New Testament description of a minister, he is not called of God to that office, and is no minister of Christ, but is indeed running unsent. No form of ordination can pretend to such a clear foundation in the New Testament as the description of the persons who should be elders of the church ; and the laying on of hands, whether by bishops or presbyters, is of no more importance in the mission of a minister of Christ, than the waving of one's hand in the air, or the putting of it into his bosom; for now, when the power of miracles has ceased, it is obvious that such a rite, by whomsoever performed, can convey no powers, whether ordinary or extraordinary. Indeed it appears to have been sometimes used even in the apostolic age without any such intention. See Acts xiii. 3. In a word, whoever in his life and conversation is conformable to the character which the inspired writers give of a bishop or elder, and is likewise qualified by his 'mightiness in the scripture,' to discharge the duties of that office, is fully authorised to administer the sacraments of baptism and the Lord's supper, to teach, exhort, and rebuke, with all long suffering and doctrine, and has all the call and mission which the Lord now gives to any man; whilst he who wants the qualifications mentioned has not God's call, whatever he may have; nor any authority to preach the gospel of Christ, or to dispense the ordinances of his religion. From this view of the Independent principles, which is faithfully taken from their own writers, it appears, that, according to them, even the election of a congregation confers upon the man whom they may choose for their pastor no new powers, but only a new relation between him and a particular flock, giving him an exclusive right, either by himself or in conjunction with other pastors constituted in the same manner, to exercise among them that authority which he derives immediately from Christ, and which, in a greater or less degree, is possessed by every sincere Christian.

There are two sects of Independents in Scotland: the first of whom have no peculiar denomination besides the general one of Independents or Congregationalists. Their religious sentiments are strictly Calvinistic, and they agree in general with those of the English Independents. The other sect is generally denominated in Scotland Glassites, from their founder Mr. John Glas; and sometimes in England Sandemanians, from Mr. Robert Sandeman, who spread their doctrines in England and America. Some subdivisions have lately taken place among them: but both sects agree in the general principles above stated with regard to church government.

The INDEPENDENTS are a sect of protestants, so called from their maintaining that each congregation of Christians, which meets ordinarily in one place for public worship, is a complete church, has full power to regulate every thing relating to religious government within itself, and is in no respect dependent upon, or accountable to, other churches. This term is used specifically

for a respectable and increasing body of Protestant dissenters in England : a large portion of the Protestant churches of North America are also Independents; and the term will describe generically the sentiments upon church government of the Baptists in both these countries, and various other dissenting bodies in England.

The Independents, considered as a sect, arose in England during Elizabeth's reign. The hierarchy established by her, the vestments worn by the clergy, the book of common prayer, and, above all, the sign of the cross used in administering baptism, were very offensive to many of her subjects, who, during the persecutions of queen Mary I., had taken refuge among the protestants of Germany and Geneva. They thought that the church of England resembled in these particulars the antichristian church of Rome; and they called for a more thorough reformation and a purer worship. From this circumstance they were first stigmatised by their adversaries with the general name of Puritans. Elizabeth was not disposed to comply with their demands; and the Puritans were not united among themselves. Unanimous in nothing, but in their antipathy to the forms of doctrine and discipline established by law, they were soon divided' into a variety of sects.

Of these the most famous was that which was formed about 1581 by Robert Brown, a man of insinuating manners, but neither steady nor consistent in his principles and conduct. See BROWN. He did not differ much, in point of doctrine, either from the church of England. or from the rest of the Puritans; but he had formed new and singular notions concerning the nature of a church, and the rules of ecclesiastical government. He maintained that such a number of persons as could be contained in an ordinary place of worship ought to be considered as a church, and enjoy all the rights and privileges of an ecclesiastical community. These small societies he pronounced independent, jure divino, and entirely exempt from the jurisdiction of the bishops, in whose hands the court had placed the reins of spiritual government; as well as from that of presbyteries and synods, which other Puritans regarded as the supreme visible sources of ecclesiastical authority. He also maintained that the power of governing each congregation resided in the people; and that each member had an equal share in this government. Hence all points both of doctrine and discipline were submitted to the discussion of the whole congregation; and whatever was supported by a majority of voices passed into a law. The congregation also elected certain brethren to the office of pastors, to perform the duties of public instruction and divine worship; reserving however to themselves the power of dismissing these ministers, and reducing them to the condition of private members, whenever they should think such a step conducive to the spiritual advantage of the community. The right of the pastors to preach was not exclusive, or peculiar to them alone. To any member who thought proper to exhort or instruct the brethren, was accorded the liberty of prophesying or preaching. The zeal with which Brown and his associates propagated these opinions was doubtless intemperate. He affirmed that all communion was to be broken off with those religious societies that were founded upon a different plan from his; and treated the church of England as a spurious church, whose ministers were unlawfully ordained, whose discipline was popish and antichristian, and whose sacraments and instiutions were destitute of all efficacy. The sect, unable to endure the severe treatment which followed the avowal of these sentiments, retired into the Netherlands, and founded churches at Middlebourg, Amsterdam, and Leyden; but their founder returned to England; and, having renounced his principles of separation, took orders in the established church, and obtained a benefice.

The Puritan exiles, whom he thus abandoned, soon split into parties, and their affairs declined. This engaged the wiser part of them to mitigate the severity of their founder's plan, and to soften the riger of his uncharitable decisions. The person who had the chief merit of bringing about this reformation was John Robinson, one of their pastors, a man who had much piety, and no inconsiderable portion of learning. This well-meaning reformer, perceiving the defects that reigned in the discipline of Brown, and in the spirit and temper of his followers, employed his zeal and diligence in correcting them, and in new modelling the society, so as to render it less odious to its adversaries, and less liable to the just censure of those true Christians who look upon charity as the chief end of the commandments. Hitherto the sect had been ealled Brownists. But Robinson having, in his Apology, affirmed, Cætum quemlibet particularem esse totam, integram, et perfectam eeclesiam, ex suis partibus constantem, immediatè et Independenter quoad alias ecclesias sub ipso Christo, the sect was henceforth called Independents, of which the apologist was considered as the founder. The Independents now exhibited candor and charity enough to aeknowledge that true religion and solid piety might flourish in communities under the jurisdiction of bishops, or the government of synods and presbyteries. They were also much more attentive than the Brownists, in keeping up a regular ministry in their communities : for, while the latter allowed promiseuously all ranks and orders of men to teach in public, the Independents had, and still have, a certain number of ministers, chosen respectively by the congregations where they are fixed; nor is any person among them permitted to speak in public before he has submitted to a proper examination of his capacity and talents, and been approved of by the heads of the con-gregation. This society has produced divines as eminent for learning, piety, and virtue, as any church in Christendom.

From 1642 the Independents are very frequently mentioned in our annals. The English Independents assumed this title publicly in a piece which they published at London in 1644, entitled Apologetical Narration of the Independents. But afterwards, to avoid the odium of sedition and anarchy charged on the seet, numbers of them renounced this title, and called

themselves Congregational Brethren, and their religious assemblies congregational churches. The first Independent or congregational church in England was set up in 1616 by Mr. Jacob. who had adopted the religious sentiments of Robinson. The charge alleged against them by Rapin (in his History of England, vol. II. p. 514, folio edition), that they could not so much as endure ordinary ministers in the church, &c., is groundless. He was led into this mistake by confounding the Independents and Brownists. Other charges equally unjustifiable have been urged against the Independents by this historian, and others. Rapin says, that they abhorred monarchy, and approved of a republican government. This might have been true with regard to many persons among them, in common with other seets; but it does not appear, from any of their public writings, that republican principles formed their distinguishing characteristic. On the contrary, in a public memorial drawn up by them in 1647, they declare, that they do not disapprove of any form of eivil government, but 'do freely acknowledge that a kingly government, bounded by just and wholesome laws, is both allowed by God, and also a good accommodation unto men. The Independents, however, have been generally ranked among the regicides, and charged with the death of Charles I. Whether this fact be admitted or denied, no conclusion can be fairly drawn from the greater prevalence of republican principles, or from violent proceedings at that period, that can affect the distinguishing tenets and conduct of the Independents in our times. It is certain that the present Independents are steady friends to a limited monarchy. Rapin is further mistaken when he represents the religious principles of the English Independents as contrary to those of all the rest of the world. It appears from two confessions of faith, one composed by Robinson on behalf of the English Independents in Holland, and published at Leyden in 1619, entitled Apologia pro Exulibus Anglis, qui Brownistæ vulgo appellantur; and another drawn up in London in 1658, by the principal members of this community in England, entitled Λ Declaration of the Faith and Order owned and practised by the Congregational Churches in England, agreed upon and consented unto by their Elders and Messengers, in their Meeting at the Savoy, October 12th, 1658, as well as from other writings of the Independents, that they differed from the rest of the reformed in no single point of any consequence, except that of ecclesiastical government; and their religious doetrines were almost entirely the same with those adopted by the church of Geneva,

During the administration of Cromwell the Independents acquired considerable reputation and influence; and he made use of them as a check to the ambition of the Presbyterians, who aimed at a very high degree of ecclesiastical power, and who had succeeded, soon after the elevation of Cromwell, in obtaining a parliamentary establishment of their own church government. But after the Restoration their cause declined; and in 1691 they entered into an association with the Presbyterians residing in and about London, comprised in nine articles, that tended to the maintenance of their respective institutions. These may be found in the second volume of Whiston's Memoirs, and the substance of them in Mosheim. At this time the Independents and Presbyterians, called from this association the United Brethren, were agreed with regard to doctrines, being generally Calvinists, and differed only with respect to ecclesiastical discipline. But at present, though the English Independents and Presbyterians form two distinct parties of Protestant Dissenters, they are distinguished by very trifling differences with regard to church government. The Independents are generally more attached to the tenets distinguished by the term Calvinism than the Presbyterians.

Independency was first carried to the American colonies in 1620, and, by successive puritan emigrants from England, in 1629 and 1633. One Morel, in the sixteenth century, endeavoured to introduce it into France; but it was condemned at the synod of Rochelle, where Beza presided; and again at the synod of Rochelle in 1644. On this subject, see Mosheim's Ecclesiastical History, by Maclean, vol. IV.; Neal's History of the Puritans, vols. II. III. and IV.; and Burnet's History of his own Times, vol. I., &c. The Independents of the present day, it may be added, have sustained a noble part in the advocacy of Bible, Missionary, and Education Societies, of every description.

INDERABIA, an island of small extent near the mouth of the Persian Gulf. It is perhaps three miles in length, low, level, and narrow, and separated from the main land by a strait, three iniles in breadth, and which may be navigated without much danger: but ships running for shelter under the island must not come within a mile of its south-east end, until a tree, which stands by itself, bears W. N. W. Lat. 26° 40' N.

INDERGEREE, a river of Sumatra, on the north-east coast, running into the sea, in long. 103° 20' E., lat. 0° 33' S.

INDERGUR, or INDARGHUR, is the name of various hill fortresses in Hindostan, so called after one of the Hindoo deities.

INDERMAY POINT, a cape on the north coast of Java, in long. 108° 18' E., lat. 6° 12' S.

INDESERT,' n.s. In and desert. Want of merit. This is a useful word, but not much received.

Those who were once looked on as his equals, are apt to think the fame of his merit a reflection on their Addison. own indeserts.

INDES'INENTLY, adv. Fr. indesinenter; Lat. in and desino. Without cessation.

They continue a month indesinently.

Ray on the Creation. INDESTRUC'TIBLE, adj. In and destructible. Lat. in and destruo. Not to be destroyed.

Glass is so compact and firm a body, that it is inde-Boyle. structible by art or nature.

INDETERMINATION, n. s. tled ; indeterminate, unfixed ; indefinite : inde-

692

terminately, not in a settled manner : indetermination, want of fixed or stated direction.

By contingents I understand all things which may be done, and may not be done, may happen, or may not happen, by reason of the *indetermination* or accidental concurrence of the causes. Bramhall.

There is not only obscurity in the end, but beginning of the world; that, as its period is inscrutable, so is its nativity indeterminable. Brownc.

His perspicacity discerned the loadstone to respect the North, when ours beheld it indeterminately. Id.

We should not amuse ourselves with floating words of indetermined signification, which we can use in soveral senses to serve a turn. Locke.

The rays of the same color were by turns trausmitted at one thickness, and reflected at another thickness, for an indeterminate number of successions. Newton's Opticks.

The depth of the hold is indeterminately expressed in the description. Arbuthnot on Coins.

INDETERMINATE PROBLEM, or unlimited problem, in algebra, that which admits of a great number of different answers, or of innumerable different solutions. In such problems the number of unknown quantities concerned is greater than the number of conditions or equations by which they are to be found ; from which it happens, that generally some other conditions or quantities are assumed to supply the defect, which, being taken at pleasure, give the same number of answers as varieties in those assumptions. Diophantus was the first writer on Indeterminate Problems, in his Algebra, first published in 1575 by Xylander. His book being wholly on this subject, such questions have been called Diophantine Problems. Des Cartes, Fermat, Frenicle, Wallis, Euler, Grange, &c., have cultivated this branch of algebra : and Mr. J. Leslie, in the second volume of the Edinburgh Philosophical Transactions, has given an ingenious paper on the solution of Indeterminate Problems, by a new and general principle.

INDEVOUT', adj.) Lat. indevotus (in, deo, INDEVO'TION, n. s. (votus); Fr. indevot. Not religious: a want of devotion; irreligion.

He prays much; yet curses more; whilst he is meek, but indevout. Decay of Piety.

Let us make the church the scene of our penitence, as of our faults; deprecrate our former indevotion, and, by an exemplary reverence, redress the scandal of prophaneness. Id.

IN'DEX, n. s. Lat. indico. The discoverer; the hand that points to any thing, as the hour of a dial: the table of contents to a book.

To such indexes, although small

To their subsequent volumes, there is seen

The baby figure of the giant mass Of things to come at large.

Shakspeare.

Her silver head adorning

(Her dotage index) much she bragged, yet feigned, For by false tallies many years she gained.

Fletcher's Purple Island.

That which was once the index to point out all virtues, does now mark out that part of the world where least of them resides. Decay of Piety.

Tastes are the indexes of the different qualities of plants, as well as of all sorts of aliment. Arbuthnot.

They have no more inward self-consciousness of what they do or suffer, than the index of a watch, or Bentley. the hour it points to.

693

If a book has no index or good table of contents, 'tis very useful to make one as you are reading it; and in your index to take notice only of parts new to you. Watts

But I shall add them in a brief appendix, To come between mine epic and its index.

Byron. Don Juan.

INDEX, EXPURGATORY, a catalogue of prohibited books in the church of Rome. The first catalogues of this kind were made by the inquisitors; and afterwards approved of by the council of Trent, with some retrenchments and additions. Thus, an index of heretical books being formed, it was confirmed by a bull of Clement VIII. in 1595, and printed with several introductory rules; by the fourth of which the use of the Scriptures in the vulgar tongue is forbidden in these words :- ' Since it is plain by experience, that if the sacred writings are permitted every where, and without difference to be read in the vulgar tongue, men, through their rashness, will receive more harm than good ; let the bishop or inquisitor determine, with the advice of the parish priest or confessor, to whom to permit the reading of the Bible, translated by Catholic authors in the vulgar tongue, according as they shall judge whether it be most likely that such reading of the scripture may do harm, or tend to the increase of faith and piety. Let them also have the same power as to all other writings. But if any, without such leave, shall presume to read or have them, without first showing the Bible to the ordinaries, he shall not receive the absolution of his sins. And as to all booksellers who shall sell the Bibles translated into the vulgar tongue, without such leave, or by any other method shall publish them, let them forfeit the price of the books, and let the money be given to pious uses by the bishop; and let them be subject to other punishments; at the pleasure of the said bishop, according to the nature of the offence. As to regulars, they shall not read or buy them, without leave first obtained from their prelates.' By the tenth rule it is ordained, that no book shall be printed at Rome without the approbation of the pope's vicar or some person delegated by the pope; nor in any other place, unless allowed by the bishop of the diocese, or some person deputed by him, or by the inquisitor of heretical pravity. In pope Clement's catalogue is a decree that all the books, even of Catholic authors, written since the year 1515, which was the year preceding that in which Luther began to declaim against indulgences, should be corrected; not only by retrenching what is not conformable to the doctrine of Rome, but also by adding what may be judged proper by the correctors.

The duke of Alva, after this, procured another to be printed at Antwerp in 1571, which was published by Francis Junius about the year 1586. There were two others published in 1584 and 1612, by the cardinals Quiroga and Sandoval, and several others by the inquisitors and masters of the sacred palace. The most consi-

derable of all the indices is that of Anthony, a Sotomayor, supreme president and inquisitorgeneral in the kingdom of Spain, which was made for all the states subject to the king of Spain, and comprehends all the others. This was published, with the advice of the supreme senate of the general inquisition, in 1640, and reprinted at Geneva in 1667. To this there were many rules prefixed; and to the Geneva edition was added the index of the decrees which were made by the master of the holy palace, by virtue of his office, or by the command of the holy congregation, or by the holy congregations for the indices and holy office, after the before-mentioned index of the council of Trent. The rules of the former indices are explained and confirmed by these; and the fifth rule, which enlarges the fourth of the index of Trent, prohibits not only all bibles in the vulgar tongue, comprehending all except those that are Hebrew, Greek, Latin, Chaldee, Syriac, Ethiopic, Persic, and Arabic; but all parts of them, either printed or manuscript, with all summaries and abridgments in the vulgar language or tongue .- Limborch's History of the Inquisition, book ii., chap. 16.

The INDEX OF A BOOK is that part annexed to a book, referring to the particular matters therein contained. The index is intended to to point out every important particular in a book, in its alphabetical order, that the reader may at once, and without difficulty, find out any article he wishes to be informed of, that is discussed or mentioned in the work : and as these are hardly known even to the author, till the work is finished, the index always appears with most propriety subjoined to the work. Every book of any extent ought to have both contents and index. Most modern indexes to books are very carelessly compiled. About a century or two ago very complete indexes were made to various learned works by the editors of the classics in usum Delphini, as well as by Minellius, Farnabius, Oudendorp, Ruddiman, and other literati. But now the compilation of an index, being thought too great a drudgery by authors, is often entrusted to persons very ill-qualified for the task; in consequence of which modern indexes are seldom either complete or properly arranged. And if the work is extensive, the reader is perplexed with three or four different indexes, or an index divided into so many parts, while one complete general index, properly compiled and arranged, would answer the purpose much better.

INDEX OF A GLOBE is a little stile fitted on to the north pole, and turning round with it, pointing to certain divisions in the hour circle. It is sometimes also called gnomon. See Geo-GRAPHY.

INDEXTER/ITY, n.s. In and dexterity. Want of dexterity; want of readiness; want of handiness; clumsiness; aukwardness.

The *indexterity* of our consumption-curers demonstrates their dimness in beholding its causes. *Harvey*. INDIA, an abridgment of Hindostan, is a name often given to that region of Asia lying to the south of Tartary, and between Persia and China, with its dependent islands. It contains, besides Hindostan, the BIEMAN EMPIRE, SIAM, COCHIN CUINA, TONQUIN, THIBET, JAPAN, and CEVLON; but is now, in its geographical features, more usually, and far more properly, described under those respective heads, which see.

But we may conveniently consider, under this head, the chief occurrences, of an historical kind, connected with this interesting portion of the carth.

1. India as known to the ancients.—By the name of India the ancients understood only the western peninsula, on this side the Ganges, and the peninsula beyond it, having little or no knowledge of the countries which lie farther eastward. But though originally they were acquainted only with the western parts of Hindostan, they gradually extended the name of India over the other countries they discovered to the east; so that probably they would have involved all the rest in the same general designation, had they been as well acquainted with them as are the moderns. By whom these countries were originally peopled is a question which, in all probability, will never be solved. Certain it is, that some works in these parts discover marks of astonishing skill and power in the inhabitants; such as the images in the island of Elephanta, the rocking stones of immense weight, yet so nicely balanced that a man can move them with his hand, the observatory at Benares, &c. These stupendous works are, by Bryant, attributed to the Cushites or Babylonians; and it is possible that the subjects of Nimrod, the beginning of whose kingdom was in Shinar, might extend themselves in this direction, and thus fill the fertile regions of the east with inhabitants, before they migrated to the less mild and rich countries to the westward. Thus would be formed for a time that great division betwixt the inhabitants of India and other countries; so that the western nations knew not even of the existence of India, but by obscure report; while the inhabitants of the latter, ignorant of their own origin, invented a thousand idle tales concerning the antiquity of their tribes, which some of the moderns have been credulous enough to believe. The first among the western nations who distinguished themselves by their application to navigation and commerce, and who were of consequence likely to discover these distant nations, were the Egyptians and Phœnicians. The former, however, soon lost their inclination for naval affairs, and held all sea-faring people in detestation; though the extensive conquests of Sesostris, if we can believe them, must have in a great measure supplied this defect. He is said to have fitted out a fleet of 400 sail in the Arabian Gulf or Red Sea, which conquered all the countries lying along the Erythrean Sea to India; while the army, led by himself, marched through Asia, and subdued all the countries to the Ganges; after which he

crossed that river, and advanced to the Eastern Ocean. Great disputes have been carried on with respect to this conqueror, and his expedition; but Dr. Robertson, in his Disquisition concerning Ancient India, doubts whether any such expedition was ever made. Herodotus makes no mention of the conquest of India by Sesostris, though he relates his history at some length: and Diodorus Siculus, who first mentions it, informs us that he had it from the Egyptian priests; who related ' many things rather from a desire to promote the honor of their country than from attention to truth.' Strabo rejected the account altogether, and ranks the exploits of Sesostris in India with the fabulous ones of Bacchus and Hercules.

It is certain, however, that the Tyrians kept up a constant intercourse with some parts of India by navigating the Arabian Gulf, or the Red Sea. Of this navigation they became masters by taking from the Idumeans some maritime places on the coast; but, as the distance betwixt the nearest place of that sea and Tyrc was considerable, the land carriage must have been very tedious and expensive ; for which reason it was necessary to become masters of a port on the east of the Mediterranean, nearer to the Red Sea than Tyre. With this view they took possession of Rhinvelura; and to that port all the goods from India were conveyed by a much shorter and less expensive route. This is the first authentic account of any intercourse betwixt India and the western part of the world : and to this we are without doubt in a great measure to ascribe the vast wealth and power for which the city of Tyre was anciently renowned; for in other respects the whole territory of Phœnicia was but of little consequence. Notwithstanding the frequency of these voyages, however, the ancients have left little account of them. The most particular description we have of the wealth, power, and commerce of ancient Tyre, is in the prophecies of Ezekiel. If the Tyrians kept any journals of their voyages, it is probable that they were lost when the city was destroyed by Alexander the Great.

Though the Israelites, in the reigns of David and Solomon, carried on an extensive and lucrative commerce, yet Dr. Robertson is of opinion that they did not trade to any part of India. There are only two places mentioned to which their ships sailed, viz. Ophir and Tarshish; both of which are now supposed to have been situated on the east coast of Africa; the ancient Tarshish was probably the present Mocha: and Ophir the kingdom of Sofala, so remarkable in former times for its mines, that it was called by oriental writers the golden Sofala. See OPHIR and TARSHISH. Thus India continued long unknown to, and undisturbed by the western nations. But, soon after the destruction of the Babylonian monarchy by the Persians, we find Darius Hystaspis undertaking an expedition against the Indians. Herodotus informs us, that he sent Scylax of Caryandra to explore

the river Indus; who sailed from Caspatyrus, a town at its source, and near the territories of Pactya, eastward to the sea; thence, turning westward, he arrived at the place where the Phœniciaus had formerly sailed round Africa, after which Darius subdued the Indians, and became master of that coast. His conquests, however, were not extensive, as they did not reach beyond the territory watered by the Indus; yet the acquisition was very important, as the revenue derived from the conquered territory, according to Herodotus, was near a third of that of the whole Persian empire. But very little knowledge of the country was acquired by this expedition of Darius, for the Greeks paid no regard to the transactions of barbarians; and as for Scylax, he told so many incredible stories in the account he gave of his voyage, that he was disbelieved in almost every thing, whether true or false. The Greeks acquired much more knowledge of India by Alexander's expedition, although be went no farther into the country than the Setlege (Hyphasis). See HINDOSTAN. The breadth of this district, from Ludhana on the Setlege to Attock on the Indus, is computed to be 259 geographical miles in a straight line; and Alexander's march, computed in the same manner, did not exceed 200; nevertheless by the spreading of his numerous army over the country, and the exact measurement and delineation of all his movements by men of science whom he employed, a very extensive knowledge of the western part of India was obtained. Of this celebrated conqueror's exploits, previous to this expedition, an account will be found under the article MACEDON.

According to major Rennel, the space of country through which Alexander sailed on the Indus was not less than 1000 miles; and as, during the whole of that navigation, he obliged the nations on both sides of the river to submit to him, we may be certain that the country on each side was explored to some distance. An exact account, not only of his military operations, but of every thing worthy of notice relating to the countries through which he passed, was preserved in the journals of his three officers, Lagus, Nearchus, and Aristobulus; and these journals Arrian followed in the composition of his history. From these authors we learn, that, in the time of Alexander, the western part of India was possessed by seven very powerful monarchs. The territory of Porus, which Alexander first conquered and then restored to him, is said to have contained no fewer than 2000 towns; and the king of the Prasii had assembled an army of 20,000 cavalry, 2000 armed chariots, and a great number of elephants, to oppose the Macedonian monarch on the banks of the Ganger. The navigable rivers with which the Panjab country abounds, afforded then, and still continue to afford, an intercourse from one part to another by water: and, as these rivers probably had then many ships on them for commerce, Alexander might easily collect all the number he is said to have had, viz. 2000; since it is reported, that Semiramis was opposed by double the number on the Indus, when she invaded India.

The country on each side the Indus was

695

found, in the time of Alexander, to be in no degree inferior in population to the kingdom of Porus. The climate, soil, and productions of India, as well as the manners and customs of the inhabitants, are exactly described, and the descriptions found to correspond in a surprising manner with modern accounts. The stated change of seasons, now known by the name of monsoons, the periodical rains, the swellings and inundations of the rivers, with the appearance of the country during the time they continue, are particularly mentioned. The descriptions of the inhabitants are equally particular; their living entirely upon vegetables; their division into tribes or casts, with many of the particularities of the modern Hindoos. The military operations, however, extended but a very little way into India properly so called; no further indeed than the modern province of Lahore, and the countries on the banks of the Indus, from Moultan to the sea. To secure the obedience of those countries, Alexander built, it is said, a number of fortified cities; and, the farther eastward he extended his conquests, the more necessary did he find this task. Three he built in India itself; two on the banks of the Hydaspes, and a third on the Acesines, both navigable rivers, falling into the Indus, after they have united their streams. By these he intended not only to keep the adjacent countries in awe, but to promote a commercial intercourse between different parts. With this view, on his return to Susa, he surveyed the course of the Euphrates and Tigris, causing the cataracts or dams to be removed, which the Persian monarchs had built to obstruct the navigation of these rivers. After the navigation was thus opened, he proposed that the valuable commodities of India should be imported into the other parts of his dominions by the Persian Gulf, and through the Red Sea to Alexandria, and thence dispersed over Europe.

On the death of Alexander, the eastern part of his dominions devolved first on Pytho, the son of Agenor, and afterwards on Selencus. The latter was sensible of the advantages of keeping India in subjection. With this view, he undertook an expedition into that country, partly to confirm his authority, and partly to defend the Macedonian territories against Sandracottus, king of the Prasii. The particulars of his expedition are very little known; Justin being the only author who mentions them. Plutarch tells us that Seleucus carried his arms farther into India than Alexander; and Pliny, whose authority is of considerably greater weight than either, corroborates the testimony of Plutarch in this instance, though his language is obscure. Bayer thinks it implies that Seleucus marched from the Hyphasis to the Hysudrus, thence to Palibothra, and thence to the mouth of the Ganges; the distances of the principal stations being marked, and amounting in all to 2244 Roman miles. But Dr. Robertson considers it very improbable that the expedition of Seleucus should have been continued so far, as in that case 'the ancients would have had a more accurate knowledge of this part of the country than they seem ever to have possessed.' The career of Scleucus in the east was stopped by Antigonus, who prepared

to invade the western part of his dominions. The fermer was therefore obliged to conclude a treaty with Sandracottus; but Dr. Robertson is of opinion, that during the lifetime of Seleucus, which continued forty-two years after the death of Alexander, no diminution of the Macedonian territories took place. With a view of keeping up a friendly intercourse with the Indian prince, Seleucus sent Megasthenes, one of Alexander's officers, to Palibothra, capital of the kingdom of the Prasii, on the banks of the Ganges. This city is by Dr. Robertson thought to be the modern Allahabad, but major Rennel supposes it to be Patna. As Megasthenes resided in this city for a considerable time, he made many observations relative to India in general, which he afterwards published. But he mingled with his relations the most extravagant fables; such as accounts of men with ears so large that they could wrap themselves up in them; of tribes with one eye, without mouths or noses, &c., if the extracts from his book, given by Arrian, Diodorus, and other ancient writers, can be credited. After the embassy of Megasthenes to Sandra-cottus, and that of his son Damaichus to Allitrochidas, the successor of Sandracottus, we hear no more of the affairs of India with regard to the Macedonians, until the time of Antiochus the Great, who made a short incursion into India about 197 years after the death of Seleucus. All that we know of this expedition is, that the Syrian monarch, after finishing a war he carried on against the two revolted provinces of Parthia and Bactria, obliged Sophagasenus, king of the country which he invaded, to pay a sum of money, and give him a number of elephants. It is probable that the successors of Antiochus were obliged, soon after his death, to abandon all their Indian territories.

After the loss of India by the Syrians, an intercourse was kept up for some time betwixt it and the Greek kingdom of Bactria. This last became an independent state about sixty-nine years after the death of Alexander; and, according to the few hints we have concerning it in ancient authors, carried on a great traffic with India. Nay, the Bactrian monarchs are said to have conquered more extensive tracts in that region than Alexander himself had done. Six princes reigned over this new kingdom in succession; some of whom, elated with the conquests they had made, assumed the title of the great king, by which the Persian monarchs were distinguished in their highest splendor. Strabo informs us, that the Bactrian princes were deprived of their territories by the Scythian Nomades, who came from the country beyond the Saxartes, and were known by the names of Asii, Pasiani, Tachari, and Scaurauli. This is confirmed by the testimony of the Chinese historians, quoted by M. de Guignes. According to them, about 126 vears before the Christian era, a powerful horde of Tartars pushed from their native seats on the confines of China, and obliged to move farther to the west, passed the laxartes, and, pouring in upon Bactria like an irresistible torrent, overwhelmed that kingdom, and put an end to the dominion of the Greeks, after it had lasted nearly 136 years. From this time to the close of the

fifteenth century all thoughts of establishing any dominion in India were totally abandoned by the Europeans. The only object now was to promote a commercial intercourse with that country; and Egypt was the medium by which that intercourse was to be promoted. Ptolemy, the son of Lagus, first raised the power and splendor of Alexandria, by carrying on a trade to India. His son Ptolemy Philadelphus prosecuted the same plan very vigorously. In his time the Indian commerce once more began to centre in Tyre; but, to remove it effectually thence, he attempted to form a canal between Arsinoe on the Red Sea, near the place where Suez now stands, and the Pelusiac, or eastern branch of the Nile. This canal was about 100 cubits broad, and thirty deep; so that by means of it the productions of India might have been conveyed to Alexandria entirely by water. We know not whether this work was ever finished, or whether it was found useless on account of the dangerous navigation towards the northern extremity of the Red Sea; but it is certain that no use was made of it, and a new city, named Berenice, situated almost under the tropic upon the western shore of the Red Sea, became the staple of Indian commerce. Thence the goods were transported by land to Coptos, a city three miles from the Nile, to which it was joined by a navigable canal. Thus, however, there was a very tedious land carriage of no less than 258 Roman miles through the barren desert of Thebais; but Ptolemy caused search to be made every where for springs, and, wherever these were found, he built inns for the accommodation of travellers.

Ships during this period sailed from Berenice, and coasting along the Arabian shore to the promontory of Syagrus, now Cape Rafalgate, held their course along the coast of Persia, till they arrived at the mouth of the western branch of the Indus. They either sailed up this branch till they came to Pattala, now Tatta, at the upper part of the Delta, or continued their course to some other emporium on the west part of the Indian coast. A more convenient course was afterwards found by sailing directly to Zizenis, a place concerning which there is now some dispute. Montesquieu believes it to have been the kingdom of Sigertis, on the coast adjacent to the Indus, and which was conquered by the Bactrian monarchs; but major Rennel is of opinion that it was a port on the Malabar coast. Dr. Robertson thinks that during the time of the Ptolemies very little progress was made in the discovery of India, and contests the opinion of major Rennel, that ' under the Ptolemies the Egyptians extended their navigation to the extreme point of the Indian continent, and even sailed up the Ganges to Palibothra, now Patna.' In this case, he thinks, that the interior parts of India must have been much better known to the ancients, than we have any reason to believe they were. The extreme danger of navigating the Red Sea in ancient times seems to have been the principal reason which induced Ptolemy to remove the communication with India, from Arsince to Berenice, as there were other hartours on the same coast considerably nearer the Nile

than it. After the ruin of Coptos, by the emperor Dioclesian, the Indian commodities were conveyed from the Red Sea to the Nile from Cosseir, supposed by Dr. Robertson to be the Philoteras Portus of Ptolemy, to Cous, the Vicus Apollinis, a journey of four days. Hence Cous, from a small village, became an opulent city; but in process of time the trade from India removed to Kene, farther down the river. It was to this monopoly of Indian commerce, that Egypt owed its vast wealth and power, during the time of its Macedonian monarchs; but it appears surprising that no attempt was made by the Syrian monarchs to rival them in it, especially as the latter were in possession of the Persian gulf, from whence they might have imported the Indian commodities by a much shorter navigation than could be done by the Egyptians.

On the conquest of Egypt by the Romans, the Indian commodities continued, as usual, to be imported to Alexandria in Egypt, and from thence to Rome; but the most ancient communication betwixt the east and west parts of Asia seems never to have been entirely given up. Syria and Palestine are separated from Mesopotamia by a desert; but the passage through it was much facilitated by its affording a station which abounded in water. Hence the possession of this station became an object of such consequence, that Solomon built upon it the city called in Syria Tadmor, and in Greek Palmyra. Both these names are expressive of its situation in a spot adorned with palm trees. Though its situation for trade may to us seem very unfavorable; being sixty miles from the Euphrates, by which alone it could receive the Indian commodities, and 203 from the nearest coast of the Mediterranean; yet the value and small bulk of the goods in question rendered the conveyance of them by a long carriage over land not only practicable but lucrative and advantageous. Hence the inhabitants became opulent and powerful, and this place long maintained its independence after the Syrian empire became subject to Rome.

2. India from its intercourse with the Romans, until the erection of the Gaznian empire .- The excessive eagerness of the Romans for Asiatic luxuries of all kinds kept up an unceasing intercourse with India, during the whole time that the empire continued in its power; and, even after the destruction of the western part, it was kept up between Constantinople and those parts of India which had been visited formerly by merchants from the west. Long before this period, however, a much better method of sailing to India had been discovered by one Hippalus, the commander of an Indian ship, who lived about eighty years after Egypt had been annexed to the Roman empire. This man having observed the periodical shifting of the monsoons, and how steadily they blew from the east or west during some months, ventured to leave the coast, and sail boldly across the Indian Ocean, from the mouth of the Arabian Gulf to Musiris, a port on the Malabar coast; which discovery was reckoned a matter of such importance, that the name of llippalus was given

to the wind by which he performed the voyage. Pliny gives a very particular account of the manner in which the Indian traffic was now carried on, mentioning the particular stages, and the distances between them: viz. From Alexandria to Juliopolis, according to this writer, was two miles; and there the cargo destined for India was shipped on the Nile, and carried to Coptos, distant 303 miles, the voyage being usually per-formed in twelve days. From Coptos they were conveyed by land to Berenice, distant 258 miles, and halting at different stations as occasion required. The journey was finished on the twelfth day; but on account of the heat the caravan travelled only in the night. The ships left Berenice about midsummer, and in thirty days reached Ocelis, now Gella, at the mouth of the Arabian Gulf, or the modern Cape Fartaque on the coast of Arabia Felix; from whence they sailed in forty days to Musiris, already menti-Their homeward voyage began early in oned. December; when setting sail with a north-east wind, and meeting with a south or south-west one when they entered the Arabian Gulf, the voyage was completed in less than a year. With regard to the situation of Musiris, as well as of Barace, another Indian port to which the ancients traded, major Rennel and Dr. Robertson agree that they stood between Goa and Tellicherry; and that probably the modern Meerzaw or Merjee is the Musiris, and Barcelore the Barace of the ancients. Ptolemy, who flourished about A. D. 200, having the advantage of so many previous discoveries, gives a more particular description of India than is to be met with in any of the ancient writers; notwithstanding which his accounts are frequently inconsistent not only with modern discoveries, but with those of more ancient geographers than himself. A capital error in his geography is, that he makes the peninsula of India stretch from the Sinus Barygazenus, or gulf of Cambay, from west to east; instead of extending, according to its real direction, from north to south; and this error appears the more extraordinary, that Megasthenes had published a measurement of this peninsula, nearly consonant to truth, which had been adopted with some variations by Eratosthenes, Strabo, Diodorus Siculus, and Pliny. Ilis in-formation concerning the situation of places, however, was much more accurate. With respect to some districts on the eastern part of the peninsula, as far as the Ganges, he comes very near the truth. M. d'Anville, has determined the modern names of many of Ptolemy's stations, as Kilkare, Negapatam, the mouth of the river Cauveri, Masulipatam, &c. The peninsula of Malacca was in all probability the boundary of the ancient discoveries by sea, but by land they had correspondence with countries still farther distant.

While the Scleucidæ continued to enjoy the empire of Syria, the trade with India continued to be carried on by land in the way already mentioned. The Romans, having extended their dominious as far as the Euphrates, found this method of conveyance still established, and the trade was by them encouraged and protected. But the progress of the caravans being frequently interrupted by the Parthians, particularly when they travelled towards those countries where silk and others of the most valuable manufactures were procured, it became an object to the Romans to conciliate the friendship of the sovereigns of those distant countries. This attempt seems to have been made; for the Chinese historians tell us, that Antoun, by whom they mean the emperor Marcus Antoninus, the king of the people of the western ocean, sent an embassy to Ounti, who reigned in China A. D. 166.

With regard to the Indian islands, considering the little way they extended their navigation, the ancients could not be acquainted with many of them. Ceylon, however, they called Taprobane : the name was entirely unknown in Europe before the time of Alexander the Great; but that conqueror, though he did not visit, had heard of it; but all the accounts of ancient geographers concerning it are confused and contradictory. The other islands described by Ptolemy to the eastward of Taprobane are, according to Dr. Robertson, those called Andaman and Nicobar in the Gulf of Bengal. From the time of Ptolemy to that of the emperor Justinian we have no account of any intercourse of the Europeans wnn India, or of any progress made in the geo-graphical knowledge of the country. Under that emperor Cosmas, an Egyptian merchant, made some voyages to India, whence he acquired the surname of Indicopleustes. Having afterwards turned monk, he published several works; one of which, named Christian Topography, has reached us. In this, though mixed with many strange reveries, he relates, with great simplicity and appearance of truth, what he had seen in his travels or had learned from others; and describes several places on the western coast of the hither peninsula, which he calls the chief seat of the pepper trade. From one of the ports on that coast, named Male, Dr. Robertson thinks that the name of Malabar may pro-bably be derived, as well as that of Maldives, given to a cluster of islands at no great distance. Cosmas informs us also, that in his time the island of Taprobane had become a great staple of trade. He supposed it to lie about half way betwixt the Persian Gulf and the country of the Sinæ: in consequence of which commodious situation it received the silk of the Sinæ, and the precious spices of the remote regions of the east, which were from thence conveyed to all parts of India, Persia, and the Arabian Gulf. He calls it not Taprobane, but Sieldibia, derived from Selendib, or Screndib, a name by which it is still known in the east. From him also we learn, that the Persians, having overthrown the empire of the Parthians, applied themselves with great diligence and success to maritime affairs; in consequence of which they became formidable rivals to the Romans in the Indian trade. The latter being thus in dan-ger of entirely losing that lucrative branch, · Justinian formed a scheme of preserving some share of it by means of his ally the emperor of Abyssinia. In this he was disappointed, though afterwards he obtained his end in a way entirely unexpected. Two monks who had been employ-

ed as missionaries in different parts of the east, and had penetrated as far as the country of the Seres or China, induced by the liberal promises of Justinian, brought a quantity of the eggs of silkworms in a hollow cane. They were then hatched by the heat of a dunghill; and, being fed with the leaves of the mulberry, worked and multiplied as well as in those countries of which they are natives. Vast numbers were soon reared in Greece; from whence they were exported to Sicily, and from thence to Italy; in all which countries silk manufactures have since been established. On the conquest of Egypt by the Saracens, in 640, the India trade was of course transferred to them; and they soon began to pursue it with much more vigor than the Romans had done. The city of Bassora was built by the caliph Omar, upon the west banks of the great river formed by the union of the Euphrates with the Tigris. Thus the command of both rivers was secured, and the new city soon became a place of almost as much consequence as Alexandria itself.

Dr. Robertson takes notice, that, from the evidence of an Arabian merchant who wrote in 852, it appears, that not only the Saracens, but the Chinese also, were destitute of the mariner's compass; contrary to a common opinion, that this instrument was known in the east long before its discovery in Europe. Notwithstanding this disadvantage, they penetrated far beyond Siam, which had set bounds to the navigation of Europeans. They became acquainted with Sumatra and other Indian islands; extending their navigation as far as Canton in China. A regular commerce was now carried on from the Persian Gulf to all the countries lying betwixt it and China, and even with China itself. Many Saracens settled in India properly so called, as well as in the countries beyond it. In the city of Canton they were so numerous, that the emperor permitted them to have a cadi or judge of their own religion; the Arabian language was understood and spoken in every place of consequence; and ships from China are even said to have visited the Persian Gulf. According to the Arabian accounts of those days, the peninsula of India was at that time divided into four kingdoms. The first was composed of the provinces situated on the Indus and its branches, the capital of which was Moultan. The second had the city of Canoge, which, from its remaining ruins, appears to have been a very large place. The Indian historians relate, that it contained 30,000 shops, in which betel nut was sold, and 60,000 sets of musicians and singers who paid a tax to government. The third kingdom was that of Cachemire, first mentioned by Massoudi, who gives a short description of it. The fourth kingdom, Guzerat, is represented by the same author as the most powerful of the whole. Another Arab writer, who flourished about the middle of the fourteenth century, divides India into three parts; the northern comprehending all the pro-vinces on the Indus; the middle extending from Guzerat to the Ganges; and the southern, which he denominates Comar, from Cape Comorin. From the relation of the Arabian merchant above mentioned, explained by the commentary of

another Arabian who had likewise visited the eastern parts of Asia, we learn many particulars concerning the inhabitants of these distant regions at that time, which correspond with what is observed among them at this day. They take notice of the general use of silk among the Chinese, and the manufacture of porcelain, which they compare to glass. They also describe the tea-plant, with the manner of using its leaves; whence it appears, that in the ninth century the use of this plant in China was as common as it is at present. They mention likewise the great progress which the Indians had made in astronomy ; a circumstance which seems to have been unknown to the Greeks and Romans; they assert, that in this branch of science they were far superior to the most enlightened nations of the west, on which account their sovereign was called the King of Wisdom. The superstitions, extravagant penances, &c., known to exist at this day among the Indians, are also mentioned by those writers; all which particulars manifest that the Arabians had a knowledge of India far superior to that of the Greeks or Romans. The industry of the Mahommedans, in exploring the most distant regions of the east, was rivalled, however, by the Christians of Persia, who sent missionaries all over India and the countries adjoining, as far as China itself. But, while the western Asiatics thus kept up a constant intercourse with these parts, the Europeans had in a manner lost all knowledge of them. The port of Alexandria, from which they had formerly been supplied with the Indian goods, was now shut against them; and the Arabs, satisfied with supplying the demands of their own subjects, neglected to send any by the usual channels to the towns on the Mediterranean. The inhabitants of Constantinople and some other great towns were supplied with Chinese commodities by the most tedious and difficult passage imaginable. The silk of that country was purchased in the most westerly province named Chensi; thence it was conveyed by a caravan, which marched eighty or 100 days to the banks of the Oxus. Here it was embarked, and carried down the river to the Caspian; whence, after a dangerous voyage across that sea, it was carried up the river Cyrus as far as it is navigable; after which it was conducted by a land-carriage of five days to the river Phasis, then down that stream into the Euxine, and thence to Constantinople. The passage of goods from Hindostan was less tedious; being carried either directly to the Caspian or to the Oxus, but by a passage much shorter than that from China; after which they were conveyed down the Phasis to the Euxine, and thus to Constantinople. In spite of every difficulty, however, this commerce flourished, and Constantinople became a considerable mart for East Indian commodities; and from it all the rest of Europe was chiefly supplied with them for more than two centuries. The perpetual hostilities in which the Christians and Mahommedans were during this period engaged, contributed still to increase the difficulty; but, the more it increased, the more desirous Europeans seemed to be of possessing the luxuries of Asia. About this

time the cities of Amalfi and Venice, with some others in Italy, having nequired a great degree of independence, began to exert themselves in promoting domestic manufactures, and importing the productions of India. Some traces of this revival of a commercial spirit, according to Dr. Robertson, may be observed from the end of the seventh century. But, during the seventh and eighth centuries, it is very probable that no commercial intercourse whatever took place betwixt Italy and Alexandria; for, prior to this period, all the public deeds of the Italian and other cities of Europe were written upon paper made of the Egyptian papyrus, but after that upon parchment. About the end of the tenth century, a considerable revolution took place in India, by the conquests of Mahmud Gazni, who erected the empire of Gazna.

3. India, from the erection of the Gaznian empire, to the death of Mohammed Shah.—The authentic history of Hindostan is reckoned to commence with the conquests of Mahmud Gazni. Major Rennel thinks nothing before that period is to be depended on. Mahmud's kingdom had arisen out of that of the Saracens, who had extended their conquests immensely, under the caliph Al-Walid, both to the east and west. Mahmud was the third from Abistagi, a governor of Khorasan, who had revolted from the king of Bucharia. He possessed great part of the ancient Bactria. Gazna, near the source of the Indus, and Balkh, were his chief cities. After conquering the rest of Bactria, he invaded Ilindostan, A. D. 1000, and reduced the province of Moultan, which was inhabited by the Kuttry and Rajpoot tribes (the Catheri and Malli of Alexander), who still retained their ancient bravery, and made a very formidable resistance. Mahmud being equally influenced by a love of conquest, and a superstitious zeal to exterminate the Hindoo religion, a league was at last formed against him among all the Indian princes, from the Ganges to the Nerbudda. Their allied troops were, however, defeated; and in 1008 the famous temple of Nagracut in the Panjab was destroyed. In 1011 Mahmud destroyed the city and temple of Tanafar, and reduced Delhi. In 1018 he took Canoge, and demolished the temples of that and several other cities; but failed in his attempts on Ajimere. In his twelfth expedition, in 1024, he reduced the whole peninsula of Guzerat, and destroyed the famous temple of Sumnaut, as well as those of all the other cities he conquered. At his death, in 1028, he possessed the east and largest part of Persia, with the Indian provinces from the west part of the Ganges to Guzerat, and those between the Indus and the mountains of Ajimere.

But in 1158 this extensive empire began to fall to pieces. The west and largest part was seized by the Gauri, while the east contiguous to the Indus remained in the possession of Cusroe, whose capital was Lahore. In 1184 his sons were expelled by the Gauri, and in 1194 Mohammed Gori penetrated into Hindostan as far as Benares, committing as great devastation as Mahmud Gazni had done. The also reduced the south part of Ajimere, and the territory south of the Jumna, the fort of Gualior, &c. On his death, in 1205, the enpire of Gazna was again divided, and the Patan or Alghan empire was founded by Cuttub, who had the Indian part, the Persian remaining to Eldoze. Cuttub inade Delhi his capital; and in 1210 his successor, Altunish, reduced the greatest part of Hindostan Proper. One of his sons obtained the government of Bengal, and, from this period, one of the emperor's sons had always that government. During his reign, the bloody Jenghiz Khan put an end to the other branch of the Gazna, but Hindostan was left undisturbed.

The kingdom of Malwa, which had been reduced in 1205 by Cuttub, shook off the yoke in 1265, and the Rajpoots revolted. From this period the most dreadful confusion and massacres followed almost to the time that the British government commenced. The empire being subdivided among a set of rapacious governors, the people were reduced to the greatest degree of misery. To add to their distress, the Moguls made such frequent and formidable invasions, that at last the emperor Ferose HI. allowed them to settle in the country in 1292. The emperor was incited by Alla, governor of Gurrah, to attempt the conquest of the Deccan; and Alla being employed in that business, wherein he amassed an immense quantity of treasure, no sooner accomplished it, than he deposed and murdered Ferose, and assumed the sovereignty of Hindostan. After this he reduced the forts of Guzerat, Ratanpour, and Cheitore; and in 1303 the city of Warangole, capital of Tellingala. After this the remainder of Malwa was subdued; in 1306 the conquest of the Deccan was undertaken; and in 1310 Alla carried his army into Dowiatabad and the Carnatic. But all this usurper's expeditions, and those of his general Cafoor, seem to have been made more with the view of plunder than of permanent conquest. The quantity of riches Cafcor amassed was so great, that it is said his soldiers carried away only the gold, leaving the silver behind as too cumbersome. In 1322 several places rebelled, but were reduced; and the Carnatic was ravaged from sea to sea in 1326, when Alla died. His successors were not able to retain the dominions he left. Under Mohammed III. the inhabitants of the Deccan revolted, and dreve the Mahommedans completely out of all their territories, except the city of Dowlatabad. In 1344 Belaldeo, king of the Deccan, who had headed the revolt, founded the city of Bisnagur. Many provinces in Bengal, Guzerat, and Panjab, also revolted. Ferose III., who succeeded Mohammed in 1351, was a wise prince, who preferred the improvement of his empire by the arts of peace, to the extension of it by war and conquest. In his reign, which lasted thirty-seven years, agriculture, commerce, and manufactures, were encouraged. But upon his death, in 1388, a civil war broke out, which continued five years, till Mahmud III. succeeded in 1393. During this period Hindostan exhibited the uncommon phenomenon of two emperors residing in the same capital, yet at war with each other. In this unfortunate situation of affairs, Tamer-

lane, after subduing all the west of Tartary and Asia, turned his arms against Hindostan, and made an easy conquest of it. But the bloody monster, not contented with his victory, ordered a general massacre of the inhabitants, in consequence of which, it is said, that 100,000 of them were murdered in one hour. In January, 1399, he defeated the Indian army, with great slaughter, and soon after took the city of Delhi, which then consisted of three cities, surrounded by walls. Though no resistance was made, and of course there was no pretence for bloodshed, yet a quarrel was fomented within a few days by his Tartar soldiers, who pillaged the city, massacred most of the people, and sold the rest for slaves. The spoils, in plate and jewels, were immense. After this dreadful carnage, Tamerlane marched through the other provinces of Hindostan, defeating the Indians every where, and slaughtering the worshippers of fire. On the 25th of March this bloody conqueror retired, leaving Mahmud in possession of the throne, and reserving only Panjab to himself.

The death of Mahmud III., in 1413, put an end to the Patan dynasty. He was succeeded by Chizer, a descendant of Mahomet the impostor, and his posterity continued to reign till 1450, when Alla II. abdicated the throne, and Belloli, an Afghan, took possession of it. Under him a prince who resided at Jionpour became so formidable, that he left him only the shadow of authority. Belloli's son, however, recovered a great part of the empire, about 1501, when he made Agra his residence. In the reign of Ibraham II. Sultan Baber, a descendant of Tamerlane, conquered a considerable part of the empire. His first expedition was in 1518; and in 1525 he took Delhi. On the death of Baber, who reigned only five years, his son Humaioon was driven from the throne, and obliged to take shelter among the Rajpoot princes of Ajimere. The sovereignty was usurped by Sheer Khan, who in 1545 was killed at the siege of Cheitore. His territories extended from the Indus to Bengal; but the government was so unsettled, that no fewer than five sovereigns succeeded within nine years after his death. This induced a strong party to join in recalling Humaioon; who is said to have been a prince of great virtue and abilities; but he lived only one year after his return. Upon his death, in 1555, his son Aebar succeeded, one of the greatest princes that ever reigned in Hindostan. He was then only fourteen years of age; but, during his long reign of fifty-one years, he established the empire on a more sure foundation than it had probably ever been before. His first years were spent in reducing the revolted provinces, and in securing their future obedience, not only by appointing faithful governors, but by attending to the rights and privileges of the people, and establishing an unlimited toleration in religion. In 1585 he invaded the Deccan; but, though the war continued twenty years, the only progress made was the reduction of Candeish, Tellingana, the west part of Berar, and the north part of Amednagur. The city of Amednagur was taken in 1601, after a tedious and bloody siege. Under his successor, Jehan Guire, the war was faintly earried on, the

empire being disturbed by his rebellious son Shah Jehan, and his councils distracted by the influence of his mistress Noor Jehan. In this monarch's reign Sir Thomas Roe, the first British ambassador at the court of Hindostan, arrived. Jehan Guire died in 1627, and was succeeded by his son Shah Jehan, who pushed the conquest of the Deccan with vigor, but in so destructive a manner, that most of the princes submitted. A war next broke out with the Portuguese which ended in their expulsion from Hoogly. Shah Jehan was a debauched prince; and his rebellion against his father was retaliated by that of his son Aurengzebe, who dethroned him, disguising his ambition under the mask of religion, and committing the greatest crimes under that pretence. He engaged in a war with his brothers, Morad and Dara, whom he defeated and put to death, and then pretended to lament their misfortune. He, however, treated his father with tenderness till his death in 1666. From 1660, when Aurengzebe attained full possession of the throne, till 1678, a profound tranquillity prevailed throughout the empire; but from a jealousy of Sevagee, the founder of the Mahratta state, he undertook the conquest of the Deccan; and, having quelled a rebellion of the Patans beyond the Indus, he persecuted the Hindoos so severely, that the Rajpoot tribes in Ajimere commenced a war against him. In this war, having headed his armies in person, he was hemmed in among the mountains, and would have been taken prisoner, had not the Rajpoots generously allowed him to escape, as well as his empress, whom they actually had taken prisoner. This did not prevent him from renewing his incursions into that country in 1681.

He took and razed Checture, committing great devastations, and destroying the Hindoo temples and idols every where; but was at last obliged to abandon his persecutions, and allow the Hindoos to remain in peace. He reduced, however, the greatest part of the Deccan, and even during the last five years of his life was employed in the field. His long absence from his capital occasioned rebellions to break out in various parts; and about this period the Jats, or Jauts, first made their appearance in the province of Agra. At his death, in 1707, his empire extended from 10° to 35° lat., and nearly as many degrees in long. 'His revenue,' says major Rennel, ' exceeded £35,000,000 sterling, in a country where provisions are about four times as cheap as in England. But so weighty a sceptre could be wielded only by a hand like Aurengzebe's; and accordingly, in fifty years after his death, a succession of weak princes and wicked ministers reduced this astonishing empire to nothing.

He left four sons; Mausum, Azem, Kaum-Bush, and Acbar. This last had rebelled against his father, and been obliged to fly to Persia thirty years before. A civil war commenced between Mausum and Azem; and a decisive battle was fought, wherein 300,000 men were engaged on each side, and Azem was defeated and killed. Mausum then assumed the title of Bahader Shah, and, during his short reign of five years, gave proofs of considerable abilities. He defeated

701

who, in the reign of Shah Jehan, had silently established themselves along the eastern mountains, and had now taken up arms in Lahore, ravaging the country to the banks of the Jumnah. Bahader Shah died at Lahore, after a short illness, and the empire was again contested among his four sons. Of these the second, named Azem Coshaum, took possession of the treasures, but was opposed by his brothers, who agreed to divide the empire. Azem was defeated and killed, in a battle gained chiefly by the valor of Shah Jehan, the youngest, who was willing to abide by the agreement. But the intrigues of Zoolfecar Khan, an omrah in high trust, prevented this. A new civil war took place, in which Jehan was killed. The two surviving brothers tried their fortune in a third battle, in which Jehauder, the eldest, being victor, took possession of the throne; but in nine months was dethroned by Furroksere, the son of Azem Ooshaun, assisted by Houssein Ali Khan and Abdoollah Khan, two brothers, who had extensive governments in the eastern provinces. In 1713 the Seiks again took arms; and, in 1716, were grown so formidable, that the emperor marched against them. About this time the English East India Company obtained the famous firman, or grant, by which their goods of export and im-port were exempted from duties. Furroksere was deposed and murdered by the brothers Houssein and Abdoollah, who set up another emperor, whom they also deposed and murdered in the same year; and thus, in eleven years after Aurengzebe's death, eleven of his posterity, who had either possessed or been competitors for the throne, were exterminated; and the government declined so rapidly, that the empire seemed ready to fall to pieces. In 1718 the two brothers raised to the throne Mohammed Shah, the grandson of Bahader : who, warned by the fate of his predecessors, soon rid himself of these two powerful subjects, though at the expense of a civil war. But new enemies started up. Nizam Al Mulek, viceroy of the Deccan, in 1722, had been offered the place of vizier, or prime minister, but did not accept it. Independence was his aim, and the increasing power of the Mahrattas furnished him with a pretence for augmenting his army. Persuaded that he had a party at court, he, in 1738, came thither, with a great body of armed followers; but, finding that the interest of the emperor was still too powerful for him, he invited the famous Persian usurper, Nadir Shah, or Kouli Khan to invade Hindostan.

This invitation was readily accepted, and Nadir entered the country without opposition; yet, when far advanced into Hindostan, he considered the issue of matters to be so uncertain, that he offered to evacuate the country and retire for fifty lacks of rupees, about £500,000 sterling. The intrigues of the nizam and his party hindered the emperor from complying with this demand; instead of which he threw himself upon the usurper's mercy, who then took possession of Delhi, and demanded a ransom of £30,000,000 sterling. After a conference with

the emperor, Nadir seized upon 200 cannon, with some treasure and jewels which he sent off to Candahar. He then marched back to Delhi, where a commotion arose about the price of corn. While Nadir endeavoured to quell it, a shot was fired at him, and narrowly missed him; upon which the barbarian ordered a general massaere of the inhabitants, and slaughtered 120,000, or, according to some, 150,000 persons. This was followed by a seizure of all the jewels, plate, &c., which could be found; besides, exacting the £30,000,000, which was done with the utmost rigor.

In the midst of these scenes Nadir caused the marriage of his son to be celebrated with a grand-daughter of Aurengzebe, and then took leave of the emperor, with professions of friendship, on the 6th of May 1739. He is said to have carried off goods and treasure to the value of £125,000,000 sterling. Mohammed had also ceded to him all the provinces of Hindostan west of the Indus. The villanous nizam possessed almost all the remaining power of the empire, which he employed to establish himself in the sovereignty of the Deccan. Bengal had become independent in 1738, under Aliverdy Cawn, and was not long after invaded by a vast army of Mahrattas in the emperor's name, who, not being able to pay them his arrears of tribute, sent them to Bengal to collect it themselves. About the same time the Rohillas, a tribe from the mountains between India and Persia, erected an independent state on the east of the Ganges, eighty miles from Delhi. The empire seemed now to be running fast to its dissolution. Nadir Shah being murdered, Abdallah, one of his generals, seized on the east part of Persia and the adjacent Indian provinces which Mohammed Shah had ceded to Nadir, and formed them into the kingdom of Kandahar, or Abdalli. See KAN-DAHAR.

4. India, from the death of Mohammed Shah to the recovery of Calcutta by the English, in 1757 .-In 1739 Mohammed Shah died, and was succeeded by his son Ahmed; during whose reign, which lasted only six years, the division of the remainder of the empire took place; and nothing remained to the family of Tamerlane but a small tract of territory round Delhi. The Jauts established themselves in Agra; Oude was seized on by Seifdar Jang, father of the late Sujah Dowlah; Allahabad by Mohammed Kouli; Ajmere reverted to its ancient lords the Rajpoots; Malivah was divided between the Poonah Mahrattas and several native zemindars; and the Mahrattas, besides their dominion in the Deccan, possessed the greatest part of Berar, Guzerat, and Orissa. Abdallah, having established his empire of Kandahar, entered Lahore and Moultan: and now 'the whole country of Hindostan,' says major Rennel, 'was in commotion, each party fearing the machinations or attacks of the other; so that all regular government was at an end, and villany was practised in every form. Perhaps in the annals of the world it has seldom happened, that the bonds of government were so suddenly dissolved, over a portion of country containing at least 60 000,000 of inhabitants.' In 1748 the nizam Al Mulek died, at the age of 104; and

was succeeded by his son Nazir Jung, to the prejudice of his elder brother Gazi, vizier to the nominal emperor.

The contest that followed on this occasion, for the throne of the Decean and the nabobship of Arcot, first engaged the British and French to act as auxiliaries on opposite sides. Immediately after the peace of Aix-la-Chapelle, the French commandant, M. Dupleix, began to sow dissension among the nabobs, who had by this time usurped the sovereignty of the country. Nizam Al Mulek, viceroy of Deccan and nabob of Arcot, had, as officer for the Mogul, nominated Anaverdy Khan to be governor of the Carnatic in 1745. On the death of the nizam his second son, Nazir Zing, was appointed to succeed him in his viceroyalty, and his nomination was confirmed by the Mogul. He was opposed by his cousin Muzapher Zing, who applied to Dupleix for assistance. By him he was supplied with a body of Europeans and some artillery; after which, being also joined by Chunda Saib, an active Indian prince, he took the field against Nazir Zing. The latter was supported by a body of British troops under colonel Laurence: and the French, dreading the event of an engagement, retired in the night; so that their ally was obliged to throw himself on the elemency of Nazir Zing. His life was spared, though he himself was detained as a state prisoner; but the traitor, forgetting the kindness shown him on this occasion, entered into a conspiracy against the life of Nazir Zing, and murdered him in his camp; in which infamous transaction he was encouraged it is said by Dupleix and Chunda Saib, who had retired to Pondicherry. Immense riches were found in the tents of Nazir Zing, great part of which fell to the share of Dupleix, whom Muzapher Zing now associated with himself in the government. By this association the Frenchman assumed the state and formalities of an eastern prince; and he and his colleague Muzapher Zing appointed Chunda Saib nabob of Arcot. In 1749 Anaverdy Khan had been defeated and killed by Muzapher Zing and Chunda Saib, assisted by the French; after which his son, Mohammed Ali Khan, had put himself under the protection of the English at Madras, and was confirmed by Nazir Zing, as his father's successor in the nabobship or government of Arcot. This government therefore was disputed betwixt Mohammed Ali Khan, appointed by the legal viceroy Nazir Zing, and supported by the English company, and Chunda Saib, nominated by the usurper Muzapher Zing, and protected by Dupleix, who commanded at Pondicherry. Muzapher, however, did not long enjoy his ill-acquired authority; for in 1751 the nabobs who had been the means of raising him to the power he enjoyed, thinking themselves ill rewarded for their services, fell upon him suddenly, defeated his forces, and put him to death; proclaiming Salabat Zing next day viceroy of the Decean. On the other hand, the Mogul appointed Gauzedy Khan, the elder brother of Salabat Zing, who was confirmed by Mohammed Ali Khan in the government of Arcot; but the affairs of the Mogul were at that time in such disorder that he could not support the nomination he had

made. Chunda Saib in the mean time determined to recover, by force, the nabobship of Arcot, from which he had been deposed by the Mogul, who had placed Anaverdy Khan in his room. With this view he had recourse to Dupleix at Pondicherry, who reinforced him with 2000 sepoys, sixty Caffrees, and 420 French; upon condition that, if he succeeded, he should cede to the French the town of Velur in the neighbourhood of Pondicherry, with its dependencies, consisting of forty-five villages. Thus reinforced, he de-feated Anaverdy Khan, who lost his life in the engagement, re-assumed the government of Arcot, and punctually performed the engagements he had come under to his French allies. All this time Mohammed Ali Khan had been supported by the English, to whom he fled after his father's death. By them he was supplied with a reinforcement of men, money and ammunition, under the conduct of major Laurence, a brave and experienced officer; whereby he gained some advantages over the enemy; and, repairing afterwards to Fort St. David's, he obtained a farther reinforcement. With all this assistance, however, he accomplished nothing of any moment; and, the English auxiliaries having retired, he was defeated by his enemies. He now was obliged to enter into a more close alliance with the English, and cede to them some commercial points which had been long in dispute; after which captain Cope was despatched to put Trichinopoli in a state of defence, while de Gingis, a Swiss officer, marched at the head of 400 Europeans to the assistance of the nabob. On this occasion Mr. (afterwards lord) Clive first appeared in a military capacity. He had been employed before as a writer, but seemed very little qualified for that or any other department of civil life. He now marched towards Arcot at the head of 210 Europeans and 500 sepoys; and in his first expedition displayed the qualities of a great commander. His movements were conducted with such secrecy and despatch, that he made himself master of the enemy's capital before they knew of his march; and gained the affections of the people by his generosity, in affording protection without ransom. In a short time, however, he found himself invested in Fort St. David's by Rajah Saib, son to Chunda Saib, an Indian chief, pretender to the nabobship of Arcot, at the head of a numerous army; the operations of the siege being conducted by European engineers. Thus, in spite of his utmost efforts, two practicable breaches were made, and a general assault given; but Mr. Clive, having intelligence of the intended attack, defended himself with such vigor, that the assailants were every where repulsed with loss, and obliged precipitately to raise the siege. Mr. Clive, being reinforced by a detachment from Trichinopoli, then marched in quest of the enemy; and, having overtaken them in the plains of Arani, attacked and entirely defeated them on the 3d of December 1751. This victory was followed by the surrender of the forts of Timery, Conjaveram, and Arani; after which he returned in triumph to Fort St. David's. In the beginning of 1752 he marched towards Madras, where he was reinforced by a small body of

troops from Bengal. Though the whole did not

exceed 300 Europeans, with as many natives as were sufficient to give the appearance of an army, he boldly proceeded to a place called Koveripauk, about fifteen miles from Arcot, where the enemy lay to the number of 1500 sepoys, 1700 horse, with 150 Europeans, and eight pieces of cannon. Victory was long doubtful, until Mr. Clive having sent round a detachment to fall upon the rear of the enemy, while the English attacked the entrenchments in front with their bayonets, a general confusion ensued, the enemy was routed with considerable slaughter, and only saved from total destruction by the darkness of the night. The French to a man threw down their arms on this occasion, and surrendered themselves prisoners of war; all the baggage and cannon falling at the same time into the hand of the victors. On the return of Mr. Clive to Fort St. David's, he was superseded in the command by major Laurence. Being detached by him with 400 Europeans, a few Mahratta soldiers, and a body of sepoys, to cut off the enemy's retreat to Pondicherry, he was attended with his usual success, took several forts, vanquished the French commander M. d'Anteuil, and obliged him with all his party to surrender prisoners of war. Chunda Saib, in the mean time, lay encamped with an army of 30,000 men at Syringham, an island near Trichinopoli; but, major Laurence having intercepted his provisions, he was forced to fly. Being obliged to pass through the camp of the Tanjore general, he obtained a pass for that purpose; but was nevertheless detained by the nabob, who was an ally of the British, and his head was struck off. After the flight of Chunda Saib his army was attacked and routed by major Laurence; and the island of Syringham surrendered, with about 1000 French soldiers under the command of Mr. Law, brother to him who schemed the Mississippi Company. M. Dupleix, mortified at this bad success, proclaimed Rajah Saib, son to Chunda Saib, nabob of Arcot; and afterwards produced forged commissions from the great Mogul, appointing him governor of all the Carnatic from the Kristnah to the sea. To carry on this deception, a messenger pretended to come from Delhi, and was received with all the pomp of an ambassador from the great Mogul. -Dupleix, mounted on an elephant and preceded by music and dancing women, after the oriental fashion, received his commission from the hands of this impostor; after which he affected the state of an eastern prince; kept his durbar or court, appeared sitting cross-legged on a sofa, and received presents as sovereign of the country, from his own council as well as from the natives. Thus the forces of the English and French East India companies were engaged in a course of hostilities, under the title of auxiliaries to the contending parties at a time when no war existed between the two nations. In the mean time Gauzedy Khan assumed the dignity appointed him by the Mogul; but had not been in possession of it above fourteen days when he was poisoned by his own sister. His son, Shah Abadin Khan, was appointed to succeed him by the Mogul; but, the latter being unable to give him proper assistance, Salabat Zing remained without any rival, and made a present to the

French commander of all the English possessions Thus concluded the camto the northward. paign of 1752. Next year both parties received considerable reinforcements; the English by the arrival of admiral Watson with a squadron of ships of war, having on board a regiment commanded by colonel Aldercroon; and the French by M. Gadeheu, commissary and governor-general of all their settlements, on whose arrival M. Dupleix departed for Europe. The new governor made the most friendly proposals, and desired a cessation of arms until the disputes could be adjusted in Europe. These being readily listened to on the part of the British, deputies were sent to Pondicherry, and a provisional treaty and truce were concluded, on condition that neither of the two companies should for the future interfere in any of the differences that might take place in the country. The other articles related to the settlements that should be retained or possessed by the respective companies until fresh orders should arrive from the courts of London and Versailles; and till then it was stipulated, that neither of them should be allowed to procure any new grant or cession, or to build forts in defence of any new establishment; nor should they proceed to any cession, retrocession, or evacuation of what they then possessed; but every thing should remain

on the same footing as formerly. The treaty was published on the 11th of January 1755; at the end of which month admiral Watson returned with his squadron from Bombay; and M. Gadeheu returned to France in the beginning of February, leaving M. Leyrit his successor at Pondicherry. M. Bussy, with the souhahdar Salabat Zing, commanded in the north; and M. de Saussay was left to command the troops at Syringham. Matters, however, did not long continue in a state of tranquillity. Early in the year it appeared that the French were endeavouring to get possession of all the M. Bussy demanded the fortress Deccan. of Golconda from Salabat Zing; and M. Leyrit encouraged the governor who rented Velu to take up arms against the nabob. He even sent 300 French and as many sepoys from Pondicherry to support this rebel, and oppose the English employed by the nabob to collect his revenues from the tributary princes. In this office they had been engaged ever since the cessation of hostilities; one-half of the revenue being paid to the nabob, and the other to the company, which now involved them in military expeditions into the country of the polygars, who had been previously summoned to send agents to settle accounts with the nabob. Four of them obeyed the summons; but one Lachenaig refused, and it was therefore resolved to attack him. The country was very strong, being fortified both by nature and art: it was surrounded by craggy hills, detached from one another, and covered with bushes so as to be im-passable for any but the natives. The works, which the natives had thrown up from hill to hill, were indeed very rude, being formed of large stones laid one upon another without any cement, and flanked by round earthen towers ; but before the wall was a deep and broad ditch, with

a large hedge of bamboos in front, so thick that it could not be penetrated but by the hatchet or fire. Two lines of this kind were forced, though not without some loss; after which, Lachenaug was obliged to submit. The English army now marched to Madura, a strong Indian town about sixty miles south of Trichinopoli. On their approach it submitted without opposition, and the inhabitants seemed pleased with their change of government. Here a deputation was received from a neighbouring polygar, desiring an alliance, accompanied with an offer of two settlements on the sea coast, opposite to the island of Ceylon. Before this time they could not have reached Tinevelly, but by a circuitous march of 400 or 500 miles; but from the new settlements the distance to that place was only fifty miles, and reinforcements or supplies of any kind might be sent them from Madras or Fort St. David in four or five days. This offer being accepted. colonel Heron, the English commander, marched to attack the governor of Madura, who had fled to Coilgoody. The road was so rugged, that cannon could with difficulty be brought up : and, as the troops were not furnished with scaling ladders, there seemed to be little hope of gaining the place. The colonel, however, determined to make an assault after the Indian manner, by burning down the gates with straw; and eventually the place was taken and plundered, not sparing even the temples. After this exploit the army returned to Madura; where leaving a gar-rison, they proceeded to Tinevelly, which submitted without opposition, and owned the jurisdiction of the nabob. It afterwards appeared that the revenues collected in this expedition had not been sufficient to defray the expenses of the army; and a report being spread that Salabat Zing was advancing into the Carnatic along with M. Bussy, the French commander, it was thought proper to recal colonel liferon to Trichinopoli. Before this he had been prevailed on by Mazuphe Cawn, the Indian chief who accompanied him, to convey to him an investiture of the countries of Madura and Tinevelly, for an annual rent of £187,500 sterling. In his way he was likewise induced by the same chief to make an attempt on a strong fort named Nellytangaville, situated about thirty miles west of Tinevelly, and belonging to a refractory polygar. This attempt, however, proving unsuccessful for want of cannon, the colonel returned with Mazuphe Cawn to Trichinopoli. The last expedition of this commander was against [a fort named Volsynatim, situated near the entrance of the woods belonging to the Colleries. In their march the English army had to go through the pass of Natam, one of the most dangerous in the peninsula. It begins about twenty miles north of Trichinopoli, and continues for six miles through a wood; being barely sufficient to admit a single carriage, at the same time that a bank running along each side rendered it impossible to widen it. A detachment of pioneers and sepoys were sent to scour the woods before the main body ventured to pass through such a dangerous defile; but the march was after all stopped by one of the heaviest tumbrils sinking in a slough, out of which the oxen were not able

This prevented the other tumbrils to draw it. from moving forward, as well as three field pieces that formed the rear division of artillery, and the whole line of baggage; and in this divided and defenceless state the rear division of the baggage was attacked by the Indians; and the whole would have been destroyed, had it not been for the courage and activity of captain Smith, who here commanded forty Caffres and 200 sepoys, with one six-pounder. Considerable damage, however, was done, and the Indians recovered their gods. Colonel Heron being tried by a court-martial for misconduct in this expedition, and found guilty, was declared incapable of serving the company; soon after which he returned to Europe, and died in Holland.

In the mean time Nanderauze, an Indian prince, formed a scheme to get possession of Trichinopoli; and communicated his design to M. de Saussay, the commander of the French troops: but this gentleman communicated this intelligence to the English commander, and the enterprise miscarried. As soon as the company were informed of the acquisitions made by M. Bussy in the Deccan, it was determined to encourage the Mahrattas to attack Salabat Zing, in order to oblige him to dismiss his French auxiliaries. It was necessary therefore to select a commander well experienced in the political systems of the country, as well as in military affairs; and for this purpose Mr. Clive, now governor of Fort St. David's, was invested with a lieutenant-colonel's commission in the king's troops. Three companies of the king's artillery consisting of 100 men each, and 300 recruits, were sent from England on this occasion, and they arrived at Bombay on the 27th of November : when on a sudden the presidency of Madras conceived that this expedition could not be prosecuted without infringing the convention made with the French commander. It was therefore laid aside, and the presidency of Madras directed all their force for the present against Tulagee Angria, who had long been a formidable enemy to the English commerce. The dominions of this pirate consisted of several islands near Bombay, and an extent of land on the continent about 180 miles in length, and from thirty to sixty in breadth. He possessed also several forts that had been taken from the Europeans; the trade of piracy having, it seems, been hereditary in his family, and indeed followed by most of the inhabitants of this coast. His fleet consisted of two kinds of vessels peculiar to this country, named grabs and gallivats; both having generally two masts, and some three ; the latter being about 200 tons burden, and the former 150. They had forty or fifty oars, by which they might be moved at the rate of four miles an hour; and were mounted with six or eight pieces of cannon, carrying balls from 6 to 12 lbs. Angria had commonly a fleet of sixty or seventy of these vessels. An unsuccessful attempt had been made in 1717, by the presidency of Bombay, against the forts of Geriah and Kennary, the principal strong holds of Angria. Another was made in 1722, under admiral Matthews, against a fort named Coilabley, about fifteen leagues south of Bombay: but this also miscarried, through the Vol. XI.

cowardice and treachery of the Portuguese, who pretended to assist the English. The Mahrattas having implored the assistance of the English against this common enemy, commodore William James was sent from Bombay on the 22nd of March 1755, with the Protector of forty-four, the Swallow of sixteen guns, and two bomb ketches; but with instructions not to hazard the fleet by attacking any of the pirate's forts, only to blockade the harbours, while the Mahratta army carried on their operations by land. He had scarcely commenced his voyage when he fell in with a considerable fleet of the pirates, which he would have taken, had it not been for the timidity and dilatory behaviour of his allies. They had invested three of the forts, but durst not approach nearer than two miles, and even there entrenched themselves up to the chin, to be secure against the fire of the fort. The commodore, provoked at this pusillanimous behaviour, determined, for the honor of the British arms, to exceed the orders he had received. Running within 100 yards of a fort named Severndroog, he in a few hours ruined the walls, and set it on fire; a powder magazine also blowing up, the people, to the number of about 1000, abandoned the place. The whole force of the attack being then turned upon Goa, a white flag was soon hung out as a signal of surrender. The governor, however, did not wait the event of a capitulation, but passed over to Severndroog, where he hoped to maintain his ground. The fire was now renewed against this fortress; and, the seamen having cut a passage through one of the gates with their axes, the garrison soon surrendered; at the same time that two other forts besieged by the Mahrattas hung out flags of truce and capitalated, and thus were four of Angria's forts, hitherto deemed impregnable, subdued in one day. These successes were followed by the surrender of Bancoote, a strong fortified island, now called Fort Victoria, which the British retained in possession : the other forts were delivered up to the Mahrattas. On the arrival of admiral Watson in November 1755, it was determined to root out the pirate at once, by attacking Geriah his capital: but it was so long since any Englishmen had seen this place, and the reports of its strength had been so much exaggerated, that it was thought proper to first reconnoitre it. It was then attacked by such a formidable fleet, that Angria, losing courage at their approach, fled to the Mahrattas, leaving Geriah to be defended by his brother. The fort was soon obliged to surrender. All its ramparts were either cut out of the solid rock, or built of stones ten feet long edgeways: in it were found 200 pieces of brass cannon, six brass mortars, and a great quantity of ammunition and military stores, besides money and effects to the value of £125,000. About 2000 people were made prisoners; among whom were the wife, children, mother, brother, and admiral of the pirate; but they were treated with elemency: and his family, at their own request, continued under the protection of the English at Geriah. The other forts belonging to Angria soon submitted; so that his power on the coast of Malabar was entirely annihilated.

While the affairs of the British went on thus

successfully, M. Bussy had been constantly employed near the person of Salabat Zing, and made use of his influence with that prince to enlarge the possessions of the French : at length the prime minister of Salabat Zing represented to him the danger and shame of allowing a small body of foreigners thus to give law to a great prince; and, having formed a powerful combination against the French, obtained an order for their dismission. M. Bussy took his leave without any marks of disgust, having under his command about 600 Europeans, 5000 sepoys, and a fine train of artillery. Orders were sent to all the polygars to oppose his passage; but, notwithstanding this opposition, Bussy reached Hydra-bad with very little loss. Here he took possession of a garden belonging to the kings of Golconda, where he resolved to keep his post until succours should arrive from Pondicherry and Masulipatam. Salabat Zing proposed to attack him here; and, the better to attain his purpose, applied to the English presidency at Madras for a body of troops to assist him in that service. Accordingly a detachment of 400 Europeans and 1500 sepoys was on the point of being ordered to join Salabat, when expresses from Bengal informed them of the greatest danger that had ever threatened the British settlements in Hindostan. This arose from the displeasure of Surajah Dowla, the new nabob of Bengal. His grandfather Aliverdy Khan having died, in April or May 1756, Surajah succeeded to the nabobship of Bengal, Bahar, and Orixa. He was congratulated on his accession by Mr. Drake, the English president at Calcutta, and readily promised protection to his countrymen; but he soon after took offence at the imprisonment of Omichund, an eminent Gentoo merchant, who had lived several years under the protection of the English government. Of this circumstance, however, Surajah did not directly complain; but founded his pretence of war upon the conduct of the English in repairing the fortifications of Calcutta; which indeed was absolutely necessary, on account of the great probability of a war with the French. The nabob, however, threatened an attack if the works were not instantly demolished. With this requisition the president and council pretended to comply; but nevertheless went on with them. Surajah Dowla took the field on the 30th of May 1756, with an army of 40,000 faot, 30,000 horse, and 400 elephants; and on the 2d of June detached 20,000 men to invest the fort at Cassumbazar, a large town on an island formed by the west branch of the Ganges. This fort was regularly built, with sixty cannon, and defended by 300 men, principally sepoys. The nabob pretending a desire to treat, Mr. Watts, the chief of the factory, was persuaded to put himself in his power; which he had no sooner done, than he was made a close prisoner, along with Mr. Batson, a surgeon, who accompanied him. The two prisoners were treated with great indignity, and threatened with death; but two of the council who had been sent for by the tyrant's command were sent back again, with orders to persuade the people of the factory to surrender it at discretion. This proposal met with great opposition; but was at last complied with, though very little to the advan-

tage of the prisoners; for they were not only deprived of every thing they possessed, but stripped almost naked, and sent to Hoogly, where they were closely confined. The nabob, encouraged by this success, marched directly to Calcutta, which he invested on the 15th. The capture of this city, and the catastrophe that followed, are related under the article CALCUTTA. See also HOLWELL. The news of this disaster put an end to the expedition projected against M. Bussy; and colonel Clive was instantly despatched to Bengal with 400 Europeans and 1000 sepoys, on board of the fleet commanded by admiral Watson. They did not arrive till the 15th of December at a village called Fulta, situated on a branch of the Ganges, where the inhabitants of Calcutta had taken refuge after their misfortune. Their first operations were against the forts of Busbudgia, Tanna, Fort William, and Calcutta, now in the hands of the enemy All these were reduced almost as soon as they approached them. Hoogly, the place of rendezvous for all nations who traded to Bengal (its warehouses and shops being always filled with the richest merchandise of the country), was likewise reduced and destroyed, with the granaries and storehouses of salt on each side the river; which proved very detrimental to the nabob, by depriving him of the means of subsistence for his army. Surajah Dowla, enraged at this success of the English, now seemed determined to crush them at once by a general engagement. From this, however, he was intimidated by a successful attack on his camp, which induced him to conclude a treaty, on the 9th of February, 1757, on the following conditions: 1. That the privileges granted to the English by the Mogul should not be disputed : 2. That all goods with English orders should pass, by land or water, free of any tax: 3. All the Company's factories which had been seized by the nabob should be restored; and the goods, money, and effects, accounted for: 4. That the English should have liberty to fortify Calcutta: and, 5. To coin their own gold and silver.

5. India from the war with France in 1757 to the taking of Pondicherry in 1761 .- As intelligence was now received of a war between France and England, an attack was meditated on Chandernagore. It remained therefore only to obtain the consent of the nabob; but, in ten days after the conclusion of the treaty, he sent a letter to admiral Watson, complaining of his intention, and surmising that the English designed to turn their arms against him as soon as they made themselves masters of Chandernagore. This was strenuously denied by the admiral; and a number of letters passed, in which the latter made use of expressions which were supposed to imply a tacit consent that Chandernagore should be attacked. An attack was therefore made, and it soon capitulated. This intelligence, however, seemed to be by no means agreeable to Surajah Dowla. He pretended displeasure on account of the English infringing the treaties, and complained that they had ravaged some parts of his dominions. This was denied by the admiral; but from this time both parties made preparations for war. The nabob returned no

answer till the 13th of June, when he sent a declaration of war. The English council at Calcutta now resolved on the deposition of the nabob; which at this time appeared practicable, by supporting the pretensions of Meer Jaffier Ali Cawn, who had entered into a conspiracy against him. Meer Jaffier had married the sister of Aliverdy Cawn, the predecessor of Surajah; and was now supported in his pretensions by the general of the horse, and by Jugget Seet the nabob's banker, the richest merchant in all India. By these three the design was communicated to Mr. Watts, the English resident at the nabob's court, and by him to colonel Clive and the secret committee at Calcutta. The management of the affair being left to Mr. Watts and Mr. Clive, it was thought proper to communicate it to Omichund, through whom the correspondence that was necessary might be carried on with Meer Jaffier. This agent proved so avaricious, that it was resolved to serve him in his own way; and, by a piece of treachery to him also, to gain their point with both parties. Two treaties were therefore written out; in one of which it was promised to comply with Omichund's demand, but in the other his name was not even mentioned; and both these treaties were signed by all the principal persons concerned, admiral Watson alone excepted, whom no political motives could influence to sign an agreement which he did not mean to keep. These treaties, the same in every other respect, were to the following purport: 1. All the effects and factories be-longing to Bengal, Bahar, and Orixa, were to remain in possession of the English, nor should any more of the French ever be allowed to settle in these provinces. 2. In consideration of the losses sustained by the English Company, by the capture and plunder of Calcutta, he agreed to pay one crore of rupees, or £1,250,000 sterling. 3. For the effects plundered from the English at Calcutta, he engaged to pay fifty lacks of rupees, or $\pounds 625,000$. 4. For the effects plundered from the Gentoos, Moors, and other inhabitants of Calcutta, twenty lacks, or £250,000. 5. For the effects plundered from the American merchants, inhabitants of Calcutta, seven lacks, or £87,500. 6. The distribution of all these sums to be left to admiral Watson, colonel Clive, Roger Drake, William Watts, James Kilpatrick, and Richard Becher, esquires, to be dis-posed of by them to whom they think proper.

Colonel Clive began his march against Surajah Dowla on the 13th of June, the day on which that chief sent off his last letter. The decisive action at Plassey followed, in which the treachery of Meer Jaffier, who commanded part of the naboh's troops, and stood neuter during the engagement, rendered the victory easy. The engagement, rendered the victory easy. unfortunate nabob fled to his capital, but left it the following evening, disguised like a faquir, with only two attendants. By these he appears to have been abandoned and even robbed; for on the 3d of July he was found wandering forsaken and almost naked on the road to Patna. Next day he was brought back to Muxadabad; and a few hours after privately beheaded by Meer Jaffier's eldest son.

The usurper took possession of the capital in

triumph; and, on the 29th of June, colonel Clive went to the palace, and in presence of the rajahs and grandees of the court solemnly handed him to the musnud (or carpet) and throne of state, where he was unanimously saluted soubahdah or nabob, and received the submission of all present. While these transactions were going forward, the utmost efforts were used to expel the French entircly from Bengal. By the articles of capitulation at Chandernagore, the whole of that garrison were to continue prisoners of war; but, about the time of signing the treaty, Mr. Law with a small body of troops made his escape out of Cassumbazar, and bent his march towards Patna. There he had been protected by the late nabob; and, on the commencement of fresh hostilities, had collected about 100 French, the only remains of that nation in Bengal. With these he was within two hours' march of Surajah Dowla's camp when the battle of Plassey was fought; on hearing of which he stopped; but afterwards, being informed of the nabob's escape, he marched again to his assistance, and was within a few hours of joining him when he was taken. Three days after he was pursued by Major Eyre Coote at the head of 223 Europeans, three companies of sepoys, fifty Lascars, or Indian sailors, and ten Marmutty men, or pioneers, to clear the roads, together with two pieces of cannon, six-pounders. On this expedition the major exerted his utmost diligence to overtake his antagonist, and spent a very considerable space of time in the pursuit; for, though he set out on the 6th of July, he did not return to Muxadabad till the 1st of September. Mr. Law, however, had the good fortune to escape. Major Coote now obliged Ramnarain, the most powerful rajah in the country, to swear allegiance to Meer Jaffier; and laid open the interior state of the northern provinces. Before his return, admiral Pocock had succeeded to the command of the fleet on the decease of admiral Watson. News were also received, that the French had been very successful on the coast of Coromandel.

Salabat Zing had applied to the English for assistance against the French; but, as they were prevented from performing their agreement by the disaster at Calcutta, he was under the necessity of accommodating the differences with his former friends, and admitting them again into his service. M. Bussy was now reinforced by the troops under Law, who had collected 500 Europeans in his journey. With these he un-dertook to reduce the English factories of Ingeram, Bandermalanka, and Vizagapatam : but as the latter was garrisoned by 140 Europeans and 420 sepoys, it was supposed that it would make some defence; by the conquest of it, however, the French became masters of all the coasts from Ganjam to Masulipatam. In the southern provinces the like had success attended the British cause. The rebel polygars, having united their forces against Mazuphe Cawn, obtained a complete victory; after which, the English sepoys being prevailed upon to quit Madura, the conqueror seized upon that city for himself. In the beginning of 1758 the French made an attempt on Trichinopoli. The command was given to M. d'Auteuil, who invested the place

2 Z 2

with 900 men in battalion, 4000 sepoys, 100 hussars, and a great body of Indian horse. The place was then in no condition to withstand such a force, as most of the garrison had gone to besiege Madura under captain Caillaud; but hearing of the danger he marched back, and entered the town by a road which the enemy had neglected to guard : when the French general drew off his forces disconcerted, and returned to Pondicherry. Captain Callaud then hid stege to Madura, but was so vigorously repulsed, that he was obliged to turn the siege into a blockade, and, before any progress could be made in it, Mazuphe Cawn was prevailed upon to resign it for the sum of 170,000 rupees. A large garrison of sepoys was now again therefore put into the place, and Caillaud returned to Trichinopoli. An attempt was next made by colonel Ford on Nellore; but the enterprise proved unsuccessful, through the unheard of cowardice of a body of sepoys, who, having sheltered themselves in a ditch, absolutely refused to stir a step. Several other enterprises of no great moment were undertaken; but the event was on the whole unfavorable to the British, whose force by the end of the campaign was reduced to 1718 men, while that of the French amounted to 3400 Europeans, of whom 1000 were sent to Pondicherry.

Both parties now received considerable reinforcements from Europe; admiral Pocock being joined on the 24th of March by commodore Stevens with a squadron of five men of war, and the French by nine men of war and two frigates, having on board general Lally with a large body of troops. The British admiral went in quest of them, and an engagement took place, in which the French were defeated with the loss of 600 killed and a great number wounded; while the English had only twenty-nine killed and eighty-nine wounded. The former returned to Pondicherry, where they landed their men, money, and troops. After the battle three of the British captains were tried for misbehaviour, and two of them dismissed from the service. As soon as his vessels were refitted, the admiral sailed again in quest of the enemy; but could not bring them to an action before the 3d of August, when the French were defeated a second time, with the loss of 251 killed and 602 wounded. Notwithstanding this success at sea, the British were greatly deficient in land forces; the re-establishment of their affairs in Bengal having almost entirely drained the settlements on the coast of Coromandel. The consequence of this was the loss of Fort St. David, which the French general Lally reduced, destroying the fortifications and villages, and ravaging the country in such a manner as filled the natives with indignation. He proved successful, however, in the reduction of Devicottah, but was obliged to retreat with loss from before Tanjore, his army being distressed for want of supplies. From this time the affairs of the French daily declined. On their retreat from Tanjore, they abandoned the island of Syringham; they took Tripatore, Lowever, but were defeated in their designs on the important post of Chinglapet, about forty-five miles south-west of Madras. Their next enterprises on Fort St. George and

Madras were equally unsuccessful. The latter was besieged from the 12th of December, 1758, to the 27th of February, 1759, when they were obliged to abandon it with great loss.

The remainder of the year 1759 proved entirely favorable to the British arms. D'Ache the French admiral, who had been very roughly handled by admiral Pocock on the 3d of August, 1758, having refitted his fleet, and been reinforced by three men of war at the islands of Mauritius and Bourbon, now ventured once more to face his antagonist. A third battle ensued on the 10th of September, 1759, when the French, notwithstanding their superiority both in number of ships and weight of metal, were obliged to retreat with considerable loss; having 1500 men killed and wounded, while those on board the English fleet did not exceed 569. By the 17th of October the British fleet was conipletely refitted; and admiral Pocock, having been joined by a reinforcement of four men of war, soon after returned to England. All this time the unfortunate general Lally had been employed in unsuccessful endeavours to retrieve the affairs of his countrymen; but his fate was at last decided by laying siege to Wandewash, which had lately been taken by colonel Coote. The advantage in numbers was entirely in favor of the French general ; the British army consisting only of 1700 Europeans, including artillery and cavalry, while the French amounted to 2200 Europeans. The auxiliaries on the English side were 3000 black troops, while those of the French amounted to 10,000 black troops, and 300 Caffres; nor was the difference less in proportion in the artillery, the English bringing into the field only fourteen pieces of cannon and one howitzer, while the French had twenty-five pieces in the field and five on their batteries against the fort. The battle began about 11 A. M. on the 22d of January, 1760, and in three hours the whole French army fled towards their camp; but quitted it on finding themselves pursued by the English, who took all their cannon except three small pieces. They collected themselves under the walls of Cheltaput, about eighteen miles from the field of hattle, and soon after retired to Pondicherry. Colonel Coote now caused the country to be wasted to the very gates of this fortress, by way of retaliation for what the French had done in the neighbourhood of Madras. He then set about the siege of Cheltaput, which surrendered in one day; a considerable detachment of the enemy was intercepted by captain Smith; the fort of Timmery was reduced by major Monson, and the city of Arcot by captain Wood. This last conquest enabled the British to restore the nabob to his dominions, of which he had been deprived by the French; and it greatly weakened both the French force and interest in India. M. Lally, in the mean time, had -recalled his forces from Syringham, by which means he augmented his army with 500 Europeans. These were now shut up in Pondicherry, which was become the last hope of the French in India. To complete their misfortunes, admiral Cornish arrived at Madras with six men of war; and, as the French had now no fleet in these parts, the admiral readily engaged to cooperate with the land forces. The consequence

was the reduction of Carical, Chellambrum, and Verdachellum, by a strong detachment under major Monson; while colonel Coote reduced Permacoil, Almamverpa, and Waldour. He was thus at last enabled to lay siege to Pondicherry itself; and the place capitulated on the 15th of January, 1761, by which an end was put to the power of the French in this part of the world.

6. Of the British wars with the native powers, to the appointment of lord Clive as governor of Bengal.—While the British were thus employed Meer Jaffier, the nabob of Bengal, who had been raised to that dignity by the ruin of Surajah Dowla, found himself in a very disagreable situation. The treasure of the late nabob had been valued at sixty-four crore of rupees (about £80,000,000 sterling), and in expectation of this sum, Meer Jaffier had submitted to the exactions of the English. On his accession to the government, however, the treasure of which he became master fell so much short of expectation, that he could not fulfil his engagements to them, and was reduced to the extremity of mortgaging his revenues. In this dilemma his grandees became factious and discontented, his army mutinous for want of pay, and himself odious to his subjects. The English themselves, who had raised him to supreme power, also brought a variety of charges against him. On the 13th of June, 1760, Mr. Holwell wrote from Calcutta to Mr. Warren Hastings, that he had received, by express, intelligence of the murder of the princesses of Aliverdy Khan and Shah Ahmet in a most inhuman manner, by Meer Jaffier's orders. In like manner we are told that many others of Surajah Dowla's relations had perished; yet when it was thought proper to replace Meer Jaffier, in 1761, all these dead persons were found alive excepting two. It must also be remembered, in behalf of the unfortunate nabob, that, besides the sums exacted of him by the English at his accession, he had ceded to them a large extent of territory, and granted them so many immunities in trade, that he had in a manner deprived himself of all his resources. There were accounts of this remarkable revolution published at the time materially differing from one another. Our troops according to each of them took possession of the palace; Meer Cossim was raised to the musnud; and the old nabob hurried into a boat, with a few of his domestics and necessaries, and sent away to Calcutta in a manner wholly unworthy of the high rank he so lately held. The servants of the company, who were the projectors of the revolution, made no secret that there was a present promised them of twenty lacks of rupees from Cossim, who was desirous of making the first act of his power the assassination of Jaffier, and was very much displeased when he found that the English intended giving him protection at Calcutta.

It could scarcely be supposed that Meer Cossim, raised to the nabobship in this manner, would be more faithful to the English than Meer Jaffier had been. Nothing advantageous to the interests of the company could indeed be reasonably expected from such a revolution. No successor of Meer Jaffier could be more entirely in subjection than the late nabob, from his natural

imbecility, had been. This last consideration had induced many of the council at first to oppose the revolution; and indeed the only plausible pretence for it was, that the administration of Meer Jaffier was so very weak, that, unless he was aided and even controlled by some persons of ability, he himself must soon be ruined, and very probably the interests of the company along with him. Meer Cossim, however, was a man of a very different disposition from his father-inlaw. As he knew that he had not been served by the English out of friendship, so he did not think of making any return out of gratitude; but, instead of this, considered only how he could most easily break with such troublesome allies. For a while, however, it was necessary for him to take all the advantage he could of his alliance with them. By their assistance he cleared his dominions of invaders, and strengthened his frontiers, and he reduced the rajahs who had rebelled against his predecessor, obliging them to pay the usual tribute; by which means he repaired his finances, and thereby secured the fidelity of his troops. Having thus, by the assistance of the English, brought his government into subjection, he took the most effectual means of securing himself against their power. As the vicinity of his capital, Muxadabud, to Calcutta, gave the English factory there an opportunity of inspecting his actions, and interrupting his designs when they thought proper, he took up his residence at Mongheer, a place 200 miles farther up the Ganges, which he fortified in the best and most expeditious manner. Sensible of the advantages of the European discipline, he now resolved to new-model his army. For this purpose he collected all the Armenian, Persian, Tartar, and other soldiers of fortune, whose military characters might serve to raise the spirits of his Indian forces, and abate their natural timidity. He also collected all the wandering Europeans who had borne arms, and the sepoys who had been dismissed from the English service, and distributed them among his troops. He changed the fashion of the Indian muskets from matchlocks to firelocks; and, as their cannon were almost as deficient as their small arms, he procured a pattern of one from the English, by which he soon formed a train of artillery : having thus done every thing in his power to enable himself to withstand the English by force of arms, he resolved also to free his court from their emissaries, by imprisoning or putting to death every person of any consequence in his dominions who had shown any attachment to their interest. Ilis next step was to free himself from those restraints which his predecessor Meer Jaffier, and even he himself, had been obliged to lay upon the Indian trade, to gratify the avarice of his European allies. At his accession, indeed, he had ceded to the company a tract of land worth no less than £700,000 annually, besides £70,000 a-year on other accounts. All this, however, was not sufficient; the immunities granted them in trade were of still worse consequence than even those vast concessions. He knew by experience the distress which these immunities had brought upon his predecessor, and therefore determined to put an end to them. In pursuance

of this resolution, he began in 1762 to subject the English traders every where to the payment of certain duties, and required that their disputes, if beyond the limits of their own jurisdiction, should be decided by his magistrates. This gave such alarm at Calcutta, that, in November 1762, the governor Mr. Vansittart waited on him in person at Mongheer, to expostulate with him upon the subject. The nabob answered his remonstrances by saying that if the servants of the English company were permitted to trade in all parts, and in all commodities, custom free, they must of course draw all the trade into their own hands, and his customs would be of little value. That he would sooner collect no customs, and so draw a number of merchants into the country and increase his revenues by encouraging the cultivation and manufacture of a large quantity of goods. By these intimations Mr. Vansittart was much disconcerted; and under the circumstance thought proper to submit to certain regulations, by which the trade of the English was put under restrictions. This excited the utmost indignation at Calcutta. On the 17th of January, 1763, the council passed a resolution, disavowing the treaty made by the governor; affirming that he assumed a right to which he was by no means authorised; that the regulations proposed were dishonorable to them as Englishmen, and tended to the ruin of all public and private trade; and that the president's issuing out regulations, independent of the council, was an absolute breach of their privileges. They sent orders therefore to all the factories, that no part of the agreement between the governor and nabob should be submitted to. Application was again made to Meer Cossim to persuade him to a third agreement; but, before the success of this negotiation could be known, hostilities commenced on the part of the English. There was at that time in Patna (a city on the Ganges, about 300 miles above Calcutta), a fortified factory belonging to the East India Company, where were a a few European amd Indian soldiers. By this factory the city was suddenly attacked on the 25th of June 1763, and instantly taken, though it was defended by a strong garrison. The go-vernor and garrison fled into the country on the first appearance of danger; but, perceiving that the victors took no care to prevent a surprise, he suddenly returned with a reinforcement, retook the city, and drove all the English into their fort. Eventually the English left the fort with a design to retreat into the territories of a neighbouring nabob; but being pursued by a superior force they were all either killed or taken. The nabob at the same time slaughtered the deputies who had been sent him by the council of Calcutta, to treat about a new agreement with regard to commercial affairs. These acts of treacherous hostility were soon followed by a formal declaration of war. Meer Jaffier, notwithstanding the crimes formerly alleged against him, was proclaimed nabob of Bengal, and the English army immediately took the field under the command of major Adams. The whole force, however, at first consisted only of one regiment of the king's troops, a few of the Company's, two troops of European cavalry, ten companies of sepoys, and

twelve pieces of cannon. These very soon came to action with the enemy; and cleared the country of them as far as Cossimbuzar River, a branch of the Ganges which lay between Calcutta and Muxadabad, or Murshedabad, the capital of the province.

All the pains taken by Meer Cossim to discipline his troops had not made them able to cope with the Europeans. The English were suffered to pass the river without opposition ; but an army of 10,600 Indians was advantageously posted between the river and the city. These were entirely defeated, and major Adams pushed on directly for the capital. In his way he found the Indians again strongly posted with entrenchments fifteen feet high, and defended by a nu-merous artillery. This strong post was taken by stratagem; a feint being made with a small body of troops against that part where the enemy had collected their greatest strength. In the mean time the greatest part of the British army had in the night marched round the Indian fortification. and by day break made a furious assault on a place where there was only a slight guard. These instantly fled; the entrenchments were abandoned; and the city fell into the hands of the conquerors. The British now penetrated into the heart of the province, crossed the numerous branches of the Ganges, and traversed morasses and forests in quest of the enemy. Meer Cossim, on the other hand, was not wanting in his defence; but the utmost efforts he could use were totally insufficient to stop the career of an enemy so powerful and victorious. The two armies met on the banks of a river called Nunas Nullas, on the second of August 1763. Cossim had chosen his post with great judgment, and his forces had much of the appearance of an European army, not only in their arms and accoutrements, but in their division into brigades, and even in their clothing. The battle was more obstinate than usual, being continued for four hours : but, though the Indian army consisted of no fewer than 20,000 horse and 8000 foot, the English proved in the end victorious, and the enemy were obliged to quit the field with the loss of all their cannon. From this time the Indians did not attempt any regular engagement with the British. They made a stand indeed at a place named Auda Nulla, which they had fortified in such a manner that it seemed proof against any sudden attack. But here also they suffered themselves to be deceived, and the place was taken with great slaughter. They now abandoned a vast tract of country, to the very gates of Mongheer. The next operation was the siege of Mongheer itself; which, notwithstanding all the pains Meer Cossim had been at to fortify it, held out only nine days after the trenches were opened : so that nothing now remained to complete the conquest of Bengal but the reduction of the city of Patna. Meer Cossim, in the mean time, enraged at the progress of the English, vented his rage on the unhappy prisoners taken at Patna: all of whom, to the number of about 200, he caused to be inhumanly murdered. Dr. Fullarton was the only person who escaped, having received a pardon from the tyrant a few days before the massacre. This inhumanity was far

from being of any service to the cause of Meer Cossim. Major Adams marched without delay from Mongheer to Patna; and, as the place was indifferently fortified, it made but a feeble resistance. The cannon of the English soon made a practicable breach, and in eight days this great city was taken by storm. Thus the nabob was deprived of all his fortified places, his army was reduced to a small body, and himself obliged to fly to Sujah Dowla nabob of Oude, who acted as grand vizier to the Mogul. Here he was kindly received, and an asylum promised for his person; but admittance was refused to his army, nor would the nabob consent to make his country a seat of war. The English were entire masters of Bengal; for, though Meer Jaffier was pro-claimed nabob, he had no authority but what they conferred on him. Major Adams did not long survive the conquest of Patna, which was taken on the 6th November 1763; he died in Meer Cossim being thus driven March 1764. out, an agent was sent from Calcutta to Sujah Dowla, proposing an alliance with him and the Mogul, and offering to asssist them against Meer Cossim or any other enemy who should attempt an invasion of their dominions; in return for which it was expected that they should declare themselves open enemies to Cossim, and use their utmost endeavours to seize and deliver him up with all his effects. This design was communicated to Major Adams on the 8th of December 1763; but, as he was next day to resign the command of the army, major Carnac was desired to watch the motions of Meer Cossim, as well as to guard the dominions of Meer Jaffier against any hostilities which might be attempted.

It soon appeared that the friendship of the English was not what Sujah Dowla desired. He considered them as usurpers, who, having obtained a footing in the country under pretence of commerce, could be satisfied with nothing less than the entire possession of it, to the ruin of the original inhabitants. In the beginning of February 1764, therefore, he had determined to assist Meer Cossim in attempting to recover Bengal, and the president and council of Calcutta determined to commence an immediate and offensive war against him. But difficulties occurred in carrying on a war at this time, arising from the death of major Adams, whose name had become formidable to the Indians, and the inutinous disposition of the army. The former was obviated by the appointment of colonel Hector Munro, who, in military skill, was not inferior to his predecessor ; and a most severe example of the mutineers was made, twenty-four of whom were blown away from the mouths of cannon. Meer Cossim commenced hostilities by cutting off a small party of English troops, and sending their heads to the Mogul and Sujah Dowlah. An army of 50,000 men was collected, with a most formidable train of artillery. The hostile armies met on the 22nd of October, 1764, at Buxard, on the Carumnassa, about 100 miles above Patna. The event was similar to that of other engagements with the British. The allied Indian army was defeated with the loss of 6000 killed on the spot, 130 pieces of cannon, a proportionable quantity of military stores, and

all their tents; while, on the side of the conquerors, only thirty-two Europeans and 239 Indians were killed, and fifty-seven Europeans and 473 Indians wounded. The only place of strength now belonging to the allies on this side the river was a fort named Chanda Geer, which stood on the top of a high hill, or rather rock, situated on the bank of the Ganges, by which it could be constantly supplied with provisions; and as to military stores, it stood in little need of them, so long as stones could be found to pour down on the assailants. Notwithstanding these difficulties, however, colonel Munro advanced to attack it, but was repulsed ; and, though the attack was renewed next day, it was attended with no better success : on which the English commander proceeded to encamp with his army under the walls of Benares. Soon after this, colonel Munro being recalled, the command devolved on major Sir Robert Fletcher. The nabob in the mean time, instead of attacking the English army at once, contented himself with sending out parties of light horse to skirmish with its advanced posts, while the main body lay at the distance of about fifteen miles from Benares. On the 14th January 1765 Sir Robert ventured at midnight to break up his camp under the walls of Benares, and to march off towards the enemy. In three days he came up with the main body, who retreated before him; on which he resolved to make another attempt on Chanda Geer, which he reduced ; or rather the garrison mutinied for want of pay, and obliged the commander to surrender. The reduction of Chanda Geer was followed by that of Eliabad, a large city on the Ganges, between sixty and seventy miles above Chanda Geer, defended by thick and high walls, and a strong fort. Sujah Dowla in the mean time had been abandoned by the Mogul, who concluded a treaty with the English soon after the battle of Buxard. He, however, gathered together the remains of his routed armies, and applied to the Mahrattas for assistance. This native people, though very formidable to the other nations of Ilindostan, had never been able to cope with the English. On the 20th of May, 1765, general Carnac, having assembled his troops, marched immediately to attack them ; and, having gained a complete victory at a place called Calpi, obliged them to retreat with precipitation across the Yumna. Sujah Dowla, now destitute of every resource, determined to throw himself on the clemency of the English. Previous to this, however, he allowed Meer Cossim and the assassin Somers to escape; nor could any consideration ever prevail upon him to deliver them up. Three days after the battle of Capi, the nabob surrendered himself unconditionally to general Carnac.

In the beginning of February this year died Meer Jaffier Ali Cawn, nominal nabob of Bengal. The succession was disputed betwixt his eldest surviving son Najem il Doula, a youth of about eighteen years of age, and a grandson by his eldest son Miran, at that time only seven years old. As the English were absolute sovereigns of the country, it was the council of Calcutta which had, in fact, to decide this question. The point being carried in favor of Najem, it

was next debated on what terms he should be admitted to the succession. The late nabob, among other impositions, had obliged himself to support an army of 12,000 horse, and as many foot. It was alleged that he had not fulfilled his engagement, and that he had disbanded most of the troops. It was, therefore, now judged ex pedient that the nabob should settle £800,000 annually on the company, to be paid out of the treasury; that he should also discard the prime minister Nuncomar, and receive in his place a person appointed by the council, who was to act in the double capacity of minister and governor. The council were also to have a negative upon the nomination of all the superintendants and principal officers employed in collecting or receiving of the revenues. With these extravagant requisitions the young nabob was obliged to comply, though he had discernment enough to perceive that he was now a mere slave to the council of Calcutta. Obliged by treaty to dismiss Nuncomar from the office of vizier, he still continued to show him the same favor, until at last he was charged with carrying on a treasonable correspondence with Sujah Dowla, for which the nabob was enjoined to send him to Calcutta to take his trial. The unfortunate prince used every method to deliver his favorite from the impending danger, but to no purpose : he was obliged to submit to the mortification of having all his desires with regard to his release rejected, though the committee afterwards set him at liberty without trial. The extraordinary powers thus exerted by the council of Calcutta seem at last to have induced the company to desire some more efficient control over them. The great character which lord Clive had already gained in the east justly marked him out as a proper person for adjusting their affairs. On the 3rd of May 1765 he, therefore, arrived, with full powers as commander-inchief, president, and governor of Bengal. An unlimited power was also committed to a select committee, consisting of his lordship and four gentlemen, to act and determine every thing themselves, without dependence on the council. It was, however, recommended in their instructions to consult the council in general; but the sole power of determining all cases was left with them, until the troubles of Bengal should be entirely ended. By these gentlemen a plan of reformation was instantly set about : by which, however, violent disputes were occasioned; but the committee, disregarding these, exerted their authority to the full extent, seldom even acquainting the council with their transactions, and never waiting for their opinion.

7. From the arrival of lord Clive, as president of Bengal, to the death of Hyder Aly.—Lord Clive found that the success of the British arms could be productive of nothing but wars; that to ruin Sujah Dowla was to break down the strongest barrier which the Bengal provinces could have against the incursions of the Mahrattas and other native powers to the west, who had long desolated the northern provinces; and that the Mogul, with whom the company had concluded a treaty, was utterly unable to support himself, and would require the whole British power in the east to

secure him in his dignity. He therefore concluded a treaty with Sujan Dowla. The Mogul emperor was satisfied by obtaining a more ample revenue than he had for some time enjoyed, by which means he might be enabled to march an army to Delhi: for the company his lordship obtained the office of duan, or collector of revenues, for the province of Bengal and its dependencies. Thus Sujah Dowla was again put in possession of his dominions, excepting a small territory which was reserved to the Mogul, and estimated at twenty lacks of rupees, or £250,000 annually. The company were to pay twenty-six lacks of rupees, amounting to £325,000 sterling. They engaged also to pay to the nabob of Bengal an annual sum of fifty-three lacks, or £662,500 for the expenses of government, and the support of his dignity. The remainder of the revenues of Bengal were allotted to the company, who, on their part, guaranteed the territories in possession of Sujah Dowla and the Mogul.

The East India Company had now acquired the sovereignty of a territory equal in extent to the most flourishing kingdom in Europe. By all this, however, they were so far from being enriched, that the disorder of their affairs attracted the attention of government, and gave the British ministry an opportunity at last of depriving them of their territorial possessions, and subjecting the province of Bengal to the authority of the crown. New misfortunes also occurred in the east, and the company found a most formidable enemy in Hyder Aly. This man had raised himself from the rank of a sepoy, to be one of the most considerable princes in Hindostan. Being sensible that the power of the English was an insuperable bar to his designs, he practised on the nizam of the Deccan; and partly by promises, partly by threats, engaged him to renounce his alliance with the company, and to enter into a war against them. Having introduced the European discipline among his troops, he imagined that, with the advantage of numbers, he should be able to cope with his antagonists. In this, however, he was deceived ; for, on the 16th September 1767, his army was entirely defeated by colonel Smith near Trinomally; after which the nizam deserted his new ally, and concluded another treaty with the English. From the latter, however, he did not obtain peace, but at the expense of ceding to them the Duanny of the Balegat Carnatic, which includes the dominions of Hyder Aly and some petty princes. Hyder, thus deserted by his ally, transferred the seat of war to a mountainous country, where, during 1767, nothing decisive could be effected; but his Indian cavalry was sometimes enabled to cut off the supplies, and interrupt the communications of the British. During these operations some ships were fitted out at Bombay, which conveyed 400 European soldiers, and about 800 sepoys to attack Mangalore, one of Hyder's principal sea-ports. This enterprise proved successful, and nine ships were brought away; but too small a garrison having been left in the place, it was almost immediately after retaken. In the mean time the appointment of field deputies to attend the army, and to control and superintend the conduct of the commander-

m-chief, greatly weakened the British operations. Hyder Aly had the prudence to avoid a general engagement, but frequently intercepted the convoys of the English, cut off their detached parties, and wearied them out with long and continual marches. The news of his success, against an enemy hitherto invincible by all the powers of India, so raised his reputation, that adventurers flocked to him from all parts; by which means his cavalry soon increased to upwards of 90,000, to which, however, his infantry bore no proportion. Notwithstanding all his success, the forces of Hyder Aly were altogether unable to cope with those of Britain, even when there was the greatest imaginable disparity of A detachment of the company's numbers. forces had made an assault upon a fort called Mulwaggle, in which they were repulsed with some loss. This, with the small number of the detachment, encouraged Hyder to march, at the head of a great part of his army, to the protection of the fort. The commanding officer however, colonel Wood, did not hesitate, with only 460 Europeans and 2300 sepoys, to attack this army, consisting of 14,000 horse, 12,000 men armed with matchlock guns, and six battalions of sepoys. The engagement lasted six hours; when at last Hyder, notwithstanding his numbers, was obliged to retreat, leaving the field covered with dead bodies; and the loss of the British was upwards of 300 killed and wounded. This engagement, however, was attended with no consequences affecting the war in general, which went on for some time in the same manner, and greatly to the disadvantage of the company. The divisions and discontents among the officers and council daily increased, the soldiers deserted, and every thing went to ruin. The revenues of the establishment of Madras being at last unequal to the expenses of the war, large remittances were made from Bengal to answer that purpose; and, as these were made in a kind of base gold coin, the company is said by that means alone to have lost £40,000 in the difference of exchange. At last Hyder Aly suddenly appeared within a few miles of Madras, which occasioned such an alarm, that the presidency were induced to enter into a negociation with him. An offensive and defensive treaty was therefore concluded on the 3d of April 1769, on the simple condition that the forts and places taken on both sides should be restored, and each party sit down contented with their own expenses.

It was stipulated that, in case of either party being attacked by their enemies, the other should give them assistance : and in this case even the number of troops to be supplied by each was specified. It soon after appeared, however, that the presidency of Madras was resolved to pay very little regard to this engagement. Hyder Aly, being in a little time after involved in a war with the Mahrattas, applied for assistance; but was refused by the presidency, who pretended that they themselves dreaded a quarrel with the Mahrattas. Hyder now, therefore, found himself overmatched, and applied several times to expect; but was constantly refused. This first

appears to have inclined him to apply to the French, and by their means he obtained military stores in the greatest abundance, a number of experienced officers and soldiers, and much of the European discipline. Thus, in a short time, imagining himself a match for the Mahrattas, he renewed the war, and gained such decisive advantages as quickly obliged them to conclude an advantageous treaty with him. It now appeared that the English had not much hesitation in quarrelling with the Mahrattas. These tribes were originally governed by princes called rajahs, who reigned at Setterah ; and, though in process of time they came to be divided into a number of petty states, yet they paid a nominal respect to the ram-rajah, who had a right to assemble the chiefs, and order out their troops on any emergency. By degrees the dignity of ramrajah or sou-rajah (as he was also called) became merely titular, the administration being entirely possessed by the paishwa or chancellor. This office being usurped by one particular family, Nana-row, the reigning paishwa seized the ramrajah, and confined him in a fortress. At his death he left two sons, Mada-row and Narainrow; of whom the former, being the elder, succeeded him in the paishwaship. Ionogee Boosla, or Bouncello, the immediate predecessor of Modagee Boosla, rajah of Berar, was one of the pretenders to the dignity of ram-rajah, as being the nearest of kin; at the same time that Roganut-row, called also Ragobah, uncle to Madarow himself, pretended to the paishwaship. On this account the latter was confined by Madarow, but he imprudently released him a little before his death, and recommended to him in the most affectionate manner the care of his brother Narain-row, who was to succeed to the paishwaship. Rogonaut, notwithstanding this, murdered Narain-row, and then fled to Bombay, where, on promising a cession of territory, he was protected and encouraged in his pretensions. The Mahrattas remonstrated against his behaviour; but the English had determined to profit by the civil dissentions of the Indian powers, and paid little regard to the justice or injustice of their cause. The Mahrattas therefore not only made up their differences with Hyder Aly, but became determined enemies to the English, at the same time that a confederacy was formed among the most powerful princes of India to expel from that part of the world these western intruders.

The resentment of Hyder Aly was particularly directed against the presidency of Madras; he had also received fresh provocation by their causing a bedy of troops to march through his dominions without his leave, to the assistance of a prince for whom he had no friendship; as also by the capture of the French settlement of Mahie, on the coast of Malabar, which he said was within his dominions, and consequently that the French were under his protection. Ilis troops were therefore assembled from every quarter, and the greatest preparations made for a powerful invasion. The presidency of Madras in the mean time spent their time in mutual altercations, neglecting even to secure the mountain passes, through which alone an invasion

could be made, until their active antagonist, having seized and guarded those passes, suddenly poured out through them 100,000 men, among whom was a large body of European troops under French officers, and commanded by colonel Lally, a man of great bravery and experience. The alarm was given on the 24th of July 1780, that Hyder Aly's horse were only nine miles from Madras. The inhabitants instantly deserted their houses, and fled into the fort; while the unresisted barbarian burnt the villages, reduced the inferior forts, and prepared to lay siege to the capital. It being now absolutely necessary to make some resistance, measures were taken for assembling the troops; in doing which, an express was sent to colonel Baillie, at that time at Gumeroponda, twenty-eight miles from Madras, to proceed thence directly to Conjeveram with the corps under his command. But the first regiment of cavalry posisively refused to move without money; and, as they persisted in their resolution, were at last made prisoners, and sent to Madras. The main army, then consisting of 1500 Europeans, and 4200 sepoys, under Sir Hector Munro, with their train of artillery, proceeded towards Conjeveram. On their arrival they found the town in flames, great bodies of the enemy's cavalry advancing on both flanks, and no appearance of colonel Baillie's detachment. The march of this body had been impeded by a small river, swelled by a sudden fall of rain. Hyder Aly having now raised the siege of Arcot, in which he had been employed, marched towards Conjeveram; in the neighbourhood of which he encamped, and in the course of several days, at different times, offered battle. On the 6th of September, he detached his son Tippoo Saib with the flower of his army to cut off the detachment under colonel Baillie, who was now at Perrambaukam, a small village distant about fifteen miles, he himself remaining in the neighbourhood of Conjeveram, to watch the motions of Sir Hector Munro. The detachment under Tippoo consisted of 30,000 horse, 8000 foot, and twelve pieces of cannon. Notwithstanding this superiority in number, however; they were bravely repulsed by colonel Baillie's troops; and a junction was effected with a detachment under Sir Robert Fletcher, sent by Sir llector Munro. This was on the 9th of September, and next morning orders were given for the whole army to march; colonel Fletcher's detachment being dispersed in different parts of the line. About ten at night several guns began to open on the rear of the English, on which colonel Baillie detached eaptain Rumley with five companies of sepoy grenadiers to storm. This he could not accomplish, being interrupted by an unexpected torrent, which it was found impossible to ford. Next day Hyder Aly himself joined Tippoo, and suddenly opened on colonel Baillie's detachment the fire of from sixty to seventy pieces of cannon, with an innumerable quantity of rockets; and for a while Hyder's nu-merous cavalry, supported by his regular infantry and European troops, driven on by threats, encouraged by promises, and led on by his most distinguished officers, hore on our little army in different quarters, without, however, making

the least impression. Our men, both Europeans and sepoys, repeatedly presented and recovered their fire-arms as if they had been manœuvring on a parade. The enemy were repulsed in every attack; numbers of their best cavalry were killed, and many more were wounded; even their infantry were forced to give way: and Hyder would have ordered a retreat, had it not been for the advice of general Lally, who informed him that it was now too late, as general Munro was most probably advancing on their rear from Conjeveram; for which reason nothing remained but to break the detachment by their artillery and cavalry. Tippoo Saib had by this time collected his party together, and renewed the cannonade; and, at the same time that the English were under the necessity of sustaining an attack both from the father and son, two of their tumbrils were blown up by Hyder's guns, and a large opening made in both lines. They had now no other ammunition than grape; their guns discontinued firing: and in this dreadful situation, under a terrible fire not only of guns but rockets, losing great numbers of officers and men, they remained from half-past seven till nine o'clock. Hyder Aly, now perceiving that the guns were quite silenced, came with his whole army round their right flank. The cavalry charged them in distinct columns, and in the intervals between these the infantry poured in vollies of musketry with dreadful effect. Mhiar Saib, with the Mogul and Sanoor cavalry, made the first impression. These were followed by the elephants and the Mysorean cavalry, which completed the overthrow of the detachment. Colo-nel Baillie, though grievously wounded, rallied the Europeans, and once more formed them into a square, and with this handful of men he gained an eminence, where, without ammunition, and most of the people wounded, he resisted and repulsed thirteen separate attacks: but, fresh bodies of cavalry continually pouring in, they were broken without giving way. Many of our men, desperately wounded, raising themselves from the ground received the enemy on their bayonets. Captain Lucas's battalion of sepoys, at the time when our men moved up to a rising ground, was stationed to the right of the European grenadiers; but that corps seeing the Europeans in motion, and misunderstanding perhaps this evolution for a retreat, broke in the utmost confusion. The Europeans, bravely sustaining their reputation, remained in this extre-mity of distress steady and undaunted, though surrounded by the French troops, and by Hyder's cavalry to the number of 40,000. They even expressed a desire, though their number did not exceed 400, of being led on to the attack. At length colonel Baillie, finding that there was no prospect of being relieved by general Munro, held up a flag of truce to one of the chiefs of Hyder's army. But this was treated with contempt, and the surdar endeavoured at the same time to cut off the colonel. A few minutes after, however, our men received orders to lay down their arms, with intimation that quarter would be given. This order was scarcely complied with, when the enemy rushed in upon them in the most savage and brutal manner; and, but for the humane interposition of the French commanders, the gallant remains of our little army must have fallen a sacrifice to that savage thirst of blood with which the tyrant disgraced his victory. In this unfortunate action nearly 700 Europeans were killed on the spot: the loss on Hyder Aly's part was so great, that he industriously concealed it; being enraged that the conquest of such an inconsiderable body should cost him so many of his bravest troops. Ever after he seemed to consider the English with an extreme degree of terror; insomuch that, notwithstanding his present exultation on account of this victory, he no sooner heard a report of Sir Hector Munro's march to attack him, than he left his camp in the utmost confusion, abandoning great part of his tents and baggage, and all the wounded.

On the news of colonel Baillie's disaster, the supreme council of Bengal requested Sir Eyre Coote to take upon him the management of the war; and a large supply of men and money was instantly decreed. In the interim Sir Hector Munro had been greatly harassed on his march to Madras, whither he had retreated after colonel Baillie's disaster; the forces of Hyder Aly had infested all the places in that neighbourhood in such a manner, as in a great measure to cut off all supplies; and Arcot, the capital of the most faithful ally the British ever had, was taken by storm. But no sooner had Sir Eyre Coote taken upon him the command, than his antagonist changed his plan of operations. He detached large parties of his numerous forces to lay siege to the principal fortresses belonging to the company; while, with the bravest and best disciplined part, he kept the field against the British commander. On the very first appearance of our army, however, his resolution failed, and he abandoned the siege of every place he had invested, retiring to a considerable distance on the other side of the Palaar, without even disputing the passage of it. The next operation was to secure Pondicherry, whose inhabitants had revolted. But they were easily disarmed, their magazines seized, and all the boats in their possession destroyed; in consequence of which precaution, a French squadron that soon after appeared off Pondicherry, was obliged to depart without being furnished with necessaries. But in the mean time Hyder Aly, having drawn large reinforcements from all parts of his dominions, resolved to try his fortune in a pitched battle. His army, it is said, amounted to 200,000 men, 40,000 of whom were cavalry, and 15,000 well disciplined sepoys. Still, however, he durst not openly attack the British army, but took a strong post, whence he might harass them on their march. Sir Eyre Coote, was not backward to make the attack; and, on the other hand, Hyder Aly prepared to engage him with all possible advantage. The battle was fought on the 1st of July, 1781; and, notwithstanding the vast superiority of Hyder Aly's army, he was routed with great slaughter. The Indians, however, made a much more obstinate resistance than usual; the engagement lasted from 9 A. M. till 4 P. M.; and the deficiency of the English in cavalry pre-

vented them from pursuing the advantage they had gained.

Hyder Aly was soon encouraged to venture another battle. This was fought on the 27th of August the same year, on the very spot where colonel Baillie had been defeated. It was more obstinately contested than even the former, being continued with great fury from 8 A. M. to near dusk. A number of brave officers and soldiers fell on the part of the British, owing chiefly to the terrible fire of the enemy's artillery, and the advantageous position of their troops. At last the Indian army was totally defeated, and driven from every post it had occupied; though, from the obstinate resistance made at this time, Hyder began to entertain hopes that his forces might, by a succession of such battles, be at last enabled to cope with the English. He therefore ventured a third battle some weeks after, but was defeated with greater loss than before. Undiscouraged by this bad success, however, he laid siege to Vellore; and, expecting that the relief of it would be attempted, seized a strong pass through which he knew the British army must direct their march. The British commander accordingly advanced, and found the enemy in possession of some very strong grounds on both sides of a marsh, through which he was obliged to pass. Here he was attacked on all sides, but chiefly on the rear, the enemy directing their force principally against the baggage and provisions. But their utmost efforts, were unsuccessful, and Sir Eyre Coote forced his way to Vellore. Ilyder Aly did not fail to wait his return through the same pass; and, having exerted his utmost skill in posting his troops, attacked him with vigor: but though the English were assaulted in front and in both flanks at once, and a heavy cannonade was kept up during the whole time of the engagement, the Indians were at last defeated with great slaughter. By these successes the presidency of Madras were now allowed so much respite, that an enterprise was planned against the Dutch settlement of Negapatam, situated to the south of Madras. A very inconsiderable force, however, could yet be spared for this purpose, as Hyder Aly, though so often defeated, was still extremely formidable. Sir Hector Munro had the management of the expedition: and so furious was the attack of the British sailors, that the troops left to guard the avenues to the place were defeated at the very first onset. A regular siege ensued; which was of a very short duration, a breach being soon made, and the garrison surrendering prisoners of war. The loss of Negapatam was quickly followed by that of Trincomale.

Admiral Hughes, who had conveyed Sir Hector Munro with the land forces to the former place and assisted him with his sailors, immediately afteits surrender set sail for the latter, where he arrived about the middle of January 1782. Trincomale itself was quickly reduced; but the main strength of the settlement consisted in a fort named Ostenburgh, the principal place on the island, and by the capture of which the whole settlement could be reduced. The governor proving obstinate, this place was taken by storm with the loss of about sixty on the part of the British, and very little on that of the Dutch, the victors giving quarter the moment it was asked.

A more formidable enemy, however, now appeared on the coast of Coromandel. This was Suffrein the French admiral, who, setting out from France with eleven ships of the line and several stout frigates, had fallen in with the Hannibal of fifty guns, and taken her when separated from her consorts. This ship, along with three others, a seventy-four, a sixty-four, and a fifty, had been sent out to the assistance of Sir Edward Hughes; and the three last had the good fortune to join him before the arrival of Suffrein. The latter, supposing that he had not yet received this reinforcement, bore down upon the English squadron at Madras, to which place they had sailed immediately after the capture of Trincomale. Perceiving his mistake, however, he instantly bore away. The English admiral pursued, took six vessels, five of them English prizes, and the sixth a valuable transport laden with gunpowder and other military stores, besides Laving on board a number of land officers and about 300 regular troops. This brought on an engagement, in which M. Suffrein, perceiving the rear division of the British fleet unable to keep up with the rest, directed his force principally against it. The ships of admiral Hughes himself and commodore King sustained the most violent efforts of the French, having two, and sometimes three, vessels to contend with. Thus the commodore's ship was reduced almost to a wreck; but about 6 P. M., the wind becoming more favorable to the English, the squadron of the enemy were obliged to draw off. The loss of men on the part of the British amounted to little more than 130 killed and wounded, but, that of the French exceeded 250. After the battle Sir Edward returned to Madras; but hearing nothing of Suffrein there, he made the best of his way for Trincomale, being apprehensive of an attack upon that place, or of intercepting a convoy of stores and reinforcements then expected from England. Suffrein was actually at that time on his way to intercept it. This brought the hostile fleets again in sight of each other; and, the British admiral having been reinforced by two ships of the line, a desperate battle ensued, which continued till towards night, when the ships on both sides were so much shattered, that neither could renew the engagement next day. Though these engagements were not decisive, they were nevertheless of the utmost prejudice to the affairs of Hyder Aly, who was thus prevented from receiving the succours he had been promised from France; and he was still farther mortified by the defeat of his f rces before Tellicherry, which he had blocked up since the commencement of hostilities.

This misfortune was the more sensibly felt, as an open passage was now left for the English into those countries best affected to Hyder. His bad success, here, however, was in some measure compensated by the entire defeat of about 2000 English infantry and 300 cavalry under colonel Braithwaite, a brave and experienced officer. This detachment, consisting of chosen troops

from Sir Eyre Coote's army, lay encamped on the banks of the Coleroon, which forms the north boundary of Tanjour. Tippoo Saib, having procured exact intelligence of its situation, formed a design of attacking it, while no danger was suspected, on account of the distance of Hyder Aly's army. He set out on this design with an army of 15,000 horse and 5000 foot, accompanied by a body of French regulars; and, having crossed the Coleroon, suddenly surrounded the British forces. The colonel, perceiving his danger, formed his men into a square, distributing the artillery to the several fronts, and keeping his cavalry in the centre. He thus resisted for three days the utmost efforts of his numerous enemies, always compelling them to retreat with great loss. At last general Lally, rightly conjecturing that the strength of the English must be exhausted and their number thinned by such desperate service, proposed that the infantry, which was fresh and entire, should attack one of the fronts of the square, while the forces of Tippoo should do the same with the other three. This proved successful; the British forces were broken with great slaughter, which however was stopped by the humanity of the French commander; who even obtained from Tippoo Saib the care of the prisoners, and treated them with a degree of humanity which they certainly would not otherwise have experienced. A number of British officers, however, perished in the engagement, and only one remained unwounded.

In the mean time, the succours from France, so long expected by Hyder, arrived; and, as soon as a junction was formed, they proceeded, under the command of M. Duchemin, to invest Cuddalore; which, not being in a situation to stand a siege, was surrendered on capitulation. Some other places of less consequence were also reduced, until at last, being joined by Hyder's numerous forces, they determined to lay siege to Vandervash, a place of great importance, and the loss of which would have been extremely detrimental to the English. This quickly brought Sir Eyre Coote with his army to its relief; but Hyder Aly, notwithstanding his being reinforced by the French, durst not yet venture a battle in the open field. On this the British commander proceeded to attack Arnee, the principal deposit of his warlike stores and necessaries. Thus the latter was obliged to quit his advantageous ground; but he did so with such secrecy and speed, that he came upon the British army unawares, while preparing for its last march to Arnce, now only five miles distant. Perceiving that the march of the British was through low grounds, encompassed on most parts with high hills, he planted his cannon upon the latter; from which he kept a continual and heavy fire on the troops below, while his numerous cavalry attacked them on every side. Notwithstanding all disadvantages, however, the British comman der at last closed in with the enemy; and after an obstinate dispute completely routed them on the 2d of June 1782.

Still Sir Eyre Coote, wanting cavalry, in which the enemy abounded, was obliged to move nearer Madras; soon after which he was obliged, on

account of his bad state of health, to relinquish the command of the army te general Stuart. Hyder Aly, now perceiving that he was likely to obtain no decided success by land, began to rest his hopes on the success of the French by sea. He therefore earnestly requested M. Suffrein, who possessed at that time a decisive superiority in the number of ships, to lose no time in attacking the British squadron before it could be joined by a reinforcement which was then on its way, and was reported to be very formidable. As the French commander was by no means deficient in courage a third engagement took place on the 5th of July 1783. At this time the Bri-tish had the advantage of the wind, the battle was much more close, and the victory more plainly on their side; though it is said, that had not the wind fortunately shifted, a total defeat would have ensued. After the engagement, the French admiral proceeded to Cuddalore, having received intelligence that a large body of French troops in transports was arrived off the island of Ceylon, with three ships of the line. As this seemed to afford hopes of retaliation, he used such diligence in refitting his ships, that the flee* was able to put to sea in the beginning of August, to make an attempt on Trincomale; and so well were his designs conducted, that Sir Edward Hughes received no intelligence of the danger till it was too late; the place was not in a condition to resist a siege; and, the French batteries having silenced those of the fort in two days, a capitulation took place on the 31st of August. Sir Edward did not arrive at Trincomale before the 2d of September, when he had the mortification to see the forts in the hands of the French, and Suffrein in the harbour with fifteen sail of the line, while he had only twelve. He ventured an engagement, but the issue of the battle was only shattering the fleets, and killing and wounding a number of men on both sides. The superiority of the English, however, was very manifest; and in entering the harbour of Trincomale the French lost a seventy-four gun ship. The loss of Trincomale was severely felt by the English; for, while the French lay safely in the harbour refitting their squadron, the English were obliged, for that purpose, to sail to Madras. Here the fleet was assailed by one of the most dreadful storms ever known on that coast. Trading vessels, to the number of nearly 100, were wrecked, as well as those for Madras laden with rice, of which there was an extreme scarcity at that place. This now was augmented to a famine, which carried off vast numbers of the inhabitants, before supplies could arrive from Bengal. The continuance of the bad weather obliged Sir Edward, with his whole squadron, to sail to Bombay, where he ar-rived in the end of the year, when his squadron was so much shattered, that, in order to repair it with proper expedition, he was obliged to distribute it between the dockyards of Bombay and the Portuguese settlement at Goa.

In the mean time Sir Richard Bickerton arrived at Bombay from England with five men of war, having on board 5000 troops. It was the intention of France to signalise the campaign of this year by an immense force both by sea and

land in India. The forces already on the coast of Coromandel were to be joined by 5000 regulars, from their islands on the African coast; and Suffrein was to be reinforced by several ships of the line, when it was hoped that a decided superiority at sea would be obtained over the English. To oppose these designs it was deemed necessary by the presidency of Bombay to make a powerful diversion on the coast of Malabar. Here was situated the kingdom of Mysore, the sovereignty of which had been usurped by Hyder Aly under the title of Dayva. It is nearly in the same parallel with Arcot. On the north was Canara, the favorite possession of Hyder Aly. The expedition had been set on foot as early as the end of 1781; a strong body of forces under colonel Humberstone had taken the cities of Calicut and Panyan, besides others of less note, and penetrated into the inland country. Having made himself master of a place called Mongarry Cotta, which commanded the entrance into the inner parts of the country, he proceeded to attack Palatacherry, a considerable town some miles distant; but, being suddenly environed with a numerous and hostile army, instead of making himself master of the place, it was with the utmost difficulty that he made his escape, after losing all his provisions and baggage. A force consisting of 20,000 foot and 10,000 horse, under Tippoo Saib, also advanced against him with such celerity, that the colonel had only time to retreat to Panyan, where he was superseded in the command by colonel Macleod, and soon after the place was invested by the forces of the enemy, among whom was gene-ral Lally with a considerable body of French. Two British frigates, however, having come to the assistance of the place, rendered all the attempts of the enemy to reduce it abortive. At last Tippoo, impatient of delay, made a vigorous effort against the British lines; but, though both the Indian and French commanders behaved with bravery, the attack not only proved unsuccessful, but they were repulsed with such loss as determined Tippoo to abandon the siege of the place, and retire beyond the Panyan. As soon as the presidency of Bombay were acquainted with the success of colonel Ilumberstone, general Matthews was despatched to his assistance with a powerful reinforcement. This expedition, which began the campaign of 1783 in Canara, has been related with circumstances so disgraceful, and so exceedingly contrary to the usual behaviour of British troops, that we cannot account for them. In the story of the conquest and recovery of Canara,' say the editors of the New Annual Register, ' the Spaniards may be said to be brought a second time upon the seene. The Spaniards of Britain were overtaken in the midst of their career; and he who is more of a man than an Englishman, will rejoice in the irregular and unmeasured, but at the same time the just and merited, vengeance that was inflicted upon them, by the prince whose domi-nions they were ravaging !' In support of this exclamation the following account is given of the expedition: general Matthews had formed a design of carrying the war into the heart of Hyder Alv's dominions. For this purpose, the

English invested the city of Onore, about 300 miles south of Bombay, and one of the princi-pal places in Canara 'It was taken by assault,' says Dr. Andrews, 'with great slaughter, and plundered with circumstances of avarice and rapine that disgraced the victors; among whom, at the same time, great discontents arose concerning the division of the spoil.' ' No quarter,' say the editors of the Annual Register ' was given by the victorious English; every man they met was put to the sword. 'The carnage,' says one of the officers in a private letter, ' was great; we trampled thick on the bodies that were strewed in the way. It was rather shocking to humanity, but such are only secondary considerations, and to a soldier, whose bosom glows with heroic glory, they are thought only accidents of course ; his zeal makes him aspire after farther victory. This part of the peninsula had hitherto been untouched by the barbarous and unsparing hands of Europeans, and, of consequence, was full of riches and splendor. In the fortress of Onore were found sums of money to an unknown amount, besides jewels and diamonds. A con-siderable part of this appears to have been secured as private plunder by general Matthews. The complaints of the military were loud; they thought, and naturally, that the acquisition of riches was the fair and reasonable consequence of the perpetration of bloodshed. But their commander turned a deaf ear to their representations; and hastened, by adding new laurels to his fame, to hide the slander that might otherwise rest upon him.' From Onore the army proceeded to the nearest fortresses on the sea coast, More and Cundapour. Here they were joined by a reinforcement from Bombay, under colonel Macleod and Humberstone, with positive orders to proceed for Bidnore. On this general Matthews marched for the Ghauts, mountains where there is a pass three miles in length, though only eight feet wide, which was then strongly fortified, and defended by a vast number of the 'The English,' say our authors, 'hownatives. ever, had already obtained a considerable reputation by their executions; and the use of the bayonet, the most fatal instrument of war, and which was employed by them on all occasions, created such an extreme terror in the enemy, as to enable them to surmount this otherwise im-pregnable defile.' The gaining of this pass laid open the way to Bidnore, the capital, to which a summons was now sent. An answer was returned, that the place was ready to submit, provided the inhabitants were not molested, and the governor was permitted to secure his property. The wealth of this city was undoubtedly great, but the estimates of its amount are very different. By the accounts of Bombay, it was stated only at £175,000, while the officers concerned in the expedition say that it was not less than £1,200,000 or even £1,920,000: and even this was only public property; that seized upon by the soldiers, and which belonged to private persons, was undoubtedly very considerable also. This treasure was at first shown by the general to his officers, and declared to belong to the army; but he afterwards told them that it was all the property of the Mahommedan governor,

and had been secured to him by the terms of the surrender. It was therefore sent to Cundapour, under the convoy of lieutenant Matthews. brother to the general, to be thence transmitted to Bombay. The discontents of the army were now carried to the utmost height; and the contest became so serious, that colonels Macleod, Humberstone, and Shaw, quitted the service altogether, and returned to Bombay. The officers charged their general with the most insatiable and shameful avarice; while he, in return, accused his whole army of doing every thing disrespectful and injurious to him; of paying no regard to order and discipline, and of becoming loose and unfeeling as the most licentious freebooters. From Bidnore detachments were sent to reduce several fortresses, the principal of which was Annanpour, or Anantpore. Here orders were issued for a storm and no quarter. Every man in the place was put to death, except one horseman who made his escape after being wounded in three places. ' The women, unwiling to be separated from their relations, or exposed to the brutal licentiousness of the soldiery, threw themselves in multitudes into the moats with which the fort was surrounded : 400 beautiful females, pierced with the bayonet, and expiring in one another's arms, were in this situation treated by the British with every kind of outrage.' This exploit was succeeded by the reduction of Carwa and Mangalore, which completed the reduction of Canara, when general Matthews put his army into cantonments for the ainy season. This rapid success was owing to the death of Hyder Aly, which happened in the end of 1782.

8. India, from the accession of Tippoo Saib, to his death. His son, Tippoo Saib, however, having taken possession of the government, and settled his affairs as well as time would allow, instantly resumed his military operations. On the 7th of April, 1783, he appeared before Bidnore, so that general Matthews had scarcely time to collect a force of 2000 men, and to write to Bombay for a reinforcement. But the presidency were so much prejudiced against him by the reports of his officers, that they suspended him from his commission, appointing colonel Macleod to succeed to the command of the army. Tippoo Saib now advanced with a vast army, supposed not to be fewer than 150,000 men, covering the hills on each side of the metropolis as far as the eve could reach. The army of general Matthews, unable to cope with such a force, were quickly driven from the town, and forced to take refuge in the citadel. Tippoo having cut off their re-treat, by gaining possession of the Ghauts, laid close siege to the fortress; which in less than a fortnight was obliged to capitulate. The terms proposed were, that all public property should remain in the fort; that the English should engage not to act against Tippoo for a stipulated time; that they should march out with the honors of war; that they should pile their arms, and have full liberty to proceed unmolested with their private property to the sea coast, from thence to embark for Bombay; and in this capitulation the garrisons of Annanpour and other inland fortresses were also included. But all these terms

were afterwards disregarded by Tippoo, who said that the British had forfeited their title to liberty, by a breach of the articles of capitulation, in embezzling and secreting the public money, which was all, in good faith, to be delivered up. That this was really the case seems to be universally acknowledged. By this circumstance the fate of the garrison was decided. General Matthews was sent for next morning to a conference. He was not, however, admitted to the presence of Tippoo, but immediately thrown into chains. Most of the other principal officers were, on various pretences, separated from the army. The general and his companions were conducted to Seringapatam, the capital of Mysore; and, after having experienced a variety of severities, were at last put to death by poison.

We now proceed to give some account of the war with the Mahrattas, begun by reason of the protection afforded to the assassin Rogobah Row. This man had formerly obliged the Mo-gul to take shelter in the English factory at Bengal; but, losing his credit among his own countrymen, was expelled. On his arrival at Bombay an alliance was formed between him and the English government; by which the latter engaged to replace him in the Mahratta regency, in consideration of some valuable cessions of territory. The supreme council of Bengal, however, disowned this treaty, and concluded one with the Mahrattas in March 1776; by which it was agreed, that they should provide for Ragobah's subsistence according to his rank, on condition of his residing in their country. This being not at all agreeable to Ragobah, he fled once more to Bombay, where a new con-federacy was entered into for his restoration. The council of Bengal approved of this, on account of the approaching rupture with France; and a detachment was, in February 1778, or-dered to march across the continent of India. By some mismanagement in this expedition, the whole army was obliged to capitulate with the Mahratta general on the 9th of January 1779. One of the terms of the capitulation was, that a body of troops which were advancing on the other side should be obliged to return to Bengal. But general Goddard, the commander of these forces, denying the right of the council of Bengal to remand him, proceeded on his march, and arrived on the 18th of February. Here he received orders to conclude a new treaty, if it could be obtained on easier terms than that of the capitulation, by which it had been engaged to cede all our acquisitions in the country of the Mahrattas. Such flagrant disregard to any stipulations that could be made greatly provoked the Mahrattas, and induced them to join in the confederacy with Hyder Aly. The war, however, was successfully begun by general Goddard, in January 1780. In three months he reduced the whole province of Guzerat. Madajee Sindia, the Mahratta general, advanced to oppose him ; but, as he did not choose to venture a battle, the English general stormed his camp, and totally routed him. Other exploits were performed in the course of this campaign ; during which Mr. Hastings, the governor-general, seeing no hopes of an accommodation, entered into a treaty with

the rajah of Gohud, and with his consent major Popham reduced a fortress in his dominions, named Guallior, garrisoned by the Mahrattas, and hitherto reckoned impregnable. These successes were followed by the dreadful incursions of Hyder Aly above related, which put a stop to the conquests of general Goddard; all the forces he could spare being required to assist the army under Sir Eyre Coote. The last exploit of general Goddard was the reduction of the island of Salsette, and of a strong fortress near it, named Bassein. The army of Sindia, consisting of 30,000 men, was also "defeated this year by colonel Carnac; and the Mahrattas, disheartened by their losses, consented to a separate peace with the British.

The expenses incurred by these wars were so great, that Mr. Hastings was reduced to the greatest difficulties. All the treasure of Bengal was exhausted, and it was found necessary to draw extraordinary contributions from the British al-lies. One of the most remarkable results was the revolt of Benares. The rajah of this country had formerly put himself under the protection of the English, who, on their part, agreed to secure his dominions to him, on condition of his paying an annual subsidy to the nabob of Oude. In 1770 the rajah died, and was succeeded by his son Cheit Sing, who held the sovereignty at the time we speak of. On the death of the nabob. in 1775, a new treaty was made with his successor, by which the sovereignty of Benares was transferred to the East India Company, an acquisition equivalent to £240,000 per annum; at the same time that the subsidy paid by Suja Dowla, and which by lord Clive had been fixed at £36,000, and afterwards raised to £220,000, was now augmented to £312,000 per annum. On receiving intelligence, in July 1778, that war had actually commenced between France and Britain, Cheit Sing was required to pay £50,000 as his share of the public burdens. This de-mand was met with extreme reluctance by a prince who already contributed £240,000, and probably thought that an abundant equivalent for the protection he enjoyed. The same requisition, however, was made the two succeeding years, but with a promise that the demand should cease when peace was restored. A body of troops was also quartered upon him, and he was obliged to pay for their maintenance, lest he should not voluntarily pay the additional £50,000. In November 1780, in addition to these requirements, he was also ordered to send into the field such a body of horse as he could spare; but this was never complied with. In July 1781, Mr. Hastings having, it is said, re-ceived some intelligence that the oppressed rajah meditated rebellion, set out on a visit to the nabob of Oude, and in his way proposed to clear up the misunderstanding. The method by which he intended to do this was to lay a fine upon the prince of £400,000 or £500,000 ; and as a reason for doing so, it was alleged, that the late rajah had left £1,000,000 sterling in his treasury; a sum which was continually increasing. Cheit Sing advanced to the borders of his territories to meet the governor-general, behaving with all imaginable submission; and, having received

private intelligence of what was meditated against him, offered to pay down .£200,000. This was refused; and the governor-general, having reached the capital, forbid the rajah his presence, and by a letter acquainted him with his causes of complaint. Cheit Sing sent a respectful answer; but, as he endeavoured to exculpate himself, Mr. Hastings was so far from being satisfied, that he put the prince under arrest. Such an unheard-of proceeding excited the utmost surprise and resentment, in subjects accustomed to regard their sovereign with a degree of reverence little short of adoration. On the very day of the arrest they assembled tumultuously, cut in pieces the guard which had been set on the palace, and carried off their prince in triumph. It does not appear, however, that this was any other than a transitory tumult; for, though they could easily have cut off the governor-general, they made no at-tempt against him. Cheit Sing protested his innocence, and made the most unlimited offers of submission, but all in vain. Ilis government was declared vacant, and the zemindary bestowed on the next heir; while the annual subsidy to the government of Bengal was augmented from £240,000 to £400,000 annually. The miserable rajah was forced to fly his country; and his mother, though promised leave to retire upon conditions, was attacked in her retreat, and plundered by the soldiers. After all his endeavours to procure money, however, Mr. Hastings found this adventure turn out much less profitable than he had expected; for the treasury of the fugitive prince was seized and retained by the soldiers.

With the nabob of Oude a new treaty was concluded; the design of which was evidently to ease him of some of the burdens to which he was at that time subjected. Part of the British troops were therefore withdrawn from his dominions. As Fizulla Khan, the most prosperous of his dependents, had been called upon to furnish a body of 5000 horse to join the nabob's army, and had not complied with the requisition, the guarantee of his treaty with the naboh, formerly executed, was withdrawn ; but, it being afterwards discovered that his territory was not equivalent to the claims of the governor, the treaty was renewed on payment of a slight fine. As the widow of Sujah Dowla was suspected of favoring the late rajah Cheit Sing, the reigning prince was allowed to reclaim the treasures of his father in her possession, and likewise to deprive her of a small province she had in possession, on condition of paying her a certain stipulated allowance annually. The treasures were seized as payment of the debts of the prince to the company.

Hostilities continued in India between the French and British, till the year 1783 was far advanced, and long after tranquillity had been restored in other parts of the world. In the beginning of the season for action, the governor and council of Bengal determined to send an ample supply to the presidency of Madras, that so they might be enabled to put an end to the war, which Tippoo seemed willing to prosecute with even more vigor than his father had done. For this purpose Sir Eyre Coote, who, for his

health, had gone to Bengal by sea, set sail once more for Madras, being entrusted with a large sum of money for the expenses of the war. In his passage he was chased for forty-eight hours by two French men of war. The solicitude and fatigue he underwent during this time, being almost constantly upon deck, occasioned a relapse, so that he died in two days after his arrival. The invasion of Tippoo's dominions having cal-led him off from the Carnatic, general Stuart took the opportunity of attacking him in another quarter. Colonel Fullarton was despatched with a large body of troops to invade the province of Coimbatour. This he executed with great suc-General Stuart, however, having still eess. greater designs in view, was obliged to recall this gentleman in the midst of it. The siege of the strong fortress of Cuddalore was the operation which engaged his attention. It was now become the principal place of arms belonging to the French; was strongly fortified, and garrisoned by a numerous body of the best troops of France, as well as a considerable number of Tippoo's choicest forces. The siege therefore proved so difficult, that, though the British displayed the utmost valor and military skill, they were not able to reduce the place until hostilities were interrupted by the news of a general pacification having taken place in Europe. In this siege a corps of sepoy grenadiers encountered and overcame the French troops opposed to them with fixed bayonets. For this remarkable instance of valor, they not only received the highest applause at the time, but provision was made for themselves and families by the presidencies to which they belonged. After the reduction of Hydernagur, and the destruction of the army under general Matthews, the British possessed only three places of consequence in the kingdom of Canara. These were Maugalore, Onore, and Carwa. The siege of all these places was undertaken at once. Mangalore, the principal port in the country, was defended by a very numerous garrison under major Campbell. Tippoo sat down before it on the 19th of May; and the attack and defence were both conducted with the greatest spirit and activity. Notwithstanding the utmost efforts of the beseigers, however, and that the garrison were reduced to the last extremity for want of provisious, they held out in spite of every difficulty, until, peace being concluded, the place was afterwards delivered up. In other parts nothing more happened, than an indecisive engagement between M. Suffrein and admiral Hughes.

A combination of various causes contributed to produce the war of 1789. The splendid embassy sent by Tippoo to the court of France, soon after the peace of Mangalore in 1784, had given reason to suspect that some plan was concerted between that cont and the tyrant of Mysore, for the annoyance of Great Britain; but this plan, whatever was its extent, was defeated by the French revolution. The Dutch were no less jealous of the increasing power of Tippoo, on account of the vicinity of their flourishing settlement at Cochin to the sultan's territories. They also possessed the forts of Crangamore and Acottah in this vicinity. To

procure possession of these forts, Tippoo marched a formidable force, in June 1789, towards Cranganore, of which the Dutch had taken possession, when in alliance with his father Hyder Aly. The Dutch afterwards sold them both to the rajah of Travancore, an ally of Britain; and thus, with their usual policy, placed Britain as a barrier against Tippoo's encroachments on their settlement at Cochin. The rajah gave farther offence to the sultan, by purchasing some ter-ritory from the rajah of Cochin, a tributary of Tippoo, without consulting him. Tippoo, therefore, made a direct attack upon the lines of Travancore, on the 29th of December 1789; but, on receiving a remonstrance from the British government at Fort George, he desisted, sent back the prisoners, and affirmed as an apology, that the rajah's people had first fired on his troops. On the 1st of May, 1790, the rajah attacked Tippoo, who had continued quiet from December 29th. For this step the rajah alleged in excuse the hostile preparations of Tippoo, in erecting batteries, &c. This attack was expected by the British, and some say concerted with them. The grand Carnatic army was instantly assembled, under general Meadows, in the southern provinces, and a plan of operations agreed on, between him and general Abercrombie, who had the command of the Bombay army, and colonel Kelly of the centre army; so named from its position between Madras and Mysore. The Nizam and the Poonah Mahrattas were appointed to penetrate into the territory of Tippoo across their respective frontiers, and Seringapatam was fixed on as the common centre. On the 24th of May general Meadows joined the grand army, and on the 15th of June entered Tippoo's dominions, when the fort of Carroor immediately surrendered. Seven days were spent in marching fifty-nine miles to Duraporum, where they found a supply of grain, and heard that Tippoo had ascended the Ghauts. On the 22d of July the army entered Coimbettore, which was evacuated, though it contained much grain and military stores. Several other forts were also reduced. In the end of August colonel Floyd reduced Sattimungalum, though garrisoned by a battalion, and well supplied with provisions. But on the 12th of September Tippoo began a smart cannonade on this detachment, who retreated to Coimbettore on the 13th; but, being closely pressed, repulsed the Mysorean troops on the 14th. On the 18th general Meadows marched to the east to offer Tippoo battle, but found he had retreated to Sattimungalum, on which he returned to Coimbettore.

On the 12th of October he heard that Tippoo had retaken Daraporum, and the British garrison airived in camp on the 17th, speaking warmly of the honorable treatment they had received from Tippoo. General Meadows left Coimbettore on the 20th; and the history of the grand army is nothing but a journal of its marches in pursuit of the enemy till the 17th of November, when it formed a junction with the centre army at Poolamputty; and on the 18th they came in sight of the rear of Tippoo's cavalry. From this period the united armies under general Meadows took their course back to Trichinopoly to procure

supplies, but did not arrive till the 8th of December, the weather being bad. Here they learned that Tippoo had arrived at Munsurput, on the Coleroone, opposite Trichinopoly, on the 28th of November, where he continued en-camped till the 6th of December, but without attacking that city. Meantime a detachment from the Bombay army, under lieutenant-colonel Hartley, rendered great service to the rajah of Travancore; and on the 5th general Abercrombie, with the remainder of the forces from Bornbay, arrived at Tellicherry. On the 14th Sir Ralph marched to attack Cannanore, which, with the garrison, surrendered on the 17th, and the troops engaged not to serve against the British during the war. About the same time colonel Hartley took Ferokabad, the capital of the Malabar coast. On the 27th Barragurry and Cootahpoor surrendered; so that the whole coast, from the Billipatam to Cape Comorin, was now in possession of the British and their allies.

On the 15th of January, 1791, the army under general Meadows left Trichinopoly, and proceeded to Madras, where lord Cornwallis had arrived on the 13th of December. On the 29th his lordship joined the grand army at Vellont, which proceeded early in February to Vellore; and, having deceived Tippoo by a feint, passed the Muglee on the 22d of February with all its stores and baggage. On the 24th lord Cornwallis proceeded for Bangalore. On the 6th March the town was stormed and taken, with the loss of 100 men. On the 12th batteries were opened on the fort, and on the 17th and 21st Tippoo drew out his army, but without effect. The fort was stormed on the evening of the 21st, with a dreadful carnage, though with little loss on the British side. Not less than 1000 fell, .t is supposed, by the bayonet, and 300, mostly wounded, were taken. The army remained at Bangalore till the 28th of March, when they proceeded towards Chinna-Balabaram; and on the 7th of April were joined by 15,000 of the ni-zam's troops. On the 17th colonel Oldham joined them with 700 Europeans, 4500 Indians, and a supply of provisions. On the 3d of May they set out for Seringapa-

tam, and on the 13th arrived at Arakeery, whence they had a view of Tippoo's capital, nine miles distant, and observed the main body of his army crossing from the island to the north side of the Cavery. Mean time lord Cornwallis, having received intelligence that general Abercrombie had ascended the Ghauts on the Malabar side, resolved to form a junction of their forces, but finding it impracticable to make a ford across the Cavery, determined to march round the ridge of mountains on the right. On the morning of the 15th the enemy's line was seen in a strong position. The British army was then formed into two divisions under colonel Maxwell and general Meadows. The former having success-fully stormed a height occupied by Tippoo's troops, the action became general along the front. Colonel Maxwell then advanced rapidly to gain another height on the enemy's left flank, while the cavalry under colonel Floyd attacked their right; on which Tippoo was forced to give way,

though his retreat was gradual and masterly. Four guns were taken, and the enemy were pursued, till the fire from the island batteries obliged the British to desist, and encamp partly on the field of battle. After destroying his battering train, and sending orders to general Abercrombie, who had obtained possession of Periapatam, to return with all speed, lord Cornwallis moved from his encampment to return to Bangalore ; and on the 28th was joined by 30,000 Mahrattas, with a supply of provisions. In their route they took several forts, and on the 18th of July Ousoor, with the forts near it, submitted. On the 30th the combined troops encamped six miles from Bangalore. General Abercrombie, having also destroyed his battering train, was obliged to lead back a sick and dispirited army, over those almost impassable mountains they had so lately passed.

While the army lay encamped near Seringapatam, a present of fruit had been sent by Tippoo to lord Cornwallis, with some overtures for a separate peace. The present, however, was returned, and the sultan assured, that no peace could be granted unless the allies were included. Tippoo next sent a vakeel with full powers to treat, but still the mission proved unsuccessful. During the winter months lord Cornwallis omitted nothing that tended to ensure the success of the next campaign. After reducing the hill forts north-east of Bangalore, Nundydroog, the capital of a large district, was besieged; and, being built upon the top of a mountain 1700 feet high, three-fourths of which were inaccessible, it stood a siege from the 22d of September to the 18th of October, when a breach was made. The carnage which would have followed was prevented, partly by a number of the garrison escaping over a low part of the wall, but chiefly by the humane and laudable exertions of captain Robertson, who commanded the storming party. On the 31st of October colonel Maxwell took Fort Penagra by storm, but one half of the garrison was put to the sword. At Kistnaghery he met with a more serious resistance. The lower fort was easily reduced, but the garrison in the upper fort defended it with great obstinacy. Immense rocks and showers of stones were hurled down; the scaling ladders were broken, and, after two hours of vigorous assault, colonel Maxwell desisted from the attempt. In September Coimbettore was besieged by a detachment sent by Tippoo, and was so bravely de-fended by lieutenant Chalmers, that the Indians were obliged to raise the siege. But being again besieged by a fresh party sent by Tippoo, and a detachment sent to its relief by lord Cornwallis, under major Cuppage, being defeated by the Cawn, lieutenant Chalmers was obliged to capitulate on the 2d of November, and the garrison marched out with the honors of war.

On the 10th of December colonel Stewart encamped within three miles of the celebrated fortress of Severndroog, on the north side; on the 17th he opened two batteries, at 700 and 1000 yards' distance; and on the 19th another within 250 yards, which, on the 21st, effected a breach at 11 A. M. when the assault was made, and in an hour the valor of the British

troops made them masters of a fortress hitherto deemed impregnable. On the 4th of December Outredroog, another fort twelve miles distant, was also taken by storm. Several other forts were now reduced, and Gumuncondah was blocked up by Hafez Jee, one of the nizam's best generals. It was relieved, however, by Hyder Saib, Tippoo's eldest son, who took Hafez Jee and great part of his troops prisoners. Early in November general Abercrombie returned to Tellicherry, and, on the 5th of the next month, he proceeded on his march through the Ghauts towards the Mysore country; while the Mahrattas, under Purseram Bhow, reduced several forts on the Tam and the Budra, which gave them access to a fertile district, that afforded seasonable supplies. The grand object, the reduction of Tippoo's capital, was now to be attempted. The allied armies on the 1st of February, 1792, commenced their march, and on the 5th arrived within sight of Seringapatam, under the walls of which Tippoo was strongly posted. His front line was situated on the north side of the Cavery, behind a strong hedge, and defended by heavy cannon in the redoubts. In the front there were at least 100 pieces of cannon ; and in the fort and island which formed his second line there were three times as many. The allies encamped six miles from Tippoo, in two divisions separated by the small river Lockarry. The British army formed the front line : the reserve was about a mile in the rear, where the armies of the nizam and Mahrattas were also posted at a further distance. On the 6th of February orders were issued to attack Tippoo's camp and lines at 7 P.M. The right division, consisting of 3300 infantry, was commanded by general Meadows; the centre, consisting of 3700, by lord Cornwallis; and the left, of only 1700 men, by colonel Maxwell. At eight o'clock the whole body was under arms, the evening was serene, and the troops moved on in silence by the light of the moon. While they were on their march colonel Duff's camp was struck, which gave the first notice of the intended attack to the allies, who were astonished when they found that lord Cornwallis had ventured on this desperate enterprise with only a part of his infantry unsupported by artillery, between ten and eleven at night; the centre column, within a mile of the hedge, touched upon Tippoo's grand guard of cavalry, who were coming with rockets, &c., to disturb the British camp, but immediately galloped off to the lines. Finding themselves thus discovered, the column advanced with the utmost rapidity, and entered the enemy's lines within fiftcen minutes after the news could have reached them. The right column, having met with more impediments, was later in reaching the hedge than the centre column ; but it entered the lines about eleven, when the battle became general; the enemy at last gave way, and at day-break general Meadows found himself complete master of the field .. The chief object of the centre column being to gain possession of the island, the front division dispersed the enemy, and passing Tippoo's tent, which had been abandoned, pressed forward to the river, in two parties, The first under captain Monson

crossed the ford under the walls without opposition, and proceeded to the east gate of the city, but, finding it shut, marched to an extensive market-place, where they made a great slaughter of the enemy. They were followed by the other party, under colonel Knox, who proceeded to the rajah's garden, and thence to the suburb Shaher-Gangam, the gates of which they forced open, and drove the enemy from all their batteries. The centre division advanced to the sultan's redoubt, which they found abandoned, and afterwards co-operated with colonel Maxwell in defeating Tippoo's right wing. Lord Cornwallis, with the reserve, remained close by the hedge, where the column had first entered, and two hours before day-break was joined by captain Hunter's party; soon after which they were attacked by a strong body of troops, part of Tippoo's centre and left, who, being now recovered from their panic, rallied with redoubled resolution.

The conflict was carried on with inflexible courage on both sides, and it was near day-light, before the enemy was repulsed. Lord Corn-wallis then retired to the Pagoda Hill, where he was met by general Meadows. Mean time the left division under colonel Maxwell, after ascending the Carighaut Hill, with little resistance, and marching down to the river, where they were much galled by the firing from Tippoo's right line, crossed the ford and joined the victorious parties, who had got possession of the east ex-tremity of the island. The battle was continued in different parts during the whole of the 7th of February. The most desperate conflict was at the sultan's redoubt, which was defended by a small party under colonel Kelly, against three vigorous attacks, seconded by a heavy cannonade from the forts. The enemy being driven from every post on the north side of the river, the camp was advanced as near to the hedge as the firing from the fort would permit; and a chain of posts along the north and east faces of the fort was formed, so as to invest Seringapatam on its two principal sides. Thus pressed on every quarter, and his whole power reduced within the narrow limits of a citadel, the sultan became anxious to procure peace. He therefore released lieutenants Chalmers and Nash, who had been captured at Coimbettore, and had been well treated, presented the former with 500 rapees and two shawls, and sent a letter by him to lord Cornwallis, requesting he would return with the On the 16th of February the Bomanswer. bay army, under general Abercrombie, after a fatiguing march, wherein they were much harassed by detached parties of the enemy, joined lord Cornwallis, and afforded a reinforcement of about 2000 Europeans and 4000 natives. Vigorous preparations were therefore made to attack the fort on the north side ; where trenches were opened and batteries constructed. Meantime, to draw off the attention of the enemy from these operations, major Dalrymple and captain Robertson, with the seventy-first regiment and thirteenth battalion of sepoys, were sent to attack his cavalry, encamped on the south side of the river. They entered the camp un-discovered, killed with the bayonet above 100

men and 300 horses, and returned without losing a man. On the night of the 19th a parallel and redoubt were completed near the walls of the fort, on the opposite side of the river; which the sultan, next day, in vain attempted to overthrow. He then endeavoured to deprive the camp of water, by altering the course of a large canal, but in this attempt too he was disappointed, a party being despatched under captain Wahab, who soon dislodged the enemy and repaired the canal.

On the 19th the grand operation of the siege commenced by opening the trenches, and by a heavy discharge from all the batteries : in the mean time the Bombay army crossed the river to invest the west side of the capital. But, in consequence of the application through lieutenant Chalmers, lord Cornwallis agreed to receive Tippoo's envoys to treat of peace. On the 15th, 16th, 19th, and 21st, Sir J. Kennaway and Mr. Cherry, assisted by vakeels, or envoys, from the nizam and Hurry Punt the Mahratta chief, met with Tippoo's vakeels, to treat of peace, but little progress was made in the negociation. The siege continued without intermission, and general Abercrombie, on the 22nd, took possession of a redoubt and grove between his camp and the fort, but with the loss of 104 men. During the night of the 22nd and 23rd new batteries were erected, and Purseram Bhow, with 20,000 horse, several thousand foot, and thirty cannon, was daily expected. In the mean time, Tippoo had been obliged to send off all his cavalry and camp followers to Mysore, and was in want of every thing, while the British army was well supplied. In this hopeless situation, he was compelled to accept of any terms proposed by lord Cornwallis. These, all things considered, were moderate. Preliminaries of peace were signed on the 23rd of February, on the following terms : 1. That Tippoo should cede one-half of his dominions to the allied powers; 2. That he should pay three crores, and thirty lacks of rupees; 3. That all prisoners should be restored; And, 4, That two of his eldest sons should become hostages for the performance of the treaty. On the 24th hostilities ceased, and on the 26th the two princes, Abdul Calick aged about ten, and Mooza Ud Deen about eight, mounted each on an elephant richly caparisoned, arrived in the British camp, and were received with kindness by lord Cornwallis. On the 19th of March the definitive treaty was finally adjusted and signed.

For seven years the affairs of India continued in a state of doubtful tranquillity. But from 1796, the sultan of Mysore is accused of having constantly excited the jealousy of the British government. This was in no small degree increased by a proclamation of the French governor of the Isle of France in 1798, which openly mentioned an alliance formed between Tippoo and the French republic, for the destruction of the British power in India. It was also alleged, that Tippoo had sent an embassy to Zemaun Shah, to encourage him in his threatened invasion of Hindostan. Mean time Tippoo professed the most friendly intentions of preserving concord and harmony. The British governor-general, however, giving little credit to these profes-

723

3 A 2

sions, began to strengthen his alliances with the nizam and the paishwa, and in September concluded a subsidiary treaty with the former. In consequence of this, the French army at Hyderabad was surrounded by the English and the nizam's troops, the sepoys were disarmed, and the French officers sent prisoners to Bengal. Matters were in this state, when the news arrived of the French invasion of Egypt, and of lord Nelson's victory. The governor-general, on this, wrote a letter to Tippoo, dated 3rd of November, acquainting him of his knowledge of his connexion with the French republic, and proposing to send major Doveton to adjust all differences. On the 10th of December he sent another letter to the same purpose; and on the 15th received a reply from the sultan, wherein he expressed the utmost surprise at the military preparations on foot, conscious as he was of having observed the treaty with the most inviolable fidelity. On the 25th he sent another letter to the governor, wherein he congratulates his lordship on the victory over the French; explains the nature of the pretended embassy to the Isle of France, which he says, was a mere mercantile adventure, and supposes the French had taken the advantage of it, to spread reports to disturb the union between the two states. To this letter the governor-general returned an answer, again proposing a negociation, and urging the sultan not to delay his reply beyond one day. To this no answer was received till the 13th of February, when a letter without a date arrived, stating, that he was setting out on a hunting expedition, and begging his lordship to send major Doveton slightly attended. Meantime the governor-general, fearing the approach of the monsoon, had ordered lieutenant-general Ilarris to enter Mysore with his army, and, in his reply to Tippoo, informed him, that general Harris was now the only person anthorised to receive his communications, with a view to the restoration of peace.

The reduction of the fort of Seringapatam was in fact the object of general Harris, whose first movement was on the 11th of February. The nizam's contingent, consisting of 12,000 foot, and 6000 cavalry, joined the British army on the 18th, and next day general Harris forwarded the governor's letter to the sultan, published his lordship's declaration in name of the allies, and began hostilities by sending a detach-ment against the hill forts of Neeldurgum and Auchitty, which surrendered without resistance. On the 7th of March Odeadurgum surrendered to colonel Oliver, and next day Fort Ruttingheri was taken after a slight resistance. The army under general Harris consisted of 31,000 men, besides the nizam's cavalry, all completely equipped. That under general Stuart, on the Malabar coast, was equally efficient. Between the 9th and the 14th of March the army under general Harris changed its positions from Kelamungalum, to Callacondapilly, Anicul, and Bangalore; near which last place about 4000 of Tippoo's horse appeared, but, after a few shots from the British field pieces, drew off. On the 16th the army took the rout of Cankanelli; and on the 20th and 21st encamped seven miles north of it. They now learned that Tippoo was

within fifteen miles; and on the 23rd, as they approached Sultanpettah, a cloud of dust showed that he was in motion. He had in fact quitted his position on the bank of the Maddoor (where he might have disputed the passage) and encamped at Mallavelly. Instead of opposing the British in this quarter, he on the 6th of March passed his own frontier, and attacked a part of the Bombay army under general Stuart, not exceeding 6000 men; who, notwithstanding Tippoo's force consisted of 11,800 of his best troops, repulsed him with considerable loss.

Upon this he retreated to Seringapatam, and on the 14th advanced to meet general Harris. On the 25th the British army encamped five miles east of Mallavelly; and on the 27th came within sight of the sultan's. A general engage-ment took place, but was of short duration, the enemy retiring with their guns to the next height. Their loss was estimated at about 1000, while that of the British did not exceed seventy. On the 3rd of April the army came within sight of Seringapatam, and took its position on the 5th about 3500 yards from the west face. That night an attack was made on the outposts, and on the 6th the principal ones were in possession of the British. On the 9th general Harris received a letter from Tippoo, declaring, that he adhered firmly to the treaties, and demanding the reason of the advance of the English army, and of the recurrence of hostilities? The general replied by referring to the marquis of Wellesley's letters. Matters continued in a state of mutual preparation from this period to the 13th, when suddenly a heavy fire commenced from the fort and batteries. Next day generals Floyd and Stuart arrived, and took their ground in the rear.

On the 16th the Bombay army crossed the Cauvery, which was almost dry, and took a strong position which on the 22nd was attacked at all its posts by 6000 of the enemy's infantry, and Lally's corps of Frenchmen, who behaved with their usual bravery; but they were as bravely repulsed, and compelled to retire with the loss of about 700 men. On the 20th general Harris had received an overture of peace from Tippoo, and on the 22nd it was answered by a draft of preliminaries. The terms proposed were, To cede half his territories in perpetuity to the allies : to pay two crores of rupees; to renounce the alliance of the French for ever; to dismiss every native of France from his ser-vice; to receive ambassadors from each of the allies; and to give as hostages four of his sons and four of the principal officers. The enemy's guns on the west face were silenced on the 24th, as well as those of two round towers on the 26th. On the 28th Tippoo acknowledged the receipt of general Harris's proposals, and stated that the points in question were weighty and important, and without ambassadors could not be brought to a conclusion; that therefore he was about to send two gentlemen, who would explain themselves to him. The British general briefly replied, by referring to the terms in his last, as the only conditions of treating. On the 2nd of May, the works being completed, the British batteries began to open, and in the course of the day a breach was made in the fausse-brayo wall; the

main rampart was shattered; and, to complete the misfortune of the besieged, a shot having struck their magazine, it blew up with a dreadful explosion. The breach being thought practicable, on the night of the 4th of May 4000 men were stationed in the trenches before daybreak. The assault was led on by general Baird, and began at one o'clock. In six minutes the forlorn hope had reached the summit of the breach, where the British colors were instantly crected. In a few minutes the breach, which was 100 feet wide, was crowded with men. After a short conflict the panic became general in the fort; thousands quitted it, and others laid down their arms. A flag of truce was soon after sent to the palace of the sultan, offering protection to him and his friends upon surrendering unconditionally. The young prince surrendered to general Baird, but Tippoo was not to be found. After much entreaty, enforced even by threats, the killedar affirmed, that the sultan was not in the palace, but had been wounded during the assault, and lay in the gateway on the north face of the fort. There, among heaps of slain, the body of the unfortunate monarch was found, still warm, and covered with wounds.

Ilis dominions were now partitioned among his conquerors, and the Mahrattas were admitted to a share, from motives of policy, though they had taken no part in the war. To the East India Company were allotted the districts of Combatoor and Daraporum, the province of Canara, all the territory between the British possessions in the Carnatic and those of Malahar, with the forts and ports forming the heads of all the passes above the Ghauts on the Table Land, and the fort, city, and island of Seringapatam. To the nizam were assigned the districts of Gooty and Gurrumconda, together with a tract of country along the line of Chitteldroog, Sera, Nundidroog, and Colar. To the Mahrattas were given Harponelly, Chitteldroog, Scondo, Anagoondy, and a part of Biddenore, except the forts on the frontiers. A descendant of the ancient rajahs of Mysore, about five years old, was sought out and placed on the throne with great ceremony (under certain conditions): and the sons and relations of Tippoo were removed into the Carnatic. Thus terminated one of the most important of our Indian wars with equal glory to the British arms, and advantage to the British interests in India; by securing them, at least for some time, against the re-appearance of a formidable enemy.

9. Of British India during the wars with the Mahrattas and to the peace of 1805.—We have alluded to the rise and early form of the Mahratta power in India. In 1795 died the young peishwa Madhurow, and the government was for a length of time distracted by the internal dissensions which followed this event—Bajecrow and Chimnajee, the surviving sons of Ragobah, a fortunate usurper of the middle of the last cenury, being alternately raised to the throne. At this time the peishwa's authority extended no further than the Poonah Sait branch of the Mahratta state, comprising most of the original country of that tribe, but none of their conquests. Yet this branch was recognised as the head of the other Mahratta states. After many vicis-

situdes the eldest brother, Bajeerow, was at last fixed on the throne by the assistance of Dowlet Row Scindia, who only, however, permitted hum to enjoy a nominal sovereignty.

With the peishwa all the British treaties had been concluded without reference to any of the subordinate Mahratta chiefs. Neither Scindia, therefore, who held previously to this time the whole of Candeish, nor Bhoorsle, the rajah of Berar, were consulted with regard to them, and the former soon manifested a sense of his new importance; in fact, while we were enriching their nominal chief with the spoils of our hardearned conquest of Tippoo, several Mahratta chiefs were afterwards found to have corresponded with and assisted him to the last.

Under these circumstances the marquis Wellesley, in 1802, endeavoured by negociation to effect an improved system of alliance with the court of Poonah. It was at this time engaged in a war with Jeswunt Row Holkar, who possessed the fertile province of Malwa; and on the 25th of October, 1802, the army of Dowlet Row Seindia, combined with that of the peishwa, was totally defeated by Holkar near Poonah; on the same day he fled towards Severndroog, in the Concan, where he embarked for Bassein, which he reached on the 1st of December; and on the 31st of that month a treaty of perpetual friendship and alliance was concluded between the peishwa and the British government; by the conditions of which the friends and enemies of the one were to be considered in the same relation to the other.

The peishwa now agreed to receive into his dominions a subsidiary force of 6000 infantry, with their usual proportion of field pieces and European artillerymen attached; for the payment of which he assigned districts in the southern quarter of his country. Such was the treaty of Bassein, executed on the 31st of December, 1802, and formally ratified in the ensuing spring.

In the interim Holkar had occupied the capital of the peishwa, Poonah, and major-general Sir Arthur Wellesley, brother of the governor general, was directed in virtue of the late treaty to move on that capital. When he had advanced within sixty miles of Poonah, he heard of the enemy's intention to plunder the city on his approach; he therefore astonished all India by performing this journey at the head of his cavalry and over an almost impassable road in thirty-two hours, and was, welcomed by the city as a deliverer.

But Scindia proved a treacherous ally, and to general Wellesley was confided in the course of the summer full power to treat with or declare war against him and the rajah of Berar, as he should find them disposed. In the army of the former was a French officer of great experience, M. Perron, who had procured an important assignment of territory from Scindia, on the right bank of the Jumna; which he had in fact formed into a small French state. This was the period of the peace of Amiens, in virtue of which also Pondicherry became restored to France; but lord Wellesley under the existing circumstances determined not to deliver it up, and, before any enquiry could be instituted into his reasons, intelligence arrived of the renewal of the war between England and France.

It was now evident that three at least of the Mahratta chieftains were hostilely disposed to the British, and an extensive plan of warlike operations was combined, while negociations were for four months very steadily and earnestly entered upon with each of them. In the course of August the governor general put in motion in various parts of the British frontier 54,918 men. Sir Arthur Wellesley, finding no other alternative, took the field on the 8th of that month, and invested and carried in succession Ahmednughur and Aurungabad. He came up with the allied forces of Scindia and Bhoonsla on the 23rd of September, and, though not at this time at the head of more than 4500 men, he did not hesitate to attack the enemy, who mustered between 30,000 and 40,000, one-third of whom were commanded by European officers, and gained a most complete victory.

General Lake, the commander-in-chief, attacked, near Coel, in the Douab, that part of Scindia's army which was under the command of M. Perron, who rapidly retreated before him, leaving Coel in our possession. The British also stormed and took the important fort of Ally Ghen on the 4th of September, in which were M. Perron and his grand depôt of stores; and immediately pushed forward to Secundra and Jehna Nullah, within six miles of Delhi. Here was fought the celebrated battle of Delhi, in which General Lake exhibited that union of talent, courage, and coolness, for which he was distinguished, and the immediate consequences of which were the possession of that ancient capital, and of the person of the unfortunate Shah Alum, the descendant and representative of the Moguls.

We cannot detail the less important operations. In Bundlecund the forces of Shumshere Bahadur, a chief nearly independent but nominally acknowledging the peishwa, were defeated by colonel Powell, and the whole province submitted to our arms. Agra was ultimately taken by general Lake, and Sir Arthur Wellesley followed up his recent victory, by chasing before him Bhoonsla; while colonel Stephenson took the important fortresses of Boorhampoor and Asseer Gheer. The battle of Laswaree followed on the part of general Lake, in which he engaged and defeated 9000 infantry and 5000 horse, and terminated the campaign. In December both Scindia and Boohnsla were anxious to make peace; the former ceding the whole of the Douab, all his territories north of Jeypoor and Judpoer, Baroach in the Guzerat, and Ahmednughur in the Deccan: and the latter the province of Cuttack, including the fort and district of Balasore, to the British; who thus, in a brilliant campaign of five months, dissolved a formidable confederacy of the native powers, and obtained every object of the war.

But military operations were continued against Holkar, who, in fact, was the soul and strength of the late confederacy. Ile was, on the peace above mentioned, offered the liberty of retiring unmolested to his own states; but he immedidiately began to plunder the Jeynaghur territory. It was not until late in 1804, however, that active operations were commenced against him. On the 13th of November in that year general Fraser attacked and defeated a force of this chief's amounting to twenty-four battalions of infantry, a body of irregular horse, and 160 pieces of ordnance, but at the expense of the valuable life of the British general; and lord Lake advanced upon the great body of Holkar's cavalry, which was posted at Furruckabad, and totally defeated it; Holkar himself escaping with difficulty. At this period, however, a new treachery on the part of the British allies, that of the rajah of Bhurtpore, unexpectedly prolonged the war. This chief suddenly received and supplied Holkar with whatever of military power he possessed for further depredations, until in April, 1805, a separate peace was made with him, and Holkar fled.

Such was the situation of British India, at the period of the marquis Wellesley's return to Europe; he had conducted our affairs in this quarter of the globe with an oriental magnificence of design, and perhaps of expenditure; but he seems fairly to claim the merit of having crushed in a most masterly manner the alarming combinations of Mahratta and French enmity, and entirely to have laid the basis of the measures which lord Cornwallis only arrived in India to complete.

This was in July, 1805. Holkar was without ally or territory, but still in arms; and Scindia, dissatisfied with the late peace, had imprisoned our resident, and was apparently only waiting an opportunity to break out into hostilities. The finances of the Indian government were also in great disorder.

Lord Cornwallis scarcely lived to act in his new and arduous office of fully restoring tranquillity and confidence. He had indeed taken a masterly view of the general state of affairs, suggested various retrenchments, and provided for the existing wants of the troops; but on travelling towards the army he only reached Gazypoor, in Benares, where he died October the 5th. Sir George Barlow, the second in command, who had accompanied him, happily pursued his suggestions, and 22nd of November a satisfactory arrangement was made with Scindia, and on the 24th of the following month with Holkar.

10. British India from 1805 to the end of the Burmese war in 1826.—The peace, concluded under the directions of lord Cornwallis, lasted without any open rupture until the end of the year 1814.

The following year was occupied with the Nepaulese war, and several reverses at first attended the British operations in the hill country. But the perseverance of general Sir David Ochterlony soon brought this dispute to a close; and obtained as the result the cession of the whole country from Kemaoon to the Sutlege.

This year, at the opposite extremity of the peninsula, the king of Kandy was likewise made to submit to British prowess, and the whole of Ceylon became annexed to our Indian empire. See the article CYNON. In October 1815, and March 1816, two expeditions of the Pindarees, a predatory band of native robbers, disturbed the peace of the Madras presidency. They were a species of Cossack, or light cavalry, formerly attached to the native armies, and having their horses well trained to long marches and hard fare. Armed with a bamboo spear, from twelve to eighteen feet long, every fifteenth man carried a matchlock; about 400 out of every 1000 were well mounted; of the remaining 600, 400 were indifferently mounted, and the rest were slaves and campfollowers, keeping up with the corps as they best could. About the year 1814 these bands comprised about 40,000 horse, who subsisted wholly on plunder.

On the first of their present expeditions they crossed the Nerbuddah in a north-west direction, and, dividing into parties, penetrated to the Kishna. They were only deterred at this time from crossing into the presidency by the swollen state of the river; but, in their return along the line of the Godavery and the Wurda, they passed the British positions, making good their retreat with an immense booty.

The second expedition crossed the Nerbuddah, on the western frontier of the district of Masulipatam, under the Madras presidency, on the 10th of March. Next day they marched thirty-eight miles southward, plundering ninety-two villages, with almost unheard of cruelty, and, on the 12th, they marched thirty-eight miles, plundering fifty-four villages. By the middle of May they had all recrossed the Nerbuddah, loaded with spoil, and with very little loss. During twelve days, which they had remained within the British territories, it was found that 182 persons had been put to a cruel death, 505 were severely wounded, and 3603 had been put to various descriptions of torture. A defensive line of posts was now therefore extended along the Nerbuddah, and across the country for about 150 miles, and, when this was penetrated by new expeditions, a very different account was soon sent homeward. By the activity of the British corps employed, almost all of these expeditions were intercepted, and very few of the plunderers made good their retreat.

It was resolved however, in the year 1817, to commence offensive operations—to hunt the enemy into their native holds, and either to exterminate them, or to drive them from the position which they occupied, in the very centre of India. By the end of the rainy season of that year a numerous army took the field for this purpose. The plan was, that the armies of the different presidencies should advance southward, and, gradually converging to a common centre, hem in, on every side, the territory of the robhers.

While the Indian government was occupied with this plan, their old enemies were not idle. Bajee Rao, the existing peishwa of Poonah, made a fresh attempt on our forbearance. When all the British troops had moved southward, with the exception of a brigade, he first declared himself by attacking this small body. He was however repulsed at all points. This was on the 5th of November. On the 13th the brigade was

joined by general Smith's division, which had advanced on the Godavery. The enemy's camp was attacked next day, but it was found deserted, and that general had to undertake a sort of personal pursuit of the peishwa, who was hunted from place to place, until he at length surrendered —was deposed—and resigned the whole practical government of his dominions to the British.

Appa Saheb, the rajah of Nagpoor, and Holkar, pursued similar plans, and the result was the same. In November and December both were overcome; and placed their territories under British protection: nor was the main object of the British plans materially delayed by these occurrences; the Pindarees were driven first out of the province of Malwa, and, retiring as the British advanced, were at length hemmed in, and the greater part of them destroyed. The rest were humbled to complete submission, and their three most influential chiefs surrendered, on condition of being spared a military execution.

We have noticed under the article BURMHAN EMPIRE our first dispute with that important native power. The late rupture was of a far more serious character. It arose in an unfounded claim of the court of Ava to the island of Shapuree; in pursuit of which the Burmese chiefs in Arracan attacked and drove off the island a small party of British troops, stationed there for police purposes. An explanation being demanded and refused, and further agressions being made on the states of Cachar and Jynteea, then under British protection, the governor-general declared hostilities to have commenced in the spring of 1824. Rangoon soon submitted to a British expedition; then the islands of Cheduba and Negreis; and before the close of the campaign we were masters of Tavoy and Mergui, the most valuable possessions of the Burmese on the Tenasserim coast. A slight check was experi-eneed by our army, however, at Rameo, on the Chittagong frontier; and a mutiny took place among the native troops at Barrackpore, which at first excited considerable alarm. But the prompt and able measures of general Dalzel and his officers soon terminated this last interruption; twelve ringleaders of the mutiny were executed, and the regiment in which it occurred broke up. The general results of the war in 1824 were decidedly in our favor.

Throughout the year 1825 hostilities were continued against the Burmese, and with considerable, but not decisive success. The fort and pagoda of Syriam fell early in the year; then the defences of the enemy on the Lyng, Donabew, Prome, and the whole of Arracan. In September an armistice was concluded, and negociations for peace were opened, in the course of which the prisoners on each side were exchanged, and the armistice continued until the 2d of November. The Burmese had at this time an army of 60,000 men in the field; and their system of laying waste the country subjected our troops to considerable difficulty in obtaining provisions.

In the terms of peace proposed, the ministers of the king of Ava principally ebjected to the cession of territory, and the indemnification in money demanded by the British commanders. when his majesty of the Golden Foot, as the head of the Burmhan empire is styled, heard of these proposals, he is said to have broke out into the most furious burst of passion, and gave orders for the immediate renewal of hostilities. The whole Burmese army now advanced along the Irawaddy against Prome, which it gradually surrounded, and repulsed an advance of two brigades of native infantry, under colonel M' Dowgal. On the 1st of December, however, Sir Archibald Campbell was prepared to commence operations on the immense but unorganised masses of the enemy; and drove the whole of them before him to Melloone, on the right bank of the Irrawaddy. Here they concentrated, and again entered into negociations with the British, the result of which was the signature of a treaty ceding Arracan and the provinces of Mergui, Tavoy, and Zea, to the company, and agreeing that Assem, Cachar, Zeating, and Munnipoor, should be placed under princes to be nominated by the British. The court of Ava was further to pay to the company a crore of rupees by instalments, as an indemnification for the expenses of the war. This treaty was signed on the 3d of January 1826, and fifteen days were allowed for its ratification by the court; but it afterwards appeared that it never was sent thither, and the British army continued to advance on the capital. When it was within four days' march of that place the Burmese government appeared to think seriously that it must make these important concessions for a peace; and Dr. Price, an American missionary, was the bearer of the first instalment of the money stipulated, and brought with him all the prisoners that had been detained at Ava. He also, after some further delay, produced the ratified treaty. On the 5th of March the troops who had so nobly maintained this unequal warfare, and marched from victory to victory into the very heart of an immense hostile empire, began their retreat to Rangoon.

We believe the Burmese have since continued to pay, though with no small tokens of reluctance, the instalments specified.

This year was also signalised by the taking of the town and fortress of BHURTPORE (see that article) and the suppression of a revolt against the rajah, who had placed himself under our protection.

INDIA COMPANY, EAST. It was not until the close of the sixteenth century, and after the Portuguese had been established for nearly 100 years in the east, that Great Britain appeared as her competitor in this part of the world. But in 1577 Sir Francis Drake sailed to India by Cape Horn, and returned by the Cape of Good Hope: he was succeeded by less celebrated adventurers, who all agreeing with him in the favorable accounts they brought home of the commerce and inhabitants, in 1599 the first regular company for trading hither was formed. In 1583 queen Elizabeth had given introductory letters to the princes of India to two adventurers, Newberry and Filch, and others in 1596 to Allot and Bromfield, all of whom proceeded to the court of the great Mogul by land, and were well received there

The company we have mentioned subscribed a capital of £30,000 in 101 shares, varying in amount from £100 to £3000; and on the 30th of December the queen granted them letters patent as a Society of Merchants of London trading to the East Indies. They equipped a squadron, which arrived at Achen in 1602, and met with a favorable reception from the king : hence it proceeded to Java; established a factory at Bantam; and, loading the ships with pepper, returned to England. Eight other successful voyages were performed between this period and 1613, yielding a profit of from 100 to 200 per cent.

The first English expeditions were entirely of a commercial nature, and the establishments they formed were with the consent of the native princes: such were Masulapatam and Calicut, where they had factories a few years after their first appearance in India. It was, however, soon found that this pacific conduct would not permit them to compete with the Portuguese and Dutch, who possessed fortified places and secure ports, while we were dependent for the bare permission to trade on the caprice of the natives.

When our merchants endeavoured to obtain admission to Surat, in 1611, the Portuguese threatened to burn all the towns of that coast if they were received. The squadrons of the two nations met off Surat, and the English, under Middleton, were obliged to retire. The following year captain Brest, arriving off the same port with a stronger force, twice defeated the Portuguese fleet, though much superior; and in 1613 concluded a treaty of commerce with the Mogul, by which a free trade to all parts of his dominions was granted to the English. In the same year James 1. sent an ambassador to Achen, who procured permission to establish a factory in that city, with considerable commercial privileges; and between 1613 and 1629 the English had also formed settlements at Priaman and Ticoo, on the west coast of Sumatra; while the Dutch had established factories at Padang, &c. But both nations were shortly after driven entirely from the island by the king of Achen, now grown jealous of the encroachments of those new visitors.

Though, during the reign of James I., the English Company received little support from the government, by activity, perseverance, and the prudent choice of its servants, it had gradually acquired strength and solidity in India; when the Dutch, feeling that their own success depended on the ruin of their rivals, attacked them in every part of India; and, as they now possessed the same advantages over the English that the Portuguese did over them on their first arrival, it is not to be wondered at if they were every where successful.

After the Indian seas had been dyed with the blood of both nations, the Dutch remained victorious; and would probably have entirely driven the English from these seas had not the companies at home interposed. One of the chief objects of contention between the two nations was the commerce of the Spice Islands, of which the English claimed a share. The companies, in order to accommodate this difference, conclude 1 a treaty in 1619, by which the produce of these islands was to be divided between them in the proportion of two-thirds to the Dutch and onethird to the English, each contributing a like proportion towards the expenses of the establishments. This treaty, however, did not satisfy the Dutch in India, and, on pretence that the English had formed a conspiracy against them, they seized all the persons of the English factory at Amboyna in 1622, and, after inflicting unparalleled tortures on them, put them publicly to It is impossible to see in this atrocious death. massacre any thing but the effect of avidity without bounds; for it would be absurd to suppose that ten factors and eleven soldiers, the number of persons composing the English factory, should form a design to get possession of a fort garri-soned by 200 Dutch. The English king was, however, too deeply immersed in theological controversy to pay much attention to the rights of his subjects, and no vengeance was taken for the massacre of Amboyna, but the Dutch were permitted quietly to enjoy the fruits of their iniquity; and, in order to secure them more efficiently, they prevailed on the kings of Ternate and Tidor, the two most powerful princes of the Moluccas, in consideration of the payment of £3000 a year, to cause all the clove and nutmeg trees in their respective islands to be destroyed By this means the culture of the annually. clove was confined to Amboyna, and that of the nutmeg to the Banda Islands, of which the Dutch had the entire and undisputed possession.

The affairs of the English still continued to decline in India, and the civil wars which deluged the mother country with blood, during the latter part of the life of Charles 1., accelerated their down-hill career, so that, at the death of that ill-fated monarch, the East India Company was an empty shadow, and its trade reduced to insignificance.

Cromwell, irritated against the Dutch for assisting the unfortunate Stuarts, and affording an asylum to their proscribed adherents, commenced a maritime war against Holland, which was successful in every part of the world, and the republic was at length obliged to sue for peace. Though Cromwell might have dictated his own terms with respect to India, he contented himself with securing a free trade to the English, obliging the Dutch government to disavow the massacre of Amboyna, and to make some compensation to the descendants of the victims. The Island of Ron was also to be restored to the English; but from this island, which is little better than a rock, and without any harbour, the Dutch had previously extirpated all the nutmeg trees; nevertheless the English returned to it, but were again driven from it by their rivals in 1666.

The security of its trade, however, restored the affairs of the English Company, which went on successfully for some years, until it received a check from a rivalry to which that success had given rise. Charles II., whose sole object throughout his reign was to raise money for his dissolute pleasures, sold permission to private merchants to trade to India, in direct violation of the company's charter, while he at the same

time made the company pay for permission to prosecute the interlopers; the natural consequence was a kind of civil war for some years between the two parties in the Indian seas. The Dutch also still harassed the English whenever an opportunity presented itself; and in 1682, by their intrigues, they procured the monopoly of the pepper of Bantam, and obliged the English to withdraw their factory thence.

The English Company determined to revenge this aggression, and for that purpose fitted out a fleet of twenty-three vessels, on board which were embarked 8000 troops; but, at the moment this formidable armament was on the point of sailing, the king directed its departure to be postponed. Charles doubtless expected to receive a large sum from the company to revoke his order; but, being disappointed, he did not hesitate to sell the honor of the nation and the interests of his subjects to their enemies, and for the sum of $\pounds 1,000,000$ sterling, paid him by the Dutch, the expedition was ordered to be entirely laid aside.

The English, driven from Java, once more turned their views towards Sumatra, and in 1684 an envoy was sent from Madras to Achen, to demand permission to crect a fort there. This was, however, refused; but a free trade was granted them, and hberty to erect a wooden factory, which was immediately constructed.

While the English envoys were at Achen the rajahs of Priaman and other places on the west coast of Sumatra were there also, soliciting assistance of the Achenese against the Dutch, who had usurped their territories and otherwise injured them.

These chiefs, seizing the idea of opposing the two European nations to each other, offered the English envoys the monopoly of their pepper, and the liberty to build forts, provided they would rid them of the Dutch. On this condition a treaty was concluded between the Madras government and the Sumatra chiefs in 1685, and vessels were immediately despatched to Sumatra, where the establishment of Bencoolen was formed. In spite of the intrigues of the Dutch, the English obtained a firm footing in the island while the influence of their rivals declined, and at the close of the seventeenth century was almost entirely destroyed.

But, while the English were thus extending their establishments on the east, they had nearly lost one of their chief settlements on the west. The expenses of the flect which the company had equipped to chastise the Dutch had so greatly exhausted its resources, that it was obliged to send its ships to India without funds, to procure cargoes on credit if possible, and, from the good faith which had hitherto marked its dealings, merchandise to the value of £280,000 was thus procured. The means resorted to, to acquit this debt, were disgraceful to the English name, and were nearly productive of the total destruction of the English commerce in Western India. It appears that Sir Josiah Child, the chairman of the court of directors, unknown to his colleagues, sent instructions to his brother, the governor of Bombay (which had been given to Charles II. as the marriage portion of his queen Catherine) to

make such demands of the Mogul government of Surat as he knew must be refused. These demands were accordingly made, and, as foreseen, were rejected with contempt, when Child, on. pretence that this rejection was tantamount to a declaration of war, seized all the vessels belonging to the subjects of the Mogul, to an immense value. Aurungzebe, who then swayed the sceptre of Hindostan, lost no time in preparing to punish the authors of this unprovoked robbery. In 1689 his generals landed 20,000 men on the island of Bombay, defeated the English who opposed them, and obliged them to shut themselves up in the citadel, where they were closely besieged. Child, now as cowardly as he had before been treacherous, despatched a deputation to the Mogul emperor, to demand grace, and the English envoys were led into his presence with their hands tied behind them. The monarch, however, feeling the advantages that his subjects derived from their commerce with the English, was not inflexible, but after insisting on the dismission of Child, and on a compensation to his subjects who had been robbed, he restored to the English the privilege of a free trade throughout his dominions.

The loss sustained by the company, through this iniquity of its servants, was irretrievable, and the revolution and war that succeeded it accelerated the ruin of its affairs. A general outery was at this time also raised against the injustice of monopolies, and against that of the East India Company in particular. The business was at last brought before parliament, in which it was determined that a new company should be established under its sanction, on advancing $\pounds 2,000,000$ to government at eight per cent. interest, and that the old company, which derived its privileges from the crown alone, should be permitted to continue its trade till the expiration of its charter, which was not far distant.

After the old and new companies had endeavoured to ruin each other for some time, they wisely put an end to hostilities by a union in 1702. In 1708 the company lent a farther sum of $\pounds 1_200,000$ to government without interest, which reduced the interest of the whole debt due to it to five per cent., and for this advance the charter was extended, and it received the title of the United Company of Merchants trading to the East Indies.

The English first sent ships to China in 1634, and in 1677 were permitted to establish a factory at Amoy, and to trade to Canton.

The company's charter, granted in 1708, was prolonged from time to time, and in 1730 it was renewed for thirty-three years, on consideration of the reduction of the interest of the debt due to it by government, from five to three per cent., by the means of another loan without interest. In 1744 the war between England and France reduced the commerce of the latter in India for a time, but peace again restored the French affairs, which became more flourishing than ever.

At this period we may date the first commencement of the British dominion in India, which now, like a mighty Colossus, rests either foot on the utmost limits of the East. As early as the year 1640 the English received permission to build a factory at Hoogly, but they were prohibited from fortifying it in any manner, and an ensign and thirty soldiers, as an honorary guard to the factors, was the only military force allowed them. Their defenceless situation exposing them to the exactions of the natives, in 1686 they attempted to establish a defensive post by force of arms, which entirely failed ; but in 1689 they received permission to establish a factory at Sootenutty, ten miles below Hoogly, and about the same time they were allowed a free trade, on payment of an annual sum in lieu of customs. In 1696 the petty princes on the west side of the Hoogly took up arms against the nabob of Bengal, and made a rapid progress, taking Hoogly, and other towns of consequence. On this occasion all the European factors in Bengal declared for the nabob, and, demanded permission to put their factories in a state of defence against the common enemy, and the nabob in general terms desiring them to provide for their own safety, they immediately fortified their own factories; the Dutch at Chinsurah, the French at Chandernagore, and the English built Fort William, close to their factory at Sootenutty, to which they have given the name of Calcutta, and which, together with a small territory round it, they were permitted to purchase from the zemindar or Indian proprietor. Such was the slender foundation of the immense fabric of British dominion in India.

From the invasion of Nadir Shah in 1738, the Mogul empire was torn in pieces, as we have intimated, by different factions and pretenders to the crown, until it was at length reduced to a state of total debility in 1753. During these troubles we have also seen that both the French and English had gradually extended their influence on the continent, and in 1747 the latter had obtained the revenues of Bengal, Bahar, and Orissa. It was not to be expected that the rival European nations would long remain tranquil under the observation of each other's increasing power. In the war of 1756 Chandernagore and all its dependencies were taken from the French, the loss of Masulapatam, Mahé, and Carrical followed, while the French captured the English settlements on Sumatra. The adverse squadrous had also frequent but indecisive engagements, but the French were at last obliged to quit the Coromandel coast, and leave the English masters of the navigation of the Bay of Bengal. Pondicherry was taken in 1761, and at the same time all the natives of France found in the Carnatic were sent to Europe.

By the peace of 1763 all the French possessions in India were restored, on condition of constructing no fortification in Bengal; but their power in India had received too severe a shock to be ever able to recover itself.

From the commencement of the eighteenth century, Holland being at peace, except during the latter part of the American war, the Dutch retained their possessions, and carried on their commerce in the Indian seas undisturbed, until the French revolution drew them into its vortex. The Cape of Good Hope, Ceylon, Malacca, and the Spice Islands, were captured by the English in 1795, at the # me time that they lost all the settlements on the continent of India. By the peace of Amiens their establishments were restored, except Ceylon, which was confirmed to the English. In the late war the Dutch again lost all their settlements in India, but recovered them, with the exception of the Cape of Good Hope, by the peace of Paris.

It is sufficient to observe further that, with the exception of the capture of Calcutta by the nabob Surajah Dowla, in 1756, but which was

IN'DIAN ARROW-ROOT, n.s. Latin maranta. A root. A sovereign remedy for the bite of wasps, and the poison of the manchineel tree. This root the Indians apply to extract the venom of their arrows.—*Miller*.

IN'DIAN CRESS, n. s. Lat. acriviola. A plant.

IN'DIAN FIG, n.s. Lat. opuntia. A plant. IN'DIAN RED, n.s. Is a species of ochre; a very fine purple earth, and of a firm compact texture, and great weight.

INDIANA, one of the United States of North America, formed in 1816. It is bounded north by the north-west territory, Michigan Lake and territory; east by the state of Ohio; south by Ohio River, which separates it from Kentucky; and west hy the state of Illinois. Long. 84° 42' to 87°49' W., lat. 37°45' to 41°52' N. It is 284 miles long from north to south, and 155 from east to west; containing about 37,000 square miles. There are no slaves in this State. In 1810 it contained four counties and twenty-seven townships. The number of militia, in 1815, amounted to 15,171.

The counties, chief towns, and population, in 1815, are thus exhibited :---

Counties.	Pop.	Chief Towns.
Clark	7000	Charlestc-vn.
*Crawford		
Dearborn	4426	Lawrenceburg.
*Davis		
*Dubois		
Franklin	7970	Brookville.
Gibson	5330	Princeton.
Harrison	6769	Corydon.
*Jackson		Brownstown
Jefferson	4093	Madison.
#Jennings		Vernon.
Knox	Q800	Vincennes.
*Lawrence		
*Monroe		
*Orange		Paoli.
Perry	3000	Troy.
Posey	3000	Harmony.
*Sullivan	ł	Fort Harrison.
Switzerland	3500	Vevay.
Warwick	6606	Darlington
Washington	3000	Salem.
Wayne	6290	Salisbury.
Total	67784	

* Formed since the census of 1815.

Corydon, is the seat of government, and Vincennes the largest town. The other most recovered the following year, the progress of our territorial power in India has been uninterrupted; and that in 1765 we were quietly in possession of Bengal, Bahar, and Orissa, nominally indeed as tributaries to the Mogul, but who was a mere puppet in the hands of the British; and that since that period the company has been engaged in almost continual wars with the native princes, from whom it has acquired the absolute dominion of above one-half of the peninsula. See HINDOSTAN.

considerable towns are Vevay, Brookville, Jeffersonville, and Madison. All these, with the exception of Vincennes are new, and have risen suddenly into notice. There are many others recently established, some of which are very flourishing.

The legislature is composed of a senate and house of representatives. The representatives are elected annually, and the members of the senate once in three years. The governor and lieutenant-governor are elected for three years, and may be re-elected once, The legislature meets on the first Monday in September.

The principal rivers are the Ohio, Wabash, White River, Whitewater, Tippecanoe, Illinois, Plein, Theakiki, St. Joseph's, and St. Mary's

There are no mountains in Indiana; the country, however, is more hilly than the territory of Illinois, particularly towards Ohio River. A range of hills, called the Knobs, extends from the falls of the Ohio to the Wabash, in a southwest direction, which in many places produces a broken and uneven surface. North of these hills lie the flat woods, seventy miles wide. Bordering on all the principal streams, except the Ohio, there are strips of bottom and prairie land; both together from three to six miles in width. Between the Wabash and lake Michigan the country is mostly champaign, abounding alternately with woodlands, prairies, lakes, and swamps.

A range of hills runs parallel with the Ohio, from the mouth of the Great Miami to Blue River, alternately approaching to within a few rods, and receding to the distance of two miles. Immediately below Blue River the hills disappear, and there is presented to view an immense tract of level land, covered with a beavy growth of timber. North of the Wabash, between Tippecanoe and Ouitanan, the banks of the streams are high, abrupt, and broken, and the land, except the prairies, is well timbered. Between the Plein and Theakiki the country is flat, wet, aud swampy, interspersed with prairies of an inferior soil. The sources of rivers are generally in swamps or lakes, and the country around them is low, and too wet for cultivation.

There are two kinds of prairies, the river and the upland prairies: the former are bottoms destitute of timber, and are said to exhibit vestiges of former cultivation; the latter are from thirty to 100 feet more elevated, and are far more numerous and extensive. Some of them are not larger than a common field, while others extend farther than the eye can reach. They are usually bounded by heavy timbered forests, and not unfrequently adorned with copses of small trees. In spring and summer they are covered with a luxuriant growth of grass and ftagrant flowers, from six to eight feet high. The soil of these plains is often as deep and fertile as the best bottoms. The prairies bordering on the Wabash are particularly rich. Wells have been dug in them, where the vegetable soil was twenty-two feet deep, under which was a stratum of fine white sand. The ordinary depth is from two to five feet. The principal productions are wheat, Indian corn, rye, oats, barley, buck-wheat, potatoes, pulse, beef, pork, butter, whiskey, and peach-brandy.

The climate is generally healthy and pleasant. The Wabash is frozen over in the winter, so that it may be safely crossed on the ice. More than one-half of the land in this state yet remains in the possession of the Indians.

Not far from Big Blue River there is a large cave, the entrance of which is on the side of a hill, that is about 400 feet high. Here are found great quantities of sulphate of magnesia, or Epsom salt, and of nitre, &c.

IN'DÍCANT, adj. ln'dicate, v. a. Indica'tion, n. s. Indic'ative, adj. Indic'ativety, adv. Indic'ativety, a. Fr. indication; Lat. indico. That which points out: indicate, to direct a point to: indication, mark; token; sign; symptom; discovery; or explanation:

indicative, showing; informing: a certain modification of a verb, expressing affirmation or indication: indiction, declaration or proclamation. Indict. See INDITE.

These be the things that govern nature principally, and without which you cannot make any true analysis, and *indication* of the proceedings of nature.

Bacon's Natural History.

After a legation ad res repetendas, and a refusal, and a denunciation and *indiction* of a war, the war is left at large. Bacon.

These images, formed in the brain, are indicatively of the same species with those of sense. Grew.

The frequent stops they make in the most convenient places, are a plain *indication* of their weariness. Addison.

The verb is formed in a certain manner to affirm, deny, or interrogate; which formation, from the principal use of it, is called the *indicative* mood.

Clarke's Latin Grammar.

We think that our successes are a plain indication of the divine favour towards us. Atterbury.

The depravation of the instruments of mastication is a natural *indication* of a liquid diet. Arbuthnot.

If a person that had a fair estate in reversion should be assured by some skilful physician, that he would inevitably fall into a disease that would totally deprive him of his understanding and memory; if, I say, upon a certain belief of this *indication*, the man should appear overjoyed at the news, would not all that saw him conclude that the distemper had seized him? Bendley.

Through the waved branches, o'er the greensward glancing,

'Midst other indications of festivity,

Seeing a troop of his domestics dancing

Like dervises who turn as on a pivot.

Byron. Don Juan.

As an accomplishment, therefore, and as an agreeable indication of youthful gaiety, it must no doubt be considered. Canning's Microcosm.

INDICATION, in medicine (indicatio; from indico, to show). An indication is that which demonstrates in a disease what ought to be done. It is three-fold; preservative, which preserves health; curative, which expels a present disease; and vital, which respects the powers and reasons of diet. The scope from which indications are taken, or determined, is comprehended in this distich:

----- Ars, ætas, regio, complexio, virtus, Mos et symptoma, repletio, tempus, et usus.

The INDICTION, in chronology, instituted by Constantine the Great, is properly a cycle of tributes, orderly disposed, for fifteen years, and by it accounts of that kind were kept. Afterwards, in memory of the great victory obtained by Constantine over Mezentius, 8 Cal. October 312, by which an entire freedom was given to Christianity, the Council of Nice, for the honor of Corstantine, ordained that the accounts of years should be no longer kept by the Olympiads, which till that time had been done; but that, instead thereof, the indiction should be made use of, by which to reckon and date their years, which hath its epocha A. D. 313, January 1.

INDICTMENT, in English law, is a written accusation of one or more persons of a crime or misdemeanor, preferred to, and presented upon oath by, a grand jury. 'To this end,' says Blackstone, ' The sheriff of every county is bound to return to every session of the peace, and every commission of over and terminer, and of general gaol delivery, twenty-four good and lawful men of the county, some out of every hundred, to enquire, present, do, and execute all those things, which on the part of our lord the king shall then and there be commanded them. They ought to be freeholders; but to what amount is uncertain. As many as appear upon this pannel are sworn upon the grand jury, to the amount of twelve at the least, and not more than twenty-three; that twelve may be a majority. Which number, as well as the constitution itself, we find exactly described so early as the laws of king Ethelred : Exeant seniores duodecim Thani, et præfectus cum eis, ut jurent super sanctuarium quod eis in manus datur, quod nolint ullum innocentem accusare, nec aliquem noxium celare. In the time of king Richard I. (according to Hoveden) the process of electing the grand jury, ordained by that prince, was as follows :- Four knights were to be taken from the county at large, who chose two more out of every hundred; which two associated to themselves ten other principal freemen, and those twelve were to answer concerning all particulars relative to their own district. This number was probably found too large and inconvenient; but the traces of this institution still remain, in that some of the jury must be summoned out of every hundred. This grand jury are previously instructed in the articles of their enquiry by a charge from the judge who presides upon the bench. They then withdraw to sit and receive indictments, which are preferred to them in the name of the king, but at the suit of any private prosecutor; and they are only to hear evidence on bchalf of the pro-

secution : for the finding of an indictment is only in the nature of an enquiry or accusation, which is afterwards to be tried and determined ; and the grand jury are only to enquire upon their oaths, whether there be sufficient cause to call upon the party to answer it. A grand jury, however, ought to be thoroughly persuaded of the truth of an indictment, so far as their evidence goes; and not to rest satisfied merely with remote probabilities: a doctrine that might be applied to very oppressive purposes. The grand jury are sworn to enquire only for the body of the county, pro corpore comitatus; and therefore they cannot regularly enquire of a fact done out of that county for which they are sworn, unless particularly enabled by act of parliament; and to such a point was this anciently carried, that, where a man was wounded in one county and died in another, the offender was at common law indictable in neither, because no complete act of felony was done in any one of them: but by stat. 2 and 3 Edw. VI. he is now indictable in the county where the party died. And, by stat. 2 Geo. II., if the stroke or poisoning be in England, and the death upon the sea or out of England, or vice versâ, the offenders and their accessories, may be indicted in the county where either the death, poisoning, or stroke, shall happen. And so in some other cases; as particularly where treason is committed out of the realm, it may be enquired of in any county within the realm, as the king shall direct, in pursuance of statutes 26 Hen. VIII. and Edw. VI. And counterfeiters, washers, or minishers of the current coin, together with all manner of felons and their accessories, may, by stat. 26 Hen. VIII. (confirmed and explained by 34 and 35 Hen. VIII.), be indicted and tried for those offences, if committed in any part of Wales, before the justices of gaol delivery and of the peace, in the next adjoining county of England, where the king's writ runneth. Murders also, whether committed in England or in foreign parts, may, by virtue of the stat. 33 Hen. VIII., be enquired of and tried by the king's special commission in any shire or place in the kingdom. By stat. 10 and 11 W. III. all robberies and other capital crimes committed in Newfoundland may be enquired of and tried in any county of England. Offences against the black act, 9 Geo. I., may be enquired of and tried in any county of England, at the option of the prosecutor. So felonies, in destroying turnpikes, or works upon navigable rivers, erected by authority of parliament, may, by statutes 8 Geo. II. and 13 Geo. III., be enquired of and tried in any adjacent county. By stat. 26 Geo. II. plundering or stealing from any vessel in distress or wrecked, or breaking any ship contrary to stat. 12 Ann., may be prosecuted either in the county where the fact is committed, or in any county next adjoining; and, if committed in Wales, then in the next adjoining English county. Felonics committed out of the realm, in burning or destroying the king's ships, magazines, or stores, may, by stat. 12 Geo. III., be enquired of and tried in any county of England, or in the place where the offence is committed. By stat. 13 Gco. III. misdemeanors committed in India may be tried upon informa-

tion or indictment in the court of king's bench in Eugland; and a mode is marked out for examining witnesses by commission, and transmitting their depositions to the court. But, in general, all offences must be enquired into, as well as tried, in the county where the fact is committed. Yet if larceny be committed in one county, and the goods carried into another, the offender may be indicted in either; for the offence is complete in both. Or he may be indicted in England for larceny in Scotland, and carrying the goods with him into England, or vice versa; or for receiving in one part of the united kingdom goods that have been stolen in another. But for robbery, burglary, and the like, he can only be indicted where the fact was actually committed: for though the carrying away and keeping of the goods is a continuation of the original taking, and is therefore larceny in the second county, yet it is not a robbery or burglary in that jurisdiction. The grand jury are to find the whole of the bill or no part: they are in no manner to amend it.

When the grand jury have heard the evidence, if they think it a groundless accusation, they used formerly to indorse on the back of the bill ignoramus; or we know nothing of it: intimating that, though the facts might possibly be true, that truth did not appear to them. But now they assert in English more absolutely, Not a true bill; or Not found: and then the party is discharged without farther answer. But a fresh bill may afterwards be preferred to a subsequent grand jury. If they are satisfied of the truth of the accusation, they then endorse upon it, A true bill; anciently, Billa vera. The indictment is then said to be found, and the party stands indicted. But, to find a bill, there must at least twelve of the jury agree; for so tender is the law of England of the lives of the subjects, that no man can be convicted at the suit of the king of any capital offence, unless by the unanimous voice of twenty-four of his equals and neighbours;' that is, by twelve at least of the grand jury, in the first place, assenting to the accusation; and afterwards by the whole petit jury, of twelve more, finding him guilty upon his trial. But if twelve of the grand jury assent it is a good presentment, though some of the rest disagree. And the indictment, when so found, is publicly delivered into court.

Indictments must have a precise and sufficient certainty. By stat. 1 Hen. V. all indictments must set forth the Christian name, surname, addition of the state and degree, mystery, town, or place, and the county of the offender; and all this to identify his person. The time and place are also to be ascertained, by naming the day and township in which the fact was committed : though a mistake in these points is in general not held to be material, provided the time be laid previous to the finding of the indictment, and the place to be within the jurisdiction of the court; unless where the place is laid, not merely as a venue, but as part of the description of the fact. But sometimes the time may be very material, where there is any limitation in point of time assigned for the prosecution of offen-ders; as by the stat. 7 W. III., which enacts

that no prosecution shall be had for any of the treasons or misprisions therein mentioned (except an assassination designed or attempted on the person of the king), unless the bill of indictment be found within three years after the offence committed: and, in case of murder, the time of the death must be laid within a year and a day after the mortal stroke was given. The offence itself must also be set forth with clearness and certainty; and in some crimes particular words of art must be used, which are so appropriated by the law, to express the precise idea which it entertains of the offence, that no other words, however synonymous they may seem, are capable of doing it. Thus, in treason, the facts must be laid to be done 'treasonably, and against his allegiance; anciently, proditoriè et contra ligeantiæ suæ debitum;' else the indictment is void. In indictments for murder it is necessary to say that the party indicted ' murdered,' not ' killed' or 'slew,' the other; which, till the late statute, was expressed in Latin by the word murdravit. In all indictments for felonies the adverb ' feloniously,' felonice, must be used; and for burglaries, also, burglariter, or, in English, 'burglariously :' and all these to ascertain the intent. In rapes the word rapuit, or 'ravished,' is necessary, and must not be expressed by any periphrasis, in order to render the crime certain. So in larcenies, also, the words felonice cepit et asportavit, ' feloniously took or carried away,' are necessary to every indictment: for these only can express the very offence. Also, in indictments for murder, the length and depth of the wound should in general be expressed, in order that it may appear to the court to have been of a mortal nature : but, if it goes through the body, then its dimensions are immaterial; for that is apparently sufficient to have been the cause of the death. Also, where a limb, or the like, is absolutely cut off, such description is needless. Lastly, in indictments, the value of the thing which is the subject or instrument of the offence must sometimes be expressed. In indictments for larcenies this is necessary, that it may appear whether it be grand or petit larceny; and whether entitled or not to the henefit of clergy. In homicides of all sorts it is necessary; as the weapon with which it is committed is forfcited to the king as a deodand

INDIES, WEST, a denomination under which is comprehended a large chain of islands extended in a curve from the Florida shore on the northern peninsula of America to the gulf of Venezuela on the southern. Columbus gave this name to them under the notion that they formed part of the Indian continent, which it was his object in his first voyage to find. The following are the principal of these islands :- Curazao, Trinidad, Tobago, Grenada, St. Vincent, Barbadoes, Martinico, Dominica, Mary Galante, Guadaloupe, Antigua, Barbuda, St. Christopher, St. Eustatius, St. Bartholomew, St. Martin, Anguilla, St. Thomas, Porto-Rico, St. Domingo, Jamaica, Cuba, and the Bahamas; a full description of which will be found under their respective denominations.

found under DOCE, n. s. Fr. inaugerence, INDDF FERENCE, n. s. Lat. in and differo. INDIF'FERENT, adj. INDIF'LERENTLY, adv.

Neutrality; cqui-poise from motives

on either side; impartiality; negligence; unconcern: indifferent, not to have such difference as that the one is preferable to the other; disinterested. Passable; having mediocrity; of a middling state; neither good nor worst: this is an improper and colloquial use, especially when applied to persons. Indifferently, without dis-tinction; not well; tolerably; passably; middlingly, &c.

Metcalfe was partial to none, but indifferent to all; a master for the whole, and a father to every one.

Ascham.

Id.

The nature of things indifferent is neither to be commanded nor forbidden, but left free and arbitrary. Hooker.

The choice is left to our discretion, except a principal bond of some higher duty remove the indifference that such things have in themselves : their indifference is removed, if we take away our own liberty. Id.

Doth his majesty

Incline to it or no? -He scems indifferent.

Shakspeare. I am a most poor woman and a stranger, Born out of your dominions; having here

No judge indifferent, and no more assurance Of equal friendship and proceeding.

Set honour in one eye, and death i' the' other, And I will look on death indifferently. Id.

I am myself indifferent honest ; but yet I could accuse me of such things, that it were better that my mother had not born me. Id. Hamlet.

In choice of committees it is better to chuse indifferent persons, than to make an indifferency by putting in those that are strong on both sides.

Customs, which of themselves are indifferent in other kingdoms, became exceeding evil in this realm, by reason of the inconveniences which followed there-Davies. upon.

There can hardly be an indifferent trial had between the king and the subject, or between party and party, by reason of this general kindred and consanguinity. Id.

A moyle will draw indifferently well, and carry great burthens. Carew.

Some things admit of mediocrity :

A counsellor, or pleader at the bar,

May want Messala's powerful eloquence,

Or be less read than deep Casselius;

Yet this indifferent lawyer is esteemed.

Roscommon.

One thing was all to you, and your fondness made Temple. you indifferent to every thing else.

They live too long, who happiness out-live !

For life and death and things indifferent, Each to be chose as either brings content.

Dryden.

A perfect indifferency in the mind, not determinable by its last judgment, would be as great an imperfection as the want of indifferency to act, or not to act, till determined by the will. Locke.

Being indifferent, we should receive and embrace opinions according as evidence gives the attestation Id. of truth.

This I mention only as my conjecture, it being indifferent to the matter which way the learned shall determine.

Though at first it was free, and in my choice, whether or no I should publish these discourses; yet, the publication being once resolved, the dedication was South. not so indifferent.

Bacon's Essays.

Disturb man's rest ; Cato knows neither of them :

Indifferent in his choice to sleep or die. Addison. It was a law of Solon, that any person who in the civil commotions of the republick remained neuter, or an indifferent spectator of the contending parties, should be condemned to perpetual banishment.

Id. Freeholder.

735

Were pardon extended indifferently to all, which of them would think himself under any particular Addison. obligation?

There is not one of these subjects that would not sell a very indifferent paper, could I think of gratifying the publick by such mean and base methods. Id.

I hope it may indifferently entertain your lordship at an unbending hour. Rowe.

This has obliged me to publish an indifferent collection of poems, for fear of being thought the author Prior. of a worse.

Whiteness is a mean between all colours, having itself indifferently to them all, so as with equal facility to be tinged with any of them. Newton.

But how indifferent soever man may be to eternal happiness, yet surely to eternal misery none can be indifferent. Rogers.

A place which we must pass through, not only with the indifference of strangers, but with the vigilance of those who travel through the country of an Id. enemy.

The people of England should be frighted with the French king and the pretender once a year; the want of observing this necessary precept, has produced Arbuthnot. great indifference in the vulgar.

Indifference, clad in wisdom's guise,

All fortitude of mind supplies;

For how can stony bowels melt,

In those who never pity felt?

He will let you know he has got a clap with as much indifferency as he would a piece of public news. Id.

Messenger of grief

Perhaps to thousands, and of joy to some, To him indifferent whether grief or joy

Cowper.

Swift.

ile speaks not-scarce regards me-not a word-Nor looks ; yet he was soft of voice and aspect. Indiff. rent not austere. Byron. Sardanapalus.

Besides these, a friend of mine, a great elymologist, has assured me, that hombast and bombasin originally sprung from the same root ; and fustian, every body knows, is a term applied indifferently to passages in poetry, or materials for a pair of breeches.

Canning.

IN'DIGENCE, n. s. IN'DIGENCY, n. s. Indigentia. Penury; poverty; want: indi-poverty; in gent, poor; needy; necessitous; void; empty; in want, used with the particle of.

Herken what is the sentence of the wise,

Bet is to dien than have indigence.

Thy selve neighbour wol thee despise ;

If thou he poure, farewel, thy reverence.

Chaucer. The Man of Lawes Tale. Such bodies have the tangible parts indigent of moisture. Bacon.

For ev'n that indigence, that brings me low, Makes me myself, and him above to know. Dryden. Rejoice, O Albion, severed from the world,

By nature's wise indulgence ; indigent

Of nothing from without. Phillips. Where there is happiness there must not be indigency, or want of any due comforts of life.

Burne's Theory.

Charity consists in relieving the indigent. Addison.

Athens worshipped God with temples and sacrifices, as if he needed habitation and sustenance, and that the heathens had such an apprehension about the indigency of their gods, appears from Aristophanes and Bentley. Lucian.

How low, how little are the proud ;

Gray. Ode to Spring. How indigent the great.

INDIG'ENOUS, adj. Fr. indigene ; Lat. indigena. Native to a country; originally produced or born in a region.

Negroes were all transported from Africa, and are not indigenous or proper natives of America, Browne.

It is wonderful to observe one creature, that is mankind, indigenous to so many climates. Arbuthnot.

INDIGEST', adj. 7 Fr. indigeste ; Lat. indi-gestus. Not separated INDIGES'TED, adj. INDIGES'TIBLE, adv. finto orders; not ar-INDIGES'TION, n. s. franged; not formed, shaped, or methodised; not concocted in the stomach; not brought to suppuration : indigestible, not capable of being digested; not convertible to nutriment: indigestion, a morbid debility in the stomach; want of concoctive power; the state of meats unconcocted.

By irksome deformities, through endless and senseless effusions of undigested prayers, they oftentimes disgrace the worthiest part of Christian duty towards Hooker. God.

Hence, heap of wrath, foul indigested lump; As crooked in thy manners as thy shape.

Shakspeare.

Set a form upon that indigest project, So shapeless and so rude.

Id. King John. This mass, or indigested matter, or chaos, created in the beginning, was without the proper form, which it afterwards acquired. Ralcigh.

The fumes of indigestion may indispose men to thought, as well as to diseases of danger and pain.

Temple. Before the seas, and this terrestrial ball,

One was the face of nature, if a face ;

Rather a rude and indigested mass.

Dryden. Dreams are bred

From rising fumes of indigested food. Id. Eggs are the most nourishing and exalted of all animal food, and most indigestible : nobody can digest the same quantity of them as of other food.

Arbuthnot on Dict.

His wound was indigested and inflamed.

Wiseman.

The political creed of the high-principled men sets the protestant succession upon a firmer foundation than all the indigested schemes of those who profess revolution principles. Swift.

And indigestion's grand multiplication Requires arithmetic beyond my forces.

Byron. Don Juan.

INDIGITATE, v. a. Fat. indigito. To INDIGITATION, n. s. Spoint out; to show by

the fingers: the act of pointing out or directing. Antiquity expressed numbers by the fingers : the depressing this finger, which in the left hand implied but six, in the right hand indigitated six hundred.

Browne's Vulgar Errours.

As though there were a seminality of urine, we foolishly conceive we behold therein the anatomy of every particle, and can thereby indigitate their affections. Id.

We are not to indigitate the parts transmittent.

Harvey.

Which things I conceive no obscure indigitation of More against Atheism. providence.

INDIGN', adj. INDIG NANT, adj.

Fr. indigne; Lat. indignus, indignor. ln-INDIGNATION, n. s. dign, unworthy; unde-INDIG'NITY, n s. serving; disgraceful: in-

INDIG'NITY, n S. dignant, angry; raging with passion; a union of wrath and disdain: indignation, anger with contempt; the wrath of a superior being; the effect of anger: indignity, contumelious treatment ; violation of right, attended with insult.

There was great indignation against Israel.

2 Kings.

Milton.

Wondering upon this thing, quaking for drede, She saide ' Lord !' indigne and unworthy

Am I to thilke honour, that ye me bedie ;

But as ye wol yourself right so wol I,

And here I swere that never willingly

In work ne thought I nill you disobeie,

For to be ded, through me, were both to deie. Chaucer. The Clerkes Tale.

And Malèhouche gan, first, the talè tel,

To sclaunder Trouth of indignacion.

Id. Complaint of the Blacke Knight.

But he so full of indignation was,

That to his prayer nought he would incline. Spenser. Faerie Quecnc.

Bishops and prelates could not but have bleeding hearts to behold a person of so great place and worth constrained to endure so foul indignities. Hooker.

If heavens have any grievous plague in store, Let them hurl down their indignation

On thee thou troubler of the world. Shakspeare. And all indign and base adversities

Make head against my estimation. Id.

Where there is a kingdom that is altogether unable or indign to govern, is it just for another nation, that is civil or policed, to subdue them ? Bacon.

No emotion of passion transported me, by the indignity of his carriage, to any thing unbeseeming myself. King Charles.

From those officers, warm with indignation at the insolences of that vile rabble, came words of great contempt. Clarendon.

Man he made, and for him built Magnificent this world, and earth his seat,

Him lord pronounced ; and, O indignity !

Subjected to his service angel-wings,

And flaming ministers to watch and tend

Their earthly charge.

He scourged with many a stroke the indignant waves. Id.

But keep this swelling indignation down, And let your cooler reason now prevail. Rowe.

What rage that hour did Albion's soul possess, Let chiefs imagine, and let lovers guess !

He strides indignant, and with haughty cries

To single fight the fairy prince defies. Tickel. The lustful monster fied, pursued by the valorous and indignant Martin. Arbuthnot to Pope.

He does not see how that mighty passion for the church can well consist with those indignities and that contempt men bestow on the clergy. Swift.

The more the bold, the bustling, and the bad, Press to usurp the reins of power, the more Behoves it virtue with indignant zeal

To check their combination. Thomson. -; even the oak Thrives by the rude concussion of the storm : He seems indeed indignant, and to feel The impression of the blast with proud disdain,

Cowper, Nor be thy generous indignation checked,

Nor checked the tender tear to misery given ;

From guilt's contagious power shall that protect, This soften and refine the soul for heaven.

Beattie.

By leaving the quantity of heating indeterminate, he gives every reader the liberty to administer it, in exact proportion, to the sum of indignation which he may have conceived against his hero.

Canning. Microcosm.

IN'DIGO, n. s. Lat. Indicum. A plant, by the Americans called anil. In the middle of the flower is the style, which afterwards becomes a jointed pod, containing one cylindrical seed in one partition, from which indigo is made, which is used in dyeing for a blue color.— Miller.

INDIGO is a dye prepared from the leaves and small branches of the indigofera tinctoria. The plants when gathered are thrown into the steeping-vat, which is a large tub filled with water, in which they undergo a fermentation, which in twenty-four hours at furthest is completed. A cock is then turned, to let the water run into the mortar or pounding tub. The steeping vat is then cleaned out, that fresh plants may be thrown in : and thus the work is continued without interruption. The water which has run into the pounding tub is found impregnated with a very subtile earth, which constitutes the dregs or blue substance that is the object of this process, and which must be separated from the useless salt of the plant, because this makes the dregs swim on the surface. To effect this, the water is forcibly agitated with wooden buckets, full of holes, and fixed to a long handle. This part of the process requires great caution. If the agitation be discontinued too soon, the part that is used in dyeing, not being sufficiently separated from the salt, would be lost. If, on the other hand, the dye were to be agitated too long after the complete separation, the parts would be brought together again, and form a new combination; and the salt, reacting on the dregs, would excite a second fermentation, that would alter the dye, spoil its color, and make what is called burnt indigo. These accidents are prevented by a close attention to the least alterations that the dye undergoes, and by the precaution which the workmen take to draw out a little of it from time to time in a clean vessel. When they perceive that the colored particles collect by separating from the rest of the liquor, they leave off shaking the buckets, to allow time to the blue dregs to precipitate to the bottom of the tub, where they are left to settle till the water is quite clear. Holes made in the tub, at different heights, are then opened one after another, and thus useless water is let out. The blue dregs remaining at the bottom having acquired the consistence of a thick muddy liquid, cocks are then opened, which draw it off into the settler. After it is still more cleared of much superfluous water, in its third and last tub, it is drained into sacks; whence, when water no longer filters through the cloth, this matter, now become of a thicker consistence, is put into chests, where it entirely loses its moisture. In three months the indigo is fit for sale. It is used in washing, to give a bluish color to linen : painters also employ it in their water colors; and dyers cannot make fine blue without it. The ancients

procured it from the East Indies; in modern times it has been transplanted into America and the West Indies. There are two kinds of indigo prepared in the East Indies, particularly on the coast of Coromandel, at Pondicherry, &c. Of these the worst kind is used for giving the body of color to the dyed substance, the other being employed only to give it a gloss afterwards.

Bergmann mixed one part of well pulverised indigo with eight parts of colorless sulphuric acid, of the specific gravity of 1.900, in a glass vessel slightly closed. The acid very quickly acted upon the indigo, and excited much heat. After a digestion of twenty-four hours the solution was effected; but the mixture was opaque and black. If the sulphuric acid be first diluted in water, it attacks only the earthy principle which is mixed with the indigo, and some of the mucilaginous parts. The fixed alkalies, saturated with carbonic acid, separate a very fine blue powder from the solution of indigo, which is deposited very slowly. The concentrated nitric acid attacks indigo with so much activity as to set it on fire. The muriatic acid by digestion, and even boiling upon indigo, takes up only the earthy matter, the iron, and a little of the extractive matter, which gives it a brown color, but in no respect attacks the blue color. Pure or caustic fixed alkali dissolves some matters foreign to the coloring matter of the indigo, but acts very little on the coloring particles. Pure volatile alkali has nearly the same effect.

Bergmann concludes, from his analysis, that 100 parts of good indigo contain of mucilaginous matter 12, resinous matter 6, earthy matter 22, oxide of iron 13.

There remain forty-seven parts, which are the coloring matter, nearly in a state of purity, and afford by distillation carbonic acid 2, alkaline liquor 8, empyreumatic oil 9, coal 23.

M. Chevreul has given the following results of his very elaborate analysis of Guatimala indigo:

(Ammonia . 12
By water	Disoxygenised indigo
Dy match	Green matter
(Bitter matter
(Green matter
By alcohol	Red matter
	Indigo
By muriatic acid	Red matter 6 Carbonate of lime . 2
by manatic acti	Carbonate of lime . 2
	Oxide of iron and alumina 2
	Silica 3
	Pure indigo 45
	100

When commercial indigo is exposed to a heat of about 400° Fahrenheit, it evolves a beautiful crimson smoke, which may be condensed in crystalline needles, which are supposed to be pure indigo. The blue vat of the dyer contains indigo deoxidised by protoxide of iron, and rendered soluble in its yellow-green state by lime water. If a portion of this solution be exposed to the air, in a shallow vessel, the indigo will speedily absorb oxygen, and precipitate in its usual state of an insoluble blue powder. This, being dried and digested in a mixture of alcohol

VOL. XI.

and muriatic acid, becomes also pure indigo by the abstraction of all the resin and lime. In this state it is a soft powder, of an intensely deep blue, verging sometimes on purple. It is unchangeable by the air. If into the sulphate of indigo, above described, a few pieces of iron or zinc are put, the nascent hydrogen seizes its oxygen, and discolors it. Sulphuric acid, rendered smoking by a little sulphurous acid, is a a better solvent of indigo than pure oil of vitriol. By boiling a little sulphur in this, its solvent power is improved.

In order to find the value of any sample of indigo, Mr. Dalton directs us to take one grain, carefully weighed, from a mass finely pulverised. Put this into a wine glass, and drop two or three grains of concentrated sulphuric acid upon it. Having triturated them well, pour in water, and transfer the colored liquid into a tall cylindrical jar, about one inch inside diameter. When the mixture is diluted with water, so as to show the flame of a candle through it, mix the liquid solution of oxymuriate of lime with it, agitating it slowly, and never putting any more in till the smell of the preceding portion has vanished. The liquid soon becomes transparent, and of a beautiful greenish-yellow appearance. After the dross has subsided, the clear liquid may be passed off, and a little more water put into the sediment, with a few drops of oxymuriate of lime, and a drop of dilute sulphuric acid; if more yellow liquid is produced, it arises from particles of indigo which have escaped the action of the oxymuriate before, and must be added to the rest. The value of the indigo is in proportion to the quantity of real oxymuriate of lime necessary to destroy its color. The value may also be well estimated by the quantity and intensity of the amber-colored liquid which the indigo produces, independently of any valuation of the oxymuriate of lime.

Another method of trying the goodness of this substance is by fire; for the pure indigo will be entirely consumed, while the extraneous particles will remain. The pounded indigo is much more subject to adulteration than such as is sold in cakes or tablets; as the ashes or dirt with which it is mixed are very apt to separate from the pure coloring substance when standing in a liquid state, as it must always do before the moisture is evaporated : whence, on breaking indigo so adulterated, the extraneous matter will be perceived in strata of a different color.

Indigo is commonly divided, from the color which it exhibits upon breaking, into three kinds, copper-colored, purple, and blue. It is said that the dyers use chiefly the first, and the calico-printers the last. On what particular circumstances these different appearances depend, we know not; nor is it certainly known whether the real quality of the indigo has any connexion with them. The deepest and liveliest blue indigo, rubbed with the nail, appears like polished copper; and solutions of all the sorts, inade in alkaline lixivia, assume alike a coppercolored skin upon the surface.

INDIGOFERA, the indigo plant, a genus of the decandria order, and diadelphia class of plants, natural order thirty-second, papilionacea:

CAL patent: con carina, furnished with a tubulated patulous spur on each side; the legume is linear. There are several species, the most remarkable is the

I. tinctoria, a native of the warm parts of Asia, Africa, and America, and from which indigo is made. The root is three or four lines thick, and more than a foot long, of a faint smell something like parsley. From this root issues a single stem, nearly of the same thickness, about two feet high, straight, hard, almost woody, covered with a bark slightly split, of a gray ash color towards the bottom, green in the middle, reddish at the extremity, and without appearance of pith in the inside. The leaves, ranged in pairs around the stalk, are of an oval form, smooth, soft to the touch, furrowed above, of a deep green on the under side, and connected by a very short peduncle. From about one-third of the stem to the extremity there are ears that are loaded with very small flowers, from twelve to fifteen, but destitute of smell. The pistil, which is in the midst of each flower, changes into a pod, in which the seeds are enclosed. This plant, says Mr. Loudon, is one of the most profitable articles of culture in Hindostan, because an immense extent of land being required to produce but a moderate bulk of the dye, few undertake to raise it but large capitalists, and because the whole manufacture may be carried on without even the aid of a house. The first step in the culture of the plant is to render the ground, which should be friable and rich, dry, and perfectly free from weeds. The seeds are then sown in shallow drills about a foot apart. The rainy season must be chosen for sowing, otherwise, if the seed is deposited in dry soil, it heats, cor-rupts, and is lost. The crop, being kept free from weeds, is fit for cutting in two or three months, and this may be repeated in rainy sea-sons every six weeks. The plants must not be. allowed to come into flower, as the leaves in that case become dry and hard, and the indigo produced is of less value; nor must they be cut in dry weather, as they would not spring again. A crop generally lasts two years. The indigo is, however, one of the most precarious of oriental crops; being liable to be destroyed by hail, which does comparatively little injury to the sugar-cane and other plants. As this plant soon exhausts the soil, because it does not absorb a sufficient quantity of air and dew to moisten the earth, the planter should have a vast space which may remain covered with trees, till it becomes necessary to fell them, to make room for the indigo.

INDIRECT, adj. INDIRECTION, n.s. INDIRECTION, n.s. INDIRECTIN, adv. INDIRECT'NESS, n.s. Otherwise than obliquely consequentially to a purpose of a purpose.

or consequentially to a purpose; as, an indirect accusation; wrong; improper; not fair or honest. Indirection, oblique means; dishonest practice. Indirectly, obliquely; unfairly. Indirectness, fraudulent art.

Those things which they do know they may, upon sundry *indirect* considerations, let pass; and although themselves do not err, yet may they deceive others. *Hooker*. IND

And thus do we, of wisdom and of reach, With windlaces, and with essays of byas, By *indirections* find directions out.

Shakspeare. Hamlet.

The tender prince

Would fain have come with me to meet your grace; But hy his mother was per force with-held. --Fy, what an *indirect* and prevish course

Is this of her's? Id. Richard III.

He bids you then resign

Your crown and kingdom, indirectly held

From him the true challenger. Id. Henry V. I had rather coin my heart than wring

From the hard hands of peasants their vile trash,

By any indirection. Id. Julius Cæsar. Think you, that any means under the sun

Can assecure so indirect a course ? Daniel.

He that takes any thing from his neighbour, which was justly forfeited, to satisfy his own revenge or avarice, is tied to repentance, but not to restitution; because I took the forfeiture *indirectly*, I am answerable to God for my unhandsome, unjust, or uncharitable circumstances. Taylor.

O pity and shame ! that they who to live well Entered so fair, should turn aside, to tread Paths *indirect*. Milton.

Indirect dealing will be discovered one time or other, and then he loses his reputation. Tillotson.

Still she suppresses the name, which continues his doubts and hopes; and at last she *indirectly* mentions it. Broome.

INDISCERN'IBLE, adj. Lat. in, de, cerno. INDISCERN'IBLY, adv. SNot perceptible or discoverable: in a manner not to be perceived.

Speculation, which, to my dark soul,

Deprived of reason, is as indiscernible

As colours to my body, wanting sight. Denham.

INDISCERPTIBLE, *adj.* Lat. and *indis*-INDISCERPTIBLL'ITY, *n.s. (cerpo.* Not to be separated; incapable of being broken or destroyed.

INDISCOV'ERY, n. s. In and discovery. Fr. découvrir. The state of being hidden. An unusual word.

The ground of this assertion was the magnifying esteem of the ancients, arising from the *indiscovery* of its head. Browne.

INDISCREET', adj. INDISCREET'LY, adv. INDISCRET'LY, adv. INDISCRETION, n. s. incautious; inconsiderate; rash: want of due foresight and prudence.

If thou be among the *indiscreet*, observe the time; but be continually among men of understanding.

Ecclesiastes.

Job on justice hath aspersions flung, And spoken *indiscreetly* with his tongue.

Sandys.

Why then

Are mortal men so fond and indiscreet,

So evil gold to seek unto their aid; And having not complain, and having it upbraid? Spenser.

Indiscretion sometimes serves us well, When our deep plots do fail.

Shakspeare. Hamlet.

Let a great personage undertake an action passionately, let him manage it *indiscreetly*, and he shall have enough to flatter him. *Taylor*. Loose papers have been obtained from us by the importunity and divulged by the *indiscretion* of friends, although restrained by promises. Swift.

Past indiscretion is a venial crime,

And if the youth, unmellowed yet by time, Bore on his branch, luxuriant then and rude, Fruits of a blighted size, austere and crude.

Cowper.

739

INDISCRIM'INATE, adj. Latin, indis-INDISCRIM'INATELY, adv. Criminatus. Undistinguishable : not with any mark of distinction.

Liquors, strong of acid salts, destroy the blueness of the infusion of our wood; and liquors *indiscriminately*, that abound with sulphureous salts, restore it. Boyle.

Others use defamatory discourse purely for love of talk; whose speech, like a flowing current, bears away *indiscriminately* whatever lies in its way.

Government of the Tongue.

But I must not be understood to praise the whole indiscriminately. Beattie.

There are in Turkey a body of men, against whom universal contempt is *indiscriminately*, as well as undeservedly, directed; and these are the worshipful company of Grocers. *Canning. Microcosm.*

company of Grocers. INDISPEN'SABLE, adj. Lat. in and dis-INDISPEN'SABLENESS, n.s. penso. Not to be INDISPEN'SABLY, adv. remitted; not to be spared; necessary state of not being to be spared.

Every one must look upon himself as *indispensably* obliged to the practice of duty. Addison.

Rocks, mountains, and caverns, against which these exceptions are made, are of *indispensable* use and necessity, as well to earth as to man. Woodward.

The love of truth is natural to man; and adherence to it his *indispensable* duty. Beattie.

INDISPOSE', v.a. INDISPO'SEDNESS, n. s. INDISPO'SEDNESS, n. s. in and dispositus. To place in an unfavorable position, with reference to something else : to make unfit; to disincline; disorder; disqualify. Indisposedness, a disordered state of mind. Indisposition, disorder of health; sickness; disinclination; dislike.

The indisposition of the church of Rome to reform herself, must be no stay unto us from performing our duty to God. *Hooker.*

The king did complain of a continual infirmity of body, yet rather as an *indisposition* in health than any set sickness. Hayward.

It is not any innate harshness in picty that renders the first essays of it unpleasant; that is owing only to the *indisposedness* of our own hearts.

Decay of Piety.

The king was sufficiently *indisposed towards* the persons or the principles of Calvin's disciples.

Clarendon. The soul is not now hindered in its actings by the stemperature of *indisposed* organs. Glanville.

distemperature of *indisposed* organs. Glunville. Though it weakened, yet it made him rather *indisposed* than sick, and did no ways disable him from studying. Walton.

I have known a great fleet lose great occasions, by an *indisposition* of the admiral, while he was neither well enough to exercise, nor ill enough to leave the command. Temple.

Wisdom is still looking forward, from the first *in*dispositions into the progress of the disease.

L'Estrange.

It has a strange efficacy to indispose the heart to religion. South's Sermons.

His life seems to have been prolonged beyond its natural term, under those *indispositions* which hung upon the latter part of it. Addison's Freeholder.

The mind, by every degree of affected unbelief, contracts more and more of a general *indisposition* towards believing. Atterbury,

Nothing can be reckoned good or bad to us in this life, any farther than it prepares or *indisposes* us for the enjoyments of another. Id.

A mind unnerved, or *indisposed* to bear The weight of subjects worthiest of her care.

Cowper.

INDIS'PUTABLE, adj. INDIS'PUTABLENESS, n. s. INDIS'PUTABLENESS, n. s. INDIS'PUTABLY, adv. tible; evident; certain: a state of actual certainty: without controversy or opposition.

They questioned a duty that had been indisputably granted to so many preceding kings. Howel.

The thing itself is questionable, nor is it *indisputa-bly* certain what death she died. Browne.

There is no maxim in politicks more *indisputable*, than that a nation should have many honours to reserve for those who do national services. Addison.

The apostle asserts a clear *indisputable* conclusion, which could admit of no question. Rogers.

That it is a character drawn faithfully from nature, by the hand of a master, most accurately delineated, and most exquisitely finished, is indeed *indisputable*. *Canning*. Microcosm.

INDISSOL'VABLE, adj.	Lat. in and dis-
	solvo; Fr. indis-
INDIS'SOLUBLE, adj.	soluble. Not sepa-
	rable as to its
INDIS'SOLUBLY, adv.	parts; obligatory;

binding for ever. Indissolubility, resistance to a dissolving power; perpetuity of obligation. Indissolubly, in a manner resisting all separation.

Far more comfort it were for us, to be joined with you in bands of *indissoluble* love and unity, to live as if, our persons being many, our souls were but one.

Hooker.

There is the supreme and *indissoluble* consanguinity between men, of which the heathen poet saith we are all his generation. Bacon's Holy War.

On they move

Indissolubly firm; nor obvious hill, Nor strait'ning vale, nor wood, nor stream divide Their perfect ranks. Milton.

Adam, though consisting of a composition intrinsically dissolvable, might have held, by the Divine Will, a state of immortality and *indissolubleness* of his composition. Hale.

When common gold and lead are mingled, the lead may be severed almost unaltered; yet if, instead of the gold, a tantillum of the red elixir be mingled with the saturn, their union will be so *indissoluble*, that there is no possible way of separating the diffused elixir from the fixed lead. Boyle

The remaining ashes, by a further degree of fire, may be *indissolubly* united into glass. Id.

What hoops hold this mass of matter in so close a pressure together from whence steel has its firmness, and the parts of a diamond their hardness and *indis*solubility? Locke.

They might justly wonder, that men so taught, so obliged to be kind to all, should behave themselves so contrary to such heavenly instructions, such indissolable obligations. South.

Metals, corroded with a little acid, turn into rust, which is an earth tasteless and *indissolvable* in water ; and this earth, imbibed with more acid, becomes a metallick salt. Newton.

They willingly unite, Indissolubly firm : from Dubris south

To northern Orcades.

Phillips. Deposition and degradation are without hope of any remission, and therefore the law stiles them an indissolvable bond ; but a censure, a dissolvable bond.

Ayliffe's Parergon.

Wit, like every other power, has its boundaries. Its success depends on the aptitude of others to receive impressions; and as some bodies, indissoluble by heat, can set the furnace and crucible at defiance, there are minds upon which the rays of fancy may be pointed without effect, and which no fire of sentiment can Johnson's Rambler. agitate or exalt.

INDISTINCT', adj. Fr. indistinct ; Lat. INDISTINCTION, n. s. (in and distinguor. Con-INDISTINCT'LY, adv. fused; not plainly INDISTINCT'NESS, n. s. marked; not exactly discerning; having a character of illegibility:

uncertainty; omission; obscurity; a want of clearness. We throw out our eyes for brave Othello,

Even till we make the main and the aerial blue An indistinct regard. Shakspeare.

That which is now a horse, even with a thought, The rack dislimns, and makes it indistinct As water is in water. Id.

Making trial thereof, both the liquors soaked indistinctly through the bowl. Browne's Vulgar Errours.

The indistinction of many of the same name, or the misapplication of the act of one unto another, hath made some doubt.

She warbled in her throat,

And tuned her voice to many a mery note :

But indistinct, and neither sweet nor clear. Dryden.

An indistinction of all persons, or equality of all orders, is far from being agreeable to the will of God. Sprat.

There is unevenness or indistinctness in the style of these places, concerning the origin and form of the earth. Burnet's Theory.

In its sides it was bounded distinctly, but on its ends confusedly and indistinctly, the light there vanishing by degrees. Newton's Opticks.

Old age makes the cornea and coat of the chrystaline humour grow flatter; so that the light, for want of sufficient refraction, will not converge to the bottom of the eye, but beyond it, and by consequence paint in the bottom of the eye a confused picture; and according to the indistinctness of this picture, the object will appear confused. Newton.

When we speak of the infinite divisibility of matter, we keep a very clear and distinct idea of division and divisibility ; but when we come to parts too small for our senses, our ideas of these little bodies become obscure and indistinct. Watts.

INDISTUR'BANCE, n. s. In and disturb. Calmness: freedom from disturbance.

What is called by the Stoicks apathy, and by the Scepticks indisturbance, seems all but to mean, great tranquillity of mind. Temple.

INDIVID'UAL, adj.	Fr. individu ; Lat.
INDIVIDUAL'ITY, n. s.	in and divido. One
INDIVID'UALLY, adv.	person separate from
INDIVID'UATE, v.a.	all others : undivided;
INDIVIDUA'TION, n.s.	not to be disjoined :
INDIVIDU'ITY, n.s.	individuality, sepa-
INDIVISIBIL'ITY, n. s.	rate existence : indi-
INDIVIS'IBLENESS, n. s.	vidually, numeri-
INDIVIS'IBLE, adj.	cally; incommuni-
INDIVIS'IBLY, adv.	cab.y: individuate,

to distinguish or make single : individuation, that which makes an individual : individuity, the state of being an individual: indivisible, what cannot be broken into parts; so small as that it cannot be smaller; having reached the last degree of divisibility : indivisibly, so as to be incapable of separation or division.

How should that subsist solitarily by itself, which hath no substance, but individually the very same whereby others subsist with it ? Hooker.

Neither is it enough to consult, secundum genera, what the kind and character of the person should be; for the most judgment is shewn in the choice of individuals. Bacon.

I dare not pronounce him omniscious, that being an attribute individually proper to the god-head, and incommunicable to any created substance.

Hakewill.

To give thee being, I lent Out of my side to thee, nearest my heart, Substantial life, to have thee by my side Henceforth an individual solace dear. Milton.

Long eternity shall greet our bliss With an individual kiss.

Under his great vicegerent reign abide

United, as one individual soul,

For ever happy.

Milton.

Id.

Here is but one indivisible point of time observed, but one action performed ; yet the eye cannot comprehend at once the whole object. Dryden.

They present us with images more perfect than the life in any individual. Id. Dufresnoy.

No man is capable of translating poetry, who, besides a genius to that art, is not a master both of his author's language and of his own; nor must we understand the language only of the poet, but his particular turn of thoughts and expression, which are the characters that distinguish and individuate him from all other writers. Dryden.

A pestle and mortar will as soon bring any particle of matter to indivisibility as the acutest thought of a mathematician. Locke.

Must the whole man, amazing thought ! return To the cold marble, or contracted urn !

And never shall those particles agree, That were in life this individual he?

He would tell his instructor, that all men were not singular; that individuality could hardly be predicated of any man; for it was commonly said, that a man is not the same he was, and that madmen are beside themselves. Arbuthnot.

We see each circumstance of art and individual of nature summoned together by the extent and fecundity of his imagination.'

Pope's Preface to the Iliad.

Know all the good that individuals find, Lies in three words, health, peace, and competence.

Pope.

It would be wise in them, as individual and private mortals, to look back a little upon the storms they have raised, as well as those they have escaped.

Swift.

What is the principle of individuation? Or what is it that makes any one thing the same as it was before ?

The object of any particular idea is called an individual: so Peter is an individual man, London is an individual city. Id.

It is long before we are convinced of the small proportion which every individual bears to the collective Johnson. body of mankind.

Prior.

An individual is a sacred mark. Not to be pierced in play, or in the dark.

Cowper.

There are certain forms and etiquettes in life, which, though the neglect of them does not amount to the commission of a crime, or the violation of a duty, are yet so established by example, and sanctioned by custom, as to pass into statutes, equally acknowledged by society, and almost equally binding to individuals, with the laws of the land, or the precepts of morality. Beattie.

Just so at the beginning of the French Revolution : the first work of the reformers was to loosen every established political relation, every legal holding of man to men, to destroy every corporation, to dissolve every subsisting class of society, and to reduce the nation into individuals, in order, afterwards, to congregate them into mobs. Canning.

I say collectively, Sir, because individually we are allowed to have no existence; the waggery of the world, judging nine weavers and nine taylors requisite to the formation of a man. Id. Microcosm.

INDIVISIBILITY OF MATTER. See MATTER. INDOC'IBLE, adj. Fr. indocile ; Lat. in-INDOC'ILE, adj. docilis, in and doceo. Un-Steachable; insuscepti-INDOCIL'ITY, n. s. ble of instruction: refusal of instruction.

These certainly are the fools in the text, indocil, intra-table fools, whose solidity can baffle all arguments, and is proof against demonstration itself.

Bentley's Sermons.

INDOC'TRINATE, v.a. Fr. endoctriner; INDOCTRINA'TION, n. s. Lat. doctrina. To instruct in any science or opinion. Indoctrination, instruction or information.

Under a master that discoursed excellently, and took much delight in indoctrinating his young unexperienced favourite, Buckingham had obtained a quick conception of speaking very gracefully and pertinently. Clarendon.

They that never peeped beyond the common belief, in which their easy understandings were at first indoctrinated, are strongly assured of the truth of their conceptions. Glanville.

Although postulates are very accommodable unto junior indoctrinations, yet are these authorities not to be embraced beyond the minority of our intellectuals. Browne.

IN'DOLENCE, n. s. Fr. indoience, in in and doleo. Freedom from pain; laziness; in-attention; ennui. In-IN'DOLENT, adj. IN'DOLENTLY, adv. dolent, applicable to tumors ; free from pain, and

in a chronic state; careless; listless; inattentive.

Let Epicurus give indolency as an attribute to his gods, and place it in the happiness of the blest; the Divinity which we worship has given us not only a precept against it, but his own example to the contrary. Dryden.

As there must be indolency where there is happiness, so there must not be indigency. Burnet.

While lulled by sound, and undisturbed by wit, Calm and serene you indolently sit. Addison.

And thus in indolence she lies,

A giddy wasp around her flies.

Gay's Fables.

I have ease, if it may not father be called indolence. Hough.

Ill fits a chief

To waste long nights in indolent repose. Pope's Iliad.

The Spanish nation, roused from their ancient indo lence and ignorance, seem now to improve trade.

Bolingbroks.

Ah! in what perils is vain life engaged ! What slight neglects, what trivial faults destroy The hardiest frame ! of indolence, of toil, We die; of want, of superfluity. Armotrong.

Indolence is therefore one of the vices from which those whom it once infects are seldom reformed. Johnson's Rambler.

Flutters thy breath with fear, or pants for fame, Or pines, to indolence and spleen a prey, Or avarice a fiend more fierce than they ? Flee to the shade of Academus grove ; Where cares molest not, discord melts away

In harmony, and the pure passions prove How sweet the words of Truth, breathed from the lips

of Love. Beattie. Awake ! for shame ! or ere thy nobler sense

Sink in the oblivious pool of Indolence. Canning.

INDORE, a city of the province of Malwah, Hindostan, capital of the dominion of the Mahratta chief Mulhar Row Holkar. It is large but ill built, and stands in long. 76° 10' E., lat. 22° 51' N.

To INDOW', v. a. Lat. indotare. To portion; to enrich with gifts, whether of fortune or nature. See ENDOW.

IN'DRAUGHT, n. s. In and draught. An opening in the land into which the sea flows.

Ebbs and floods there could be none, when there were no indraughts, bays, or gulphs to receive a flood. Raleigh.

Inlet; passage inwards.

Navigable rivers are indraughts to obtain wealth.

Bacon.

INDRE, a river of France, which rises N. N.W. of Boussac, in the department of the Creuse; passes by St. Severe, Chatre, Chateauroux, Chatillon (where it is navigable), Loches, Cormery, Array, &c., and joins the Loire at Rigny, between Tours and Saumur. It has a course of about ninety miles.

INDRE, a small department of France, so named from the above river, which runs through it from south-east to north-west, comprehending part of the ci-devant province of Berry. It is bounded on the north by the department of Loire and Cher; east by that of Cher; south by the Creuse and Upper Vienne; and west by the departments of Vienne and Indre et Loire. It is fifty-four miles long from north to south, and forty-five broad from east to west. Chateauroux is the capital. Population 295,000.

INDRE-ET-LOIRE, a central department of France, consists of the whole of the former province of Touraine, and takes its name from the rivers Loire and Indre, which run through it : the former flowing from east to west, and the latter from south-east to north-west. .The principal place is Tours. It is divided into three arroudissements or sub-prefectures; Tours containing 129,808 inhabitants; Chinon 94,194; and Loches 59,370; twenty-four justiciaries of the peace, or cantons; and 302 communes: its total population is about 282,372. It yields a territorial revenue of 14,978,000 francs, and is a part of the fourth military division; it has a royal court at Orleans, and a bishopric at Tours. It is divided into two electoral arrondissements,

742

and sends four members to the chamber of deputies.

This department is bounded on the north-east by that of the Loire et Chere; on the northwest by that of the Sarthi; on the south-east by that of the Indre; on the south-west by that of Vienne; and on the west by that of the Maine et Loire. The soil is so agreeably varied, and the elimate so mild and delightful, that this country has always been justly called the garden of France. It is, however, far from being equally fertile in all parts, nor does it produce sufficient corn for the consumption of its inhabitants; the valleys formed by the great rivers that cross it are indeed very fruitful, as well as the hills which surround it; but, as you recede from these valleys, you find a great quantity of land uncultivated. The part of the country situated between the Loire and the Cher, which is known by the name of Varennes, is covered with a sandy, light, and very fertile soil, which is always productive, owing to its continual culture and the labor and manuring that is bestowed on it; so that it is generally considered as the best land in the department. The hills which skirt the banks of the Loire, containing a great number of habitations dug into the rock. as well as those which border the Cher, abound in vines, from which are made red and white wines of a tolerably good quality. The Loire, the Cher, the Indre, the Creuse, and the Vienne, which water and fertilise the most beautiful plains and smiling meadows; the great number of villages, chateaus, and country houses, built on both sides of the Loire; the beauty of the heavens, the softness of the climate, all unite to make this part of France one of the most delightful residences that can be found. The land is mostly chalky, cultivated partly with horses, and partly with the hoe and the spade; there are about 73,605 hectars of forests of elm, ash, beech, oak, and chestnut-trees, and 36,000 hectars of vineyards, each hectar of cultivated ground producing on an average twenty-one francs eighteen centimes.

This country yields every species of corn, maize, millet, chestnuts; excellent fruits, such as walnuts, almonds, and very choice prunes, which, when dried, are known by the name ot Tours prunes; vegetables, anise, coriander, liquorice, angelica, sengreen, hemp, mulberries, red and white wines of good quality, and a considerable quantity of wood. There are fine meadows, nurseries of fruit trees, great and small game, such as stags, roebucks, wild boars, hares, &c.; fish in abundance, as shad, lampreys, salmon, pike, &c., silk-worms, and bees. There are also some iron mines, quarries of calcareous freestone, mill stones, stones for lithographical purposes, brown freestone, marble fossils, and fullers' earth, potters' clay, pipe-clay, and sand.

In this department are carried on some manufactures of coarse cloths, and silk furniture stuffs. Ribands, laces, home-spun linen, silk, millinery, cotton, and floss silk are also made here; as well as carpets, pipes, brandy, iron, steel, files, red-lead, and shots. There are also some factories for the spinning of woollen and

cotton yarn, refining houses for sugar and beetroot, starch manufactories, brass foundries, potteries, paper-mills, and tan-yards. Powder is also made and refined here. A considerable commerce is carried on in corn, wine, dried fruits, prunes (for which it is much celebrated), dried herbs, melons, honey, wax, 'nut oil, wool, gauze, silk, coarse cloths, hemp, mill-stones, leather, iron, and steel.

The chief rivers that water this department are the Loire, the Vienne, the Cher, and the Creuse, which are navigable; the Bienne, the Indre, the Indroye, and the Claise. Various great roads run through it from Poitiers, Chateauroux, Orleans, Chartres, le Mans, Bourbon, Vendée, and Nantes.

To INDRENCH', v. a. From drench. To soak; to drown.

My hopes lie drowned; in many fathoms deep They lie *indrenched*.

Shakspeare. Troilus and Cressida.

INDU'BIOUS, adj. INDU'BITABLE, adj. INDU'BITABLY, adv. INDU'BITATE, adj. Lat. in, dubito, dubitabilis. That is not, and cannot be doubted; INDU'BITATE, adj. not suspecting; unquestionable; certain; apparent.

If he stood upon his own title of the house of Lancaster, he knew it was condemned by parliament, and tended directly to the disinherison of the line of York, held then the *indubitable* heirs of the crown.

Bacon's Henry VII.

I have been tempted to wonder how, among the jealousies of state and court, Edgar Atheling could subsist, being then the apparent and *indubitate* heir to the Saxon line. Wotton.

If we transport these proportions from audible to visible objects, there will *indubitably* result from cither a graceful and harmenious contentment.

Id. Architecture.

Hence appears the vulgar vanity of reposing an *in*dubious confidence in those antipestilential spirits.

Harvey.

The patriarchs were *indubitably* invested with both these authorities. Sprat.

I appeal to all sober judges, whether our souls may be only a mere echo from clashing atoms; or rather indubitably must proceed from a spiritual substance. Bentley.

When general observations are drawn from so many particulars as to become certain and *indubitable*, these are jewels of knowledge. Watts on the Mind.

To INDUCE', v. a. Fr. induire; Lat. induco. To influence to any thing; to persuade: of persons.

The self-same argument in this kind, which doth but *induce* the vulgar sort to like, may constrain the wiser to yield. *Hooker*.

Desire with thee still longer to converse

Induced me. Bucon. This lady, albeit she was furnished with many excellent endowments, both of nature and education, yet would she never be induced to entertain marriage with any. Hayward.

Let not the covetous design of growing rich induce you to ruin your reputation, but rather satisfy yourself with a moderate fortune; and let your thoughts be wholly taken up with acquiring to yourself a glorious name. Dryden.

To produce by persuasion or influence: of things.

Let the vanity of the times be restrained, which the neighbourhood of other nations have *induced*, and we strive apace to exceed our pattern. Bacon.

As belief is absolutely necessary to all mankind, the evidence for *inducing* it must be of that nature as to accommodate itself to all species of men.

Forbes.

To offer by way of induction, or consequential reasoning.

They play much upon the simile, or illustrative argumentation, to *induce* their enthymemes unto the people, and take up popular conceits. Browne.

To inculcate; to enforce.

This *induces* a general change of opinion, concerning the person or party like to be obeyed by the greatest or strongest part of the people. *Temple*.

To cause extrinsically; to produce; to effect. Sour things *induce* a contraction in the nerves,

placed in the mouth of the stomach, which is a great cause of appetite. Bacon.

Acidity, as it is not the natural state of the animal fluids, but *induced* by aliment, is to be cured by aliment with the contrary qualities. Arbuthnot.

To introduce; to bring into view.

To exprobate their stupidity, he *induceth* the providence of storks: now, if the bird had been unknown, the illustration had been obscure, and the exprobration not so proper. Browne.

The poet may be seen *inducing* his personages in the first Iliad, where he discovers their humours, interests, and designs. Pope.

To bring on; to superinduce; to effect gradually.

Now Night her course began, and over heaven Inducing darkness, graceful truce imposed,

And silence on the odious din of war.

Milton. Paradise Lost. Schism is marked out by the apostle as a kind of petrifying crime, which *induces* that inducation to which the fearful expectation of wrath is consequent. Decay of Piety.

INDUCE'MENT, n. s. From induce. Motive to any thing; that which allures or persuades to any thing.

The former *inducements* do now much more prevail, when the very thing hath ministered further reason. *Hooker*.

Many *inducements*, besides Scripture, may lead me to that, which if Scripture be against, they are of no value, yet otherwise are strongly effectual to persuade. Id

That moved me to't,

Then mark the' inducement.

Shakspeare. Henry VIII. He lives

Higher degree of life : inducement strong For us. Milton.

My inducement hither,

Was not at present here to find my son. Id. Instances occur of oppression, to which there appears no *inducement* from the circumstances of the actors. Rogers.

INDU'CER, n. s. From induce. A persuader; one that influences.

INDUCT', v.a. INDUCT', v.a. INDUC'TION, n. s. ductus. To introduce; to INDUC'TIVE, adj. put in actual possession of a benefice: induction, introduction or entrance; in reasoning, induction is when, from several particular propositions, we infer one general: as, the doctrine of the Socinians cannot be proved The ceremonies in the gathering were first inducted by the Venetians. Sandys' Travels.

These promises are fair, the parties sure, And our *induction* full of prosperous hope.

Shakspeare.

The inquisition by *induction* is wonderful hard; for the things reported are full of fables, and new experiments can hardly be made but with extreme caution. Bacon.

Abatements may take away infallible concludency in these evidences of fact, yet they may be probable and *inductive* of credibility, though not of science.

Hale's Origin of Mankind.

A brutish vice,

Inductive mainly to the sin of Eve. Milton. Mathematical things are only capable of clear demonstration : conclusions in natural philosophy are proved by induction of experiments, things moral by

proved by *induction* of experiments, things moral by moral arguments, and matters of fact by credible testimony. Although the experime from experiments and observed.

Although the arguing from experiments and observations by *induction* be no demonstration of general conclusions, yet it is the best way of arguing which the nature of things admits of, and may be looked upon as so much the stronger by how much the *induction* is more general: and, if no exception occur from phenomena, the conclusion may be general.

Newton's Opticks.

If a person thus instituted, though not *inducted*, takes a second benefice, it shall make the first void. *Ayliffe's Parergon*.

He brought in a new way of arguing from *induc*tion, and that grounded upon observation and experiments. Baher.

Induction INDUCTION, in law. See PARSON. is performed by a mandate from the bishop to the archdeacon, who usually issues out a precept to other clergymen to perform it for him. It is a form required by law, with intest to give all the parishioners due notice and sufficient certainty of their new minister, to whom their tythes are to be paid. The usual form of induction is as follows :- The influctor takes the clerk by the hand, and placing it on the key of the church, which must be then in the door, says, 'By virtue of this instrument, I induct you in the real, actual, and corporeal possession of the rectory or vicarage of A-, with all its fruits, profits, members, and appurtenances.' This done, he opens the door, puts the clerk in possession of the church, and shuts the door upon him; who, after he has tolled a bell (if there be any), to give the parishioners due notice of their new minister, comes out, and desires the inductor to indorse a certificate of his induction on the archdeacon's warrant, and all present signify it under Within two months after this the their hands. clerk must read the thirty-nine articles, in the parish church of his benefice, and in the time of common prayer, and declare his assent and consent: he must also then read the ordinary's certificate, in which is the declaration of his conformity, and of all this he must have two or three good

witnesses, who must sign that they heard him do it, and be ready to attest it, viva voce, if required; and, within six months after induction, he must also take the oaths of allegiance, supremacy, and abjuration, at the quarter-sessions, or in some one of the courts at Westminster Hall. This therefore is the investiture of the temporal part of the benefice, as institution is of the spiritual. And when a clerk is thus presented, instituted, and inducted into a rectory, he is then, and not before, in full and complete possession; and is called in law persona impersonata, or parson imparsonee.

INDUE', v. a. Lat. induo. To invest; to clothe. It seems sometimes to be, even by good writers, confounded with endow or indow, to furnish or enrich with any quality or excellence.

The angel, by whom God indued the waters of Bethesda with supernatural virtue was not seen; yet the angel's presence was known by the waters.

Hooker.

Milton.

His powers, with dreadful strength indued.

Chapman. One first matter all.

Indued with various forms. INDULGE', v. a. & v. n. INDUL'GENCE, n. s. INDUL'GENCY, n. s.

INDUL'GENT, adj.

Latin indulgeo. To encourage by compliance; to fondle; to favor;

) to gratify with con-INDUL'GENTLY, adv. cession; to foster. If the matter of indulgence be a single thing it has with before it; if it be a habit it has in: as, he indulged himself with a draught of wine; and, he indulged himself in shameful drunkenness. To grant, not of right but favor; to be favorable: indulgence, fond ness; forbearance: tenderness, favor granted; grant of the charch of Rome to remit certain temporal penalties; indulgent; kind; gentle; mild; gratifying: indulgently, without severity; without censure or self-reproach.

He is wel worthy to have pardon and forgevenessse of his sinne, that excuseth not his sinne, but knowlecheth and repenteth him, axing indulgence. Chaucer. The Tale of Melibeus.

Thou, that givest whores indulgencies to sin, I'll canvass thee, Shakspeare. Henry VI.

They err, that through indulgence to others, or fondness to any sin in themselves, substitute for repen-Hammond on Fundamentals. tance any thing less.

He that not only commits some act of sin, but lives indulgently in it, is never to be counted a regenerate man. Hammond.

Ancient privileges, indulged by former kings to their people, must not without high reason be revoked by their successors. Taylor.

In purgatory, indulgences, and supererogation. the asserters seem to be unanimous in nothing but profit. Decuy of Piety.

Restraint she will not brook,

And left to herself, if evil thence ensue, She first his weak indulgence will accuse.

Milton.

Indulgences, dispenses, pardons, bulls, The sport of winds. Id.

Hereafter such in thy behalf shall be The indulgent censure of posterity. Waller.

The lazy glutton safe at home will keep ; Indulge his sloth, and fatten with his sleep.

Dryden.

The glories of our isle, Which yet like golden ore, unripe in beds, Expect the warm indulgency of heaven. Id. The virgin entering bright, indulged the day To the brown cave, and brushed the dreams away.

But since among mankind so few there are, Who will conform to philosophick fare, This much I will indulge thee for thy ease, And mingle something of our times to please.

A mother was wont to indulge her daughters with dogs, squirrels, or birds; but then they must keep them well. Locke.

He must, by indulging to one sort of reprovable discourse himself, defeat his endeavours against the Government of the Tongue. rest.

Talk not of comfort, 'tis for lighter ills ;

I will indulge my sorrows, and give way

To all the pangs and fury of despair.

Addison's Cato.

God has done all for us that the most indulgent Creator could do for the work of his hands.

Rogers.

Id.

If all these gracious indulgencies are without any effect on us, we must perish in our own folly. Id.

Leo X. is deservedly infamous for his base prostitution of indulgencies. Atterbury.

To live like those that have their hope in another life, implies that we indulge ourselves in the gratifications of this life very sparingly. Id.

In known images of life, I guess

The labour greater, as the indulgence less.

Pope.

My friend, indulge one labour more," Id. Odyssey. And seek Atrides. Yet, yet a moment, one dim ray of light

Indulge, dread chaos and eternal night ! Pope.

Truth, goodness, harmony, and love,

The richest bounty of indulgent Heaven.

Thomson.

Beyond the sense Of light reflection, at the genial board

Indulge not often. Armstrona.

The desire of ease acts equally at all hours, and the longer it is indulged is the more increased.

Johnson's Rambler.

That she is rigid in denouncing death

On petty robbers, and indulges life

And liberty, and ofttimes honour too,

To peculators of the public gold. Courper.

To indulge a pious emotion, to keep it in our minds, to meditate on its object, and with reverence and in due season to give i' vocal expression, cannot fail to Beattie. strengthen it.

They who have nothing more to fear may well · Indulge a smile at that which once appalled, As children at discovered bugbcars.

Byron.

What gamester, who reduced himself from opulence to beggary, by the intemperate indulgence of a mad infatuation, does not after sitting down and venting his execrations for half an hour against his ill fortune and his folly, get up again greatly relieved by so happy an expedient. Canning. Microcosm.

INDULGENCE, in the Romish church, the remission of the punishment due to sins, granted by the church, and supposed to save the sinner from purgatory. According to the Romish doctrine, all the good works of the saints, over and above those which were necessary towards their own justification, are deposited, together with the infinite merits of Jesus Christ, in one inexhaustible treasury. The keys of this were com-

mitted to St. Peter, and to his successors the popes, who may open it at pleasure, and by transferring a portion of this superabundant merit to any particular person, for a sum of money, may convey to him either the pardon of his own sins, or a release for any one in whom he is interested, from the pains of purgatory. Indulgences were first invented in the eleventh century, by Urban II., as a recompense for those who went in person upon the glorious enterprise of conquering the Holy Land. They were afterwards granted to those who hired a soldier for that purpose; and, in process of time, were bestowed on such as gave money for accomplishing any pious work enjoined by the pope. This power of granting indulgences has been greatly abused. Pope Leo X., in order to carry on the magnificent structure of St. Peter's at Rome, published indulgences, and plenary remission, to all who should contribute money towards it. Finding the project take, he granted to Albert, elector of Mentz, and archbishop of Magdeburg, the benefit of the indulgences of Saxony and the neighbouring parts, and farmed out those of other countries to the highest bidders; who, to make the best of their bargain, procured the ablest preachers to cry up the value of the ware. The form of these indulgences was as follows : ' May our Lord Jesus Christ have mercy upon thee, and absolve thee by the merits of his most holy passion. And I, by his authority, that of his blessed apostles Peter and Paul, and of the most holy pope, granted and committed to me in these parts, do absolve thee, first from all ecclesiastical censures, in whatever manner they have been incurred; then from all thy sins, transgressions, and excesses, how enormous soever they may be, even from such as are reserved for the cognizance of the holy see, and as far as the keys of the holy church extend, the crime of heresy excepted. I remit to you all punishment which you deserve in purgatory on their account; and I restore you to the holy sacraments of the church, to the unity of the faithful, and to that innocence and purity which you possessed at baptism; so that when you die the gates of punishment shall be shut, and the gates of the paradise of delight shall be opened: and, if you shall not die at present, this grace shall remain in full force when you are at the point of death. In the name of the Father, and of the Son, and of the Holy Ghost.' The terms in which the retailers of indulgences described their benefits, and the necessity of purchasing them, are so cxtravagant, that they appear almost incredible.

' If any man,' said they, ' purchases letters of indulgence, his soul may rest secure with respect to its salvation. The souls confined in purgatory, for whose redemption indulgences are purchased, as soon as the money tinkles in the chest, instantly escape from that place of torment, and ascend into heaven. That the efficacy of indulgences was so great, that the most heinous sins, even if one should violate (which was impossible) the mother of God, would be rcmitted and expiated by them, and the person be freed both from punishment and guilt. That this was the unspeakable gift of God, in order to reconcile men to himself. Lo ! the heavens

are open; if you enter not now, when will you enter? For twelve pence you may redeem the soul of your father out of purgatory; and are you so ungrateful, that you will not rescue your parent from torment ? If you had but one coat, you ought to strip yourself instantly and sell it, in order to purchase such benefits, &c.' This monstrous abuse of indulgences contributed greatly to the reformation of religion in Germany, where Martin Luther first began to declaim against the preachers of them, and afterwards against indulgences themselves. Since that period, the popes have been more sparing in the exercise of this power : however, they still carry on a great trade in them. ' Happy times for sinners,' says a modern writer, 'their crimes were rated, and the remission of them set up by auction. The apostolic chamber taxed sins at a pretty reasonable rate; it cost but ninety livres and a few ducats for crimes which people on this side the Alps punished with death.' The prices are specified in a book of rates called the tax-book of the holy apostolic chancery, first printed at Rome in the year 1514, and ascribed by some to pope Innocent VIII. From a correct edition of this book, printed by L. Banck, professor at Norkopin, in Gothland, in 1651, it appears that the price of absolution for fornication, attended with the most heionus circumstances, was six grossi or groats; for a layman's murdering a layman five groats; for laying violent hands on a priest, without shedding blood, nine groats; for committing incest five groats; for a priest's keeping a concubine seven groats; for forging the pope's hand-writing seventeen or eighteen groats.

The following account of the existing mode of procuring indulgences in Spain, by the Rev. Joseph Blanco White, late a Catholic priest in that country, will give to our readers a sufficient idea of their nature and effect :-- ' The Spanish government,' says this respectable writer, ' has two or three paltry fortresses on the coast of Africa, which are employed as places of punishment for criminals. The existence of a few soldiers in these garrisons is construed into a perpetual war against the infidels, with whom, in the mean time, the king of Spain is mostly at peace, from inability to oppose to them an effectual resistance. The see of Rome, which wants but a slight pretext to spiritualise whatever may open a market for its wares, calls this state of things, between the Spaniards and the Africans, a perpetual war against the infidels; which being according to the principles of that see, a meritorious Christian act, deserves a pastoral encouragement. For this purpose every year are printed summaries of a papal bull, which the Spaniards purchase at different prices, according to their rank and wealth, in order to enjoy the indulgences and privileges granted by the pope in exchange for their alms. The benefits to be derived from the possession of one of these bulls are several plenary indulgences, and leave to eat, during Lent, milk, eggs, and butter, which are otherwise forbidden, under pain of mortal sin, at that season. The sale of these privileges having been found most valuable and extensive, a second, third, and even a fourth

buli, of a similar kind, were devised. The flesh bull, as it is called in Spain, allows the purchasers to eat meat during Lent every Sunday, Monday, Tuesday, and Thursday, except in passion week. The third bull is called the com-pounding bull. By possessing one of these documents, and giving a certain sum, at the discretion of any priest authorised to hear confessions, to the fund of the holy crusades; any property may be kept which, having been obtained by robbery and extortion, cannot be traced to its right owners for restitution. This composition with the pope and the king is made by depositing the sum appointed by the confessor in an iron chest, fixed outside the doors of churches: a comfortable resource indeed for the tender consciences of peculators and extortioners, two very numerous classes in Spain. The fourth bull is to be purchased for the benefit of the deceased, and is called the defunct bull. The name of any dead person being entered on the bull, a plenary indulgence is by this means believed to be conveyed to his soul, if suffering in purgatory. To secure, however, a double sale, the three latter bulls are made of no effect, unless the original summary of the crusade be possessed by the person who wishes to enjoy the dispensations and privileges therein set forth. It is also a very common practice to bury these bulls with the corpses of those whom they are intended to benefit.'

INDULT', or IDDUL'TO, n.s. Ital. and Fr. Privilege or exemption.

INDULT, in the church of Rome, is the power of presenting to benefices granted to certain persons by the pope. Of this kind is the indult of kings and sovereign princes in the Romish communion, and that of the parliament of Paris, granted by several popes. By the concordat for the abolition of the Pragmatic sanction, made between Francis I. and Leo X. in 1516, the French king had the power of nominating to bishoprics, and other consistorial benefices, within his realm. At the same time, by a particular bull, the pope granted him the privilege of nominating to the churches of Brittany and Provence. In 1648 pope Alexander VIII., and in 1668 Clement IX., granted the king an indult for the bishopric of Metz, Toul, and Verdun, which had been yielded to him by the treaty of Mun-ster; and in 1668 the same pope Clement IX. granted him an indult for the benefices in the counties of Rousillon, Artois, and the Nether-lands. The cardinals likewise have an indult granted them by agreement between pope Paul IV. and the sacred college in 1555, which is always confirmed by the popes at the time of their election. By this treaty the cardinals have the free disposal of all the benefices depending on them, and are empowered likewise to bestow a benefice in commendam.

IN'DURATE, v. a. & v. n. } Lat. induro. To INDURA'TION, n. s. } make hard; to grow hard; to harden, whether substances or feelings; to *sear the conscience; obduracy; hardness of heart.

> Yet forgate I to maken rehersaile Of waters corosif, and of limaile;

And of bodies mollification, And also of hir *induration*.

Chaucer. The Chanones Yemannes Talo.

Stones within the earth at first are but rude earth or clay; and so minerals come at first of juices concrete, which afterwards *indurate*.

Bacon's Natural History.

This is a notable instance of condensation and *in*duration, by burial under earth, in caves for a long time. Bacon.

That plants and ligncous bodies may *indurate* under water without approachment of air, we have experiments in coralines. Browne's Vulgar Errours.

INDUS, also known as the Nilab and Sinde, is an important river, having its source in a range of the mountains of Tartary, between 38° and 39° of N. lat. After passing Lahdack, in Thibet, it takes a south-westerly course through the mountains called the Hindoo Koh, and enters Hindostan in about 35° of N. lat. It has always been considered as the western barrier of Hindostan. Sixty miles from its source it is joined by the Cabul, when it is no longer fordable. It is confined by hills at the fort of Attock, and is here less than 300 yards wide, but both deep and rapid. In lat, 33° it enters the valley of Isa Kheel, and is divided by islands into several streams. In lat. 28° 20' it is joined by the Punjnud, and, declining to the south-east, it enters the province of Sinde, between 25° and 26° of lat. Here we find it again divided into two considerable branches; the principal or western divides into numerous streams, which form a Delta similar to that of the Nile or Ganges: they are, however, very shallow, and only navigable by hoats: although the tide enters with great violence, it does not run up above seventy miles. This river is said to be 1350 miles in length, and some parts of it are capable of bearing vessels of 200 tons. But there is very little commerce transported by it. Its water is very wholesome.

ter is very wholesome. INDUS'TRIOUS, adj. Fr. industrieux; INDUS'TRIOUSLY, adv. Span., Port., Italian, IN'DUSTRY, n. s. and Latin, industria-Diligent, as opposed to slothful; laborious; designed; done for the purpose. Industriously, de-

in a diligent, assiduous, laborious manner; designedly. Industry, habitual exertion.

Let our just censures Attend the true event, and put we on Industrious soldiership. Shakspeare.

Great Britain was never before united under one king, notwithstanding that the uniting had been *indus*triously attempted both by war and peace. Bacon.

His thoughts were low :

To vice industrious; but to nobler deeds Timorous and slothful. Milton.

Frugal and *industrious* men are commonly friendly to the cstablished government. Temple.

Rich industry sits smiling on the plains,

And peace and plenty tell a Stuart reigns.

Pope. Windsor Forest.

I am not under the necessity of declaring myself, and I *industriously* conceal my name, which wholly exempts me from any hopes and fears. Swift.

Friends, books, a garden, and perhaps his per, Delightful *industry* enjoyed at home. Cowper. Industrious Skill, contented Labour smile :

Far seas are studded with thy countless sails ; What wind but waits them, and what shore but hails?

Canning.

INEBRIANT, in medicine is a term applied to any thirg that affects the nerves, so as through them to alter and disturb the functions of the mind, and produce intoxication. Inebriants are divided into natural and artificial; the former chiefly in use among the oriental and other nations, the latter principally throughout Europe. Artificial inebriants are fermented liquors from farinaceous seeds, wines, and spirits, drawn by distillation. Natural inebriants are opium ; in use all over the East, and of which the Turks, through custom, swallow large quantities. Peganum harmala, Syrian rue. The seeds of which are sold in Turkey for this purpose; and with these, as Bel-lonius relates, the Turkish emperor Solyman kept himself in a continual state of intoxication. Maslac of the Turks, or bangue of the Persians, prepared from the dust of the male-flower of hemp, or from the leaves. Bangue of the Indians, from the leaves of the hibiscus sabdariffa. Pinang, or betel of the Indians. Leaves of millfoil are used by the Dalecarlians to render their beer intoxicating. Tobacco, and several others less material, may also be enumerated in the list of natural inebriants.

INE'BRIATE, v. a. & v. n. Lat. meurio. to make drunk; to grow drunk; a state of drunkenness or intoxication.

Fish, entering far in and meeting with the fresh water, as if inebriated, turn up their bellies and are taken. Sandus.

Wine sugared inebriateth less than wine pure ; sops in wine, quantity for quantity, inebriate more than wine of itself. Bacon.

That cornelians and bloodstones may be of virtue, experience will make us grant; but not that an amethyst prevents inebriation. Browne.

INEFFABIL'ITY, n. s. French megaun, Span. inefable ; Lat. French *ineffable*;

Sineffabilis. Not to INEF'FABLY, adv. be expressed in words; unutterable: almost always used in a good sense; in a manner not to be expressed.

To whom the Son, with calm aspect, and clear, Light'ning divine, ineffable, screne! Milton.

Made answer.

He all his father full expressed,

Ineffably into his face received.

Id.

Reflect upon a clear, unblotted, acquitted conscience, and feed upon the ineffable comforts of the memorial of a conquered temptation. South.

But I lose Myself in Him, in light ineffable.

Thomson's Seasons. INEFFEC'TIVE, adj. Fr. ineffectif, inefficace ; Lat. ineffec-INEFFEC'TUAL, adj. tus, inefficar. That INEFFEC'TUALLY, adv. INUFFEC'TUALNESS, n. s. can produce no INEFFICA'CIOUS, adj. effect, as weak and J deficient in power; INEF'FICACY, n. s.

unable to produce effects; weak; feeble. Ineffectual rather denotes an actual failure; and inefficacious, an habitual impotence is any effect.

The publick reading of the Apocrypha they condemn as a thing effectual unto evil : the barc reading even of Scriptures themselves they mislike, as a thing ineffectual to do good. Hooker.

As the body, without blood, is a dead and lifeless trunk; so is the word of God, without the spirit, a dead and ineffective letter. Taylor.

He that assures himself he never errs, will always err; and his presumptions will render all attempts to inform him ineffective. Glanville.

Is not that better than always to have the rod in hand, and, by frequent use, misapply and render inefficacious this useful remedy ? Locke.

Faint are his gleams, and ineffectual shoot His straggling rays in horizontal lines

Through the thick air.

Thomson's Seasons. Winter.

INEL'EGANCE, n.s. INEL'EGANEY, n.s. INEL'EGANEY, n.s. eligo. These words imply absence of the motions of the beauty, and are applicable to the motions of the body, the language, and the attire.

This very variety of sea and land, hill and dale, which is here reputed so inelegant and unbocoming, is indeed extremely charming and agreeable.

Woodward.

Modern criticks, having never read Homer, but in low and inelegant translations, impute the meanness of the translation to the poet. Broome.

INEL'OQUENT, adj. Lat. in and eloquens. Not persuasive; not oratorical; opposite to eloquent.

INEPT', adj. Lat. ineptus. Triffing ; foolish; unfit for any pur-INEPT'LY, n. s.INEP'TITUDE, adv.) pose: more correctly inaptitude, and then derived from Lat. in and aptus.

All things were at first disposed by an omniscient intellect, that cannot contrive ineptly. Glanville.

The works of Nature, being neither useless nor inept, must be guided by some principle of knowledge. More.

None of them are made foolishly or ineptly. Id.

When the upper and vegetative stratum was once washed off by rains, the hills would have become barren, the strata below yielding only mere sterile matter, such as was wholly inept and improper for the formation of vegetables. Woodward.

There is an ineptitude to motion from too great laxity, and an ineptitude 10 motion from too great ten-Arbuthnot. sion.

INEQUAL'ITY, n.s. Fr. inegalité, from Lat. inequalitas and inequalis. Difference of comparative quantity.

The thridde houre inequal that Palamon

Began to Venus temple for to gon,

Up rose the sonne, and up rose Emilie.

Chaucer. The Knightes Tule. There is so great an inequality in the length of our legs and arms, as makes it impossible for us to walk Ray. on all four.

Unevenness; interchange of higher and lower parts.

The country is cut into so many hills and inequalitics as renders it defensible. Addison on Italy.

The glass seemed well wrought; yet, when it was quicksilvered, the reflexion discovered innumerable Newton's Opticks. inequalities all over the glass.

If there were no inequalities in the surface of the earth, nor in the seasons of the year, we should lose a considerable share of the vegetable kingdom.

Disproportion to any office or purpose; state of not being adequate; inadequateness.

The great inequality of all things to the appetites of a rational soul appears from this, that in all worldly things a man finds not half the pleasure in the actual possession that he proposed in the expectation.

South.

Change of state; unlikeness of a thing to itself; difference of temper or quality.

In some places, by the nature of the earth, and by the situation of woods and hills, the air is more unequal than in others; and inequality of air is ever an enemy to health. Bacon.

Difference of rank or station.

If so small inequality between man and man make in them modesty a commendable virtue, who, respecting superiors as superiors, can neither speak nor stand before them without fear. Hooker.

INERRABIL/ITY, n.s.	Lat. in and erro.
INER'RABLE, adj.	Exemption from
INER'RABLENESS, n. s.	> error; infallibility :
INER'RABLY, adv.	old words, now ob-
INER'RINGLY, adv.	solete.

I connot allow their wisdom such a completeness and inertability as to exclude myself from judging.

King Charles.

That divers limners at a distance, without copy, should draw the same picture, is more conceivable, than that matter should frame itself so inerringly according to the idea of its kind. Glanville.

We have conviction from reason, or decisions from the inertable and requisite conditions of sense.

Browne.

INERT', adj.) Lat. iners. Dull; sluggish; INERT'LY, adv. S without energy.

Body alone, inert and brute, you'll find ;

The cause of all things is by you assigned. Blackmore.

Ye powers,

Suspend a while your force inertly strong.

Dunciad. Were brute unlively mass, inert and dead. Thomson.

The INESCA'TION, n. s. Lat. in and esca. act of baiting.

INES'TIMABLE, adj. Fr. inestimable ; Lat. inestimabilis. Too valuable to be rated; transcending all price.

I thought I saw a thousand fearful wrecks,

A thousand men that fishes gnawed upon; Wedges of gold, great anchors, heaps of pearl,

Inestimable stones, unvalued jewels.

Shakspeare. Richard III.

And shall this prize, the' inestimable prize, On that rapacious hand for ever blaze? Pope. Thus, with indulgence most severe, she cheats

Us spendthrifts of inestimable time; Unnoted notes each moment misapplied. Young.

INEV'IDENT, adj. Fr. inevident. In and evident. Not plain; obscure. Not in use.

The habit of faith in divinity is an argument of things unseen, and a stable assent unto things inevident, upon authority of the divine revealer. Browne.

INEV'ITABILITY, n. s. Fr. Port. Fr. Span. and inevitable; SItal. INEV'ITABLY, adv. inevitabile; Lat. in, evito. Impossibility to be avoided ; cer-

tainty: without possibility of escape; not to be shunned.

I had a pass with him : he gives me the stucking with such a mortal motion, that it is inevitable.

Shakspeare. Twelfth Night.

Inflammations of the bowels oft inevitably tend to the ruin of the whole. Harvey on Consumptions. Fate inevitable

Subdues us.

Milton. The day thou catest thereof, my sole command Transgrest, inevitably thou shalt die. Id.

If they look no further than the next line, it will inevitably follow, that they can drive to no certain Dryden. point.

Since my inevitable death you know, Id. Aurengzebe. You safely unavailing pity show.

Inevitable hour! 'gainst fate to strive Where Desolation plants her famished brood

Is vain ; or Ilion, Tyre might yet survive,

And Virtue vanquish all, and Murder cease to thrive. Byron. Childe Harold.

INEXCU'SABLE, adj. Lat. in excuso. Not INEXCUSABLENESS, n. s. Lat. in excuso. INEXCUSABLENESS, n. s. to be excused or bound forgivepalliated by apology: enormity beyond forgiveness or palliation.

It will inexcusably condemn some men, who, having received excellent endowments, yet have frustrated the intention. Browne.

It is a temerity, and a folly inexcusable, to deliver up ourselves needlessly into another's power.

L'Estrange.

Their inexcusableness is stated upon the supposition that they knew God, but did not glorify him. South.

Such a favour could only render them more obdurate, and more inexcusable: it would enhance their guilt. Atterbury.

If learning be not encouraged under your administration, you are the most inexcusable person alive.

Swift.

INEXHA'LABLE, adj. In and exhale. That which cannot evaporate.

A new laid egg will not so easily be boiled hard, because it contains a great stock of humid parts, which must be evaporated before the heat can bring the inexhalable parts into consistence. Browne.

INEXHAUST'ED, adj. Lat. in, exhaustus. INEXHAUST'IBLE, adj. That cannot be emp-Lat. in, exhaustus. tied, or drawn away.

So wert thou born into a tuneful strain,

An early, rich, and inexhausted vein. Dryden.

The stock that the mind has in its power, by varying the idea of space, is perfectly inexhaustible, and so Locke. it can multiply figures in infinitum.

And if, in the ardour of narration, I by chance had drained the sources of reality, and emptied the stores of truth, I betook myself, without hesitation, to ransacking the riches of fiction ; and trusted implicitly to the inexhaustible fertility of my own invention.

Canning's Microcosm.

INEXISTENT, adj. Lat. in, existo. Not INEXISTENCE, n. s., having being; not to Lat. in, existo. Not be found in nature ; existing in something else : not much used.

To express complexed significations, they took a liberty to compound and piece together creatures of allowable forms into mixtures inexistent. Browne.

We doubt whether these heterogeneities be so much as inexistent in the concrete, whence they are ob-Boyle. tained.

He calls up the heroes of former ages from a state of inexistence to adorn and diversify his poem.

Broome on the Odyssey.

INEXO'RABLE, adj. Fr. and Span. inexo-ble; Lat. inexorabilis Not to be intreated; rable ; Lat. inexorabilis not to be moved by intreaty.

You are more inhuman, more inexorable, Oh ten times more, than tygers of Hyrcania !

Shakspeare.

Id. Merchant of Venice.

Inexorable dog ! The scourge Inexorable calls to penance. Milton.

The guests invited came, And with the rest the' inexorable dame.

Dryden.

Behold the inexorable hour at hand ! Behold the inexorable hour forgot : And to forget it, the chief aim of life, Though well to ponder it is life's chief end.

Young.

A weakness of the spirit-listless days, And nights inexorable to sweet sleep, Have come upon me.

Byron.

749

INEXPEDIENT, n.s. Lat. in captures ; Want of fitness ;) want of propriety ; INEXPE'DIENCY. unsuitableness to time or place ; inconvenience.

It concerneth superiors to look well to the expediency or inexpediency of what they enjoin in different things. Sunderson.

We should be prepared not only with patience to bear, but to receive with thankfulness a repulse, if God should see them to be inexpedient. Smalridge.

INEXPE'RIENCE, n. s. Fr. inexperience; INEXPE'RIENCED, adj. Fr. inexperience; Want of experi-INEXPERT', adj. mental knowledge; unskilful: not experienced: not having tried. Inexpert, not ready or apt at

any thing. The race elect advance

Through the wild desert ; not the readiest way, Lest, entering on the Canaanite alarmed, Milton. War terrify them inea pert.

Thy words at random argue thine inexperience.

In letters and in laws

Not inexpert. Prior. With all his canvas set, and inexpert,

And therefore heedless, can withstand thy power ? Cowper.

(Through inexperience as we now perceive), We missed that happiness we might have found.

Id. Task. INEX'PIABLE, adj. Fr. inexpiabile ; La-INEX'PIABLY, adv. Stin in, expio. Not to be atoned or mollified by atonement: to a degree beyond reconciliation.

Love seeks to have love ;

My love how could'st thou hope, who took'st the way To raise in me inexpiable hate ? Milton's Agonistes. Excursions are inexpiably bad,

And 'tis much safer to leave out than add.

Roscommon.

INEXPLE'ABLY, adv. Lat. in and expleo. Insatiably. A word not in use.

What were these harpies but flatterers, delators, Sandys' Travels. and the *inexpleably* covetous?

INEX'PLICABLE, adj. Fr. inexplicable; INEX'PLICABLY, adv. Lat. in, explico. Not to be disentangled, explained, or made intelligible.

What could such apprehensions breed, but, as their nature is, inexplicable passions of mind, desires abhorring what they embrace, and embracing what they abhor ? Hooker.

INF

To me at least this seems inexplicable, if light be nothing else than pression or motion propagated through cther. Newton.

None eludes sagacious reason more,

Than this obscure inexplicable power. Blackmore. There is a calm upon me-Buron.

Inexplicable stillness.

INEXPRES'SIBLE, adj. } Lat. in, expressus. INEXPRES'SIBLY, adv. Not to be told or

uttered : beyond the power of language to state or describe.

God will protect and reward all his faithful servants in a manner and measure inexpressibly abundant.

Hammond,

Thus when in orbs

Of circuit inexpressible they stood, Orb within orb. Milton's Paradise Lost.

The true God had no certain name given to him . for Father, and God, and Creator, are but titles arising from his works; and God is not a name, but a notion ingrafted in human nature of an inexpressible being. Stillingfleet.

He began to play upon it : the sound was exceeding sweet, and wrought into a variety of tunes that were inexpressibly melodious. Addison's Spectator.

INEXPUG'NABLE, adj. Fr. inexpugnable; Lat. inexpugnabilis. Impregnable; not to be taken by assault; not to be subdued.

Why should there be implanted in each sex such a vehement and inexpugnable appetite of copulation ? Ray.

INEXTIN'GUISHABLE, adj. Fr. inextinguible; Lat. in and extinguo. Unquenchable.

Pillars, statues, and other memorials, are a sort of shadow of an endless life, and show an inextinguishable desire which all men have of it. Grew.

- in his eye

The inextinguishable spark, which fires

The souls of patriots. Glover's Leonidas. INEX'TRICABLE, adj.] Fr. inextricable ; Lat. in, extricabilis. INEX'TRICABLY, adv. Not to be disentangled; not to be cleared; not to be set free from obscurity or perplexity.

He that should tie inextricable knots, only to baffle the industry of those that should attempt to unloose them, would be thought not to have served his generation. Decay of Piety.

Men are led into inextricable mazes by setting up themselves as judges of the world. Sherlock.

In vain they strive; the' intangling snares deny, Inextricably firm, the power to fly. Pope's Odyssey.

INEYE', v. n. In and eye. To inoculate; to propagate trees by the insition of a bud into a foreign stock.

Let sage experience teach thee all the arts Of grafting and ineyeing. Phillips.

INFALISTATIO, an ancient punishment of felons, by throwing them among the rocks and sands used in sea-port towns. Some think, that infalistatus implied some capital punishment, by exposing the malefactor upon the sands till the next tide carried him away; of which custom it is said there is an old tradition. However, the penalty seems to take its name from the Norman falese, or falesia, which signified not the sands, but the rocks and cliffs impending on the seashore. Commisit feloniam, ob quam fuit suspensus, ut legatus, vel alio modo morti damna-tus, &c. vel apud Dover infalistatus, apud Southampton submersus, &c.

Id.

INFAL'LIBLE, adj.

fallibile ; Lat. in, fallor. Exemption INFAL'LIBLY, adv. from error. privileged from error; incapable of mistake; not to be misled or deceived; certain. Used both of persons and things. Infallibly, with certainty; without danger from deceit; sure in accomplishment.

Every cause admitteth not such infallible evidence of proof, as leaveth no possibility of doubt or scruple behind it. Hooker.

Believe my words ;

For they are certain and infallible.

Shakspeare. Henry VI.

Infallibility is the highest perfection of the knowing faculty, and consequently the firmest degree of assent. Tillotson.

The success is certain and infallible, and none over yet miscarried in the attempt. South.

We cannot be as God, infallibly knowing good and evil. Smalridge's Sermons.

INFALLIBILITY OF THE POPE. See Popery. INFAME', v.a. Fr. infame; Ital. in-make infamous; to brand. To defame is now used. Infamously, with open reproach; wtih public notoriety; shamefully; scandalously: infamy, notoriety of bad character.

Those that be near, and those that be far from thee, shall mock thee, which art infamous. Ezek.

The noble isle doth want her proper limbs,

Her face defaced with sears of infamy.

Shakspeare. Livia is infamed for the poisoning of her husband. Bacon.

Hitherto obscured, infamed,

And thy fair fruit let hang, as to no end Created. Milton.

That poem was infamously bad.

Dryden's Dufresnoy. At fifty chides his infamous delay.

Pushes his prudent purpose to resolve. Young. And to decline it when these motives urge

Is infamy beneath a coward's baseness.

Havard's Regulus.

Even in destruction's depth, her foreign foes, From whom submission wrings an infamous repose.

Byron. Childe Harold.

His name is never pronounced by his relations but with disapprobation and disgust; and his memory is consigned to infamy. Canning. Microcosm.

INFAMY, in law, is a term which extends to forgery, perjury, gross cheats, &c., by which a person is rendered incapable of being a witness or juror, though he is pardoned for his crimes.

IN'FANCY, n. s. Fr. enfant, infanterie, IN'FANT, n. s. & adj. Lat. infuns, infanticidi-INFAN'TA, n. s. um. The first part of INFAN'TICIDE, n. s. (life usually extended to IN'FANTILE, adj. seven years; civil in-IN'FANTRY, n. s.) fancy or minority is ex-

tended to,twenty-one years; first age; beginning or commencement of any thing. Infant, not mature; early; imperfect. Infanta, a princess descended from the royal blood of Spain. Infanticide, the slaughter of infants. Infantile, per-

taining to an infant. Infantry, the foot soldiers of an army.

There shall be no more thence an infant of days. nor an old man that hath not filled his days.

Isaiah lxv. 20.

At length a shepheard, which thereby did keepe His fleecie flocke upon the playnes around, Led with the infants cry, that loude did weepe, Came to the place, where when he wrapped found The abandoned spoyle, he softly it unbound.

Spenser. Faerie Queene.

Dare we affirm it was ever his meaning, that unto their salvation, who even from their tender infancy never knew any other faith or religion than only Christian, no kind of teaching can be available, saving that which was so needful for the first universal conversion of Gentiles, hating Christianity ? Hooker.

It being a part of their virtuous education, serveth greatly both to nourish in them the fear of God, and to put us in continual remembrance of that powerful grace, which openeth the mouths of infants to sound his praise. Hooker

Within the infant rind cf this small flower Poison hath residence, and medicine power.

Shakspeare.

Milton.

The principal strength of an army consisteth in the infantry or foot; and to make good infantry it requireth men bred in some free and plentiful manner.

Bacon's Henry VII.

But if you deign my ruder pipe to hear, (Rude pipe, unused, untuned, unworthy hearing) These infantile beginnings gently bear,

Whose best desert and hope must be your bearing. Fletcher. Purple Island.

That small infantry

Warred on by cranes.

Pirithous came t' attend

This worthy Theseus, his familiar friend :

Their love in early infancy began, And rose as childhood ripened into man.

Dryden.

In their tender nonage, while they spread Their springing leaves and lift their infant head, Indulge their childhood. Id. Virgil.

In Spain our springs, like old men's children, be Decayed and withered from their infancy. Dryden.

Young mothers wildly stare, with fear possest, And strain their helpless infants to their breast.

Id. Æncid.

The insensible impressions in our tender infancies have very important and lasting consequences.

Locke.

The fly lies all the winter in these balls in its infantile state, and comes not to its maturity till the Derham. following spring.

The difference between the riches of Roman citizens in the infancy and in the grandeur of Rome, will appear by comparing the first variation of estates with the estates afterwards possessed. Arbuthnot. .

Let such as deem it glory to destroy, Rush into blood, the sack of cities seek, Unpierced, exulting in the widow's wail, The virgin's shriek, the infant's trembling cry.

Thomson.

Here first, at Fancy's fairy circled shrine Of daisies pyed this infant offering made. Warton. A Monody.

And yet poor Edwin was no vulgar boy, Deep thought oft seemed to fix his infant eye; Dainties he heeded not, nor gaude, nor toy, Save one short pipe of rudest minstrelsy. Beattiz's Minstrel.

INF

Both baby featured, and of *infant* size, Viewed from a distance, and with heedless eyes. Cowper. Progress of Error.

Or must such minds be nourished in the wild Deep, in the unpruned forest, 'midst the roar Of cataracts, where nursing Nature smiled On *infant* Washington? Has Earth no more Such seeds within her breast, or Europe no such store? Byron. Childe Harold.

INFANCY. Anatomy discovers to us, that during infancy there is much imperfection in the human frame; e.g. its parts are disproportioned, and its organs incapable of those functions which in future life they are designed to perform. The head is larger in proportion to the bulk of the body than that of an adult. The liver and pancreas are much larger in proportion than in advanced life; their secretions are more in quantity also. The bile is very inert; the heart is stronger and larger than in future life; the quantity of blood sent through the heart of an infant, in a given time, is also more in proportion than in adults. Though these circumstances have their important usefulness, yet the imperfection attending them subjects this age to many injuries and dangers from which a more perfect state is exempted. Dr. Percival observes, that of all the children who are born alive, two-thirds do not live to be two years old.

INFA'NGTHEF, or HINGFANGTHEFT, or IN-FANGTHEOF, is compounded of three Saxon words: the preposition in, fang, or fong, to take or catch, and thef. It signifies a privilege or liberty granted unto lords of certain manors to judge any thief taken within their fee.

INFANT. See INFANCY. Infants, amongst the Jews, Greeks, and Romans, were swaddled as soon as they were born, in a manner similar to that practised by the moderns. The Jews circumcised and named their infant children on the eighth day from their birth. Upon the birth of a son, the Grecians crowned their doors with olive; of a daughter, with wool. The infant was washed in warm water, and anointed with oil-by the Spartans with wine; it was then dressed, and laid in a basket, or on a shield if the father was a warrior. At five days old they ran with it round the fire, and the mother's relations sent presents. The Greeks named their children on the tenth day, the Romans on the ninth. The naming was attended with sacrifices and other demonstrations of joy. The maternal office of suckling their children was never declined, when circumstances would permit. The names of children were registered both among the Greeks and Romans.

INFANT, in law, is a person under twenty-one years of age; whose capacities and 'ncapacities, and privileges are various.

The ages of male and female are different for different purposes. A male at twelve years old may take the oath of allegiance; at fourteen is at the years of discretion, and therefore may consent or disagree to marriage, may choose his guardian, and, if his discretion be actually proved, may make his testament of his personal estate; at seventeen may be an executor; and at twenty one is at his own disposal, and may alien his lands, goods, and chattels. A female also at

entitled to dower; at twelve is at years of maturity, and therefore may consent or disagree to marriage, and, if proved to have sufficient discretion, may bequeath her personal estate; at fourteen is at years of legal discretion, and may choose a guardian; at seventeen may be an executrix ; and at twenty-one may dispose of herself and her lands. So that full age in male or female is at twenty-one years, which age is completed on the day preceding the anniversary of a person's birth; who till that time is an infant, and so styled in law. Among the ancient Greeks and Romans, women were never of age, but subject to perpetual guardianship, unless when married nisi convenissent in manum viri : and, when that perpetual tutelage wore away in process of time, we find that, in females as well as males, full age was not till twenty-five years. Thus, by the constitution of different kingdoms, this period, which is merely arbitrary, and juris positivi, is fixed at different times. Scotland agrees with England in this point; both probably copying from the old Saxon constitutions on the continent, which extended the age of minority ad annum vigesimum primum, et eo usque juvenes sub tutelam reponunt; but in Naples persons are of full age at eighteen, and in Holland at twenty-five. The very disabilities of infants are privileges; in order to secure them from injuring themselves by their own improvident acts. An infant cannot be sued but under the protection, and joining the name of his guardian; for he is to defend him against all attacks as well by law as otherwise; but he may sue either by his guardian or prochein amy, his next friend who is not his guardian. This prochein amy may be any person who will undertake the infant's cause; and it frequently happens that an infant, by his prochein amy, institutes a suit in equity against a fraudulent guardian. With regard to estates and civil property an infant has many privileges. In general, an infant shall lose nothing by nonclaim, or neglect of demanding his right; nor shall any other laches or negli-gence be imputed to an infant, except in some very particular cases. It is generally true that an infant can neither alien his lands, nor do any legal act, nor make a deed, nor any manner of contract, that will bind him. But, although infants cannot alien their estates, yet infant-trustees, or mortgages, are enabled to convey, under the direction of the court of chancery or exchequer, or other courts of equity, the estates they hold in trust or mortgage, to such person as the court shall appoint. Also it is generally true that an infant can do no legal act : yet an infant, who has an advowson, may present to the benefice when it becomes void. For the law in this case dispenses with one rule, in order to maintain others of far greater consequence; it permits an infant to present a clerk (who, if unfit, may be rejected by the bishop), rather than either suffer the church to be unserved [till he comes of age, or permit the infant to be debarred of his right by lapse to the bishop. An infant may also purchase lands, but his purchase is incomplete; for, when he comes to age, he may either agree or disagree to it, as he thinks prudent or proper,

seven years of age may be betrothed; at nine is

heirs after him, if he dies without having com- judgment. For one lad of eleven years old pleted his agreement. It is, farther, generally may have as much cunning as another of fourtrue, that an infants under twenty-one can make no deed but what is afterwards voidable : yet in some cases he may bind himself apprentice by deed indented, or indentures for seven years; and he may by deed or will appoint a guardian to his children, if he has any. Lastly, it is generally true, that an infant can make no other contract that will bind him : yet he may bind himself to pay for his necessary meat, drink, apparel, physic, and such other necessaries; and likewise for his good teaching and instruction, whereby he may profit himself afterwards.

The law of England does in some cases privilege an infant under the age of twenty-one, as to common misdemeanors; so as to escape fine, imprisonment, and the like : and particularly in cases of omission, as not repairing a bridge, or a high-way, and other similar offences; for, not having the command of his fortune till the age of twenty-one, he wants the capacity to do those things which the law requires. But where there is any notorious breach of the peace, a riot, battery, or the like (which infants when full grown are at least as liable as others to commit); for those an infant above the age of fourteen is equally liable to suffer, as a person of the full years old was convicted on his own confession age of twenty-one. With regard to capital of murdering his bedfellow; there appearing crimes, the law is still more minute and circumspect; distinguishing with greater nicety the chievous disposition; and as the sparing this several degrees of age and discretion. By the boy merely on account of his tender years might ancient Saxon law, the age of twelve years was be of dangerous consequence to the public, by established for the age of possible discretion, when first the understanding might open; and thence till the offender was fourteen, it was ætas pubertati proxima, in which he might, or might not, be guilty of a crime according to his natural capacity or incapacity. This was the dubious stage of discretion; but, under twelve, it was held, that he could not be guilty in will, neither after fourteen could be supposed innocent of any capital crime which he in fact committed. But the sons and daughters of the kings of Spain by the law as it now stands, and has stood at least ever since the time of Edward III., the capacity of doing ill, or contracting guilt, is not so much measured by years and days, as by the

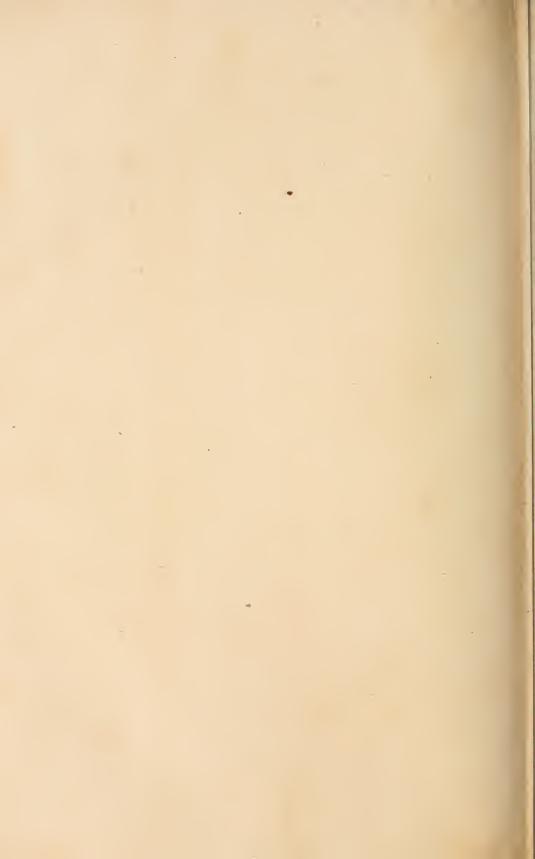

without alleging any reason; and so may his strength of the delinquent's understanding and teen; and in these cases the maxim is, that malitia supplet ætatem. Under seven years of age, indeed, an infant cannot be guilty of felony; for then a felonious discretion is almost an impossibility in nature : but at eight years old, he may be guilty of felony. Also, under fourteen, though an infant shall be prima facie adjudged to be doli incapax, yet if it appear to the court and jury that he was doli capax, and could discern between good and evil, he may be convicted and suffer death. Thus a girl of thirteen has been executed for killing her mistress : and one boy of ten, and another of nine years old, who had killed their companions, have been sentenced to death, and he of ten years actually hanged ; because it appeared, upon their trials, that the one hid himself and the other hid the body he had killed; which hiding manifested a consciousness of guilt, and a discretion to discern between good and evil. And there was an instance in the last century, where a boy of eight years old was tried at Abingdon for firing two barns, and it appearing that he had malice, revenge, and cunning, he was found guilty, condemned, and hanged accordingly. Thus also, in very modern times, a boy of ten in his whole behaviour plain tokens of a mispropagating a notion that children might commit such atrocious crimes with impunity, it was unanimously agreed by all the judges, that he was a proper subject of capital punish-But, in all such cases, the evidence of ment. that malice, which is to supply age, ought to be strong and clear beyond all doubt and contradiction.

> INFANTA, and INFANTE, are titles given to all and Portugal, except the eldest; the princes being called infantes, and the princesses infantas.
